A semi-analytic galaxy formation code.

# Contents

## I. Installation and Basic Use

1. About Galacticus  
   1.0.1. License .................................................. 4

2. Installation  
   2.1. Binaries ....................................................... 5  
   2.2. Installation Scripts ......................................... 5  
   2.3. Required Libraries and Tools  
      2.3.1. Essential Requirements ................................ 5  
      2.3.2. Typical Requirements .................................. 8  
      2.3.3. Full Requirements ...................................... 10  
   2.4. Compiling Galacticus  
      2.4.1. Compiling with OpenMP Parallelism .................... 13  
   2.5. Installing Without Root Access  
   2.6. Installing on Mac OS X  
      2.6.1. Update GNU compilers .................................. 17  
      2.6.2. Installing HDF5, FoX and FGSL ......................... 18  
      2.6.3. Installing Perl Modules ................................ 19

3. Running Galacticus  
   3.1. Configuration File ........................................... 21  
   3.2. Parameter Files  
      3.2.1. Validating Parameter Files  
      3.2.2. Generating Parameter Files ................................ 22  
   3.3. Running Galacticus  
      3.3.1. Writing Data To a Temporary File ...................... 23  
      3.3.2. Restarting A Crashed Run  
      3.3.3. Running Grids of Models ................................ 24  
      3.3.4. Analysis of Models  
      3.3.5. Running Models in “Embarrassingly Parallel” Mode .................... 30  
      3.3.6. Limiting the Load Average ................................ 31  
   3.4. Additional Codes  
      3.4.1. Excursion_Sets ....................................... 31  
      3.4.2. Halo_Mass_Functions .................................... 32  
      3.4.3. Power_Spectra ......................................... 34

4. Input Parameters ................. 37
5. Extracting and Analyzing Results

5.1. General Structure of Output File

5.1.1. UUID
5.1.2. Build Information
5.1.3. Parameters
5.1.4. Version
5.1.5. globalHistory
5.1.6. Outputs
nodeData group
mergerTree datasets
mergerTree subgroups
5.1.7. Optional Outputs
Redshifts
Mass Accretion Histories
Merger Tree Dump
Conditional Mass Functions
Pre-Evolution Merger Trees
5.2. Perl Module for Data Extraction
5.2.1. Derived Properties
Available Derived Properties
5.2.2. Galaxy Clustering via the Halo Model
5.3. Topics in Analysis of GALACTICUS Outputs
5.3.1. Building Volume Limited Samples
Building Redshift Catalogs
5.4. Postprocessing Scripts
5.5. Reprocessing Through Dust Using Grasil
5.5.1. Using the Galacticus::Grasil Module
5.6. Meta-Analysis of GALACTICUS
5.6.1. Tree Construction/Evolution Timing
5.6.2. ODE Evolver Profiler
5.7. Meta-Data in Plots
5.8. Perl Statistics Modules
5.8.1. Statistics::Histograms

6. Input Data

6.1. Broadband Filters
6.2. Merger Trees
6.2.1. Processing of Merger Tree Files
Requirements for GALACTICUS Input Parameters
6.2.2. Setting of Halo Properties
Dark Matter Scale Radii
Satellite Merger Times
Dark Matter Halo Spins

7. Tutorials

7.1. Running GALACTICUS on N-body Merger Trees
7.1.1. Setting Input Parameters
Node Positions
Virial Orbits
Merging Times and Targets
### 7.1.2. Analyzing the Output

- Positions and Velocities
- Subhalo Masses

### 7.2. Generating Mock Catalogs with Lightcones from the Millennium Simulation

### 7.3. Using the Instantaneous Recycling Approximation

### 7.4. Computing Dust Attenuation and Emission Using Galacticus+Grasil

### 7.5. Outputting Stellar Luminosities

#### 7.5.1. Postprocessing of Stellar Spectra

#### 7.5.2. Migrating Parameter Files to a New Version

#### 7.5.3. Computing Emission Lines

#### 7.5.4. Reionization Calculations

### 8. Troubleshooting

- Low CPU utilization with large numbers of output redshifts

### 9. Numerical Implementation

#### 9.1. Timestepping Criteria

- Tree Criteria
- "Branch Segment" Criteria
- "Parent" Criteria
- "Satellite" Criteria
- "Sibling" Criteria
- "Mergee" Criteria

#### 9.1.2. General Criteria

- "Simple" Criteria
- "Satellite" Criteria

#### 9.1.3. Output Criteria

- "History" Criteria
- "Main Branch Evolution" Criteria

### 10. Constraining Galacticus

#### 10.1. Model Accuracy

#### 10.2. Model Convergence

#### 10.3. Model Discrepancy

##### 10.3.1. Monte Carlo Merger Trees

##### 10.3.2. Fixed Virial Orbits

##### 10.3.3. Jiang et al. (2008) Merger Time Scatter

#### 10.4. Optimal Halo Mass Function Sampling

##### 10.4.1. Li & White (2009) Stellar Mass Function

##### 10.4.2. Refining by Other Merger Tree Statistics
III. Physical Implementation

11. Definitions and Conventions Used in Galacticus
11.1. Luminosity Units
11.2. Peculiar Velocities

12. Node Components
12.1. (Supermassive) Black Hole
  12.1.1. “Standard” Implementation
    Properties
    Initialization
    Differential Evolution
    Event Evolution
    Additional Output
  12.1.2. “Simple” Implementation
    Properties
    Initialization
    Differential Evolution
    Event Evolution
    Additional Output

12.2. Dynamics Statistics
  12.2.1. “Bars” Implementation
    Properties
    Initialization
    Differential Evolution
    Event Evolution
    Additional Output

12.3. Hot Halo
  12.3.1. “Very Simple” Implementation
    Properties
**Indices**

- **Properties**
- **Initialization**
- **Differential Evolution**
- **Event Evolution**

**Inter-Output Quantities**

- **Properties**
- **Initialization**
- **Differential Evolution**
- **Event Evolution**

## Physical Implementations

13. **Accretion of Gas into Halos**
   - **Simple Method**
   - **Null Method**

13.2. **Cosmology Functions**
   - **Matter + Lambda**
   - **Matter + Dark Energy**

13.3. **Circumnuclear Accretion Disks**
   - **Shakura-Sunyaev Geometrically Thin, Radiatively Efficient Disks**
   - **Advection Dominated, Geometrically Thick, Radiatively Inefficient Flows (ADAFs)**
   - **“Switched” Disks**
   - **Eddington-limited Disks**

13.4. **Dark Matter Structure Formation**
   - **Primordial Power Spectrum**
     - (Running) Power Law Spectrum
   - **Cosmological Mass Root Variance**
     - Filtered Power Spectrum
   - **Power Spectrum Variance Window Function**
     - Top-hat
     - Sharp in $k$-space
     - Hybrid of Top-hat and Sharp in $k$-space
   - **Non-linear Matter Power Spectrum**
     - Linear
     - Peacock & Dodds (1996)
     - CosmicEmu
   - **Transfer Function**
     - Null
     - BBKS
     - Eisenstein & Hu
     - CAMB
     - File
   - **Linear Growth Function**
     - Simple
   - **Critical Overdensity**
     - Spherical Collapse (Matter + Cosmological Constant)
13.4.8. Critical Overdensity Mass Scaling .................................................. 247
    Null ................................................................. 247
    Warm Dark Matter ............................................... 247
13.4.9. Virial Density Contrast ................................................................. 248
    Fixed ................................................................. 248
    Spherical Collapse (Matter + Cosmological Constant) .......... 248
    Kitayama & Suto (1996) ........................................... 248
    Friends-of-Friends .............................................. 248
13.4.10. Halo Bias ......................................................................................... 249
    Press-Schechter ..................................................... 249
    Sheth-Tormen ......................................................... 249
    Tinker .................................................................. 249
13.4.11. Halo Mass Function ........................................................................... 249
    Press-Schechter ..................................................... 249
    Sheth-Tormen ......................................................... 249
    Tinker .................................................................. 249
13.5. Conditional Mass Functions ..................................................................... 250
13.5.1. Behroozi et al. (2010) ....................................................................... 250
13.6. Cooling of Gas Inside Halos .................................................................... 250
13.6.1. Cooling Function .................................................................................. 250

Installation and Basic Use
1. About Galacticus

**Galacticus** is a semi-analytic model of galaxy formation. It solves equations describing how galaxies evolve in a merging hierarchy of dark matter halos in a cold dark matter universe. **Galacticus** has much in common with other semi-analytic models, such as the range of physical processes included and the type of quantities that it can predict.

In designing **Galacticus** our main goal was to make the code flexible, modular and easily extensible. Much greater priority was placed on making the code easy to use and modify than on making it fast. We believe that a modular and extensible nature is crucial as galaxy formation is an evolving science. In particular, key design features are:

**Extensible methods for all functions:** Essentially all functions within **Galacticus** are designed to be extensible, meaning that you can write your own version and insert it into **Galacticus** easily. For example, suppose you want to use an improved functional form for the cold dark matter (CDM) halo mass function. You would simply write a subroutine conforming to a specified template that computes this mass function and add a short directive (see §17.1) in your code which explains to the build system how to insert this function in **Galacticus**. A recompile of the code will then incorporate your new function.

**Extensible components for tree nodes:** The basic structure in **Galacticus** is a merger tree, which consists of a linked tree of nodes which have various properties. **Galacticus** works by evolving the nodes forwards in time subject to a collection of differential equations and other rules. Each node can contain an arbitrary number of *components*. A component may be a dark matter halo, a galactic disk, a black hole etc. Each component may have an arbitrary number of *properties* (some of which may be evolving, others of which can be fixed). **Galacticus** makes it easy to add additional components. For example, suppose you wanted to add a “stellar halo” component (consisting of stars stripped from satellite galaxies). To do this, you would write a module which specifies the following for this component:

- Number of properties;
- Interfaces to set and get property values and rates of change;
- “Pipes” which allow for flows of mass/energy/etc. from one component to another;
- Routines describing the differential equations which govern the evolution of the properties;
- Routines describing how the component responds to various events (e.g. the node becoming a satellite, a galaxy-galaxy merger, etc.);
- Auxiliary routines for handling outputs etc.

Short directives embedded in this module explain to the **Galacticus** build system how to incorporate the new component. A recompile will then build your new component into **Galacticus**. Typically, a new component can be created quickly by copying an existing one and modifying it as necessary. Furthermore, multiple implementations of a component are allowed. For example, **Galacticus** contains a component which is a Hernquist spheroid. You could add a de Vaucouler’s spheroid component. A simple input parameter then allows you to select which implementation will be used in a given run.
1. About Galacticus

Centralized ODE solver: GALACTICUS evolves nodes in merger trees by calling an ODE solver which integrates forwards in time to solve for the evolution of the properties of each component in a node. This means that you do not need to provide explicit solutions for ODEs (in many cases such solutions are not available anyway) and timestepping is automatically handled to achieve a specified level of precision. The ODE solver allows for the evolution to be interrupted. A component may trigger an interrupt at any time and may do so for a number of reasons. A typical use is to actually create a component within a given node—for example when gas first begins to cool and inflow in a node the disk component must be created. Other uses include interrupting evolution when a merging event occurs.

You should have received a copy of the GNU General Public License along with GALACTICUS. If not, see <http://www.gnu.org/licenses/>.
2. Installation

2.1. Binaries

If you just want to run GALACTICUS, and don’t want to modify the code in any way you can try using a standalone binary copy of GALACTICUS. This is often a good way to try out GALACTICUS without the overhead of installing libraries and tools required to compile GALACTICUS. Binaries can be found at the download page and are currently available only for x86_64 Linux. The binary is updated every night to reflect any updates to GALACTICUS.

2.2. Installation Scripts

Installing all the tools required for GALACTICUS can take some time. To make this process easier we’ve developed some simple installation scripts for Ubuntu, Fedora and Red Hat flavors of Linux. You can find these at the download page, with discussion of their use at the installation scripts page. These should be run as root and will attempt to install everything need to run GALACTICUS. We suggest that you look through the scripts to see what they’re doing before running them—we make no guarantees that they won’t install something that breaks other aspects of your system—use them at your own risk!

2.3. Required Libraries and Tools

We run GALACTICUS on Fedora Linux primarily. Installation instructions below are general, but we give some examples that are specific to Fedora (they probably work on other yum-based Linux distributions though). For other distributions/OSs you’ll need to figure out how to install pre-built packages or else install from source. We list tools and libraries in three categories: “essential”, “typical” and “full”. Essential tools are those required to compile and run GALACTICUS. Typical tools includes those additionally needed for common analysis tasks. The full set of tools allows you to run any of the scripts/programs included with GALACTICUS. The order in which tools are listed is the suggested order for installation—some tools depend on others which should therefore be installed first.

2.3.1. Essential Requirements

Perl The Perl language is a part of every Linux distribution that we know of, so use whatever method your distribution prefers to install it if you don’t already have it. On Fedora the following (as root) will install Perl:

```
yum install perl
```

If you need to install from source visit http://www.perl.org/ and follow the instructions given there. We currently use Perl v5.12.4, although earlier versions may work (for compiling GALACTICUS we have had success with versions as early as 5.8.8—you can use perl -v to discover which version of Perl you have installed).
2. Installation

**GNU Make** Galacticus uses GNU Make to build executables. Other implementations of make may work, but we make no guarantees. On Fedora the following (as root) will install GNU Make:

```
yum install make
```

Alternatively, GNU Make can be downloaded and installed from source as described online.

**GFortran** Galacticus is written primarily in Fortran using various aspects of the Fortran 2003 specification. We use GNU Fortran to compile Galacticus. You can use other Fortran compilers, but we make no claims as to whether they will support all required features of the Fortran language, or that they will produce correctly working code. On Fedora the following (as root) will install GNU Fortran:

```
yum install gcc-gfortran
```

Alternatively, GNU Fortran can be downloaded and installed from source as described online. Note that Galacticus requires v4.9.0 or later of gcc-gfortran—earlier versions will not work.

**g++** Galacticus contains some C++ components. We use GNU C++ to compile Galacticus. You can use other C++ compilers, but we make no claims as to whether they will produce correctly working code. On Fedora the following (as root) will install GNU C++:

```
yum install gcc-c++
```

Alternatively, GNU C++ can be downloaded and installed from source as described online.

**GNU Scientific Library** The GNU Scientific Library (GSL) is used extensively by Galacticus to perform numerous numerical functions. We currently use v1.15 of GSL—earlier versions will not work (due to Galacticus’s use of the odeiv2 ODE solver interface that was introduced in GSL v1.15). On Fedora the following (as root) will install GSL:

```
yum install gsl gsl-devel
```

Alternatively, GSL can be downloaded and installed from source as described online.

**FoX** FoX is an XML parser for Fortran. The source can be downloaded from http://www1.gly.bris.ac.uk/~walker/FoX/source/FoX-4.1.1-full.tar.gz. We recommend following the instructions provided with the download for install. We use FoX v4.1.0.

**HDF5** The HDF5 specification is used for storing output data from Galacticus. We currently use HDF5\(^2\) v1.8.8. On Fedora the following (as root) will install the HDF5 libraries:

```
yum install hdf5 hdf5-devel
```

Alternatively, HDF5 can be downloaded and installed from source. If this is done, we recommend the following build sequence:

---

\(^1\) We cannot predict if significantly later versions of GNU Fortran will successfully compile Galacticus.

\(^2\) Early versions of HDF5 may work, but versions prior to v1.8.5 have known memory leak problems.
2.3. Required Libraries and Tools

F9X=gfortran
export F9X
./configure --prefix=/usr/local --enable-fortran --enable-production
make
make check
make install

FGSL  FGSL is a Fortran interface to the GNU Scientific Library and is used extensively by GALACTICUS. It can be downloaded from the link above. We use FGSL v0.9.4 and recommend the following build sequence.

./configure --f90 gfortran
make
make install

CPAN  GALACTICUS requires some Perl modules which probably are not installed by default. We recommend that you install these via CPAN which probably is installed by default. If it is not, on Fedora the following (as root) will install CPAN:

yum install perl-CPAN

Note that you can check if any of the following Perl modules are already installed using

perl -e "use Module::Name"

If no error message is given, the module is already installed. When installing modules using CPAN (see below for example), if the install fails because of a failed test, you can often force the install by running perl -MCPAN -e 'force("install","Module::Name")'. Of course, this may mean that the module is not working correctly...

Switch  This module implements distributed conditional testing. It is part of the core Perl distribution up to Perl v5.12.0. From Perl v5.14.0 onward it must be installed using

perl -MCPAN -e 'install Switch'

XML::Simple  Provides a simple interface in Perl for processing XML files. It is used extensively by GALACTICUS for building the code and for handling various data files. On Fedora the following (as root) will install XML::Simple:

yum install perl-XML-Simple

Alternatively, it can be installed from CPAN using:

perl -MCPAN -e 'install XML::Simple'

List::MoreUtils  Provides additional list-oriented utilities in Perl. It is used when automatically constructing lists of parameters that are accepted by a given executable when that executable is compiled. On Fedora the following (as root) will install List::MoreUtils:

yum install perl-List-MoreUtils
2. Installation

Alternatively, it can be installed from CPAN using:

```perl
perl -MCPAN -e 'install List::MoreUtils'
```

**List::Uniq** Provides functionality to find unique items in lists in Perl. It is used in GALACTICUS’s build system. It can be installed from CPAN using:

```perl
perl -MCPAN -e 'install List::Uniq'
```

**XML::SAX** Provides functionality to parse XML in Perl. It is used in GALACTICUS’s build system. On Fedora the following (as root) will install **XML::SAX**:

```bash
yum install perl-XML-SAX
```

Alternatively, it can be installed from CPAN using:

```perl
perl -MCPAN -e 'install XML::SAX'
```

**XML::Validator::Schema** Provides functionality to validate XML in Perl. It is used in GALACTICUS’s build system to validate the component domain specific language (DSL). It can be installed from CPAN using:

```perl
perl -MCPAN -e 'install XML::Validator::Schema'
```

**Sort::Topological** This module implements dependency based sort and is used by the GALACTICUS build system to ensure that tasks are performed in the correct order. It can be installed using

```perl
perl -MCPAN -e 'install Sort::Topological'
```

**Date::Time** This module implements handling of dates and times and is used by various scripts to timestamp files that they create. It can be installed using

```perl
perl -MCPAN -e 'install Date::Time'
```

**Data::Dumper** This module provides formatted output of arbitrary data structures. On Fedora the following (as root) will install **Date::Time**:

```bash
yum install perl-DateTime
```

Alternatively, it can be installed from CPAN using:

```perl
perl -MCPAN -e 'install Data::Dumper'
```

2.3.2. Typical Requirements

In addition to the tools listed in §2.3.1 a typical install (allowing you to run typical analysis tasks for example) requires the following tools to be installed:

**PDL::IO::HDF5** Provides a simple Perl interface to HDF5 files. It is used by analysis scripts to extract data from GALACTICUS output files. It can be installed from CPAN using:
2.3. Required Libraries and Tools

perl -MCPAN -e 'install PDL::IO::HDF5'

**poppler**  
**poppler** is a set of tools for working with PDF files. We use v0.22.2 and recommend the following build sequence.

```
./configure  
make  
make check  
make install
```

**IO::Compress::Bzip2**  This module provides the bzip2 compression tool in Perl. On Fedora the following (as root) will install **IO::Compress::Bzip2**:

```
yum install perl-Compress-Bzip2
```

Alternatively, it can be installed from CPAN using:

```
perl -MCPAN -e 'install IO::Compress::Bzip2'
```

**IO::Prompt**  This module provides convenient reading from the prompt in Perl. On Fedora the following (as root) will install **IO::Prompt**:

```
yum install perl-IO-prompt
```

Alternatively, it can be installed from CPAN using:

```
perl -MCPAN -e 'install IO::Prompt
```

**IO::Interactive**  This module provides functionality to determine if a Perl script is running interactively. It can be installed from CPAN using:

```
perl -MCPAN -e 'install IO::Interactive
```

**Text::Table**  This module provides formatted table output in Perl. On Fedora the following (as root) will install **Text::Table**:

```
yum install perl-Text-Table
```

Alternatively, it can be installed from CPAN using:

```
perl -MCPAN -e 'install Text::Table'
```

**Text::Wrap**  This module provides formatted paragraph output in Perl. It is most likely part of a standard Perl install, but if not it can be installed from CPAN using:

```
perl -MCPAN -e 'install Text::Wrap
```

**PDL**  Provides array math handling in Perl. It is used extensively by **GALACTICUS** for analysis of models. On Fedora the following (as root) will install **PDL**:

```
yum install perl-PDL
```
2. Installation

Alternatively, it can be installed from CPAN using:

```
perl -MCPAN -e 'install PDL'
```

**PDL::NiceSlice** Provides convenient array slicing for PDL. PDL::NiceSlice can be installed from CPAN using:

```
perl -MCPAN -e 'install PDL::NiceSlice'
```

**Math::SigFigs** Provides formatting of numbers to a given number of significant figures. It is used by GALACTICUS when making plots. It can be installed from CPAN using:

```
perl -MCPAN -e 'install Math::SigFigs'
```

**Astro::Cosmology** Provides basic cosmological calculations. It is used by GALACTICUS when making plots to convert data points measured under the assumptions of one set of cosmological parameters to the cosmological parameters assumed by GALACTICUS. It can be installed from CPAN using:

```
perl -MCPAN -e 'force("install","Astro::Cosmology")'
```

2.3.3. Full Requirements

In addition to the tools listed in §2.3.1 and §2.3.2 a full install (allowing you to run all scripts and programs included with GALACTICUS) requires the following tools to be installed:

**LaTeX::Encode** This module formats text for output to a \LaTeX\ document. It can be installed using:

```
perl -MCPAN -e 'install LaTeX::Encode'
```

**File::Find** This module provides functionality for searching directory structures for files. It can be installed from CPAN using:

```
perl -MCPAN -e 'install File::Find'
```

**File::Copy** This module provides interfaces for copying and moving files in Perl. It can be installed from CPAN using:

```
perl -MCPAN -e 'install File::Copy'
```

**Image::Magick** This module provides access to the IMAGEMAGICK tools from Perl. On Fedora the following (as root) will install Image::Magick:

```
yum install ImageMagick-perl
```

Alternatively, it can be installed from CPAN using:

```
perl -MCPAN -e 'install Image::Magick'
```

---

3On some systems, LaTeX::Encode seems to have problems. Once installed, try executing: perl -e "use LaTeX::Encode". If this issues any error messages, then you should locate the LaTeXEncode.pm file on your system edit it to comment out (or remove) the "use strict;" line.
2.3. Required Libraries and Tools

Term::ReadKey This module provides a simple interface for accepting key reads from standard input in
Perl. On Fedora the following (as root) will install Term::ReadKey:

```
yum install perl-Term::ReadKey
```
Alternatively, it can be installed from CPAN using:

```
perl -MCPAN -e 'install Term::ReadKey'
```

MIME::Lite This module provides simple e-mail sending functionality in Perl. On Fedora the following
(as root) will install MIME::Lite:

```
yum install perl-MIME-Lite
```
Alternatively, it can be installed from CPAN using:

```
perl -MCPAN -e 'install MIME::Lite'
```

Date::Time This module provides date/time formatting functionality in Perl. On Fedora the following
(as root) will install Date::Time:

```
yum install perl-Date::Time
```
Alternatively, it can be installed from CPAN using:

```
perl -MCPAN -e 'install Date::Time'
```

Net::SMTP::SSL This module implements an SSL authenticated SMTP e-mail protocol in Perl. On
Fedora the following (as root) will install Net::SMTP::SSL:

```
yum install perl-Net::SMTP::SSL
```
Alternatively, it can be installed from CPAN using:

```
perl -MCPAN -e 'install Net::SMTP::SSL'
```

Net::DBus This module implements interaction with the DBus message bus system in Perl. On Fedora
the following (as root) will install Net::DBus:

```
yum install perl-Net::DBus
```
Alternatively, it can be installed from CPAN using:

```
perl -MCPAN -e 'install Net::DBus'
```

PDL::MatrixOps Provides matrix operators for PDL. It is used when generating Monte Carlo samples
of parameters from covariance matrices. PDL::MatrixOps can be installed from CPAN using:

```
perl -MCPAN -e 'install PDL::MatrixOps'
```
2. Installation

**PDL::LinearAlgebra** Provides linear algebra algorithms for PDL. It is used for Cholesky decomposition when generating Monte Carlo samples of parameters from covariance matrices. **PDL::LinearAlgebra** can be installed from CPAN using:

```
perl -MCPAN -e 'install PDL::LinearAlgebra'
```

**Gnuplot** The **Gnuplot** plotting package is used extensively by **Galacticus** to produce plots. While not required for running **Galacticus** it is recommended as it allows you to easily check model results using the preexisting plotting scripts. On Fedora the following (as root) will install **Gnuplot**:

```
yum install gnuplot
```

Alternatively, **Gnuplot** can be installed from source, following the online instructions. Note that some scripts require **Gnuplot** v4.4 or later.

**GraphViz** The **GraphViz** package is used to create plots of merger tree structures. While not required to run **Galacticus** it is recommended to allow simple graphing of such structures (useful to get a visual impression of what’s going on in the code). On Fedora the following (as root) will install **GraphViz** and a module that allows Perl to interact with it:

```
yum install graphviz perl-GraphViz
```

Alternatively, **GraphViz** can be installed from source, following the online instructions, while the Perl module can be installed from CPAN using

```
perl -MCPAN -e 'install GraphViz'
```

### 2.4. Compiling Galacticus

To build **Galacticus** (after installing all required libraries) ensure that you are in the **Galacticus/v0.0.1** directory and then simply type:

```
make Galacticus.exe
```

This will create the **Galacticus.exe** executable. The build takes some time, you’ll see a set of XML files get created first which **Galacticus** uses to figure out how modules link in to the **Galacticus** code. After that, the Fortran files are compiled. We regularly build **Galacticus** using a parallel make without any problems.

The **Makefile** contains a few options that you may want to adjust:

**FCCOMPILER** The command to invoke a Fortran 2003 compliant compiler. **Galacticus** should compile with any such compiler. In practice, we have only tried it using **GFortran v4.9.0+**. In particular, **Galacticus** makes use of certain Fortran 2003 features (notably procedure pointers, type-bound procedures and class variables) which older compilers might not handle (and some newer compilers might still have difficulty with);

**CCOMPILER** The command to invoke a C compiler.

**CPPCOMPILER** The command to invoke a C++ compiler.

---

4We cannot predict if significantly later versions of GNU Fortran will successfully compile **Galacticus**.
2.4. Compiling Galacticus

**PREPROCESSOR** The command to invoke a preprocessor to handle #IFDEF etc. statements. We normally use cpp.

**MODULETYPE** A label identifying the structure of modules built by the compiler. This is used to detected when module interfaces have been changed (requiring a recompile of all dependent code) and when only the module internals have changed. When the GFORTRAN compiler is used GCC-f95-on-LINUX should be used here. Look in ./scripts/build/Compare_Module_Files.pl for other possibilities (if your compiler isn’t listed you’ll need to either edit that script or deal with longer recompiles if you edit the code).

**FCFLAGS** Flags to pass to the Fortran compiler. Standard options for both error-checking and optimized builds for the GFORTRAN compiler are given in the Makefile.

**CFLAGS** Flags to pass to the C compiler.

**CPPFLAGS** Flags to pass to the C++ compiler.

Additionally, you can add compiler options to the GALACTICUS_FCFLAGS, GALACTICUS_CFLAGS, and GALACTICUS_-CPPFLAGS environment variables. This is useful to add machine-specific options.

### 2.4.1. Compiling with OpenMP Parallelism

By default, GALACTICUS will be compiled to run in parallel on machine with multiple CPUs using OpenMP. To disable this simply remove (or comment out the)

**FCFLAGS += -fopenmp**

line in the Makefile. When running GALACTICUS in parallel using OpenMP it may be necessary to increase the stack size allocated to each thread (since GALACTICUS calls some procedures recursively this can result in large numbers of local variables being allocated on the stack). To do this, use

```
setenv KMP_STACKSIZE 16777216
```

in csh and variants or

```
export KMP_STACKSIZE=16777216
```

in bash and variants. If you get stack overflows while running GALACTICUS in parallel, try increasing this value further.

GALACTICUS currently implements parallel calculations at the tree level—that is, each parallel thread works on a separate merger tree. This means that you need sufficient memory to hold multiple merger trees at once. The advantage of this approach is that it is highly scalable (assuming no need for communication between trees), and GALACTICUS can achieve close to optimal speed-up in many cases. The limit to the speed-up is usually determined by the workload balance between the trees. If one tree requires significantly more time to run that all other trees combined then one thread will be left working on that tree while all others have finished. To limit this problem, it is recommended that parallel runs which use `mergerTreeConstructMethod=build` (see §sec:MergerTreeConstruction) be conducted with the `[mergerTreeBuildTreesProcessDescending]=true` parameter set to true. This will cause the most massive merger trees (i.e. those which take longest to process) to be processed first.
2. Installation

2.5. Installing Without Root Access

It is possible to install GALACTICUS without root access to your computer. The following approach has worked in many cases—some adjustments may be required for your specific system. Depending on what is already installed on your system, you may be able to skip some of the following installs. Refer to §2.3.1, §2.3.2 and §2.3.3 to decide which of the following tools you want to install. (Or, alternatively, you may need to install additional tools.) Choose a location to install that has at least 4Gb of free space. In the following, this install location is referred to as /your/install/path. In the following, we assume you’re using some variant of the C-shell. If you’re using bash or some other Bourne shell, setenv VAR abcd should be translated to export VAR=abcd.

! Install GFortran, GCC and G++:

```
svn co svn://gcc.gnu.org/svn/gcc/trunk gcc-trunk
cd gcc-trunk
svn up
cd ..
rm -rf gcc-build
mkdir gcc-build
cd gcc-build
./gcc-trunk/configure --prefix=/your/install/path --enable-languages=c,c++,fortran --disable-multilib
make
make install
```

! Add to .cshrc (or equivalent):

```
setenv PATH /your/install/path/bin:$PATH
setenv LD_LIBRARY_PATH /your/install/path/lib:$LD_LIBRARY_PATH
```

! Install GSL:

```
wget "http://www.mirrorservice.org/sites/ftp.gnu.org.gnu/gsl/gsl-1.15.tar.gz"
tar xvfz gsl-1.15.tar.gz
cd gsl-1.15
./configure --prefix=/your/install/path
make
make check
make install
```

! Install FGSL:

```
wget "http://www.lrz-muenchen.de/services/software/mathematik/gsl/fortran/fgsl-0.9.4.tar.gz"
tar xvfz fgsl-0.9.4.tar.gz
cd fgsl-0.9.4
./configure --f90 gfortran --gsl /your/install/path
make
make install
```
2.5. Installing Without Root Access

! Install zlib:

```bash
wget "http://zlib.net/zlib-1.2.5.tar.gz"
tar xvfz zlib-1.2.5.tar.gz
cd zlib
./configure --prefix=/your/install/path
make
make check
make install
```

! Install HDF5:

```bash
wget http://www.hdfgroup.org/ftp/HDF5/current/src/hdf5-1.8.7.tar.gz
tar xvfz hdf5-1.8.7.tar.gz
cd hdf5-1.8.7
setenv F9X gfortran
./configure --prefix=/your/install/path --enable-fortran --enable-production
--with-zlib=/your/install/path
make
make check
make install
```

! Install FoX:

```bash
wget "http://www1.gly.bris.ac.uk/~walker/FoX/source/FoX-4.1.0-full.tar.gz"
tar xvfz FoX-4.1.0-full.tar.gz
cd FoX-4.1.0
setenv FC gfortran
./configure --prefix=/your/install/path
make
make check
make install
```

! Install Mercurial:

```bash
wget "http://mercurial.selenic.com/release/mercurial-2.4.1.tar.gz"
tar xvfz mercurial-2.4.1.tar.gz
cd mercurial-2.4.1
setenv PREFIX /your/install/path
make
make install
```

! Install Poppler:

```bash
wget "http://poppler.freedesktop.org/poppler-0.22.2.tar.gz"
tar xvfz poppler-0.22.2.tar.gz
cd poppler-0.22.2
./configure --prefix=/your/install/path
make
```
2. Installation

make check
make install

! Install Perl local::lib for local installs of modules:

mkdir .cpan
mkdir perl5
ln −sf /your/install/path/.cpan $HOME/
ln −sf /your/install/path/perl5 $HOME/
wget http://search.cpan.org/CPAN/authors/id/A/AP/APEIRON/local-lib−1.008004.tar.gz
tar xvfz local−lib−1.008004.tar.gz
cd local−lib−1.008004
perl Makefile.PL --bootstrap
make
make test
make install
perl −I$HOME/perl5/lib/perl5 −Mlocal::lib >> $HOME/.cshrc

! Install Perl modules:

perl −MCpan −e "install Sort::Topological"
perl −MCpan −e "install LaTeX::Encode"
perl −MCpan −e "install XML::Simple"
perl −MCpan −e "install Math::SigFigs"
perl −MCpan −e "install GraphViz"
perl −MCpan −e 'force("install","Astro::Cosmology")'
perl −MCpan −e "install File::Find"
perl −MCpan −e "install File::Copy"
perl −MCpan −e "install Image::Magick"
perl −MCpan −e "install Term::ReadKey"
perl −MCpan −e "install MIME::Lite"
perl −MCpan −e 'install Text::Table'
perl −MCpan −e 'install IO::Compress::Bzip2'
perl −MCpan −e 'install Date::Format'
perl −MCpan −e 'install Net::SMTP::SSL'
perl −MCpan −e 'install Net::DBus'
perl −MCpan −e 'install PDL'
perl −MCpan −e 'install PDL::LinearAlgebra'
perl −MCpan −e 'install PDL::MatrixOps'
perl −MCpan −e 'install PDL::NiceSlice'
perl −MCpan −e 'install PDL::IO::HDF5'

! Install GnuPlot:

wget "http://downloads.sourceforge.net/project/gnuplot/gnuplot/4.4.3/gnuplot−4.4.3.tar.gz"
tar xvfz gnuplot−4.4.3.tar.gz
cd gnuplot−4.4.3
./configure --prefix=/your/install/path
make
make install

! Install GraphViz:

tar xvfz graphviz-2.28.0.tar.gz
cd graphviz-2.28.0
./configure --prefix=/your/install/path
make
make check
make install

! Install Galacticus:

wget "http://users.obs.carnegiescience.edu/abenson/galacticus/versions/galacticus_v0.9.3.tar.bz2"
tar xvfj galacticus_v0.9.3.tar.bz2
cd Galacticus/v0.9.3

! Add to Makefile (below the GALACTICUS_FCFLAGS = line):

GALACTICUS_FCFLAGS += -fintrinsic-modules-path /your/install/path/finclude
 -fintrinsic-modules-path /your/install/path/include/gfortran
 -fintrinsic-modules-path /your/install/path
 -fintrinsic-modules-path /your/install/path/include
 -L /your/install/path/lib

It should then be possible to compile and run GALACTICUS.

2.6. Installing on Mac OS X

The following guidelines have been tested on a MacBook Pro, running Mac OS X V10.6.8.

2.6.1. Update GNU compilers

It is likely that the default compiler is older than GCC v4.9 that is required to properly compile the code without any errors. Use a package manager to download as recent a version as possible of gcc. For the case of MacPorts, this requires,

$ sudo port -v install gcc48 +gfortran

and reset the default version of gcc compilers by first listing available options

$ sudo port select --list gcc

and then explicitly setting to mp-gcc48 by

$ sudo port select --set mp-gcc48
2.6.2. Installing HDF5, FoX and FGSL

Once you have installed the latest compiler suite, you will need to recompile your HDF5, FoX and FGSL libraries. Download FoX (for XML parsing) from

http://www1.gly.bris.ac.uk/~walker/FoX/source/FoX-4.1.2-full.tar.gz

and run configure

$ sudo ./configure --prefix=/opt/local

i.e. install libraries in the same branch as the MacPorts distribution. Then do the usual

$ sudo make clean; sudo make; sudo make check; sudo make install

Similarly download FGSL from

http://www.lrz.de/services/software/mathematik/gsl/fortran/

and, assuming that you have downloaded GSL with MacPorts and they are installed in /opt/local/include and /opt/local/lib, run configure

$ sudo ./configure --f90 gfortran --gsl /opt/local --prefix /opt/local

i.e. install libraries in the same branch as the MacPorts distribution. Then do the usual

$ sudo make clean; sudo make; sudo make install

Finally download the latest version of HDF5, configure

$ sudo ./configure --enable-fortran --prefix=/opt/local

and do the usual

$ sudo make clean; sudo make; sudo make test; sudo make install

This should ensure that the modules (hdf5.mod, fox_dom.mod, ...) are compatible with the Galacticus build.

Galacticus requires crypt.h to install on linux-based systems; this is part of the GNU C library glibc. However, glibc has not been ported to Mac OS X and so this will not work properly. To get it working, edit source/utility.hashes.cryptographic.md5.c and comment out #include <crypt.h>, replacing it with #include <unistd.h>.

Note that you will need to amend the Makefile so that Galacticus knows where these .mod files are, which you can do by adding

FCFLAGS += -fintrinsic-modules-path /opt/local/include
-fintrinsic-modules-path /opt/local/include/gfortran
-fintrinsic-modules-path /opt/local/finclude.

You can also add

export GALACTICUS_FCFLAGS = "-L/opt/local/lib"

You can also add

to your .profile (i.e. .bashrc) file so that Galacticus knows where to find libraries (for FoX, libcrypt, ...) during linking.
2.6.3. Installing Perl Modules

Follow the instructions in the previous section to download and install new perl modules. You may need to upgrade CPAN using

\$ sudo perl -MCPAN -e 'install Bundles::CPAN'

before installation of certain modules (e.g. DateTime.pm) would proceed correctly. To install PDF::Labels, I found it necessary to

\$ sudo perl -MCPAN -e 'install PDF::Create''

and then

\$ sudo perl -MCPAN -e 'install PDF::Labels''
3. Running Galacticus

3.1. Configuration File

The file `galacticusConfig.xml`, is present, is used to configure GALACTICUS and provide useful information. It should have the following structure:

```xml
<config>
  <contact>
    <name>My Name</name>
    <email>me@ivory.towers.edu</email>
  </contact>
  <email>
    <host>
      <name>myComputerHostName</name>
      <method>smtp</method>
      <host>smtp-server.ivory.towers.edu</host>
      <user>myUserName</user>
      <passwordFrom>kdewallet</passwordFrom>
    </host>
    <host>
      <name>default</name>
      <method>sendmail</method>
    </host>
  </email>
</config>
```

The name and e-mail address in the `contact` section will be stored in any GALACTICUS models run—this helps track the provenance of the model. The `email` section determines how e-mail will be sent. Within this section, you can place one or more `host` elements, the `name` element of which specifies the host name of the computer to which these rules apply (the `default` host is used if no other match is found). For each host, the `method` element specifies how e-mail should be sent, either by `sendmail` or via `smtp`. For SMTP transport (which currently supports SSL connections only), you must specify the `host` SMTP server, `user` name. The `passwordFrom` element specifies how the password for the SMTP log in should be obtained. If set to `input` then the user will be prompted for the password as needed. Alternatively, if you use the KDE desktop and the KDEWallet password manager, setting `passwordFrom` to `kdewallet` will cause the password to be stored in the KDE wallet and retrieved from there subsequently.

3.2. Parameter Files

GALACTICUS requires a file of parameters to be given as a command line argument. The parameter file is an XML file (which makes it easy to manipulate and construct these files from within many languages, e.g. Perl) with the following structure:

```xml
<parameters>
```
3. Running Galacticus

```xml
<parameter>
  <name>parameter1name</name>
  <value>parameter1value</value>
</parameter>
```

Each parameter element contains name and value elements which contain the parameter name and desired value respectively. The value can be a number, word(s) or an array of space-separated numbers or words. Parameters are used to control the values of numerical parameters and also to select methods and other options. If a parameter is not specified in the file a default value (hard coded into GALACTICUS) will be used instead. The default values have been chosen to produce a realistic model of galaxy formation, but may change as GALACTICUS evolves.

All parameter values (both those specified in this file and those set to default) used during a GALACTICUS run are output to the Parameters group within the GALACTICUS output file. The script scripts/aux/Extract_Parameter_File.pl will, if given a GALACTICUS output file, extract the parameters from it and output them into an XML file suitable for re-input into GALACTICUS. If parameters are present in the parameter file which do not match any known parameter in GALACTICUS then a warning message, listing all unknown parameters, will be given when GALACTICUS is run. Note that this will not prevent GALACTICUS from running—sometimes it is convenient to include parameters which are not used by GALACTICUS, but which might be used by some other code.

3.2.1. Validating Parameter Files

A script, scripts/aux/validateParameters.pl, is provided to validate parameter files and thereby ensure that they are consistent with GALACTICUS's expectations and requirements. To use simply execute:

```
scripts/aux/validateParameters.pl myParameters.xml
```

No output (and an exit value of 0) indicates a valid parameter file. Invalid parameter files will result in an exit value other than 0 and will produce error messages that should help to track down the problem with the file.

3.2.2. Generating Parameter Files

Some scripts are provided which assist in the generation of parameter files. These are located in the scripts/parameters/ folder and are detailed below:

```bash
cosmologicalParametersMonteCarlo.pl
```

This script will generate a set of cosmological parameters drawn at random from the WMAP-9 constraints Hinshaw et al. [2012]. It uses the covariance matrix (currently defined in data/Cosmological_Parameters_WMAP-9.xml) to produce correlated random variables\(^1\). The generated parameters are printed to standard output as GALACTICUS-compatible XML.

---

\(^1\)Note that this does not capture the full details of the correlations between parameters, since it uses just the covariance matrix. For a more accurate calculation the full Monte Carlo Markov Chains used in the WMAP-9 parameter fitting should be used instead.
3.3. Running Galacticus

**Galacticus** is running using

```
Galacticus.exe [<parameterFile>]
```

where `parameterFile` is the name of the file containing a list of parameter values for **Galacticus**. **Galacticus** will display messages indicating its progress as it runs (the verbosity can be controlled with the `verbosityLevel` parameter). Usually, the **Galacticus** executable should be invoked from the directory in which it was built. However, you can choose to set the environment variable `GALACTICUS_ROOT_V091` to the full path to the build directory, in which case the **Galacticus** executable can be invoked from anywhere and will access all required files and scripts relative to this path. This can allow multiple users to all make use of the same **Galacticus** install.

3.3.1. Writing Data To a Temporary File

When running **Galacticus** on a compute cluster it is often advantageous to have output written to a local scratch disk during run time and only moved to networked storage after the run is complete. (Otherwise, **Galacticus** will perform many small writes to networked storage which can result in extremely slow run times.) To do this, simply set the parameter `[galacticusOutputScratchFileName]` to the full path of a file to write to on local scratch space. During the run, data will be written to this file. After the run is finished, **Galacticus** will move this file to its permanent location as specified by the parameter `[galacticusOutputFileName]`.

3.3.2. Restarting A Crashed Run

If **Galacticus** crashes, it can be useful to restart the calculation from just prior to the crash to speed the debugging process. **Galacticus** has functionality to store and retrieve the internal state of any modules and to recover this to permit such restarting. Currently, this is implemented with the build and read methods of merger tree construction, such that the internal state is stored prior to commencing the building or reading of each tree, thereby allowing a calculation to be restarted with the tree that crashed. More general store/retrieve behavior is planned for future releases.

To cause **Galacticus** to periodically store its internal state include the following input parameter:

```xml
<parameter>
  <name>stateFileRoot</name>
  <value>galacticusState</value>
</parameter>
```

This will cause the internal state to be stored to files `galacticusState.state` and `galacticusState.fgsl.state` prior to commencing building each merger tree. Should a tree crash then replace this input parameter with:

```xml
<parameter>
  <name>stateRetrieveFileRoot</name>
  <value>galacticusState</value>
</parameter>
<parameter>
  <name>mergerTreeBuildTreesBeginAtTree</name>
  <value>N</value>
</parameter>
```
3. Running Galacticus

where \( N \) is the number of the tree that crashed. This will cause calculations to begin with tree \( N \) and for the internal state to be recovered from the above mentioned files. The resulting tree and all galaxy formation calculations should therefore proceed just as in the original run (and so create the same crash condition).

**OpenMP**

When running a model in parallel using OpenMP, a separate state file will be written for each thread, with the thread number appended to the end of each state file name. For debugging purposes, it is suggested that a crashed OpenMP run be restarted using just a single thread. To do this, change the appended thread number on the state files corresponding to the thread which crashed to 0 such that they will be used by the single thread when the run is restarted.

3.3.3. Running Grids of Models

You can easily write your own scripts to generate parameter files and run GALACTICUS on these files. An example of such a script is `scripts/aux/launch.pl`. This script will loop over a sequence of parameter values, generate appropriate parameter files, run GALACTICUS using those parameters and analyze the results. This script currently supports running of GALACTICUS on a local machine, via a PBS queue (as multiple jobs or a single job), or on a CONDOR cluster. To run the script simply enter:

```
./scripts/aux/launch.pl <runFile>
```

This will launch a single instance of the script. Multiple instances can be launched and will share the work load (i.e. they will not attempt to run a model which another instance is already running or has finished). If multiple instances are to be launched on multiple machines a command line option to `launch.pl` can be used to ensure that they do not duplicate work. Adding `-instance 2:4` for example will tell the script to run only the second model from each block of four models it finds. Launching for `launch.pl` scripts on four different machines with `-instance 1:4`, `-instance 2:4`, `-instance 3:4` and `-instance 4:4` will then divide the models between those machines.

The `runFile` is an XML file with the following structure:

```xml
<parameterGrid>
  <modelRootDirectory>models.new</modelRootDirectory>
  <baseParameters>newBestParametersQuick.xml</baseParameters>
  <compressModels>no</compressModels>
  <splitModels>4</splitModels>

  <launchMethod>pbs</launchMethod>

  <local>
    <threadCount>3</threadCount>
    <ompThreads>4</ompThreads>
  </local>

  <condor>
    <galacticusDirectory>/home/condor/Galacticus/v0.9.3</galacticusDirectory>
    <universe>vanilla</universe>
    <environment>LD_LIBRARY_PATH=/usr/lib:/usr/lib64:/usr/local/lib</environment>
    <requirement>Memory &gt;= 1000 &amp;&amp; Memory &lt; 2000</requirement>
    <transferFile>{PWD}/myFile.data</transferFile>
  </condor>
</parameterGrid>
```
3.3. Running Galacticus

```xml
<wholeMachine>true</wholeMachine>
<postSubmitSleepDuration>5</postSubmitSleepDuration>
<jobWaitSleepDuration>10</jobWaitSleepDuration>
</condor>

<pbs>
<scratchPath>/scratch/me</scratchPath>
<wallTime>48:00:00</wallTime>
<memory>3gb</memory>
<ompThreads>8</ompThreads>
<queue>standard</queue>
<maxJobsInQueue>10</maxJobsInQueue>
<mpiLaunch>yes</mpiLaunch>
<mpiRun>/opt/openmpi/bin/mpirun</mpiRun>
<environment>LD_LIBRARY_PATH=/home/me/software/Galacticus/Tools/lib64:$LD_LIBRARY_PATH</environment>
<postSubmitSleepDuration>10</postSubmitSleepDuration>
<jobWaitSleepDuration>60</jobWaitSleepDuration>
</pbs>

<monolithicPBS>
<mpiLaunch>yes</mpiLaunch>
<nodes>1</nodes>
<threadsPerNode>12</threadsPerNode>
<ompThreads>6</ompThreads>
<jobWaitSleepDuration>60</jobWaitSleepDuration>
<analyze>no</analyze>
<environment>LD_LIBRARY_PATH=/home/me/software/Galacticus/Tools/lib64:$LD_LIBRARY_PATH</environment>
<includePath>/my/include/path</includePath>
<libraryPath>/opt/sgi/mpt/mpt-2.04/lib</libraryPath>
<shell>csh</shell>
<pbsCommand>source /usr/share/modules/init/csh</pbsCommand>
<pbsCommand>module load mpi-sgi/2.04_64</pbsCommand>
</monolithicPBS>

<parameters>
<label>modelLabel</label>
<parameter>
    <name>stabilityThresholdStellar</name>
    <value>1.1</value>
    <value>0.9</value>
</parameter>
</parameters>

<parameters>
<parameter>
    <name>stabilityThresholdGaseous</name>
    <value>1.1</value>
    <value>0.9</value>
</parameter>
</parameters>
```
Each parameters block contains a list of parameters following the format used in standard GALACTICUS parameter files, with the difference that each parameter can have multiple values. A model will be run for all possible combinations of these values. Additionally, any value element may contain further parameter elements. All possible values of these parameters will be looped over when, and only when, the appropriate value of the containing parameter is being used. For example, in the above example, models will be run with \([\text{starFormationKennicuttSchmidtTruncate}] = \text{true} \) and \(\text{false}\) only when \([\text{starFormationTimescaleDisksMethod}] = \text{Kennicutt-Schmidt}\) and not when \([\text{starFormationTimescaleDisksMethod}] = \text{dynamicalTime}\).

It is also possible to set the value of a parameter by modifying the current value using a Perl regular expression. This is done by given a modify element instead of a value element in the parameter definition. The modify element must contain find and replace elements, the first of which must be a valid Perl regular expression, and the second of which must specify the replacement text. In the above example, the parameters block specifies that models are two be run for \([\text{imfSelectionFixed}] = \text{Salpeter}\) and \(\text{Chabrier}\). However, for the case of \([\text{starFormationKennicuttSchmidtTruncate}] = \text{false}\) these parameters will be modified by suffixing them with “Truncated”.

Some variables, which are expanded at run time, are available. These include:

- %%galacticusOutputPath%% This will be expanded to the output path of a model. Useful for specifying paths for any additional output.

By default, each model is output into a sequentially numbered directory within the ./models directory.
By default, these directories have the prefix *galacticus*. This can be changed by including a *label* element inside a *parameters* block, in which case the content of the *label* element will be used as the prefix. This root directory can be modified by the optional *modelRootDirectory* element. Additionally, a set of base parameters can be read from a file specified by the *baseParameters* file—these will be read before each model is run and before any variations in parameters for the specific model are applied. As such, it defines the default model around which parameter variations occur. Additional options that may be present in the file (as elements within the *parameterGrid* element) are:

- **doAnalysis** If set to “no” then no analysis scripts will be run on completed models, otherwise, they will be. Optionally, the analysis script to run can be specified via the *analysisScript* element (see §3.3.4);
- **emailReport** If set to “yes” a report will be e-mailed to the address specified in *galacticusOptions.xml* when a model fails. Otherwise, the report will be written to standard output instead.
- **compressModels** If “no” then models are not compressed after being run. Otherwise, the contents of the model output directory will be compressed using *bzip2*.
- **splitModels** If set to an integer larger than 1, each *Galacticus* model will be split into that number of jobs, and those jobs will be launched (using the selected method) independently. Once finished, the outputs from these split models will be merged back into a single model. This allows, for example, effectively distributing a single *Galacticus* model over multiple nodes of a PBS cluster.

The method by which to launch jobs must be specified in the *launchMethod* element. Currently available options are:

- **local** The models will be run on the local machine. Two additional options can be specified within a *local* XML block:
  - **threadCount** The number of individual model threads to be launched.
  - **ompThreads** The number of OpenMP threads to be used by each model.
- **pbs** Jobs will be submitted to a PBS batch queue system. The following options are available and can be specified within a *pbs* XML block:
  - **scratchPath** An optional path to which the model output will be written at run time. At the completion of each run, the data will be transferred to the usual output location. This is useful to avoid network I/O during run time;
  - **wallTime** A limit on the wall time allowed for each model (optional);
  - **memory** A limit on the memory allowed for each model (optional);
  - **ompThreads** The number of OpenMP threads to use for each model (optional). This is used to request an appropriate number of processors per node;
  - **queue** The name of the queue to submit the jobs to (optional);
  - **maxJobsInQueue** The maximum number of jobs to place in the queue. Additional jobs will be held and submitted once the number of jobs in the queue drops below this value (optional);
- **mpiLaunch** If set to “yes” then the *mpirun* command will be used to launch a single copy of *Galacticus* (which may then spawn multiple OpenMP threads). If instead set to “no” then *Galacticus* is launch without the use of the *mpirun* command. Some systems will limit a code launched with *mpirun* to using just a single CPU (even if multiple OpenMP threads are spawned). In such cases, setting this option to “no” should permit multiple CPUs to be utilized.
3. Running Galacticus

mpiRun The path to the mpirun executable (optional—if not present, mpirun must be in PATH);

environment Any settings here are set in each PBS job in order to set appropriate environment variables on the machine where a job is executed;

analyze If set to “yes” then analysis (if any) will be performed as part of the PBS job. Otherwise, analysis is performed by the submitting machine.

postSubmitSleepDuration The time (in seconds) to wait after submitting each job. This prevents flooding the PBS queue manager with a large number of jobs in rapid succession.

jobWaitSleepDuration The time (in seconds) to sleep between successive checks of the PBS queue to see if any of the submitted jobs have finished.

monolithicPBS A single job will be submitted to a PBS batch queue system. This job will internally run multiple copies of GALACTICUS each with a different set of parameters. The following options are available and can be specified within a monolithicPBS XML block:

nodes The total number of nodes to use for the PBS job.

threadsPerNode The number of threads per node to use for the PBS job.

ompThreads The number of OpenMP threads to use for each model (optional). This is used to request an appropriate number of processors per node, and must be a factor of threadsPerNode;

scratchPath An optional path to which the model output will be written at run time. At the completion of each run, the data will be transferred to the usual output location. This is useful to avoid network I/O during run time;

wallTime A limit on the wall time allowed for each model (optional);

memory A limit on the memory allowed for each model (optional);

queue The name of the queue to submit the jobs to (optional);

mpiRun The path to the mpirun executable (optional—if not present, mpirun must be in PATH);

environment Any settings here are set in each PBS job in order to set appropriate environment variables on the machine where a job is executed;

analyze If set to “yes” then analysis (if any) will be performed as part of the PBS job. Otherwise, analysis is performed by the submitting machine.

postSubmitSleepDuration The time (in seconds) to wait after submitting each job. This prevents flooding the PBS queue manager with a large number of jobs in rapid succession.

jobWaitSleepDuration The time (in seconds) to sleep between successive checks of the PBS queue to see if any of the submitted jobs have finished.

condor Jobs will be submitted to a Condor cluster. The following options are available and can be specified within a condor XML block:

galacticusDirectory When a GALACTICUS job is submitted to a CONDOR cluster the GALACTICUS executable and the input parameter file are transferred to the machine where the job runs. Other files, such as data files, are not transferred. Therefore, they must be already present on any remote machine on which the job can run. This option specifies where a complete GALACTICUS installation can be found on the remote machine. If not present, it defaults to /home/condor/Galacticus/v0.9.0;

universe Specifies to which CONDOR universe jobs should be submitted. Allowed options are “vanilla” and “standard”. If the standard universe is to be used then GALACTICUS must have been linked with condor_compile—the Makefile allows this if the relevant lines are uncommented;
3.3. Running Galacticus

**environment** Any settings here are passed to CONDOR’s `environment` option in order to set appropriate environment variables on the machine where a job is executed;

**requirement** Any setting here is passed to CONDOR’s `requirements` option to specify requirements for each job. Multiple `requirement` entries will be combined (using logical and).

**transferFile** Any files listed here will be transferred the Condor worker (and so will be accessible from the path in which GALACTICUS is running). The macro `{PWD}` will be automatically expanded to the present working directory. Multiple `transferFile` entries can be given.

**wholeFile** Setting this option to `true` will add `+RequiresWholeMachine = True` to the Condor submit file. If Condor has been configured to allow jobs to take over a whole machine\(^2\), this will cause jobs to do so. This is useful if you want to run OpenMP GALACTICUS on a Condor cluster.

**postSubmitSleepDuration** The time (in seconds) to wait after submitting each job. This prevents flooding the Condor queue manager with a large number of jobs in rapid succession.

**jobWaitSleepDuration** The time (in seconds) to sleep between successive checks of the Condor queue to see if any of the submitted jobs have finished.

In addition to the `galacticus.hdf5` output file, each model directory will contain a file `newParameters.xml` which contains the parameters used to run the model and `galacticus.log` which contains any output from GALACTICUS during the run.

If present, the file `galacticusConfig.xml`, described in §3.1, is parsed for configuration options. If the contact element is present, the listed name and e-mail address will be used to determine who should receive error reports should a model crash. The error report will contain the host name of the computer running the model, the location of the model output and the log file (which may be incomplete if output is being buffered). Additionally, any core file produced will be stored in the model directory for later perusal, and the state files (see §3.3.2) for the run can also be found in the model directory.

3.3.4. Analysis of Models

The `Run_Galacticus.pl` script will automatically run `scripts/analysis/Galacticus_Compute_Fit.pl` on each model to generate plots and fitting data unless `doAnalysis=no` is set in the `runFile` (see §3.3.3). This script, which can also be running manually using

```
./scripts/analysis/Galacticus_Compute_Fit.pl <galacticusFile> <outputDirectory> [<analysisFile>]
```

where `galacticusFile` is the name of the GALACTICUS output file to analyze and `outputDirectory` is the directory into which plots and fitting data should be placed, reads the file `<analysisFile>` (or `data/Galacticus_Compute_Fit_Analyses.xml` if `<analysisFile>` is not specified) which has the following structure:

```
<analyses>
  <analysis>
    <script>scripts/plotting/Plot_HI_Mass_Function.pl</script>
    <weight>1.0</weight>
  </analysis>
  <analysis>
    <script>scripts/plotting/Plot_K_Luminosity_Function.pl</script>
    <weight>1.0</weight>
  </analysis>
</analyses>
```

\(^2\)As described here for example.
3. Running Galacticus

Each analysis element contains the name of a script to run to perform some analysis and a weight to be given to the results of this analysis when combining results to get a net goodness of fit. Each script listed will be run and is expected to have accept arguments of the form:

```
My_Analysis_Script.pl <galacticusFile> <outputDirectory> <showFit>
```

where the showFit argument can be 0 or 1 and, if set to 1, the script should output an XML chunk to standard output giving details of its fitting analysis. This chunk should have the form:

```
<galacticusFit>
  <name>Description of this analysis</name>
  <chiSquared>24.5</chiSquared>
  <degreesOfFreedom>19</degreesOfFreedom>
  <fileName>Output_File_Name.pdf</fileName>
</galacticusFit>
```

where chiSquared and degreesOfFreedom are the fitting results. All such data returned from fitting scripts will be collated by Galacticus_Compute_Fit.pl, augmented with the weight value and the net goodness of fit determined. All of this information is then output to galacticusFits.xml in the selected output directory.

Performing Other Analysis

If `<doAnalysis>` = yes and `<analysisFile>` is set to something other than an XML file it is assumed that this is an analysis script that should be run directly. The script will be executed with the output directory for the Galacticus model as the first and only argument.

3.3.5. Running Models in “Embarrassingly Parallel” Mode

While Galacticus is parallelized via OpenMP it is also possible to split a given model across several “worker” CPUs on one or more computers. The trees to be processed will be shared between these workers and the results can be later recombined. To use this “poor man’s” parallelization, add the following to a model parameter file:

```
<parameter>
  <name>treeEvolveWorkerCount</name>
  <value>N</value>
</parameter>
<parameter>
  <name>treeEvolveWorkerNumber</name>
  <value>i</value>
</parameter>
```

where N is the total number of workers to be used and i is the number of this worker (ranging from 1 to N). You can generate these individual input parameter files from a single base parameter file using:

```
scripts/aux/Split_Models_For_Workers.pl <parameterFile> <workerCount>
```
where <parameterFile> is the name of the base parameter file and <workerCount> is the number of workers required. The script will create an input file for each worker (input files will have the same name as the base parameter file but with a “_N”, where N is the worker number, inserted before the “.xml”). Output file name for each worker will be the same as specified in the base parameter file, but with a “_N”, where N is the worker number, inserted before the “.xml”.

Once all workers have finished, their outputs can (if required) be combined into a single output file using the Merge_Models.pl script as follows:

```
./scripts/aux/Merge_Models.pl <model1> <model2> .... <modelOutput>
```

where model1 etc. are the names of the various output files and modelOutput is the file into which the combined results should be placed. The Merge_Models.pl script will combine all merger trees into the output file and will additionally cumulate any data in the globalHistory groups in these files. The UUIDs of the merged files (see §5.1.1) will be concatenated (with a “:” separator) and placed into the UUIDs attribute of the new file. Additionally, a new UUID will be generated and stored in the UUID attribute of the new file.

### 3.3.6. Limiting the Load Average

If [treeEvolveLimitLoadAverage]=true then GALACTICUS will attempt to keep the load average of the system under [treeEvolveLoadAverageMaximum] by waiting to run trees if the current load average exceeds this value. [treeEvolveLoadAverageMaximum] can be set to the numerical maximum load average desired or, alternatively, can be set to processorCount in which case the number of processor cores present on the system will be used for [treeEvolveLoadAverageMaximum].

### 3.4. Additional Codes

The GALACTICUS code base can be used for other calculations. Some examples of such usage (and which are sufficiently useful in their own right) are included and are detailed in this section.

#### 3.4.1. Excursion_Sets

The Excursion_Sets code will generate an HDF5 output file which contains a variety of measures related to excursion sets in the Press-Schechter formalism. The code is built and run as follows:

```
make Excursion_Sets.exe
Excursion_Sets.exe <parameterFile> <outputFile>
```

where parameterFile is a file of parameters in GALACTICUS’s usual XML format and outputFile is the name of the file to which the excursion set data will be written. The output file has the following structure:

```
+-> barrier [dataset]
|  +-> firstCrossingProbability [dataset]
|  +-> firstCrossingRate [dataset]
|  +-> haloMass [dataset]
|  +-> haloMassFunction [dataset]
```
### 3. Running Galacticus

|  
| +-> powerSpectrum [dataset]  
|   
| +-> variance [dataset]  
|   
| +-> wavenumber [dataset]  

These datasets contain the following information:

- **haloMass** Halo mass [$M_{\odot}$];
- **wavenumber** Wavenumber corresponding to this halo mass [Mpc$^{-1}$];
- **powerSpectrum** Power spectrum at this wavenumber [Mpc$^3$];
- **variance** The variance, $S(M) = \sigma^2(M)$, at this halo mass;
- **barrier** The excursion set barrier, $B(S)$;
- **firstCrossingProbability** The probability of first crossing this barrier between $S$ and $S + dS$;
- **firstCrossingRate** The rate of first crossing of the barrier per unit time [Gyr$^{-1}$] for all pairs of halo mass;
- **haloMassFunction** The halo mass function [$M_{\odot}^{-1}$ Mpc$^{-3}$].

#### 3.4.2. Halo_Mass_Functions

The **Halo_Mass_Functions** code will generate an HDF5 output file which contains a variety of measures of the dark matter halo mass function tabulated as a function of mass and at a variety of redshifts. The code is built and run as follows:

```
make Halo_Mass_Functions.exe
Halo_Mass_Functions.exe <parameterFile> <outputFile>
```

where `parameterFile` is a file of parameters in **Galacticus**’s usual XML format and `outputFile` is the name of the file to which the halo mass function data will be written. The parameter file can specify any parameters needed for computing the mass function (they will be set to default values in cases where a parameter is not included). The redshifts at which to output halo mass functions are given by the [outputRedshifts] parameter. In addition to the usual **Galacticus** parameters three additional parameters control behavior:

- **[haloMassFunctionsMassMinimum]** The lowest mass halo (in units of $M_{\odot}$) at which to tabulate;
- **[haloMassFunctionsMassMaximum]** The highest mass halo (in units of $M_{\odot}$) at which to tabulate;
- **[haloMassFunctionsPointsPerDecade]** The number of points per decade of halo mass at which to tabulate.

The output file has the following structure:

```
|  
| +-> Outputs  
|   
|   |  
|   | +-> outputCharacteristicMass [dataset]  
|   |  
|   | +-> outputCriticalOverdensities [dataset]  
```
3.4. Additional Codes

The Parameters group contains attributes giving the values of all used parameters (just as in a GALACTICUS output file). The Outputs group contains datasets which give global properties at each requested output time as follows:

outputCharacteristicMass The characteristic mass scale (in units of $M_\odot$), $M_\ast$, at which $\sigma(M) = \delta_c(z)$;
outputCriticalOverdensities The critical overdensity for collapse of halos, $\delta_c$;
outputExpansionFactor The expansion factor;
outputGrowthFactors The linear growth factor;
3. Running Galacticus

outputRedshift The redshift;
outputTime The cosmic time (in units of Gyr);
outputVirialDensityContrast The virial density contrast of halos.

The haloMassFunctions group contains datasets which list the properties of halos as a function of mass at each requested output time as follows:

haloBias The large scale linear theory bias of the halo;
haloMass The mass of the halo (in \( M_\odot \));
haloMassFractionCumulative The mass fraction in halos above the current halo mass;
haloMassFunctionCumulative The cumulative number of halos per unit volume above the current halo mass (in units of Mpc\(^{-3} \));
haloMassFunctionLnM The halo mass function per logarithmic halo mass (in units of Mpc\(^{-3} \));
haloMassFunctionM The halo mass function per logarithmic halo mass (in units of Mpc\(^{-3} M_\odot^{-1} \));
haloNu The peak height of the halo, \( \nu = \delta_c/\sigma(M) \);
haloSigma The root-variance of the mass field smoothed in top-hat spheres;
haloVirialRadius The virial radius (in units of Mpc) of the current halo mass;
haloVirialTemperature The virial temperature (in units of Kelvin) of the current halo mass;
haloVirialVelocity The virial velocity (in units of km/s) of the current halo mass;

Dimensionful datasets have an `unitsInSI` attribute that gives their units in the SI system.

3.4.3. Power_Spectra

The Power_Spectra code will generate an HDF5 output file which contains a variety of measures of the matter power spectrum tabulated as a function of wavenumber. The code is built and run as follows:

```
make Power_Spectra.exe
Power_Spectra.exe <parameterFile> <outputFile>
```

where `parameterFile` is a file of parameters in GALACTICUS’s usual XML format and `outputFile` is the name of the file to which the power spectrum data will be written. The parameter file can specify any parameters needed for computing the power spectrum (they will be set to default values in cases where a parameter is not included). The output file has the following structure:

```
+-> powerSpectrum
  |  |
  |  +-> alpha [dataset]
  |  |
  |  +-> mass [dataset]
  |  |
  |  +-> powerSpectrum [dataset]
  |  |
  |  +-> sigma [dataset]
```
The Parameters group contains attributes giving the values of all used parameters (just as in a GALACTICUS output file). The powerSpectrum group contains datasets which give the power spectrum and related properties as follows:

**alpha** The logarithmic slope of $\sigma(M)$: $\alpha = \frac{d \ln \sigma}{d \ln M}$;

**mass** The mass scale, $M$, corresponding to the given wavenumber, $k$, defined such that $M = \frac{4\pi\Omega_{\text{M}}\rho_{\text{crit}}}{3k^3}$ (in units of $M_\odot$);

**powerSpectrum** The linear theory power spectrum at $z = 0$: $P(k)$ in units of $\text{Mpc}^3$;

**sigma** The dimensionless linear theory mass fluctuation at $z = 0$: $\sigma(M)$;

**wavenumber** The wavenumber in units of $\text{Mpc}^{-1}$.

Dimensionful datasets have an **unitsInSI** attribute that gives their units in the SI system.
4. Input Parameters

The following is an alphnumerically sorted list of all input parameters defined in GALACTICUS. Each parameter is listed by name, along with a description, default value (if one is specified in GALACTICUS), the file and program unit with which it is associated. Where relevant, references for parameters and the default values are given.

Name: tfamily H\_0
**Attached to:** tfamily module:Cosmology_Parameters
**File:** tfamily cosmology.parameters.F90
**Default value:** 69.7 (Hinshaw et al. 2012; CMB + H\_0 + BAO)
**Description:** The present day value of the Hubble parameter in units of km/s/Mpc.

Name: tfamily Omega\_DE
**Attached to:** tfamily module:Cosmology_Parameters
**File:** tfamily cosmology.parameters.F90
**Default value:** 0.7188 (Hinshaw et al. 2012; CMB + H\_0 + BAO)
**Description:** The density of dark energy in the Universe in units of the critical density.

Name: tfamily Omega\_Matter
**Attached to:** tfamily module:Cosmology_Parameters
**File:** tfamily cosmology.parameters.F90
**Default value:** 0.2812 (Hinshaw et al. 2012; CMB + H\_0 + BAO)
**Description:** The density of matter in the Universe in units of the critical density.

Name: tfamily Omega\_b
**Attached to:** tfamily module:Cosmology_Parameters
**File:** tfamily cosmology.parameters.F90
**Default value:** 0.04611 (Hinshaw et al. 2012; CMB + H\_0 + BAO)
**Description:** The density of baryons in the Universe in units of the critical density.

Name: tfamily T\_CMB
**Attached to:** tfamily module:Cosmology_Parameters
**File:** tfamily cosmology.parameters.F90
**Default value:** 2.72548 [Fixsen, 2009]
**Description:** The present day temperature of the cosmic microwave background (CMB) in units of Kelvin.

**Attached to:** tfamily module:Stellar_Population_Spectra_File
**File:** tfamily stellar_populations.spectra.file.F90
**Default value:** data/SSP_Spectra_imf$1.hdf5
**Description:** The name of the file of stellar populations to use for the named initial mass function (IMF).

Name: tfamily [regEx] stellarPopulationSpectraPostprocess[a-zA-Z0-9\_]+Methods
**Attached to:** tfamily module:Stellar_Population_Spectra_Postprocess
4. Input Parameters

File: tfamily stellar_populations.spectra.postprocess.F90
Default value: inoue2014 (for “Default” chain)
Description: The name of methods to be used for post-processing of stellar population spectra.

Name: tfamily accretionColdModeShockStabilityThreshold
Attached to: tfamily module:Accretion_Halos
File: tfamily accretion.halo.F90
Default value: 0.0126 [Birnboim and Dekel, 2003]
Description: The threshold value, \( \epsilon_{s,\text{crit}} \), for shock stability in the model of Birnboim and Dekel [2003].

Name: tfamily accretionColdModeShockStabilityTransitionWidth
Attached to: tfamily module:Accretion_Halos
File: tfamily accretion.halo.F90
Default value: 0.01 [Benson and Bower, 2010]
Description: The width of the transition from stability to instability for cold mode accretion [Benson and Bower, 2010].

Name: tfamily accretionDiskJetPowerEddington
Attached to: tfamily module:Accretion_Disks_Eddington
File: tfamily accretion_disks.Eddington_limited.F90
Default value: 0.1
Description: The jet power produced by an Eddington limited accretion disk in units of the Eddington luminosity.

Name: tfamily accretionDiskRadiativeEfficiencyEddington
Attached to: tfamily module:Accretion_Disks_Eddington
File: tfamily accretion_disks.Eddington_limited.F90
Default value: 0.1
Description: The radiative efficiency of an Eddington limited accretion disk.

Name: tfamily accretionDiskSpectraFileName
Attached to: tfamily module:Accretion_Disk_Spectra
File: tfamily accretion_disks.spectra.F90
Default value: none
Description: The name of a file from which to read tabulated spectra of accretion disks.

Name: tfamily accretionDiskSpectraMethod
Attached to: tfamily module:Accretion_Disk_Spectra
File: tfamily accretion_disks.spectra.F90
Default value: hopkins2007
Description: The method to be used for accretionDiskSpectra.

Name: tfamily accretionDiskSwitchedScaleAdafRadiativeEfficiency
Attached to: tfamily module:Accretion_Disks_Switched
File: tfamily accretion_disks.switched.F90
Default value: true
Description: Specifies whether the radiative efficiency of the ADAF component in a switched accretion disk scales with accretion rate.
Name: tfamily accretionDisksMethod
Attached to: tfamily module:Accretion_Disks
File: tfamily accretion_disks.F90
Default value: switched
Description: Selects which accretion disk method should be used.

Name: tfamily accretionHaloMethod
Attached to: tfamily module:Accretion_Halos
File: tfamily accretion.halo.F90
Default value: simple
Description: The method to be used for accretionHalo.

Name: tfamily accretionHalosSimpleAccreteNewGrowthOnly
Attached to: tfamily module:Accretion_Halos
File: tfamily accretion.halo.F90
Default value: false
Description: Specifies whether accretion from the intergalactic medium (IGM) is allowed only when a halo is growing past its previous greatest mass.

Name: tfamily accretionHalosSimpleNegativeAccretionAllowed
Attached to: tfamily module:Accretion_Halos
File: tfamily accretion.halo.F90
Default value: true
Description: Specifies whether negative accretion (mass loss) is allowed in the simple halo accretion model.

Name: tfamily accretionHistoryWechslerFormationRedshift
Attached to: tfamily module:Dark_Matter_Halo_Mass_Accretion_Histories_Wechsler2002
Default value: 0.4
Description: The formation redshift to use in Wechsler et al. [2002] halo mass accretion histories.

Name: tfamily accretionHistoryWechslerFormationRedshiftCompute
Attached to: tfamily module:Dark_Matter_Halo_Mass_Accretion_Histories_Wechsler2002
Default value: true
Description: Compute formation redshift automatically for Wechsler et al. [2002] halo mass accretion histories?

Name: tfamily accretionRateThinDiskMaximum
Attached to: tfamily module:Accretion_Disks_Switched
File: tfamily accretion_disks.switched.F90
Default value: 0.3
Description: The accretion rate (in Eddington units) above which a switched accretion disk becomes an ADAF.

Name: tfamily accretionRateThinDiskMinimum
Attached to: tfamily module:Accretion_Disks_Switched
File: tfamily accretion_disks.switched.F90
4. Input Parameters

**Default value:** 0.01  
**Description:** The accretion rate (in Eddington units) below which a switched accretion disk becomes an ADAF.

**Name:** tfamily accretionRateTransitionWidth  
**Attached to:** tfamily module:Accretion_Disks_Switched  
**File:** tfamily accretion_disks.switched.F90  
**Default value:** 0.1  
**Description:** The width (in \( \ln[M/\dot{M}_{\text{Eddington}}] \)) over which transitions between accretion disk states occur.

**Name:** tfamily adafAdiabaticIndex  
**Attached to:** tfamily module:Accretion_Disks_ADAF  
**File:** tfamily accretion_disks.ADAF.F90  
**Default value:** 1.444 (for exponential form of field-enhancing shear) or 1.333 (for linear form)  
**Description:** Specifies the effective adiabatic index of gas in an ADAF.

**Name:** tfamily adafEnergyOption  
**Attached to:** tfamily module:Accretion_Disks_ADAF  
**File:** tfamily accretion_disks.ADAF.F90  
**Default value:** pureADAF  
**Description:** Specifies the specific energy of material at the inner edge of an ADAF. pureADAF makes the specific energy equal to 1 (i.e. all energy is advected with the flow); ISCO makes the specific energy equal to that for the innermost stable circular orbit.

**Name:** tfamily adafFieldEnhanceType  
**Attached to:** tfamily module:Accretion_Disks_ADAF  
**File:** tfamily accretion_disks.ADAF.F90  
**Default value:** exponential  
**Description:** Controls how the field enhancing shear is determined. exponential will cause the form \( g = \exp(\omega t) \) [Benson and Babul, 2009] to be used, while linear will cause \( g = 1 + \omega t \) to be used instead. The functional form of \( \alpha(j) \) (if used) will be adjusted to achieve a sensible spin-up function in each case.

**Name:** tfamily adafJetEfficiencyMaximum  
**Attached to:** tfamily module:Accretion_Disks_ADAF  
**File:** tfamily accretion_disks.ADAF.F90  
**Default value:** 2  
**Description:** The maximum efficiency allowed for ADAF-driven jets (in units of the accretion power).

**Name:** tfamily adafRadiativeEfficiency  
**Attached to:** tfamily module:Accretion_Disks_ADAF  
**File:** tfamily accretion_disks.ADAF.F90  
**Default value:** 0.01  
**Description:** Specifies the radiative efficiency of an ADAF (i.e. the fraction of \( \dot{M}c^2 \) that is emitted in radiation).

**Name:** tfamily adafRadiativeEfficiencyType  
**Attached to:** tfamily module:Accretion_Disks_ADAF  
**File:** tfamily accretion_disks.ADAF.F90
**Default value:** thinDisk  
**Description:** Specifies the specific energy of material at the inner edge of an ADAF. pureADAF makes the specific energy equal to 1 (i.e. all energy is advected with the flow); ISCO makes the specific energy equal to that for the innermost stable circular orbit.

**Name:** tfamily adafViscosityFixedAlpha  
**Attached to:** tfamily module:Accretion_Disks_ADAF  
**File:** tfamily accretion_disks.ADAF.F90  
**Default value:** 0.1  
**Description:** The value for the viscosity parameter $\alpha$ in an ADAF to be used if [adafViscosityOption]=fixed.

**Name:** tfamily adafViscosityOption  
**Attached to:** tfamily module:Accretion_Disks_ADAF  
**File:** tfamily accretion_disks.ADAF.F90  
**Default value:** fit  
**Description:** Controls how the viscosity parameter $\alpha$ in an ADAF is determined. fit will cause $\alpha$ to be computed using the fitting function of Benson and Babul [2009]; fixed will cause $\alpha = [adafViscosityFixedAlpha]$ to be used.

**Name:** tfamily adiabaticContractionGnedinA  
**Attached to:** tfamily module:Galactic_Structure_Initial_Radii_Adiabatic  
**File:** tfamily galactic_structure.radius_solver.initial_radii.adiabatic.F90  
**Default value:** 0.8 (Gustafsson et al. 2006; from their Fig. 9, strong feedback case)  
**Description:** The parameter $A$ appearing in the Gnedin et al. [2004] adiabatic contraction algorithm.

**Name:** tfamily adiabaticContractionGnedinOmega  
**Attached to:** tfamily module:Galactic_Structure_Initial_Radii_Adiabatic  
**File:** tfamily galactic_structure.radius_solver.initial_radii.adiabatic.F90  
**Default value:** 0.77 (Gustafsson et al. 2006; from their Fig. 9, strong feedback case)  
**Description:** The parameter $\omega$ appearing in the Gnedin et al. [2004] adiabatic contraction algorithm.

**Name:** tfamily adiabaticContractionIncludeBaryonGravity  
**Attached to:** tfamily module:Galactic_Structure_Radii_Adiabatic  
**File:** tfamily galactic_structure.radius_solver.adiabatic.F90  
**Default value:** true  
**Description:** Specifies whether or not gravity from baryons is included when solving for sizes of galactic components in adiabatically contracted dark matter halos.

**Name:** tfamily adiabaticContractionSolutionTolerance  
**Attached to:** tfamily module:Galactic_Structure_Radii_Adiabatic  
**File:** tfamily galactic_structure.radius_solver.adiabatic.F90  
**Default value:** $10^{-2}$  
**Description:** Maximum allowed mean fractional error in the radii of all components when seeking equilibrium solutions for galactic structure.

**Name:** tfamily adiabaticContractionUseFormationHalo  
**Attached to:** tfamily module:Galactic_Structure_Radii_Adiabatic  
**File:** tfamily galactic_structure.radius_solver.adiabatic.F90  
**Default value:** false

41
4. Input Parameters

**Description:** Specifies whether or not the “formation halo” should be used when solving for the radii of galaxies.

**Name:** tfamily alfalfaHiMassFunctionZ0.00ConversionError  
**Attached to:** tfamily module:Galacticus_Output_Analyses_Mass_Functions  
**File:** tfamily galacticus.output.analysis.mass_functions.F90  
**Default value:** 0.4  
**Description:** The random error (in dex) to be added to galaxy HI masses when constructing the ALFALFA HI mass function. This error accounts for scatter in the H$_2$/HI mass ratio at fixed total gas mass.

**Name:** tfamily alfalfaHiMassFunctionZ0.00MolecularFractionKappa  
**Attached to:** tfamily module:Galacticus_Output_Analyses_Mass_Functions  
**File:** tfamily galacticus.output.analysis.mass_functions.F90  
**Default value:** 1.3  
**Description:** The parameter, $\kappa$, appearing in the model for the H$_2$/HI mass ratio used when constructing the ALFALFA HI mass function. Specifically, $\log_{10} R_{mol} = \mu + \kappa \log_{10} (M_{gas}/10^9 M_\odot)$.

**Name:** tfamily alfalfaHiMassFunctionZ0.00MolecularFractionMu  
**Attached to:** tfamily module:Galacticus_Output_Analyses_Mass_Functions  
**File:** tfamily galacticus.output.analysis.mass_functions.F90  
**Default value:** 0.9  
**Description:** The parameter, $\mu$, appearing in the model for the H$_2$/HI mass ratio used when constructing the ALFALFA HI mass function. Specifically, $\log_{10} R_{mol} = \mu + \kappa \log_{10} (M_{gas}/10^9 M_\odot)$.

**Name:** tfamily allTreesExistAtFinalTime  
**Attached to:** tfamily module:Merger_Trees_Evolve  
**File:** tfamily merger_trees.evolve.F90  
**Default value:** true  
**Description:** Specifies whether or not all merger trees are expected to exist at the final requested output time. If set to false, then trees which finish before a given output time will be ignored.

**Name:** tfamily analysisMassFunctionCovarianceModel  
**Attached to:** tfamily module:Galacticus_Output_Analyses_Mass_Functions  
**File:** tfamily galacticus.output.analysis.mass_functions.F90  
**Default value:** binomial  
**Description:** The model to use when constructing the mass function covariance matrix for main branch galaxies.

**Name:** tfamily analysisMassFunctionsCorrelationTruncateLevel  
**Attached to:** tfamily module:Galacticus_Output_Analyses_Mass_Functions  
**File:** tfamily galacticus.output.analysis.mass_functions.F90  
**Default value:** 0.0  
**Description:** The correlation below which off-diagonal elements of the covariance matrix are truncated to zero.

**Name:** tfamily analysisMassFunctionsHaloMassBinsPerDecade  
**Attached to:** tfamily module:Galacticus_Output_Analyses_Mass_Functions  
**File:** tfamily galacticus.output.analysis.mass_functions.F90  
**Default value:** 10
**Description:** The number of bins per decade of halo mass to use when constructing the mass function covariance matrix for main branch galaxies.

**Name:** tfamily analysisMassFunctionsHaloMassBinsPerDecade
**Attached to:** tfamily module:Galacticus_Output_Analyses_Mass_Functions
**File:** tfamily galacticus.output.analysis.mass_functions.F90
**Default value:** $10^{16} M_\odot$
**Description:** The maximum halo mass to consider when constructing the mass function covariance matrix for main branch galaxies.

**Name:** tfamily analysisMassFunctionsHaloMassMinimum
**Attached to:** tfamily module:Galacticus_Output_Analyses_Mass_Functions
**File:** tfamily galacticus.output.analysis.mass_functions.F90
**Default value:** $10^8 M_\odot$
**Description:** The minimum halo mass to consider when constructing the mass function covariance matrix for main branch galaxies.

**Name:** tfamily analysisSizeFunctionCovarianceModel
**Attached to:** tfamily module:Galacticus_Output_Analyses_Mass_Dpndnt_Sz_Dstrbtins
**File:** tfamily galacticus.output.analysis.mass_dependent_size_distribution.F90
**Default value:** binomial
**Description:** The model to use when constructing the mass function covariance matrix for main branch galaxies.

**Name:** tfamily analysisSizeFunctionsHaloMassBinsPerDecade
**Attached to:** tfamily module:Galacticus_Output_Analyses_Mass_Dpndnt_Sz_Dstrbtins
**File:** tfamily galacticus.output.analysis.mass_dependent_size_distribution.F90
**Default value:** 10
**Description:** The number of bins per decade of halo mass to use when constructing the mass function covariance matrix for main branch galaxies.

**Name:** tfamily analysisSizeFunctionsHaloMassMaximum
**Attached to:** tfamily module:Galacticus_Output_Analyses_Mass_Dpndnt_Sz_Dstrbtins
**File:** tfamily galacticus.output.analysis.mass_dependent_size_distribution.F90
**Default value:** $10^{16} M_\odot$
**Description:** The maximum halo mass to consider when constructing the mass function covariance matrix for main branch galaxies.

**Name:** tfamily analysisSizeFunctionsHaloMassMinimum
**Attached to:** tfamily module:Galacticus_Output_Analyses_Mass_Dpndnt_Sz_Dstrbtins
**File:** tfamily galacticus.output.analysis.mass_dependent_size_distribution.F90
**Default value:** $10^8 M_\odot$
**Description:** The minimum halo mass to consider when constructing the mass function covariance matrix for main branch galaxies.

**Name:** tfamily atomicCollisionalIonizationMethod
**Attached to:** tfamily module:Atomic_Rates_Ionization_Collisional
**File:** tfamily atomic.rates.ionization.collisional.F90
**Default value:** Verner

43
4. Input Parameters

**Description:** The name of the method to be used for computing atomic collisional ionization rates.

**Name:** tfamily atomicIonizationPotentialMethod  
**Attached to:** tfamily module: Atomic_Ionization_Potentials  
**File:** tfamily atomic.ionization_potentials.F90  
**Default value:** Verner  
**Description:** The name of the method to be used for computing atomic ionization potentials.

**Name:** tfamily atomicPhotoIonizationMethod  
**Attached to:** tfamily module; Atomic_Cross_Sections_Ionization_Photo  
**File:** tfamily atomic.cross_sections.ionization/photo.F90  
**Default value:** Verner  
**Description:** The name of the method to be used for computing atomic photo ionization rates.

**Name:** tfamily atomicRadiativeRecombinationMethod  
**Attached to:** tfamily module: Atomic_Rates_Recombination_Radiative  
**File:** tfamily atomic.rates.recombination.radiative.F90  
**Default value:** Verner  
**Description:** The name of the method to be used for computing atomic radiative recombination rates.

**Name:** tfamily backgroundRadiationCompute  
**Attached to:** tfamily module: Radiation_Intergalactic_Background_Internal  
**File:** tfamily radiation.intergalactic_background.internal.F90  
**Default value:** false  
**Description:** Specifies whether or not cosmic background radiation should be computed.

**Name:** tfamily backgroundRadiationRedshiftMaximum  
**Attached to:** tfamily module: Radiation_Intergalactic_Background_Internal  
**File:** tfamily radiation.intergalactic_background.internal.F90  
**Default value:** 30  
**Description:** The maximum redshift to use in calculations of the cosmic background radiation.

**Name:** tfamily backgroundRadiationRedshiftMinimum  
**Attached to:** tfamily module: Radiation_Intergalactic_Background_Internal  
**File:** tfamily radiation.intergalactic_background.internal.F90  
**Default value:** 0  
**Description:** The minimum redshift to use in calculations of the cosmic background radiation.

**Name:** tfamily backgroundRadiationTimeCountPerDecade  
**Attached to:** tfamily module: Radiation_Intergalactic_Background_Internal  
**File:** tfamily radiation.intergalactic_background.internal.F90  
**Default value:** 10  
**Description:** The number of bins per decade of time to use for calculations of the cosmic background radiation.

**Name:** tfamily backgroundRadiationWavelengthCountPerDecade  
**Attached to:** tfamily module: Radiation_Intergalactic_Background_Internal  
**File:** tfamily radiation.intergalactic_background.internal.F90  
**Default value:** 10
**Description**: The number of bins per decade of wavelength to use for calculations of the cosmic background radiation.

**Name**: tfamily backgroundRadiationWavelengthMaximum  
**Attached to**: tfamily module:Radiation_Intergalactic_Background_Internal  
**File**: tfamily radiation.intergalactic_background.internal.F90  
**Default value**: 100000 Å  
**Description**: The maximum wavelength (in units of Å) to use in calculations of the cosmic background radiation.

**Name**: tfamily backgroundRadiationWavelengthMinimum  
**Attached to**: tfamily module:Radiation_Intergalactic_Background_Internal  
**File**: tfamily radiation.intergalactic_background.internal.F90  
**Default value**: 100 Å  
**Description**: The minimum wavelength (in units of Å) to use in calculations of the cosmic background radiation.

**Name**: tfamily barInstabilityMethod  
**Attached to**: tfamily module:Galactic_Dynamics_Bar_Instabilities  
**File**: tfamily galactic_dynamics.bar_instability.F90  
**Default value**: ELN  
**Description**: The name of the method to be used for bar instability calculations.

**Name**: tfamily blackHoleAccretesFromHotHalo  
**Attached to**: tfamily module:Node_Component_Black_Hole_Simple  
**File**: tfamily objects.nodes.components.black_hole.simple.F90  
**Default value**: false  
**Description**: Controls whether the black hole additionally grows via accretion from the hot halo. If it does, this accretion rate is used to determine AGN feedback power.

**Name**: tfamily blackHoleBinariesComputeVelocityDispersion  
**Attached to**: tfamily module:Black_Hole_Binary_Separations_Standard  
**File**: tfamily black_holes.binaries.separation_growth_rate.standard.F90  
**Default value**: false  
**Description**: Specifies whether or not the velocity dispersion of dark matter and stars should be computed using Jeans equation in black hole binary hardening calculations. If **false**, then the velocity dispersions are assumed to equal the characteristic velocity of dark matter and spheroid.

**Name**: tfamily blackHoleBinaryInitialRadiiMethod  
**Attached to**: tfamily module:Black_Hole_Binary_Initial_Radii  
**File**: tfamily black_holes.binaries.initial_radius.F90  
**Default value**: spheroidRadiusFraction  
**Description**: The name of the method to be used for computing the initial separation of black hole binaries.

**Name**: tfamily blackHoleBinaryMergersMethod  
**Attached to**: tfamily module:Black_Hole_Binary_Mergers  
**File**: tfamily black_holes.binary_mergers.F90  
**Default value**: Rezzolla2008
4. Input Parameters

**Description:** The name of the method to be used for computing the effects of black hole binary mergers.

**Name:** tfamily blackHoleBinaryRecoilVelocityMethod  
**Attached to:** tfamily module:Black_Hole_Binary_Recoil_Velocities  
**File:** tfamily black_holes.binaries.recoil_velocity.F90  
**Default value:** null  
**Description:** The name of the method to be used for computing the recoil velocity of black hole binaries.

**Name:** tfamily blackHoleBinarySeparationGrowthRateMethod  
**Attached to:** tfamily module:Black_Hole_Binary_Separations  
**File:** tfamily black_holes.binaries.separation_growth_rate.F90  
**Default value:** null  
**Description:** The name of the method to be used for computing the separation growth rate of black hole binaries.

**Name:** tfamily blackHoleHeatingEfficiency  
**Attached to:** tfamily module:Node_Component_Black_Hole_Simple  
**File:** tfamily objects.nodes.components.black_hole.simple.F90  
**Default value:** $10^{-3}$  
**Description:** The efficiency with which accretion onto a black hole heats the hot halo.

**Name:** tfamily blackHoleHeatsHotHalo  
**Attached to:** tfamily module:Node_Component_Black_Hole_Simple  
**File:** tfamily objects.nodes.components.black_hole.simple.F90  
**Default value:** true  
**Description:** Specifies whether or not the black hole should heat the hot halo.

**Name:** tfamily blackHoleInitialRadiusSpheroidRadiusRatio  
**Attached to:** tfamily module:Black_Hole_Binary_Initial_Radii_Spheroid_Size  
**File:** tfamily black_holes.binaries.initial_radius.spheroid_size_fraction.F90  
**Default value:** 0  
**Description:** The fraction of the spheroid radius at which merging black holes will be initially placed.

**Name:** tfamily blackHoleJetEfficiency  
**Attached to:** tfamily module:Node_Component_Black_Hole_Simple  
**File:** tfamily objects.nodes.components.black_hole.simple.F90  
**Default value:** $10^{-3}$  
**Description:** The efficiency with which accretion power onto a black hole is converted into jets.

**Name:** tfamily blackHoleOutputAccretion  
**Attached to:** tfamily module:Node_Component_Black_Hole_Simple  
**File:** tfamily objects.nodes.components.black_hole.simple.F90  
**Default value:** false  
**Description:** Determines whether or not accretion rates and jet powers will be output.

**Name:** tfamily blackHoleOutputData  
**Attached to:** tfamily module:Node_Component_Black_Hole_Standard  
**File:** tfamily objects.nodes.components.black_hole.standard.F90  
**Default value:** false
**Description:** Determines whether or not properties for all black holes (rather than just the central black hole) will be output.

**Name:** tfamily blackHoleOutputMergers  
**Attached to:** tfamily module:Node_Component_Black_Hole_Standard  
**File:** tfamily objects.nodes.components.black_hole.standard.F90  
**Default value:** false  
**Description:** Determines whether or not properties of black hole mergers will be output.

**Name:** tfamily blackHoleRadioModeFeedbackEfficiency  
**Attached to:** tfamily module:Node_Component_Black_Hole_Standard  
**File:** tfamily objects.nodes.components.black_hole.standard.F90  
**Default value:** 1  
**Description:** Efficiency with which radio-mode feedback is coupled to the hot halo.

**Name:** tfamily blackHoleSeedMass  
**Attached to:** tfamily module:Galacticus_Nodes  
**File:** tfamily objects.nodes.F90  
**Default value:** 100  
**Description:** The mass of the seed black hole placed at the center of each newly formed galaxy.

**Name:** tfamily blackHoleToSpheroidStellarGrowthRatio  
**Attached to:** tfamily module:Node_Component_Black_Hole_Simple  
**File:** tfamily objects.nodes.components.black_hole.simple.F90  
**Default value:** 1.0d-3  
**Description:** The ratio of the rates of black hole growth and spheroid stellar mass growth.

**Name:** tfamily blackHoleWindEfficiency  
**Attached to:** tfamily module:Node_Component_Black_Hole_Simple  
**File:** tfamily objects.nodes.components.black_hole.simple.F90  
**Default value:** 2.2157 × 10⁻³  
**Description:** The efficiency of the black hole accretion-driven wind.

**Name:** tfamily blackHoleWindEfficiencyScalesWithRadiativeEfficiency  
**Attached to:** tfamily module:Node_Component_Black_Hole_Standard  
**File:** tfamily objects.nodes.components.black_hole.standard.F90  
**Default value:** false  
**Description:** Specifies whether the black hole wind efficiency should scale with the radiative efficiency of the accretion disk.

**Name:** tfamily bondiHoyleAccretionEnhancementHotHalo  
**Attached to:** tfamily module:Node_Component_Black_Hole_Standard  
**File:** tfamily objects.nodes.components.black_hole.standard.F90  
**Default value:** 6.0  
**Description:** The factor by which the Bondi-Hoyle accretion rate of hot halo gas onto black holes in enhanced.

**Name:** tfamily bondiHoyleAccretionEnhancementSpheroid  
**Attached to:** tfamily module:Node_Component_Black_Hole_Standard
4. Input Parameters

**Name:** tfamily bondiHoyleAccretionHotModeOnly
**Attached to:** tfamily module:Node_Component_Black_Hole_Standard
**File:** tfamily objects.nodes.components.black_hole.standard.F90
**Default value:** true
**Description:** Determines whether accretion from the hot halo should only occur if the halo is in the hot accretion mode.

**Name:** tfamily bondiHoyleAccretionTemperatureSpheroid
**Attached to:** tfamily module:Node_Component_Black_Hole_Standard
**File:** tfamily objects.nodes.components.black_hole.standard.F90
**Default value:** $10^2$
**Description:** The assumed temperature (in Kelvin) of gas in the spheroid when computing Bondi-Hoyle accretion rates onto black holes.

**Name:** tfamily boxSize
**Attached to:** tfamily module:Merger_Trees_Simple
**File:** tfamily merger_trees.file_maker.simple.F90
**Default value:** none
**Description:** The box size of the simulation from which merger trees were extracted.

**Name:** tfamily burstCriticalGasFraction
**Attached to:** tfamily module:Satellite_Merging_Mass_Movements_Baugh2005
**File:** tfamily satellites.merging.mass_movements.Baugh2005.F90
**Default value:** 0.75
**Description:** The host gas fraction above which mergers are considered to trigger a burst in the Baugh et al. [2005] merger mass movements method.

**Name:** tfamily burstMassRatio
**Attached to:** tfamily module:Satellite_Merging_Mass_Movements_Baugh2005
**File:** tfamily satellites.merging.mass_movements.Baugh2005.F90
**Default value:** 0.05
**Description:** The mass ratio above which mergers are considered to trigger a burst in the Baugh et al. [2005] merger mass movements method.

**Name:** tfamily chemicalReactionRateMethods
**Attached to:** tfamily module:Chemical_Reaction_Rates
**File:** tfamily chemical.reaction_rates.F90
**Default value:** hydrogenNetwork
**Description:** The names of the methods to be used for computing chemical reaction rates.

**Name:** tfamily chemicalStateFile
**Attached to:** tfamily module:Chemical_States_CIE_File
**File:** tfamily chemical.state.CIE_file.F90
**Default value:** none
**Description:** The name of the file containing a tabulation of the collisional chemical equilibrium chemical state.

**Name:** tfamily chemicalStateMethod  
**Attached to:** tfamily module:Chemical_States  
**File:** tfamily chemical.state.F90  
**Default value:** atomicCIECloudy  
**Description:** The name of the method to be used for computing the chemical state.

**Name:** tfamily chemicalsToTrack  
**Attached to:** tfamily module:Chemical_Abundances_Structure  
**File:** tfamily objects.chemical_abundances.F90  
**Default value:** none  
**Description:** The names of the chemicals to be tracked.

**Name:** tfamily coldModeInfallRateDynamicalTime  
**Attached to:** tfamily module:Cooling_Cold_Mode_Infall_Rates_Dynamical_Time  
**File:** tfamily cooling.cold_mode.infall_rate.dynamical_time.F90  
**Default value:** 2.0  
**Description:** The timescale (in units of the halo dynamical time) for infall of the cold mode component.

**Name:** tfamily coldModeInfallRateMethod  
**Attached to:** tfamily module:Cooling_Cold_Mode_Infall_Rates  
**File:** tfamily cooling.cold_mode.infall_rate.F90  
**Default value:** dynamicalTime  
**Description:** The name of the method to be used when computing the infall rate from the cold mode.

**Name:** tfamily coldModeIsothermalCoreRadiusOverVirialRadius  
**Attached to:** tfamily module:Hot_Halo_Cold_Mode_Density_CIsolatedCoreR_Virial_Fraction  
**File:** tfamily hot_halo.cold_mode.density_profile.cored_isothermal.core_radius.virial_radius.F90  
**Default value:** 0.3  
**Description:** The core radius in the “cored isothermal” cold mode hot halo density profile in units of the virial radius.

**Name:** tfamily coldModeMassDistribution  
**Attached to:** tfamily module:Node_Component_Hot_Halo_Cold_Mode  
**File:** tfamily objects.nodes.components.hot_halo.cold_mode.F90  
**Default value:** betaProfile  
**Description:** The type of mass distribution to use for the cold mode component.

**Name:** tfamily collisionalExcitationMethod  
**Attached to:** tfamily module:Atomic_Rates_Excitation_Collisional  
**File:** tfamily atomic.rates.excitation.collisional.F90  
**Default value:** ScholzWalters91  
**Description:** The name of the method to be used for computing collisional excitation rates.

**Name:** tfamily conditionalMassFunctionBehrooziAlphaSatellite  
**Attached to:** tfamily module:Conditional_Mass_Functions_Behroozi2010  
**File:** tfamily halo_model.conditional_mass_function.Behroozi2010.F90
4. Input Parameters

**Default value:** 1.0 (Leauthaud et al. 2011; $z_1$ sample using their SIG_MOD1 method)
**Description:** The parameter $\alpha_s$ from the fitting functions of Behroozi et al. [2010].

**Name:** tfamily conditionalMassFunctionBehrooziBCut
**Attached to:** tfamily module:Conditional_Mass_Functions_Behroozi2010
**File:** tfamily halo_model.conditional_mass_function.Behroozi2010.F90
**Default value:** 1.47 (Leauthaud et al. 2011; $z_1$ sample using their SIG_MOD1 method)
**Description:** The parameter $B_{cut}$ from the fitting functions of Behroozi et al. [2010].

**Name:** tfamily conditionalMassFunctionBehrooziBSatellite
**Attached to:** tfamily module:Conditional_Mass_Functions_Behroozi2010
**File:** tfamily halo_model.conditional_mass_function.Behroozi2010.F90
**Default value:** 10.62 (Leauthaud et al. 2011; $z_1$ sample using their SIG_MOD1 method)
**Description:** The parameter $B_{sat}$ from the fitting functions of Behroozi et al. [2010].

**Name:** tfamily conditionalMassFunctionBehrooziBeta
**Attached to:** tfamily module:Conditional_Mass_Functions_Behroozi2010
**File:** tfamily halo_model.conditional_mass_function.Behroozi2010.F90
**Default value:** 0.457 (Leauthaud et al. 2011; $z_1$ sample using their SIG_MOD1 method)
**Description:** The parameter $\beta$ from the fitting functions of Behroozi et al. [2010].

**Name:** tfamily conditionalMassFunctionBehrooziBetaCut
**Attached to:** tfamily module:Conditional_Mass_Functions_Behroozi2010
**File:** tfamily halo_model.conditional_mass_function.Behroozi2010.F90
**Default value:** $-0.13$ (Leauthaud et al. 2011; $z_1$ sample using their SIG_MOD1 method)
**Description:** The parameter $\beta_{cut}$ from the fitting functions of Behroozi et al. [2010].

**Name:** tfamily conditionalMassFunctionBehrooziBetaSatellite
**Attached to:** tfamily module:Conditional_Mass_Functions_Behroozi2010
**File:** tfamily halo_model.conditional_mass_function.Behroozi2010.F90
**Default value:** 0.859 (Leauthaud et al. 2011; $z_1$ sample using their SIG_MOD1 method)
**Description:** The parameter $\beta_{sat}$ from the fitting functions of Behroozi et al. [2010].

**Name:** tfamily conditionalMassFunctionBehrooziDelta
**Attached to:** tfamily module:Conditional_Mass_Functions_Behroozi2010
**File:** tfamily halo_model.conditional_mass_function.Behroozi2010.F90
**Default value:** 0.5666 (Leauthaud et al. 2011; $z_1$ sample using their SIG_MOD1 method)
**Description:** The parameter $\delta$ from the fitting functions of Behroozi et al. [2010].

**Name:** tfamily conditionalMassFunctionBehrooziGamma
**Attached to:** tfamily module:Conditional_Mass_Functions_Behroozi2010
**File:** tfamily halo_model.conditional_mass_function.Behroozi2010.F90
**Default value:** 1.53 (Leauthaud et al. 2011; $z_1$ sample using their SIG_MOD1 method)
**Description:** The parameter $\gamma$ from the fitting functions of Behroozi et al. [2010].

**Name:** tfamily conditionalMassFunctionBehrooziLog10M1
**Attached to:** tfamily module:Conditional_Mass_Functions_Behroozi2010
**File:** tfamily halo_model.conditional_mass_function.Behroozi2010.F90
**Default value:** 12.520 (Leauthaud et al. 2011; $z_1$ sample using their SIG_MOD1 method)
Description: The parameter $\log_{10} M_1$ from the fitting functions of Behroozi et al. [2010].

Name: tfamily conditionalMassFunctionBehrooziLog10Mstar0
Attached to: tfamily module:Conditional_Mass_Functions_Behroozi2010
Default value: 10.916 (Leauthaud et al. 2011; $z_1$ sample using their SIG_MOD1 method)
Description: The parameter $\log_{10} M_{*,0}$ from the fitting functions of Behroozi et al. [2010].

Name: tfamily conditionalMassFunctionBehrooziSigmaLogMstar
Attached to: tfamily module:Conditional_Mass_Functions_Behroozi2010
Default value: 0.206 (Leauthaud et al. 2011; $z_1$ sample using their SIG_MOD1 method)
Description: The parameter $\sigma_{\log M_*}$ from the fitting functions of Behroozi et al. [2010].

Name: tfamily conditionalMassFunctionHaloMass
Attached to: tfamily program:Conditional_Mass_Function
File: tfamily Conditional_Mass_Function.F90
Default value: all
Description: The halo mass for which to compute the conditional mass function. A value of “all” will cause the conditional mass function to be integrated over the halo mass function, giving the mass function.

Name: tfamily conditionalMassFunctionHaloMassMaximum
Attached to: tfamily program:Conditional_Mass_Function
File: tfamily Conditional_Mass_Function.F90
Default value: $10^{16} M_\odot$
Description: The maximum halo mass to use when integrating over the halo mass function.

Name: tfamily conditionalMassFunctionHaloMassMinimum
Attached to: tfamily program:Conditional_Mass_Function
File: tfamily Conditional_Mass_Function.F90
Default value: $10^6 M_\odot$
Description: The minimum halo mass to use when integrating over the halo mass function.

Name: tfamily conditionalMassFunctionMassCount
Attached to: tfamily program:Conditional_Mass_Function
File: tfamily Conditional_Mass_Function.F90
Default value: 21
Description: The number of bins for which to compute the conditional mass function.

Name: tfamily conditionalMassFunctionMassMaximum
Attached to: tfamily program:Conditional_Mass_Function
File: tfamily Conditional_Mass_Function.F90
Default value: $10^{12} M_\odot$
Description: The maximum mass for which to compute the conditional mass function.

Name: tfamily conditionalMassFunctionMassMinimum
Attached to: tfamily program:Conditional_Mass_Function
File: tfamily Conditional_Mass_Function.F90
Default value: $10^8 M_\odot$
4. Input Parameters

**Description:** The minimum mass for which to compute the conditional mass function.

**Name:** tfamily conditionalMassFunctionMethod  
**Attached to:** tfamily module:Conditional_Mass_Functions  
**File:** tfamily halo_model.conditional_mass_function.F90  
**Default value:** Behroozi2010  
**Description:** The name of the method to be used for empirical models of the conditional mass function.

**Name:** tfamily conditionalMassFunctionOutputFileName  
**Attached to:** tfamily program:Conditional_Mass_Function  
**File:** tfamily Conditional_Mass_Function.F90  
**Default value:** none  
**Description:** The name of the file to which the computed conditional mass function should be output.

**Name:** tfamily conditionalMassFunctionRedshiftMaximum  
**Attached to:** tfamily program:Conditional_Mass_Function  
**File:** tfamily Conditional_Mass_Function.F90  
**Default value:** 0  
**Description:** The maximum redshift for which to compute the conditional mass function.

**Name:** tfamily conditionalMassFunctionRedshiftMinimum  
**Attached to:** tfamily program:Conditional_Mass_Function  
**File:** tfamily Conditional_Mass_Function.F90  
**Default value:** 0  
**Description:** The minimum redshift for which to compute the conditional mass function.

**Name:** tfamily conditionalMassFunctionUseSurveyLimits  
**Attached to:** tfamily program:Conditional_Mass_Function  
**File:** tfamily Conditional_Mass_Function.F90  
**Default value:** false  
**Description:** Specifies whether the limiting redshifts for integrating over the halo mass function should be limited by those of a galaxy survey.

**Name:** tfamily coolingAngularMomentumUseInteriorMean  
**Attached to:** tfamily module:Cooling_Specific_Angular_Momenta_Constant_Rotation  
**File:** tfamily cooling.specific-angular_momentum.constant_rotation.F90  
**Default value:** false  
**Description:** Specifies whether to use the specific angular momentum at the cooling radius, or the mean specific angular momentum interior to that radius.

**Name:** tfamily coolingCutOffFormationNode  
**Attached to:** tfamily module:Cooling_Rates_Modifier_Cut_Off  
**File:** tfamily cooling.cooling_rate.modifier.cut_off.F90  
**Default value:** false  
**Description:** Specifies whether to use the virial velocity of the formation node or current node in the cooling rate “cut-off” modifier.

**Name:** tfamily coolingCutOffRedshift  
**Attached to:** tfamily module:Cooling_Rates_Modifier_Cut_Off
File: tfamily cooling.cooling_rate.modifier.cut_off.F90
Default value: 0.0
Description: The redshift below which cooling is suppressed in the “cut-off” cooling rate modifier method.

Name: tfamily coolingCutOffVelocity
Attached to: tfamily module:Cooling_Rates_Modifier_Cut_Off
File: tfamily cooling.cooling_rate.modifier.cut_off.F90
Default value: 0.0
Description: The velocity below which cooling is suppressed in the “cut-off” cooling rate modifier method.

Name: tfamily coolingCutOffWhen
Attached to: tfamily module:Cooling_Rates_Modifier_Cut_Off
File: tfamily cooling.cooling_rate.modifier.cut_off.F90
Default value: after
Description: Specifies whether cooling is cut off before or after [coolingCutOffRedshift].

Name: tfamily coolingFunctionFile
Attached to: tfamily module:Cooling_Functions_CIE_File
File: tfamily cooling.cooling_function.CIE_file.F90
Default value: none
Description: The name of the file containing a tabulation of the collisional ionization equilibrium cooling function.

Name: tfamily coolingFunctionMethods
Attached to: tfamily module:Cooling_Functions
File: tfamily cooling.cooling_function.F90
Default value: atomicCIECloudy
Description: The names of the methods to be used for computing the cooling function.

Name: tfamily coolingMeanAngularMomentumFrom
Attached to: tfamily module:Cooling_Specific_Angular_Momenta_Constant_Rotation
File: tfamily cooling.specfic_angular_momentum.constant_rotation.F90
Default value: hotGas
Description: The component (“hotGas” or “darkMatter”) from which the mean specific angular momentum should be computed for calculations of cooling gas specific angular momentum.

Name: tfamily coolingRadiusMethod
Attached to: tfamily module:Cooling_Radii
File: tfamily cooling.cooling_radius.F90
Default value: simple
Description: The name of the method to be used for calculations of the cooling radius.

Name: tfamily coolingRateMethod
Attached to: tfamily module:Cooling_Rates
File: tfamily cooling.cooling_rate.F90
Default value: White-Frenk1991
Description: The name of the method to be used when computing the cooling rate.
4. Input Parameters

Name: tfamily coolingRateSimpleScalingCutOffExponent
Attached to: tfamily module:Cooling_Rates_Simple_Scaling
File: tfamily cooling.cooling_rate.simple_scaling.F90
Default value: 1
Description: The exponent appearing in the exponential term for cooling timescale in the simple scaling cooling rate model.

Name: tfamily coolingRateSimpleScalingCutOffMass
Attached to: tfamily module:Cooling_Rates_Simple_Scaling
File: tfamily cooling.cooling_rate.simple_scaling.F90
Default value: $10^{12} M_\odot$
Description: The halo mass scale appearing in the exponential term for cooling timescale in the simple scaling cooling rate model.

Name: tfamily coolingRateSimpleScalingCutOffWidth
Attached to: tfamily module:Cooling_Rates_Simple_Scaling
File: tfamily cooling.cooling_rate.simple_scaling.F90
Default value: 1
Description: The width appearing in the exponential term for cooling timescale in the simple scaling cooling rate model.

Name: tfamily coolingRateSimpleScalingTimescale
Attached to: tfamily module:Cooling_Rates_Simple_Scaling
File: tfamily cooling.cooling_rate.simple_scaling.F90
Default value: 1 Gyr
Description: The timescale (in Gyr) for cooling in low mass halos at $z = 0$ in the simple scaling cooling rate model.

Name: tfamily coolingRateSimpleScalingTimescaleExponent
Attached to: tfamily module:Cooling_Rates_Simple_Scaling
File: tfamily cooling.cooling_rate.simple_scaling.F90
Default value: $-1.5$
Description: The exponent of $(1 + z)$ in the cooling timescale for low mass halos in the simple scaling cooling rate model.

Name: tfamily coolingRateSimpleTimescale
Attached to: tfamily module:Cooling_Rates_Simple
File: tfamily cooling.cooling_rate.simple.F90
Default value: 1 Gyr
Description: The timescale (in Gyr) for cooling in the simple cooling rate model.

Name: tfamily coolingRotationVelocityFrom
Attached to: tfamily module:Cooling_Specific_Angular_Momenta_Constant_Rotation
File: tfamily cooling.specific_angular_momentum.constant_rotation.F90
Default value: hotGas
Description: The component ("hotGas" or "darkMatter") from which the constant rotation speed should be computed for calculations of cooling gas specific angular momentum.
Name: tfamily coolingSpecificAngularMomentumMethod
Attached to: tfamily module: Cooling_Specific_Angular_Momenta
File: tfamily cooling.specific_angular_momentum.F90
Default value: constantRotation
Description: The name of the method to be used for calculations of the specific angular momentum of cooling gas.

Name: tfamily coolingTimeAvailableAgeFactor
Attached to: tfamily module: Cooling_Time_Available_White_Frenk
File: tfamily cooling.time_available.White-Frenk.F90
Default value: 0
Description: Interpolates (geometrically) between the age of the Universe and the halo dynamical time for the time available for cooling in the White-Frenk1991 method.

Name: tfamily coolingTimeAvailableMethod
Attached to: tfamily module: Cooling_Times_Available
File: tfamily cooling.time_available.F90
Default value: White-Frenk1991
Description: The name of the method to be used when computing the time available for cooling.

Name: tfamily coolingTimeMethod
Attached to: tfamily module: Cooling_Times
File: tfamily cooling.cooling_time.F90
Default value: simple
Description: The name of the method to be use for computing cooling times.

Name: tfamily coolingTimeSimpleDegreesOfFreedom
Attached to: tfamily module: Cooling_Times_Simple
File: tfamily cooling.cooling_time.simple.F90
Default value: 3
Description: Number of degrees of freedom to assume when computing the energy density of cooling gas in the "simple" cooling time module.

Name: tfamily cosmologicalMassVarianceMethod
Attached to: tfamily module: Power_Spectra
File: tfamily structure_formation.power_spectrum.F90
Default value: filteredPowerSpectrum
Description: Selects the method to be used for computing the cosmological mass variance.

Name: tfamily cosmologyFunctionsMethod
Attached to: tfamily module: Cosmology_Functions
File: tfamily cosmology.functions.F90
Default value: matterLambda
Description: The method to be used for cosmologyFunctions.

Name: tfamily cosmologyParametersMethod
Attached to: tfamily module: Cosmology_Parameters
File: tfamily cosmology.parameters.F90
Default value: simple
4. Input Parameters

Description: The method to be used for cosmologyParameters.

Name: tfamily criticalOverdensityMassScalingMethod
Attached to: tfamily module:Critical_Overdensity
File: tfamily structure_formation.critical_overdensity.F90
Default value: null
Description: The name of the method to be used for scaling critical overdensities for halo collapse with mass.

Name: tfamily criticalOverdensityMethod
Attached to: tfamily module:Critical_Overdensity
File: tfamily structure_formation.critical_overdensity.F90
Default value: sphericalTopHat
Description: The name of the method to be used for critical overdensities for halo collapse.

Name: tfamily darkEnergyEquationOfStateW0
Attached to: tfamily module:Cosmology_Functions
File: tfamily cosmology.functions.F90
Default value: -1 (cosmological constant)
Description: The equation of state parameter for dark energy, \( w_0 \), defined such that \( P = \rho w \) with \( w(a) = w_0 + w_1 a(1 - a) \).

Name: tfamily darkEnergyEquationOfStateW1
Attached to: tfamily module:Cosmology_Functions
File: tfamily cosmology.functions.F90
Default value: 0 (constant equation of state)
Description: The equation of state parameter for dark energy, \( w_1 \), defined such that \( P = \rho w \) with \( w(a) = w_0 + w_1 a(1 - a) \).

Name: tfamily darkMatterAccretionHistoryMethod
Attached to: tfamily module:Dark_Matter_Halo_Mass_Accretion_Histories
File: tfamily dark_matter_halos.mass_accretion_history.F90
Default value: Wechsler2002
Description: The name of the method to be used for calculations of dark matter halo mass accretion histories.

Name: tfamily darkMatterHaloBiasMethod
Attached to: tfamily module:Dark_Matter_Halo_Biases
File: tfamily structure_formation.halo_bias.F90
Default value: Tinker2010
Description: Selects which dark matter halo bias method to use.

Name: tfamily darkMatterHaloMassLossRateMethod
Attached to: tfamily module:Dark_Matter_Halos_Mass_Loss_Rates
File: tfamily dark_matter_halos.mass_loss_rates.F90
Default value: dynamicalTime
Description: The name of the method to be used for computing mass loss rates from dark matter halos.

Name: tfamily darkMatterHaloScaleMethod
Attached to: tfamily module:Dark Matter Halo Scales
File: tfamily dark_matter_halos.scales.F90
Default value: virialDensityContrastDefinition
Description: The method to be used for darkMatterHaloScale.

Name: tfamily darkMatterProfileConcentrationCDMMethod
Attached to: tfamily module:Dark Matter Profiles Concentration
File: tfamily dark_matter_profiles.structure.concentration.F90
Default value: gao2008
Description: The darkMatterProfileConcentration method to which the Schneider et al. [2012] modifier for WDM halo concentrations should be applied.

Name: tfamily darkMatterProfileConcentrationDiemerKravtsov2014Alpha
Attached to: tfamily module:Dark Matter Profiles Concentration
File: tfamily dark_matter_profiles.structure.concentration.F90
Default value: 1.12
Description: The parameter \( \alpha \) appearing in the halo concentration algorithm of Diemer and Kravtsov [2014].

Name: tfamily darkMatterProfileConcentrationDiemerKravtsov2014Beta
Attached to: tfamily module:Dark Matter Profiles Concentration
File: tfamily dark_matter_profiles.structure.concentration.F90
Default value: 1.69
Description: The parameter \( \beta \) appearing in the halo concentration algorithm of Diemer and Kravtsov [2014].

Name: tfamily darkMatterProfileConcentrationDiemerKravtsov2014Eta0
Attached to: tfamily module:Dark Matter Profiles Concentration
File: tfamily dark_matter_profiles.structure.concentration.F90
Default value: 6.82
Description: The parameter \( \eta_0 \) appearing in the halo concentration algorithm of Diemer and Kravtsov [2014].

Name: tfamily darkMatterProfileConcentrationDiemerKravtsov2014Eta1
Attached to: tfamily module:Dark Matter Profiles Concentration
File: tfamily dark_matter_profiles.structure.concentration.F90
Default value: 1.42
Description: The parameter \( \eta_1 \) appearing in the halo concentration algorithm of Diemer and Kravtsov [2014].

Name: tfamily darkMatterProfileConcentrationDiemerKravtsov2014Kappa
Attached to: tfamily module:Dark Matter Profiles Concentration
File: tfamily dark_matter_profiles.structure.concentration.F90
Default value: 0.69
Description: The parameter \( \kappa \) appearing in the halo concentration algorithm of Diemer and Kravtsov [2014].

Name: tfamily darkMatterProfileConcentrationDiemerKravtsov2014Phi0
Attached to: tfamily module:Dark Matter Profiles Concentration
4. Input Parameters

File: tfamily dark_matter_profiles.structure.concentration.F90
Default value: 6.58
Description: The parameter $\phi_0$ appearing in the halo concentration algorithm of Diemer and Kravtsov [2014].

Name: tfamily darkMatterProfileConcentrationDiemerKravtsov2014Phi1
Attached to: tfamily module:Dark_Matter_Profiles_Concentration
File: tfamily dark_matter_profiles.structure.concentration.F90
Default value: 1.37
Description: The parameter $\phi_1$ appearing in the halo concentration algorithm of Diemer and Kravtsov [2014].

Name: tfamily darkMatterProfileConcentrationMethod
Attached to: tfamily module:Dark_Matter_Profiles_Concentration
File: tfamily dark_matter_profiles.structure.concentration.F90
Default value: gao2008
Description: The method to be used for darkMatterProfileConcentration.

Name: tfamily darkMatterProfileMaximumConcentration
Attached to: tfamily objects.nodes.components.dark_matter_profile.scale.F90
Default value: 100
Description: The maximum concentration allowed for dark matter profiles.

Name: tfamily darkMatterProfileMethod
Attached to: tfamily module:Dark_Matter_Profiles
File: tfamily dark_matter_profiles.F90
Default value: NFW
Description: The method to be used for darkMatterProfile.

Name: tfamily darkMatterProfileMinimumConcentration
Attached to: tfamily objects.nodes.components.dark_matter_profile.scale.F90
Default value: 4
Description: The minimum concentration allowed for dark matter profiles.

Name: tfamily darkMatterProfileScaleCorrectForConcentrationDefinition
Attached to: tfamily module:Dark_Matter_Profile_Scales
File: tfamily dark_matter_profiles.structure.scale.F90
Default value: false
Description: If true, then when computing dark matter profile scale radii using concentrations, any difference between the current definition of halo scales (i.e. typically virial density contrast definitions) and density profiles and those assumed in measuring the concentrations will be taken into account. If false, the concentration is applied blindly.

Name: tfamily darkMatterShapeMethod
Attached to: tfamily module:Dark_Matter_Profiles_Shapes
File: tfamily dark_matter_profiles.structure.shape.F90
Default value: Gao2008
**Description:** The name of the method to be used for calculations of dark matter halo density profile shapes.

**Name:** tfamily deltaFunctionSpinDistributionSpin  
**Attached to:** tfamily module:Halo_Spin_Distributions_Delta_Function  
**File:** tfamily dark_matter_halos.spins.distributions.delta_function.F90  
**Default value:** 0.03687 [Bett et al., 2007]  
**Description:** The fixed value of spin in a delta function spin distribution.

**Name:** tfamily dielectronicRecombinationMethod  
**Attached to:** tfamily module:Atomic_Rates_Recombination_Dielectronic  
**File:** tfamily atomic.rates.recombination.dielectronic.F90  
**Default value:** Arnaud85  
**Description:** The name of the method to be used for computing dielectronic recombination rates.

**Name:** tfamily diskMassToleranceAbsolute  
**Attached to:** tfamily module:Node_Component_Disk_Exponential  
**File:** tfamily objects.nodes.components.disk.exponential.F90  
**Default value:** $10^{-6} M_\odot$  
**Description:** The mass tolerance used to judge whether the disk is physically plausible.

**Name:** tfamily diskNegativeAngularMomentumAllowed  
**Attached to:** tfamily module:Node_Component_Disk_Exponential  
**File:** tfamily objects.nodes.components.disk.exponential.F90  
**Default value:** true  
**Description:** Specifies whether or not negative angular momentum is allowed for the disk.

**Name:** tfamily diskOutflowExponent  
**Attached to:** tfamily module:Star_Formation_Feedback_Disks_Power_Law  
**File:** tfamily star_formation.feedback.disks.power_law.F90  
**Default value:** 3.5  
**Description:** The velocity scaling of the supernovae (SNe)-driven outflow rate in disks.

**Name:** tfamily diskOutflowFraction  
**Attached to:** tfamily module:Star_Formation_Feedback_Disks_Halo_Scaling  
**File:** tfamily star_formation.feedback.disks.halo_scaling.F90  
**Default value:** 0.01  
**Description:** The ratio of outflow rate to star formation rate in disks.

**Name:** tfamily diskOutflowRedshiftExponent  
**Attached to:** tfamily module:Star_Formation_Feedback_Disks_Halo_Scaling  
**File:** tfamily star_formation.feedback.disks.halo_scaling.F90  
**Default value:** 0.0  
**Description:** The exponent of redshift in the outflow rate in disks.

**Name:** tfamily diskOutflowTimescaleMinimum  
**Attached to:** tfamily module:Node_Component_Disk_Exponential  
**File:** tfamily objects.nodes.components.disk.exponential.F90  
**Default value:** 10^{-3}
4. Input Parameters

**Description:** The minimum timescale (in units of the disk dynamical time) on which outflows may deplete gas in the disk.

**Name:** tfamily diskOutflowVelocity
**Attached to:** tfamily module:Star_Formation_Feedback_Disks_Power_Law
**File:** tfamily star_formation.feedback.disks.power_law.F90
**Default value:** 250
**Description:** The velocity scale at which the SNe-driven outflow rate equals the star formation rate in disks.

**Name:** tfamily diskOutflowVirialVelocityExponent
**Attached to:** tfamily module:Star_Formation_Feedback_Disks_Halo_Scaling
**File:** tfamily star_formation.feedback.disks.halo_scaling.F90
**Default value:** $-2.0$
**Description:** The exponent of virial velocity in the outflow rate in disks.

**Name:** tfamily diskOutputStarFormationRate
**Attached to:** tfamily module:Galacticus_Nodes
**File:** tfamily objects.nodes.F90
**Default value:** false
**Description:** Specifies whether the `starFormationRate` method of the exponential implementation of the disk component class should be output.

**Name:** tfamily diskRadiusSolverCole2000Method
**Attached to:** tfamily module:Node_Component_Disk_Exponential
**File:** tfamily objects.nodes.components.disk.exponential.F90
**Default value:** 1
**Description:** HASH(0x157f9e8)

**Name:** tfamily diskStarFormationTimescaleMinimum
**Attached to:** tfamily module:Node_Component_Disk_Very_Simple
**File:** tfamily objects.nodes.components.disk.very_simple.F90
**Default value:** $10^{-3}$
**Description:** The minimum timescale (in units of the halo dynamical time) on which star formation may occur in the disk.

**Name:** tfamily diskStructureSolverRadius
**Attached to:** tfamily module:Node_Component_Disk_Exponential
**File:** tfamily objects.nodes.components.disk.exponential.F90
**Default value:** 1
**Description:** The radius (in units of the exponential scale length) to use in solving for the size of the disk.

**Name:** tfamily diskSuperwindMassLoading
**Attached to:** tfamily module:Star_Formation_Expulsive_Feedback_Disks_Superwind
**File:** tfamily star_formation.feedback.expulsion.disks.superwind.F90
**Default value:** 2
**Description:** The mass loading of the disk superwind.

**Name:** tfamily diskSuperwindVelocity
Attached to: tfamily module:Star_Formation_Expulsive_Feedback_Disks_Superwind
File: tfamily star_formation.feedback.expulsion.disks.superwind.F90
Default value: 200 km/s
Description: The velocity scale of the disk superwind.

Name: tfamily duttonMaccio2014FitType
Attached to: tfamily module:Dark_Matter_Profiles_Concentration
File: tfamily dark_matter_profiles.structure.concentration.F90
Default value: nfwVirial
Description: The parameter $A$ appearing in the halo concentration algorithm of Prada et al. [2011].

Name: tfamily dynamicsStatisticsBarsFrequency
Attached to: tfamily module:Node_Component_Dynamics_Statistics_Bars
File: tfamily objects.nodes.components.dynamics_statistics.bars.F90
Default value: 0.1
Description: The frequency (in fractions of the host halo dynamical time) at which to record the bar dynamical status of satellite galaxies.

Name: tfamily effectiveNumberNeutrinos
Attached to: tfamily module:Transfer_Function_Eisenstein_Hu
File: tfamily structure_formation.transfer_function.Eisenstein_Hu.F90
Default value: 3.046 [Mangano et al., 2005]
Description: The effective number of neutrino species as used in the Eisenstein and Hu [1999] transfer function.

Name: tfamily elementsToTrack
Attached to: tfamily module:Abundances_Structure
File: tfamily objects.abundances.F90
Default value: none
Description: The names of the elements to be tracked.

Name: tfamily excursionSetBarrierConstantCoefficient
Attached to: tfamily module:Excursion_Sets_Barriers_Quadratic
File: tfamily structure_formation.excursion_sets.barrier.quadratic.F90
Default value: 1.67
Description: The constant term in the excursion set barrier.

Name: tfamily excursionSetBarrierLinearCoefficient
Attached to: tfamily module:Excursion_Sets_Barriers_Quadratic
File: tfamily structure_formation.excursion_sets.barrier.quadratic.F90
Default value: 0.0
Description: The coefficient of the linear term in the excursion set barrier.

Name: tfamily excursionSetBarrierMethod
Attached to: tfamily module:Excursion_Sets_Barriers
File: tfamily structure_formation.excursion_sets.barrier.F90
Default value: criticalOverdensity
Description: The name of the method to be used for calculations of excursion set barriers.
4. Input Parameters

Name: tfamily excursionSetBarrierQuadraticCoefficient
Attached to: tfamily module:Excursion_Sets_Barriers_Quadratic
File: tfamily structure_formation.excursion_sets.barrier.quadratic.F90
Default value: 0.0
Description: The coefficient of the quadratic term in the excursion set barrier.

Name: tfamily excursionSetBarrierRatesRemapMethods
Attached to: tfamily module:Excursion_Sets_Barriers
File: tfamily structure_formation.excursion_sets.barrier.F90
Default value: null
Description: The name of the method to be used for remapping excursion set barriers for rate calculations.

Name: tfamily excursionSetBarrierRemapMethods
Attached to: tfamily module:Excursion_Sets_Barriers
File: tfamily structure_formation.excursion_sets.barrier.F90
Default value: null
Description: The name of the method to be used for remapping excursion set barriers.

Name: tfamily excursionSetBarrierRemapScalingFactor
Attached to: tfamily module:Excursion_Sets_Barriers_Remap_Scale
File: tfamily structure_formation.excursion_sets.barrier.remap.scale.F90
Default value: 1
Description: The factor by which the excursion set barrier should be rescaled if the scale remapping method is active.

Name: tfamily excursionSetFirstCrossingFarahiFileName
Attached to: tfamily module:Excursion_Sets_First_Crossing_Farahi
File: tfamily structure_formation.excursion_sets.first_crossing_distribution.Farahi.F90
Default value: none
Description: The name of the file to/from which tabulations of barrier first crossing probabilities should be written/read. If set to "none" tables will not be stored.

Name: tfamily excursionSetFirstCrossingFarahiFractionalTimeStep
Attached to: tfamily module:Excursion_Sets_First_Crossing_Farahi
File: tfamily structure_formation.excursion_sets.first_crossing_distribution.Farahi.F90
Default value: 0.01
Description: The fractional time step used when computing barrier crossing rates in the Farahi excursion set solver (i.e. the step used in finite difference calculations).

Name: tfamily excursionSetFirstCrossingMethod
Attached to: tfamily module:Excursion_Sets_First_Crossings
File: tfamily structure_formation.excursion_sets.first_crossing_distribution.F90
Default value: linearBarrier
Description: The name of the method to be used for calculations of first crossing distributions for excursion sets.

Name: tfamily filterLightconeFixedTime
Attached to: tfamily module:Galacticus_Merger_Tree_Output_Filter_Lightcones
File: tfamily galacticus.output.merger_tree.filters.lightcone.F90
Default value: false
Description: Specifies if lightcone output should occur at a fixed time (as opposed to the usual case where time evolves along the lightcone). Intended for the construction of lightcones with no evolution.

Name: tfamily filterLightconeGeometryFileName
Attached to: tfamily module: Galacticus_Merger_Tree_Output_Filter_Lightcones
File: tfamily galacticus.output.merger_tree.filters.lightcone.F90
Default value: none
Description: The name of an XML file from which to read details of lightcone geometry.

Name: tfamily filterLightconePruneTrees
Attached to: tfamily module: Galacticus_Merger_Tree_Output_Filter_Lightcones
File: tfamily galacticus.output.merger_tree.filters.lightcone.F90
Default value: none
Description: Specifies whether trees which lie wholly outside of the lightcone geometry should be pruned.

Name: tfamily freefallRadiusMethod
Attached to: tfamily module: Freefall_Radii
File: tfamily cooling.freefall_radii.F90
Default value: darkMatterHalo
Description: The name of the method to be used for calculations of the freefall radius in cooling calculations.

Name: tfamily freefallTimeAvailableMethod
Attached to: tfamily module: Cooling_Freefall_Times_Available
File: tfamily cooling.freefall_time_available.F90
Default value: haloFormation
Description: The name of the method to be used when computing the time available for freefall in cooling calculations.

Name: tfamily galacticStructureRadiiFixedFactor
Attached to: tfamily module: Galactic_Structure_Radii_Fixed
File: tfamily galactic_structure.radius_solver.fixed.F90
Default value: $\sqrt{1/2} \ [\text{Mo et al., 1998}]$
Description: The ratio of galaxy radius to $\lambda_{\text{vir}}$ in the “fixed” galactic structure radius solver algorithm.

Name: tfamily galacticStructureRadiusSolverInitialRadiusMethod
Attached to: tfamily module: Galactic_Structure_Initial_Radii
File: tfamily galactic_structure.radius_solver.initial_radii.F90
Default value: adiabatic
Description: Selects the method to be used to determine initial radii in the dark matter halo when solving for galactic structure.

Name: tfamily galacticStructureRadiusSolverMethod
Attached to: tfamily module: Galactic_Structure_Radii
File: tfamily galactic_structure.radius_solver.F90
Default value: adiabatic
Description: Selects the method to be used for solving for galactic structure.
4. Input Parameters

Name: tfamily galacticusOutputFileName
Attached to: tfamily module:Galacticus_Output_Open
File: tfamily galacticus.output.HDF5.open.F90
Default value: galacticus.hdf5
Description: The name of the file to which GALACTICUS results will be written.

Name: tfamily galacticusOutputScratchFileName
Attached to: tfamily module:Galacticus_Output_Open
File: tfamily galacticus.output.HDF5.open.F90
Default value: [galacticusOutputFileName]
Description: The name of the file to which GALACTICUS results will be written temporarily during runs.

Name: tfamily gauntFactorMethod
Attached to: tfamily module:Atomic_Radiation_Gaunt_Factors
File: tfamily atomic.radiation.gaunt_factors.F90
Default value: sutherland1998
Description: The name of the method to be used for computing Gaunt factors.

Name: tfamily gaussianRandomSeed
Attached to: tfamily module:Gaussian_Random
File: tfamily numerical.random.gaussian.F90
Default value: 843
Description: A seed for the Gaussian random number generator.

Name: tfamily generalizedPressSchechterDeltaStepMaximum
Attached to: tfamily module:Generalized_Press_Schechter_Branching
File: tfamily merger_trees.branching_probability.generalized_Press_Schechter.F90
Default value: 0.1
Description: Limits the step in $\delta_{\text{crit}}$ when constructing merger trees using the generalized Press-Schechter branching algorithm.

Name: tfamily generalizedPressSchechterMinimumMass
Attached to: tfamily module:Generalized_Press_Schechter_Branching
File: tfamily merger_trees.branching_probability.generalized_Press_Schechter.F90
Default value: 1.0d6
Description: The minimum mass to used in computing subresolution accretion rates when constructing merger trees using the generalized Press-Schechter branching algorithm.

Name: tfamily generalizedPressSchechterSmoothAccretion
Attached to: tfamily module:Generalized_Press_Schechter_Branching
File: tfamily merger_trees.branching_probability.generalized_Press_Schechter.F90
Default value: true
Description: Specifies whether or not to include smooth accretion in subresolution accretion rates when constructing merger trees using the generalized Press-Schechter branching algorithm.

Name: tfamily haloMassFunctionMethod
Attached to: tfamily module:Halo_Mass_Function
File: tfamily structure_formation.halo_mass_function.F90
**Default value:** Tinker2008  
**Description:** The name of the method to be used for computing the dark matter halo mass function.

**Name:** tfamily haloMassFunctionSamplingAbundanceMaximum  
**Attached to:** tfamily module:Merger_Trees_Mass_Function_Sampling_Halo_MF  
**File:** tfamily merger_trees.construct.mass_function_sampling.halo_mass_function.F90  
**Default value:** -1  
**Description:** The abundance (in units of Mpc$^{-3}$) above which to truncate the halo mass function when sampling halo masses for tree construction. A negative value indicates no truncation.

**Name:** tfamily haloMassFunctionSamplingAbundanceMinimum  
**Attached to:** tfamily module:Merger_Trees_Mass_Function_Sampling_Halo_MF  
**File:** tfamily merger_trees.construct.mass_function_sampling.halo_mass_function.F90  
**Default value:** -1  
**Description:** The abundance (in units of Mpc$^{-3}$) below which to truncate the halo mass function when sampling halo masses for tree construction. A negative value indicates no truncation.

**Name:** tfamily haloMassFunctionSamplingMethod  
**Attached to:** tfamily module:Merger_Trees_Mass_Function_Sampling  
**File:** tfamily merger_trees.construct.mass_function_sampling.F90  
**Default value:** haloMassFunction  
**Description:** The name of the method to be used for sampling the halo mass function when constructing merger trees.

**Name:** tfamily haloMassFunctionSamplingStellarMassFunctionErrorAlpha  
**Attached to:** tfamily module:Merger_Trees_Mass_Function_Sampling_Stellar_MF  
**File:** tfamily merger_trees.construct.mass_function_sampling.stellar_mass_function.F90  
**Default value:** none  
**Description:** The value $\alpha$ in a Schechter function describing the errors on the stellar mass function to be assumed when computing the optimal sampling density function for tree masses.

**Name:** tfamily haloMassFunctionSamplingStellarMassFunctionErrorBeta  
**Attached to:** tfamily module:Merger_Trees_Mass_Function_Sampling_Stellar_MF  
**File:** tfamily merger_trees.construct.mass_function_sampling.stellar_mass_function.F90  
**Default value:** none  
**Description:** The value $\beta$ in a Schechter function describing the errors on the stellar mass function to be assumed when computing the optimal sampling density function for tree masses.

**Name:** tfamily haloMassFunctionSamplingStellarMassFunctionErrorConstant  
**Attached to:** tfamily module:Merger_Trees_Mass_Function_Sampling_Stellar_MF  
**File:** tfamily merger_trees.construct.mass_function_sampling.stellar_mass_function.F90  
**Default value:** none  
**Description:** The constant error contribution to the stellar mass function to be assumed when computing the optimal sampling density function for tree masses.

**Name:** tfamily haloMassFunctionSamplingStellarMassFunctionErrorLogBinWidth  
**Attached to:** tfamily module:Merger_Trees_Mass_Function_Sampling_Stellar_MF  
**File:** tfamily merger_trees.construct.mass_function_sampling.stellar_mass_function.F90  
**Default value:** none
4. Input Parameters

**Description:** The logarithmic width of bins in the stellar mass function to be assumed when computing the optimal sampling density function for tree masses.

**Name:** tfamily haloMassFunction_SamplingStellarMassFunction_ErrorMassMaximum
**Attached to:** tfamily module:Merger_Trees_Mass_Function_Sampling_Stellar_MF
**File:** tfamily merger_trees.construct.mass_function_sampling.stellar_mass_function.F90
**Default value:** none
**Description:** The minimum stellar mass to consider when computing the optimal sampling density function for tree masses.

**Name:** tfamily haloMassFunction_SamplingStellarMassFunction_ErrorMassMinimum
**Attached to:** tfamily module:Merger_Trees_Mass_Function_Sampling_Stellar_MF
**File:** tfamily merger_trees.construct.mass_function_sampling.stellar_mass_function.F90
**Default value:** none
**Description:** The minimum stellar mass to consider when computing the optimal sampling density function for tree masses.

**Name:** tfamily haloMassFunction_SamplingStellarMassFunction_ErrorMstar
**Attached to:** tfamily module:Merger_Trees_Mass_Function_Sampling_Stellar_MF
**File:** tfamily merger_trees.construct.mass_function_sampling.stellar_mass_function.F90
**Default value:** none
**Description:** The value $M_\star$ in a Schechter function describing the errors on the stellar mass function to be assumed when computing the optimal sampling density function for tree masses.

**Name:** tfamily haloMassFunction_SamplingStellarMassFunction_ErrorPhi0
**Attached to:** tfamily module:Merger_Trees_Mass_Function_Sampling_Stellar_MF
**File:** tfamily merger_trees.construct.mass_function_sampling.stellar_mass_function.F90
**Default value:** none
**Description:** The value $\phi_0$ in a Schechter function, $\sigma(M) = \phi_0(M/M_\star)^\alpha \exp(-[M/M_\star]^{\beta})$, describing the errors on the stellar mass function to be assumed when computing the optimal sampling density function for tree masses.

**Name:** tfamily haloMassFunction_SimpleSystematicAlpha
**Attached to:** tfamily module:Halo_Mass_FUNCTION_Modifiers_Simple_Systematic
**File:** tfamily structure_formation.halo_mass_function.modifier.simple_systematic.F90
**Default value:** 0
**Description:** Parameter $\alpha$ appearing in model for simple systematic shift in the halo mass function.

**Name:** tfamily haloMassFunction_SimpleSystematicBeta
**Attached to:** tfamily module:Halo_Mass_FUNCTION_Modifiers_Simple_Systematic
**File:** tfamily structure_formation.halo_mass_function.modifier.simple_systematic.F90
**Default value:** 0
**Description:** Parameter $\beta$ appearing in model for simple systematic shift in the halo mass function.

**Name:** tfamily haloMassFunctionsMassMaximum
**Attached to:** tfamily module:Halo_Mass_Function_Tasks
**File:** tfamily halo_mass_functions.tasks.F90
**Default value:** $10^{15}$
**Description:** The maximum mass at which to tabulate halo mass functions.
Name: `tfamily haloMassFunctionsMassMinimum`  
**Attached to:** `tfamily module:Halo_MassFunction_Tasks`  
**File:** `tfamily halo_mass_functions.tasks.F90`  
**Default value:** $10^{10}$  
**Description:** The minimum mass at which to tabulate halo mass functions.

Name: `tfamily haloMassFunctionsPointsPerDecade`  
**Attached to:** `tfamily module:Halo_MassFunction_Tasks`  
**File:** `tfamily halo_mass_functions.tasks.F90`  
**Default value:** 10  
**Description:** The number of points per decade of halo mass at which to tabulate halo mass functions.

Name: `tfamily haloMassesIncludeSubhalos`  
**Attached to:** `tfamily module:Merger_Trees_Simple`  
**File:** `tfamily merger_trees.file_maker.simple.F90`  
**Default value:** none  
**Description:** Specifies whether or not halo masses include the masses of their subhalos.

Name: `tfamily haloModelWavenumberMaximum`  
**Attached to:** `tfamily module:Galacticus_Output_Halo_Models`  
**File:** `tfamily galacticus.output.merger_tree.halo_model.F90`  
**Default value:** $10^4$  
**Description:** The maximum wavenumber (in Mpc$^{-1}$) at which to tabulate power spectra for the halo model.

Name: `tfamily haloModelWavenumberMinimum`  
**Attached to:** `tfamily module:Galacticus_Output_Halo_Models`  
**File:** `tfamily galacticus.output.merger_tree.halo_model.F90`  
**Default value:** $10^{-3}$  
**Description:** The minimum wavenumber (in Mpc$^{-1}$) at which to tabulate power spectra for the halo model.

Name: `tfamily haloModelWavenumberPointsPerDecade`  
**Attached to:** `tfamily module:Galacticus_Output_Halo_Models`  
**File:** `tfamily galacticus.output.merger_tree.halo_model.F90`  
**Default value:** 10  
**Description:** The number of points per decade in wavenumber at which to tabulate power spectra for the halo model.

Name: `tfamily haloReformationMassFactor`  
**Attached to:** `tfamily module:Node_Component_Formation_Times_Cole2000`  
**File:** `tfamily objects.nodes.components.formation_times.Cole2000.F90`  
**Default value:** 2.0  
**Description:** Factor by which halo mass must have increased to trigger a new formation event.

Name: `tfamily haloReformationOnPromotionOnly`  
**Attached to:** `tfamily module:Node_Component_Formation_Times_Cole2000`  
**File:** `tfamily objects.nodes.components.formation_times.Cole2000.F90`
4. Input Parameters

Default value: false
Description: Specifies whether halo reformation should occur only at node promotion events, or at the precise time that the halo mass has increased sufficiently in mass.

Name: tfamily haloSpinDistributionMethod
Attached to: tfamily module:Halo_Spin_Distributions
File: tfamily dark_matter_halos.spins.distributions.F90
Default value: Bett2007
Description: The name of the method to be use for computing halo spin distributions.

Name: tfamily harrassmentMassThreshold
Attached to: tfamily module:Galactic_Dynamics_Bar_Instabilities_ELN_Tidal
File: tfamily galactic_dynamics.bar_instability.ELN_tidal.F90
Default value: 0.0
Description: The host halo mass threshold for harrassment to take effect.

Name: tfamily hdf5CacheElementsCount
Attached to: tfamily module:Galacticus_Output_Open
File: tfamily galacticus.output.HDF5.open.F90
Default value: 521
Description: Number of elements in the raw data chunk cache.

Name: tfamily hdf5CacheSizeBytes
Attached to: tfamily module:Galacticus_Output_Open
File: tfamily galacticus.output.HDF5.open.F90
Default value: 1048576
Description: Size of the raw data chunk cache in bytes.

Name: tfamily hdf5ChunkSize
Attached to: tfamily module:Galacticus_Output_Open
File: tfamily galacticus.output.HDF5.open.F90
Default value: 1024
Description: The chunk size used for outputting HDF5 datasets.

Name: tfamily hdf5CompressionLevel
Attached to: tfamily module:Galacticus_Output_Open
File: tfamily galacticus.output.HDF5.open.F90
Default value: -1
Description: The compression level used for outputting HDF5 datasets.

Name: tfamily hdf5SieveBufferSize
Attached to: tfamily module:Galacticus_Output_Open
File: tfamily galacticus.output.HDF5.open.F90
Default value: 65536
Description: The size of the sieve buffer used by the HDF5 library to speed reading/writing of partial datasets.

Name: tfamily hdf5UseLatestFormat
Attached to: tfamily module:Galacticus_Output_Open
File: tfamily galacticus.output.HDF5.open.F90
Default value: false
Description: Specifies whether to use the latest HDF5 file format.

Name: tfamily heightToRadialScaleDisk
Attached to: tfamily module:Node_Component_Disk_Exponential
File: tfamily objects.nodes.components.disk.exponential.F90
Default value: 0.137 [Kregel et al., 2002]
Description: The ratio of scale height to scale radius for exponential disks.

Name: tfamily heightToRadialScaleDiskBlitzRosolowsky
Attached to: tfamily module:Star(Formation Rate_Surface_Density_Disks_BR
File: tfamily star_formation.rate_surface_density.disks.Blitz-Rosolowsky.F90
Default value: 0.137 [Kregel et al., 2002]
Description: The ratio of scale height to scale radius for disks in the "Blitz-Rosolowsky" star formation timescale calculation.

Name: tfamily hotHaloAngularMomentumAlwaysGrows
Attached to: tfamily module:Node_Component_Hot_Halo_Standard
File: tfamily objects.nodes.components.hot_halo.standard.F90
Default value: false
Description: Specifies whether or not negative rates of accretion of angular momentum into the hot halo will be treated as positive for the purposes of computing the hot halo angular momentum.

Name: tfamily hotHaloAngularMomentumLossFraction
Attached to: tfamily module:Node_Component_Hot_Halo_Standard
File: tfamily objects.nodes.components.hot_halo.standard.F90
Default value: 0.3
Description: Specifies the fraction of angular momentum that is lost from cooling/infalling gas.

Name: tfamily hotHaloColdModeCoredIsothermalCoreRadiiMethod
Attached to: tfamily module:Hot_Halo_Cold_Mode_Density_Cored_Isothermal_Core_Radii
File: tfamily hot_halo.cold_mode.density_profile.cored_isothermal.core_radius.F90
Default value: virialRadiusFraction
Description: The name of the method to be used for computing the core radii of cored isothermal cold mode hot halo profiles.

Name: tfamily hotHaloCoolingFromNode
Attached to: tfamily module:Node_Component_Hot_Halo_Standard
File: tfamily objects.nodes.components.hot_halo.standard.F90
Default value: currentNode
Description: Specifies whether the angular momentum of cooling gas should be computed from the "current node" or the "formation node".

Name: tfamily hotHaloCoreRadiusOverScaleRadius
Attached to: tfamily function:growingDefaultConstructor
File: tfamily hot_halo.mass_distribution.cored.core_radius.F90
Default value: 0.1
Description: The core radius in the hot halo density profile in units of the dark matter profile scale
4. Input Parameters

Name: tfamily hotHaloCoreRadiusOverVirialRadius
Attached to: tfamily module:Hot_Halo_Mass_Distributions_CORE_Radii
File: tfamily hot_halo.mass_distribution.cored.core_radius.F90
Default value: 0.3
Description: The core radius in the hot halo density profile in units of the virial radius.

Name: tfamily hotHaloCoreRadiusOverVirialRadiusMaximum
Attached to: tfamily function: growingDefaultConstructor
File: tfamily hot_halo.mass_distribution.cored.core_radius.F90
Default value: 10
Description: The maximum core radius in the “cored isothermal” hot halo density profile in units of the virial radius.

Name: tfamily hotHaloExcessHeatDrivesOutflow
Attached to: tfamily module:Node_Component_Hot_Halo_Standard
File: tfamily objects.nodes.components.hot_halo.standard.F90
Default value: true
Description: Specifies whether heating of the halo in excess of its cooling rate will drive an outflow from the halo.

Name: tfamily hotHaloExpulsionRateMaximum
Attached to: tfamily module:Node_Component_Hot_Halo_Standard
File: tfamily objects.nodes.components.hot_halo.standard.F90
Default value: 1
Description: Specifies the maximum rate at which mass can be expelled from the hot halo in units of the inverse halo dynamical time.

Name: tfamily hotHaloMassDistributionBeta
Attached to: tfamily module:Hot_Halo_Mass_Distributions
File: tfamily hot_halo.mass_distribution.F90
Default value: 2/3
Description: The value of $\beta$ in $\beta$-profile hot halo mass distributions.

Name: tfamily hotHaloMassDistributionCoreRadiusMethod
Attached to: tfamily module:Hot_Halo_Mass_Distributions_CORE_Radii
File: tfamily hot_halo.mass_distribution.cored.core_radius.F90
Default value: virialFraction
Description: The method to be used for hotHaloMassDistributionCoreRadius.

Name: tfamily hotHaloMassDistributionMethod
Attached to: tfamily module:Hot_Halo_Mass_Distributions
File: tfamily hot_halo.mass_distribution.F90
Default value: betaProfile
Description: The method to be used for hotHaloMassDistribution.

Name: tfamily hotHaloNodeMergerLimitBaryonFraction
Attached to: tfamily module:Node_Component_Hot_Halo_Standard
File: tfamily objects.nodes.components.hot_halo.standard.F90
Default value: false
Description: Controls whether the hot gas content of nodes should be limited to not exceed the universal baryon fraction at node merger events. If set to true, hot gas (and angular momentum, abundances, and chemicals proportionally) will be removed from the merged halo to the unaccreted gas reservoir to limit the baryonic mass to the universal baryon fraction where possible.

Name: tfamily hotHaloOutflowReturnOnFormation
Attached to: tfamily module:Node_Component_Hot_Halo_Standard
File: tfamily objects.nodes.components.hot_halo.standard.F90
Default value: false
Description: Specifies whether or not outflowed gas should be returned to the hot reservoir on halo formation events.

Name: tfamily hotHaloOutflowReturnRate
Attached to: tfamily module:Node_Component_Hot_Halo_Standard
File: tfamily objects.nodes.components.hot_halo.standard.F90
Default value: 5
Description: Specifies the rate at which reheated mass is returned to the hot phase in units of the inverse halo dynamical time.

Name: tfamily hotHaloOutflowStrippingEfficiency
Attached to: tfamily module:Node_Component_Hot_Halo_Standard
File: tfamily objects.nodes.components.hot_halo.standard.F90
Default value: 0.1
Description: Specifies the efficiency with which outflowing gas is stripped from the hot halo, following the prescription of Font et al. (2008; i.e. this is the parameter $\epsilon_{\text{strip}}$ in their eqn. 6).

Name: tfamily hotHaloOutflowToColdMode
Attached to: tfamily module:Node_Component_Hot_Halo_Cold_Mode
File: tfamily objects.nodes.components.hot_halo.cold_mode.F90
Default value: false
Description: Specifies whether or not outflows from galaxies are returned to the cold or hot modes in the hot halo.

Name: tfamily hotHaloRamPressureForceMethod
Attached to: tfamily module:Hot_Halo_Ram_Pressure_Forces
File: tfamily hot_halo.ram_pressure_force.F90
Default value: Font2008
Description: The name of the method to be used when computing ram pressure force on hot halos.

Name: tfamily hotHaloRamPressureStrippingMethod
Attached to: tfamily module:Hot_Halo_Ram_Pressure_Stripping
File: tfamily hot_halo.ram_pressure_stripping.F90
Default value: Font2008
Description: The name of the method to be used when computing ram pressure stripping of hot halos.

Name: tfamily hotHaloRamPressureStrippingTimescaleMethod
Attached to: tfamily module:Hot_Halo_Ram_Pressure_Stripping_Timescales
4. Input Parameters

File: tfamily hot_halo.ram_pressure_stripping.timescale.F90
Default value: ramPressureAcceleration
Description: The name of the method to be used when computing ram pressure stripping timescales for hot halos.

Name: tfamily hotHaloTemperatureMethod
Attached to: tfamily module:Hot_Halo_Temperature_Profile
File: tfamily hot_halo.temperature_profile.F90
Default value: virial
Description: The name of the method to be used for computing hot halo temperature profiles.

Name: tfamily hotHaloTrackStrippedGas
Attached to: tfamily module:Node_Component_Hot_Halo_Standard
File: tfamily objects.nodes.components.hot_halo.standard.F90
Default value: true
Description: Specifies whether or not gas stripped from the hot halo should be tracked.

Name: tfamily hydrogenNetworkCMBOnly
Attached to: tfamily module:Chemical_Hydrogen_Rates
File: tfamily chemical.reaction_rates.hydrogen.F90
Default value: true
Description: Specifies whether or not to use the cosmic microwave background only when computed certain radiative rates.

Name: tfamily hydrogenNetworkFast
Attached to: tfamily module:Chemical_Hydrogen_Rates
File: tfamily chemical.reaction_rates.hydrogen.F90
Default value: true
Description: Specifies whether or not to use simplifying assumptions to speed the hydrogen network calculation. If true, H⁻ is assumed to be at equilibrium abundance, H₂⁺ reactions are ignored and other slow reactions are ignored (see Abel et al. 1997).

Name: tfamily igmPropertiesCompute
Attached to: tfamily module:Intergalactic_Medium_State_Internal_Evolver
File: tfamily intergalactic_medium.state.internal.evolver.F90
Default value: false
Description: Specifies whether or not the properties should be computed.

Name: tfamily igmPropertiesRedshiftMaximum
Attached to: tfamily module:Intergalactic_Medium_State_Internal_Evolver
File: tfamily intergalactic_medium.state.internal.evolver.F90
Default value: 400
Description: The maximum redshift to use in calculations.

Name: tfamily igmPropertiesRedshiftMinimum
Attached to: tfamily module:Intergalactic_Medium_State_Internal_Evolver
File: tfamily intergalactic_medium.state.internal.evolver.F90
Default value: 0
Description: The minimum redshift to use in calculations.
<table>
<thead>
<tr>
<th>Name: tfamily igmPropertiesTimeCountPerDecade</th>
<th>Attached to: tfamily module:Intergalactic_Medium_State_Internal_Evolver</th>
<th>File: tfamily intergalactic_medium.state.internal.evolver.F90</th>
<th>Default value: 10</th>
<th>Description: The number of bins per decade of time to use for calculations of the properties of the universe.</th>
</tr>

</table>
4. Input Parameters

**Default value:** 0.035 (internally computed)
**Description:** The yield for the Chabrier IMF in the instantaneous recycling approximation.

**Name:** tfamily imfKennicuttRecycledInstantaneous  
**Attached to:** tfamily module:Star_Formation_IMF_Kennicutt  
**File:** tfamily star_formation.IMF.Kennicutt.F90  
**Default value:** 0.57 (internally computed)  
**Description:** The recycled fraction for the Kennicutt IMF in the instantaneous recycling approximation.

**Name:** tfamily imfKennicuttYieldInstantaneous  
**Attached to:** tfamily module:Star_Formation_IMF_Kennicutt  
**File:** tfamily star_formation.IMF.Kennicutt.F90  
**Default value:** 0.044 (internally computed)  
**Description:** The yield for the Kennicutt IMF in the instantaneous recycling approximation.

**Name:** tfamily imfKroupaRecycledInstantaneous  
**Attached to:** tfamily module:Star_Formation_IMF_Kroupa  
**File:** tfamily star_formation.IMF.Kroupa.F90  
**Default value:** 0.30 (internally computed)  
**Description:** The recycled fraction for the Kroupa IMF in the instantaneous recycling approximation.

**Name:** tfamily imfKroupaYieldInstantaneous  
**Attached to:** tfamily module:Star_Formation_IMF_Kroupa  
**File:** tfamily star_formation.IMF.Kroupa.F90  
**Default value:** 0.023 (internally computed)  
**Description:** The yield for the Kroupa IMF in the instantaneous recycling approximation.

**Name:** tfamily imfMillerScaloRecycledInstantaneous  
**Attached to:** tfamily module:Star_Formation_IMF_MillerScalo  
**File:** tfamily star_formation.IMF.Miller-Scalo.F90  
**Default value:** 0.52 (computed internally)  
**Description:** The recycled fraction for the MillerScalo IMF in the instantaneous recycling approximation.

**Name:** tfamily imfMillerScaloYieldInstantaneous  
**Attached to:** tfamily module:Star_Formation_IMF_MillerScalo  
**File:** tfamily star_formation.IMF.Miller-Scalo.F90  
**Default value:** 0.026 (internally computed)  
**Description:** The yield for the MillerScalo IMF in the instantaneous recycling approximation.

**Name:** tfamily imfPiecewisePowerLawExponents  
**Attached to:** tfamily module:Star_Formation_IMF_PiecewisePowerLaw  
**File:** tfamily star_formation.IMF.piecewise_power_law.F90  
**Default value:** -2.35  
**Description:** The exponents used to define a piecewise power-law initial mass function.

**Name:** tfamily imfPiecewisePowerLawMassPoints  
**Attached to:** tfamily module:Star_Formation_IMF_PiecewisePowerLaw  
**File:** tfamily star_formation.IMF.piecewise_power_law.F90
**Default value:** 0.1, 125  
**Description:** The mass points used to define a piecewise power-law initial mass function.

**Name:** tfamily imfPiecewisePowerLawRecycledInstantaneous  
**Attached to:** tfamily module:Star_Formation_IMF_PiecewisePowerLaw  
**File:** tfamily star_formation.IMF.piecewise_power_law.F90  
**Default value:** 0.39  
**Description:** The recycled fraction for piecewise power-law stellar initial mass functions in the instantaneous recycling approximation.

**Name:** tfamily imfPiecewisePowerLawYieldInstantaneous  
**Attached to:** tfamily module:Star_Formation_IMF_PiecewisePowerLaw  
**File:** tfamily star_formation.IMF.piecewise_power_law.F90  
**Default value:** 0.02  
**Description:** The yield for piecewise power-law stellar initial mass functions in the instantaneous recycling approximation.

**Name:** tfamily imfSalpeterRecycledInstantaneous  
**Attached to:** tfamily module:Star_Formation_IMF_Salpeter  
**File:** tfamily star_formation.IMF.Salpeter.F90  
**Default value:** 0.39  
**Description:** The recycled fraction for the Salpeter IMF in the instantaneous recycling approximation.

**Name:** tfamily imfSalpeterYieldInstantaneous  
**Attached to:** tfamily module:Star_Formation_IMF_Salpeter  
**File:** tfamily star_formation.IMF.Salpeter.F90  
**Default value:** 0.02  
**Description:** The yield for the Salpeter IMF in the instantaneous recycling approximation.

**Name:** tfamily imfScaloRecycledInstantaneous  
**Attached to:** tfamily module:Star_Formation_IMF_Scalo  
**File:** tfamily star_formation.IMF.Scalo.F90  
**Default value:** 0.24 (computed internally)  
**Description:** The recycled fraction for the Scalo IMF in the instantaneous recycling approximation.

**Name:** tfamily imfScaloYieldInstantaneous  
**Attached to:** tfamily module:Star_Formation_IMF_Scalo  
**File:** tfamily star_formation.IMF.Scalo.F90  
**Default value:** 0.086 (internally computed)  
**Description:** The yield for the Scalo IMF in the instantaneous recycling approximation.

**Name:** tfamily imfSelectionDisk  
**Attached to:** tfamily module:Star_Formation_IMF_Select_Disk_Spheroid  
**File:** tfamily star_formation.IMF.select.diskSpheroid.F90  
**Default value:** Salpeter  
**Description:** The name of the initial mass function to use in the “diskSpheroid initial mass function” module for star formation in disks.

**Name:** tfamily imfSelectionFixed
4. Input Parameters

**Attached to:** tfamily module:Star_Formation_IMF_Select_Fixed  
**File:** tfamily star_formation.IMF.select.fixed.F90  
**Default value:** Chabrier  
**Description:** The name of the initial mass function to use in the “fixed initial mass function” module.

**Name:** tfamily imfSelectionMethod  
**Attached to:** tfamily module:Star_Formation_IMF  
**File:** tfamily star_formation.IMF.F90  
**Default value:** fixed  
**Description:** The name of the method to be used for selecting which IMF to use.

**Name:** tfamily imfSelectionSpheroid  
**Attached to:** tfamily module:Star_Formation_IMF_Select_Disk_Spheroid  
**File:** tfamily star_formation.IMF.select.diskSpheroid.F90  
**Default value:** Salpeter  
**Description:** The name of the initial mass function to use in the “diskSpheroid initial mass function” module for star formation in spheroids.

**Name:** tfamily infallRadiusMethod  
**Attached to:** tfamily module:Cooling_Infall_Radii  
**File:** tfamily cooling.infall_radius.F90  
**Default value:** coolingRadius  
**Description:** The name of the method to be used for calculations of the infall radius for cooling calculations.

**Name:** tfamily initialMassForSupernovaeTypeII  
**Attached to:** tfamily module:Stellar_Feedback_Standard  
**File:** tfamily stellar.astrophysics.feedback.standard.F90  
**Default value:** 8  
**Description:** The minimum mass that a star must have in order that it result in a Type II supernova.

**Name:** tfamily intergalacticMediumStateMethod  
**Attached to:** tfamily module:Intergalactic_Medium_State  
**File:** tfamily intergalactic_medium.state.F90  
**Default value:** recFast  
**Description:** The method to be used for intergalacticMediumState.

**Name:** tfamily intergalacticMediumStateFileName  
**Attached to:** tfamily module:Intergalactic_Medium_State  
**File:** tfamily intergalactic_medium.state.F90  
**Default value:** none  
**Description:** The name of the file from which to read intergalactic medium state data.

**Name:** tfamily linearGrowthMethod  
**Attached to:** tfamily module:Linear_Growth  
**File:** tfamily structure_formation.linear_growth.F90  
**Default value:** simple  
**Description:** The name of the method to be used for calculations of the linear growth factor.
Name: tfamily lognormalSpinDistributionMedian
Attached to: tfamily module:Halo_Spin_Distributions_Lognormal
File: tfamily dark_matter_halos.spins.distributions.lognormal.F90
Default value: 0.03687 [Bett et al., 2007]
Description: The median in a lognormal halo spin distribution.

Name: tfamily lognormalSpinDistributionSigma
Attached to: tfamily module:Halo_Spin_Distributions_Lognormal
File: tfamily dark_matter_halos.spins.distributions.lognormal.F90
Default value: 0.2216 [Bett et al., 2007]
Description: The dispersion in a lognormal halo spin distribution.

Name: tfamily luminosityBandRedshift
Attached to: tfamily module:Stellar_Luminosities_Structure
File: tfamily objects.stellar_luminosities.F90
Default value: none
Description: If present, force filters to be shifted to this redshift rather than that specified by [luminosityRedshift]. Allows sampling of the SED at wavelengths corresponding to other redshifts.

Name: tfamily luminosityFilter
Attached to: tfamily module:Stellar_Luminosities_Structure
File: tfamily objects.stellar_luminosities.F90
Default value: none
Description: The filter name for each stellar luminosity to be computed.

Name: tfamily luminosityFilterAbsoluteMagnitudeThresholdMaxima
Attached to: tfamily module:Galacticus_Merger_Tree_Output_Filter_Luminosities
File: tfamily galacticus.output.merger_tree.filters.luminosities.F90
Default value: none
Description: The maximum absolute magnitudes (in the AB system) of a galaxy to pass the luminosity output filter.

Name: tfamily luminosityFilterAbsoluteMagnitudeThresholdMinima
Attached to: tfamily module:Galacticus_Merger_Tree_Output_Filter_Luminosities
File: tfamily galacticus.output.merger_tree.filters.luminosities.F90
Default value: none
Description: The minimum absolute magnitudes (in the AB system) of a galaxy to pass the luminosity output filter.

Name: tfamily luminosityOutputOption
Attached to: tfamily module:Stellar_Luminosities_Structure
File: tfamily objects.stellar_luminosities.F90
Default value: present
Description: Selects which luminosities will be output at each output time:

all  Output all luminosities;

future  Output only those luminosities computed for the present output or future times;

present  Output only those luminosities computed for the present output time.
4. Input Parameters

Name: tfamily luminosityPostprocessSet
Attached to: tfamily module:Stellar_Luminosities_Structure
File: tfamily objects.stellar_luminosities.F90
Default value: none
Description: The name of the set of postprocessing algorithms to apply to this filter.

Name: tfamily luminosityRedshift
Attached to: tfamily module:Stellar_Luminosities_Structure
File: tfamily objects.stellar_luminosities.F90
Default value: none
Description: The redshift for which to compute each specified stellar luminosity.

Name: tfamily luminosityType
Attached to: tfamily module:Stellar_Luminosities_Structure
File: tfamily objects.stellar_luminosities.F90
Default value: none
Description: The luminosity type for each stellar luminosity to be computed:

rest  Compute luminosity in the galaxy rest frame;

observed  Compute luminosity in the observer frame.

Name: tfamily majorMergerMassRatio
Attached to: tfamily module:Satellite_Merging_Mass_Movements_Simple
File: tfamily satellites.merging.mass_movements.simple.F90
Default value: 0.25
Description: The mass ratio above which mergers are considered to be “major” in the simple merger mass movements method.

Name: tfamily massAccretionHistoryOutput
Attached to: tfamily module:Merger_Tree_Mass_Accretion_History
File: tfamily merger_trees.mass_accretion_history.F90
Default value: false
Description: Specifies whether or not to output mass accretion histories for the main branches of merger trees.

Name: tfamily massFlowStatisticsResetOnOutput
Attached to: tfamily module:Node_Component_Mass_Flow_Statistics_Standard
File: tfamily objects.nodes.components.mass_flow_statistics.standard.F90
Default value: true
Description: Specifies whether or not mass flow statistics should be reset to zero at each output.

Name: tfamily massFunctionCovarianceBinCount
Attached to: tfamily program:Mass_Function_Covariance
File: tfamily Mass_Function_Covariance.F90
Default value: 0.0
Description: The number of bins in the mass function for covariance calculations.

---

The luminosity computed in this way is that in the galaxy rest frame using a filter blueshifted to the galaxy’s redshift. This means that to compute an apparent magnitude you must add not only the distance modulus, but a factor of $-2.5 \log_{10}(1 + z)$ to account for compression of photon frequencies.
Name: tfamily massFunctionCovarianceFFTGridSize
Attached to: tfamily module:Statistics_Mass_Function_Covariance
File: tfamily statistics.mass_function.covariance.F90
Default value: 64
Description: The size of the FFT grid to use in computing window functions for mass function covariance matrices.

Name: tfamily massFunctionCovarianceHaloMassMaximum
Attached to: tfamily module:Statistics_Mass_Function_Covariance
File: tfamily statistics.mass_function.covariance.F90
Default value: $10^{10}\,M_\odot$
Description: The minimum halo mass to use when computing mass function covariance matrices.

Name: tfamily massFunctionCovarianceHaloMassMinimum
Attached to: tfamily module:Statistics_Mass_Function_Covariance
File: tfamily statistics.mass_function.covariance.F90
Default value: $10^{10}\,M_\odot$
Description: The minimum halo mass to use when computing mass function covariance matrices.

Name: tfamily massFunctionCovarianceIncludeHalo
Attached to: tfamily program:Mass_Function_Covariance
File: tfamily Mass_Function_Covariance.F90
Default value: true
Description: Specifies whether or not to include the halo contribution to mass function covariance matrices.

Name: tfamily massFunctionCovarianceIncludeLSS
Attached to: tfamily program:Mass_Function_Covariance
File: tfamily Mass_Function_Covariance.F90
Default value: true
Description: Specifies whether or not to include the large-scale structure contribution to mass function covariance matrices.

Name: tfamily massFunctionCovarianceIncludePoisson
Attached to: tfamily program:Mass_Function_Covariance
File: tfamily Mass_Function_Covariance.F90
Default value: true
Description: Specifies whether or not to include the Poisson contribution to mass function covariance matrices.

Name: tfamily massFunctionCovarianceMassMaximum
Attached to: tfamily program:Mass_Function_Covariance
File: tfamily Mass_Function_Covariance.F90
Default value: $10^8\,M_\odot$
Description: The maximum mass in the mass function for covariance calculations.

Name: tfamily massFunctionCovarianceMassMinimum
Attached to: tfamily program:Mass_Function_Covariance
File: tfamily Mass_Function_Covariance.F90
4. Input Parameters

Default value: \(10^8 M_\odot\)
Description: The minimum mass in the mass function for covariance calculations.

Name: tfamily massFunctionCovarianceOutputFileName
Attached to: tfamily program:Mass_Function_Covariance
File: tfamily Mass_Function_Covariance.F90
Default value: covariance.hdf5
Description: The name of the file to which the covariance matrix should be written.

Name: tfamily massFunctionCovarianceRedshiftMaximum
Attached to: tfamily program:Mass_Function_Covariance
File: tfamily Mass_Function_Covariance.F90
Default value: 0.0
Description: The maximum redshift at which calculations of the mass function covariance should be carried out.

Name: tfamily massFunctionCovarianceRedshiftMinimum
Attached to: tfamily program:Mass_Function_Covariance
File: tfamily Mass_Function_Covariance.F90
Default value: 0.0
Description: The minimum redshift at which calculations of the mass function covariance should be carried out.

Name: tfamily massVarianceFilteredPowerSpectrumTolerance
Attached to: tfamily module:Cosmological_Mass_Variance_Filtered_Power_Spectrum
File: tfamily structure_formation.cosmological_mass_variance.filtered_power_spectrum.F90
Default value: \(4 \times 10^{-6}\)
Description: The relative tolerance to use in integrating over the linear power spectrum to compute the cosmological mass variance.

Name: tfamily massVarianceFilteredPowerSpectrumTopHatTolerance
Attached to: tfamily module:Cosmological_Mass_Variance_Filtered_Power_Spectrum
File: tfamily structure_formation.cosmological_mass_variance.filtered_power_spectrum.F90
Default value: \(10^{-6}\)
Description: The relative tolerance to use in integrating over the linear power spectrum using a top-hat (real space) window function to compute the cosmological mass variance.

Name: tfamily mergeTargetTimeOffsetMaximumAbsolute
Attached to: tfamily module:Merger_Tree_Timesteps_Satellite
File: tfamily merger_trees.evolve.timesteps.satellite.F90
Default value: 0.01
Description: The maximum absolute time difference (in Gyr) allowed between merging pairs of galaxies.

Name: tfamily mergeTargetTimeOffsetMaximumRelative
Attached to: tfamily module:Merger_Tree_Timesteps_Satellite
File: tfamily merger_trees.evolve.timesteps.satellite.F90
Default value: 0.001
Description: The maximum time difference (relative to the cosmic time at the merger epoch) allowed between merging pairs of galaxies.
Name: tfamily mergerRemnantRadiativeEfficiency
Attached to: tfamily module: Satellite_Merging_Remnant_Sizes_Covington2008
Default value: 2.75 [Covington et al., 2008]
Description: The coefficient, $C_{rad}$ energy used in the Covington et al. [2008] merger remnant size algorithm.

Name: tfamily mergerRemnantSizeOrbitalEnergy
Attached to: tfamily module: Satellite_Merging_Remnant_Sizes_Cole2000
Default value: 1
Description: The orbital energy used in the “Cole2000” merger remnant sizes calculation in units of the characteristic orbital energy.

Name: tfamily mergerTreeAnalyses
Attached to: tfamily module: Galacticus_Output_Merger_Tree
File: tfamily galacticus.output.merger_tree.F90
Default value: none
Description: List of analyses to carry out on merger trees.

Name: tfamily mergerTreeBaseRedshift
Attached to: tfamily module: Merger_Tree_Smooth_Accretion
File: tfamily merger_trees.construct.smooth_accretion.F90
Default value: 0
Description: The redshift at which to plant the base node when building the smoothly accreting merger tree.

Name: tfamily mergerTreeBuildCole2000AccretionLimit
Attached to: tfamily module: Merger_Tree_Build_Cole2000
Default value: 0.1
Description: The largest fractional mass change due to subresolution accretion allowed in a timestep in merger trees built by the Cole et al. [2000] method.

Name: tfamily mergerTreeBuildCole2000FixedRandomSeeds
Attached to: tfamily module: Merger_Tree_Build_Cole2000
Default value: false
Description: Specifies whether the random number sequence should be restarted for each tree using a deterministically derived (from the tree index) seed. This allows the exact same tree to be generated even when running multiple threads.

Name: tfamily mergerTreeBuildCole2000HighestRedshift
Attached to: tfamily module: Merger_Tree_Build_Cole2000
Default value: 10^5
Description: The highest redshift to which merger trees will be built in the Cole et al. [2000] method.
4. Input Parameters

Name: tfamily mergerTreeBuildCole2000MergeProbability
Attached to: tfamily module:Merger_Tree_Build_Cole2000
Default value: 0.1
Description: The largest probability of branching allowed in a timestep in merger trees built by the Cole et al. [2000] method.

Name: tfamily mergerTreeBuildHaloMassMaximum
Attached to: tfamily module:Merger_Tree_Build
File: tfamily merger_trees.construct.build.F90
Default value: $10^{15}$
Description: The maximum mass of merger tree base halos to consider when building merger trees, in units of $M_\odot$.

Name: tfamily mergerTreeBuildHaloMassMinimum
Attached to: tfamily module:Merger_Tree_Build
File: tfamily merger_trees.construct.build.F90
Default value: $10^{10}$
Description: The minimum mass of merger tree base halos to consider when building merger trees, in units of $M_\odot$.

Name: tfamily mergerTreeBuildMassResolutionFixed
Attached to: tfamily module:Merger_Trees_Build_Mass_Resolution_Fixed
File: tfamily merger_trees.construct.build.mass_resolution.fixed.F90
Default value: $5 \times 10^9$
Description: The minimum mass (in units of $M_\odot$) of halos to be resolved in merger trees that are built.

Name: tfamily mergerTreeBuildMassResolutionScaledFraction
Attached to: tfamily module:Merger_Trees_Build_Mass_Resolution_Scaled
File: tfamily merger_trees.construct.build.mass_resolution.scaled.F90
Default value: $10^{-3}$
Description: The fraction of the tree’s root node mass to be used for the mass resolution in merger trees that are built using the “scaled” mass resolution algorithm.

Name: tfamily mergerTreeBuildMassResolutionScaledMinimum
Attached to: tfamily module:Merger_Trees_Build_Mass_Resolution_Scaled
File: tfamily merger_trees.construct.build.mass_resolution.scaled.F90
Default value: $5 \times 10^9$
Description: The minimum mass (in units of $M_\odot$) of halos to be resolved in merger trees that are built using the “scaled” mass resolution algorithm.

Name: tfamily mergerTreeBuildMethod
Attached to: tfamily module:Merger_Tree_Build
File: tfamily merger_trees.construct.build.F90
Default value: Cole2000
Description: The name of the method to be used to build merger trees.

Name: tfamily mergerTreeBuildTreeMassesFile
Attached to: tfamily subroutine:Merger_Tree_Build_Initialize
File: tfamily merger_trees.construct.build.F90  
Default value: null  
Description: Specifies the name of a file from which to read the masses of merger tree root halos when building merger trees.

Name: tfamily mergerTreeBuildTreesBaseRedshift  
Attached to: tfamily module:Merger_Tree_Build  
File: tfamily merger_trees.construct.build.F90  
Default value: 0  
Description: The redshift at which to plant the base node when building merger trees.

Name: tfamily mergerTreeBuildTreesBeginAtTree  
Attached to: tfamily module:Merger_Tree_Build  
File: tfamily merger_trees.construct.build.F90  
Default value: 1 (if processing trees in ascending order), or equal to the number of trees (otherwise)  
Description: The index (in order of increasing base halo mass) of the tree at which to begin when building merger trees.

Name: tfamily mergerTreeBuildTreesHaloMassDistribution  
Attached to: tfamily module:Merger_Tree_Build  
File: tfamily merger_trees.construct.build.F90  
Default value: uniform  
Description: The method to be used to construct a distribution of base halo masses.

Name: tfamily mergerTreeBuildTreesHaloMassExponent  
Attached to: tfamily module:Merger_Trees_Mass_Function_Sampling_Power_Law  
File: tfamily merger_trees.construct.mass_function_sampling.power_law.F90  
Default value: 1  
Description: Halo masses will be (pseudo-)uniformly distributed in $[\log(M)]^{1/(1+\alpha)}$ where $\alpha =$mergerTreeBuildTreesHaloMassExponent.

Name: tfamily mergerTreeBuildTreesHaloMassGaussianMean  
Attached to: tfamily module:Merger_Trees_Mass_Function_Sampling_Gaussian  
File: tfamily merger_trees.construct.mass_function_sampling.gaussian.F90  
Default value: none  
Description: The mean mass of halo to simulate when using a Gaussian sampling of the halo mass function.

Name: tfamily mergerTreeBuildTreesHaloMassGaussianSigma  
Attached to: tfamily module:Merger_Trees_Mass_Function_Sampling_Gaussian  
File: tfamily merger_trees.construct.mass_function_sampling.gaussian.F90  
Default value: none  
Description: The dispersion in mass of halo to simulate when using a Gaussian sampling of the halo mass function.

Name: tfamily mergerTreeBuildTreesPerDecade  
Attached to: tfamily module:Merger_Tree_Build  
File: tfamily merger_trees.construct.build.F90  
Default value: 10  
Description: The number of merger trees to build per decade of base halo mass.

<td><code>tfamily merger_trees.conditional_mass_functions.F90</code></td>
<td>$10^{10}M_\odot$</td>
<td>The minimum parent halo mass to bin when constructing conditional halo mass functions.</td>
</tr>
</tbody>
</table>
Name: tfamily mergerTreeComputeConditionalMassFunctionParentRedshifts
Attached to: tfamily module:Merger_Trees_Conditional_Mass_Function
File: tfamily merger_trees.conditional_mass_functions.F90
Default value: 0.0
Description: The set of parent halo redshifts to use when constructing conditional halo mass functions.

Name: tfamily mergerTreeComputeConditionalMassFunctionPrimaryProgenitorDepth
Attached to: tfamily module:Merger_Trees_Conditional_Mass_Function
File: tfamily merger_trees.conditional_mass_functions.F90
Default value: 2
Description: The depth in progenitor ranking for which to store ranked progenitor mass functions. For example, a value of 2 means store mass functions for the most massive, and second most massive progenitor.

Name: tfamily mergerTreeComputeConditionalMassFunctionProgenitorRedshifts
Attached to: tfamily module:Merger_Trees_Conditional_Mass_Function
File: tfamily merger_trees.conditional_mass_functions.F90
Default value: 1.0
Description: The set of progenitor halo redshifts to use when constructing conditional halo mass functions.

Name: tfamily mergerTreeConditionalMassFunctionFormationRateTimeFraction
Attached to: tfamily module:Merger_Trees_Conditional_Mass_Function
File: tfamily merger_trees.conditional_mass_functions.F90
Default value: 0.01
Description: The fraction of the current time over which to estimate the formation rate of halos when computing merger tree statistics.

Name: tfamily mergerTreeConstructFullySpecifiedFileName
Attached to: tfamily module:Merger_Trees_Construct_Fully_Specified
File: tfamily merger_trees.construct.fully_specified.F90
Default value: none
Description: The name of the file giving the fully-specified description of the merger tree to process.

Name: tfamily mergerTreeConstructMethod
Attached to: tfamily module:Merger_Tree_Construction
File: tfamily merger_trees.construct.F90
Default value: build
Description: Selects the method to be used for constructing merger trees.

Name: tfamily mergerTreeEnforceMonotonicGrowth
Attached to: tfamily module:Merger_Trees_Monotonic_Mass_Growth
File: tfamily merger_trees.monotonic_mass_growth.F90
Default value: false
Description: Specifies whether or not to enforce monotonic mass growth along the branches of merger trees.

Name: tfamily mergerTreeEvolutionDump
Attached to: tfamily module:Merger_Trees_Dump_Evolution
File: tfamily merger_trees.dump_evolution.F90
4. Input Parameters

Default value: false
Description: Specifies whether or not to output the evolution of merger trees.

Name: tfamily mergerTreeEvolutionDumpFileName
Attached to: tfamily module:Merger_Trees_Dump_Evolution
File: tfamily merger_trees.dump_evolution.F90
Default value: mergerTreeEvolution.xml
Description: Specifies the file to which merger tree evolution should be dumped.

Name: tfamily mergerTreeExportFileName
Attached to: tfamily module:Merger_Trees_Write
File: tfamily merger_trees.write.F90
Default value: galacticusExportedTrees.hdf5
Description: The name of the file to which merger trees will be exported.

Name: tfamily mergerTreeExportOutputFormat
Attached to: tfamily module:Merger_Trees_Write
File: tfamily merger_trees.write.F90
Default value: galacticus
Description: The output format to use when exporting merger trees.

Name: tfamily mergerTreeHaloMass
Attached to: tfamily module:Merger_Tree_Smooth_Accretion
File: tfamily merger_trees.construct.smooth_accretion.F90
Default value: $10^{12}$
Description: The final mass of the merger tree base halo to consider when building a smoothly accreting merger tree, in units of $M_\odot$.

Name: tfamily mergerTreeHaloMassDeclineFactor
Attached to: tfamily module:Merger_Tree_Smooth_Accretion
File: tfamily merger_trees.construct.smooth_accretion.F90
Default value: 0.9
Description: The factor by which halo mass should decrease in each step back in time building a smoothly accreting merger tree, in units of $M_\odot$.

Name: tfamily mergerTreeHaloMassResolution
Attached to: tfamily module:Merger_Tree_Smooth_Accretion
File: tfamily merger_trees.construct.smooth_accretion.F90
Default value: $10^{12}$
Description: The final mass of the merger tree base halo to consider when building a smoothly accreting merger tree, in units of $M_\odot$.

Name: tfamily mergerTreeImportGalacticusMismatchIsFatal
Attached to: tfamily module:Merger_Tree_Read_Importers
File: tfamily merger_trees.construct.read.importer.F90
Default value: true
Description: Specifies whether mismatches in cosmological parameter values between GALACTICUS and the merger tree file should be considered fatal.
Name: tfamily mergerTreeImportGalacticusReweightTrees
Attached to: tfamily module:Merger_Tree_Read_Importers
File: tfamily merger_trees.construct.read.importer.F90
Default value: false
Description: Specifies whether merger tree weights should be recomputed from the halo mass function.

Name: tfamily mergerTreeImportSussingBadValue
Attached to: tfamily module:Merger_Tree_Read_Importers
File: tfamily merger_trees.construct.read.importer.F90
Default value: -0.5
Description: Use for bad value detection in “Sussing” merger trees. Values for scale radius and halo spin which exceed this threshold are assumed to be bad.

Name: tfamily mergerTreeImportSussingBadValueTest
Attached to: tfamily module:Merger_Tree_Read_Importers
File: tfamily merger_trees.construct.read.importer.F90
Default value: lessThan
Description: Use for bad value detection in “Sussing” merger trees. Values which exceed the threshold in the specified direction are assumed to be bad.

Name: tfamily mergerTreeImportSussingBinaryFormatOld
Attached to: tfamily module:Merger_Tree_Read_Importers
File: tfamily merger_trees.construct.read.importer.F90
Default value: true
Description: Specifies whether the old binary format is to be used (for reading only).

Name: tfamily mergerTreeImportSussingConvertToBinary
Attached to: tfamily module:Merger_Tree_Read_Importers
File: tfamily merger_trees.construct.read.importer.F90
Default value: true
Description: Specifies whether halo and tree files in the “Sussing” format should be converted to binary the first time they are read and stored to file. This allows rapid re-reading in future.

Name: tfamily mergerTreeImportSussingForestFile
Attached to: tfamily module:Merger_Tree_Read_Importers
File: tfamily merger_trees.construct.read.importer.F90
Default value: none
Description: Name of file containing data on number of halos in each forest.

Name: tfamily mergerTreeImportSussingForestFirst
Attached to: tfamily module:Merger_Tree_Read_Importers
File: tfamily merger_trees.construct.read.importer.F90
Default value: 1
Description: Index of first forest to include.

Name: tfamily mergerTreeImportSussingForestLast
Attached to: tfamily module:Merger_Tree_Read_Importers
File: tfamily merger_trees.construct.read.importer.F90
Default value: -1
4. Input Parameters

Description: Index of last forest to include.

Name: tfamily mergerTreeImportSussingForestReverseSnapshotOrder
Attached to: tfamily module:Merger_Tree_Read_Importers
File: tfamily merger_trees.construct.read.importer.F90
Default value: false
Description: If true, the order of forest snapshots will be reversed after being read. This may be necessary to cause them to match the order of snapshot files.

Name: tfamily mergerTreeImportSussingMassOption
Attached to: tfamily module:Merger_Tree_Read_Importers
File: tfamily merger_trees.construct.read.importer.F90
Default value: default
Description: Mass option for Sussing merger trees.

Name: tfamily mergerTreeImportSussingMismatchIsFatal
Attached to: tfamily module:Merger_Tree_Read_Importers
File: tfamily merger_trees.construct.read.importer.F90
Default value: true
Description: Specifies whether mismatches in cosmological parameter values between GALACTICUS and “Sussing Merger Trees” format [Srisawat et al., 2013] merger tree files should be considered fatal.

Name: tfamily mergerTreeImportSussingNonTreeNodeIsFatal
Attached to: tfamily module:Merger_Tree_Read_Importers
File: tfamily merger_trees.construct.read.importer.F90
Default value: true
Description: Specifies whether nodes in snapshot files but not in the merger tree file should be considered fatal when importing from the “Sussing Merger Trees” format [Srisawat et al., 2013].

Name: tfamily mergerTreeImportSussingSubvolumeBuffer
Attached to: tfamily module:Merger_Tree_Read_Importers
File: tfamily merger_trees.construct.read.importer.F90
Default value: 0.0
Description: Specifies the buffer region (in units of Mpc/h to follow the format convention) around subvolumes of a “Sussing Merger Trees” format [Srisawat et al., 2013] merger tree file which should be read in to ensure that no halos are missed from trees.

Name: tfamily mergerTreeImportSussingSubvolumeCount
Attached to: tfamily module:Merger_Tree_Read_Importers
File: tfamily merger_trees.construct.read.importer.F90
Default value: 1
Description: Specifies the number of subvolumes along each axis into which a “Sussing Merger Trees” format [Srisawat et al., 2013] merger tree files should be split for processing through GALACTICUS.

Name: tfamily mergerTreeImportSussingSubvolumeIndex
Attached to: tfamily module:Merger_Tree_Read_Importers
File: tfamily merger_trees.construct.read.importer.F90
Default value: [0,0,0]
Description: Specifies the index (in each dimension) of the subvolume of a “Sussing Merger Trees” format
[Srisawat et al., 2013] merger tree file to process. Indices range from 0 to [mergerTreeImportSussingSubvolumeCount]−1.

Name: tfamily mergerTreeImporterMethod
Attached to: tfamily module:Merger_Tree_Read_Importers
File: tfamily merger_trees.construct.read.importer.F90
Default value: galacticus
Description: The method to be used for mergerTreeImporter.

Name: tfamily mergerTreeOutput
Attached to: tfamily module:Galacticus_Output_Merger_Tree
File: tfamily galacticus.output.merger_tree.F90
Default value: true
Description: Specifies whether or not to output galaxies.

Name: tfamily mergerTreeOutputFilters
Attached to: tfamily module:Galacticus_Merger_Tree_Output_Filters
File: tfamily galacticus.output.merger_tree.filters.F90
Default value: none
Description: A list of filters that should be applied when deciding which galaxies to output.

Name: tfamily mergerTreeOutputReferences
Attached to: tfamily module:Galacticus_Output_Merger_Tree
File: tfamily galacticus.output.merger_tree.F90
Default value: false
Description: Specifies whether or not references to individual merger tree datasets should be output.

Name: tfamily mergerTreePruneBranches
Attached to: tfamily module:Merger_Trees_Prune_Branches
File: tfamily merger_trees.prune_branches.F90
Default value: false
Description: Specifies whether or not to prune merger trees prior to evolution.

Name: tfamily mergerTreePruneHierarchyAtDepth
Attached to: tfamily module:Merger_Trees_Prune_Hierarchy
File: tfamily merger_trees.prune_hierarchy.F90
Default value: 0
Description: The depth in the hierarchy at which to prune merger trees. (Zero indicates to not prune.)

Name: tfamily mergerTreePruneNonEssential
Attached to: tfamily module:Merger_Trees_Prune_Non_Essential
File: tfamily merger_trees.prune_non_essential.F90
Default value: false
Description: Specifies whether or not to prune non-essential merger trees branches prior to evolution.

Name: tfamily mergerTreePruningMassThreshold
Attached to: tfamily module:Merger_Trees_Prune_Branches
File: tfamily merger_trees.prune_branches.F90
Default value: 0
Description: Threshold mass below which merger tree branches should be pruned.
4. Input Parameters

Name: tfamily mergerTreePruningNonEssentialID
Attached to: tfamily module: Merger_Trees_Prune_Non_Essential
File: tfamily merger_trees.prune_non_essential.F90
Default value: none
Description: ID of the essential node to avoid pruning.

Name: tfamily mergerTreePruningNonEssentialTime
Attached to: tfamily module: Merger_Trees_Prune_Non_Essential
File: tfamily merger_trees.prune_non_essential.F90
Default value: none
Description: Time of the essential node to avoid pruning.

Name: tfamily mergerTreeReadAllowBranchJumps
Attached to: tfamily module: Merger_Tree_Read
File: tfamily merger_trees.construct.read.F90
Default value: true
Description: Specifies whether nodes are allowed to jump between branches.

Name: tfamily mergerTreeReadAllowSubhaloPromotions
Attached to: tfamily module: Merger_Tree_Read
File: tfamily merger_trees.construct.read.F90
Default value: true
Description: Specifies whether subhalos are permitted to be promoted to being isolated halos.

Name: tfamily mergerTreeReadBeginAt
Attached to: tfamily module: Merger_Tree_Read
File: tfamily merger_trees.construct.read.F90
Default value: -1
Description: Specifies the index of the tree to begin at. (Use -1 to always begin with the first tree.)

Name: tfamily mergerTreeReadConcentrationFallbackMethod
Attached to: tfamily module: Merger_Tree_Read
File: tfamily merger_trees.construct.read.F90
Default value: [darkMatterProfileConcentrationMethod]
Description: The method to be used for setting node scale radii when reading merger trees from file and the node mass falls below the reliability threshold.

Name: tfamily mergerTreeReadFileName
Attached to: tfamily module: Merger_Tree_Read
File: tfamily merger_trees.construct.read.F90
Default value: none
Description: The name of the file from which merger tree data should be read when using the
[mergerTreeConstructMethod]=read tree construction method.

Name: tfamily mergerTreeReadMissingHostsAreFatal
Attached to: tfamily module: Merger_Tree_Read
File: tfamily merger_trees.construct.read.F90
Default value: true
Description: Specifies whether nodes with missing host nodes should be considered to be fatal—see §6.2.1.

Name: tfamily mergerTreeReadOutputTimeSnapTolerance
Attached to: tfamily module: Merger_Tree_Read
File: tfamily merger_trees.construct.read.F90
Default value: 0
Description: The relative tolerance required to “snap” a node time to the closest output time.

Name: tfamily mergerTreeReadPresetMergerNodes
Attached to: tfamily module: Merger_Tree_Read
File: tfamily merger_trees.construct.read.F90
Default value: true
Description: Specifies whether the target nodes for mergers should be preset (i.e. determined from descendent nodes). If they are not, merging will be with each satellite’s host node.

Name: tfamily mergerTreeReadPresetMergerTimes
Attached to: tfamily module: Merger_Tree_Read
File: tfamily merger_trees.construct.read.F90
Default value: true
Description: Specifies whether merging times for subhalos should be preset when reading merger trees from a file.

Name: tfamily mergerTreeReadPresetOrbits
Attached to: tfamily module: Merger_Tree_Read
File: tfamily merger_trees.construct.read.F90
Default value: true
Description: Specifies whether node orbits should be preset when reading merger trees from a file.

Name: tfamily mergerTreeReadPresetOrbitsAssertAllSet
Attached to: tfamily module: Merger_Tree_Read
File: tfamily merger_trees.construct.read.F90
Default value: true
Description: Asserts that all virial orbits must be preset. If any can not be set, GALACTICUS will stop.

Name: tfamily mergerTreeReadPresetOrbitsBoundOnly
Attached to: tfamily module: Merger_Tree_Read
File: tfamily merger_trees.construct.read.F90
Default value: true
Description: Specifies whether only bound node orbits should be set.

Name: tfamily mergerTreeReadPresetOrbitsSetAll
Attached to: tfamily module: Merger_Tree_Read
File: tfamily merger_trees.construct.read.F90
Default value: true
Description: Forces all orbits to be set. If the computed orbit does not cross the virial radius, then select one at random instead.

Name: tfamily mergerTreeReadPresetParticleCounts
4. Input Parameters

**Attached to:** tfamily module:Merger_Tree_Read  
**File:** tfamily merger_trees.construct.read.F90  
**Default value:** false  
**Description:** Specifies whether node particle counts should be preset when reading merger trees from a file.

**Name:** tfamily mergerTreeReadPresetPositions  
**Attached to:** tfamily module:Merger_Tree_Read  
**File:** tfamily merger_trees.construct.read.F90  
**Default value:** true  
**Description:** Specifies whether node positions should be preset when reading merger trees from a file.

**Name:** tfamily mergerTreeReadPresetScaleRadii  
**Attached to:** tfamily module:Merger_Tree_Read  
**File:** tfamily merger_trees.construct.read.F90  
**Default value:** true  
**Description:** Specifies whether node scale radii should be preset when reading merger trees from a file.

**Name:** tfamily mergerTreeReadPresetScaleRadiiConcentrationMaximum  
**Attached to:** tfamily module:Merger_Tree_Read  
**File:** tfamily merger_trees.construct.read.F90  
**Default value:** 60  
**Description:** The largest concentration ($c = r_{vir}/r_s$) allowed when setting scale radii, $r_s$.

**Name:** tfamily mergerTreeReadPresetScaleRadiiConcentrationMinimum  
**Attached to:** tfamily module:Merger_Tree_Read  
**File:** tfamily merger_trees.construct.read.F90  
**Default value:** 3  
**Description:** The lowest concentration ($c = r_{vir}/r_s$) allowed when setting scale radii, $r_s$.

**Name:** tfamily mergerTreeReadPresetScaleRadiiFailureIsFatal  
**Attached to:** tfamily module:Merger_Tree_Read  
**File:** tfamily merger_trees.construct.read.F90  
**Default value:** true  
**Description:** Specifies whether failure to set a node scale radii should be regarded as a fatal error. (If not, a fallback method to set scale radius is used in such cases.)

**Name:** tfamily mergerTreeReadPresetScaleRadiiMinimumMass  
**Attached to:** tfamily module:Merger_Tree_Read  
**File:** tfamily merger_trees.construct.read.F90  
**Default value:** 0  
**Description:** The minimum halo mass for which scale radii should be preset (if [mergerTreeReadPresetScaleRadii]=true).

**Name:** tfamily mergerTreeReadPresetSpins  
**Attached to:** tfamily module:Merger_Tree_Read  
**File:** tfamily merger_trees.construct.read.F90  
**Default value:** true  
**Description:** Specifies whether node spins should be preset when reading merger trees from a file.
Name: tfamily mergerTreeReadPresetSpins3D  
Attached to: tfamily module:Merger_Tree_Read  
File: tfamily merger_trees.construct.read.F90  
Default value: true  
Description: Specifies whether node 3-D spin vectors should be preset when reading merger trees from a file.

Name: tfamily mergerTreeReadPresetSubhaloIndices  
Attached to: tfamily module:Merger_Tree_Read  
File: tfamily merger_trees.construct.read.F90  
Default value: true  
Description: Specifies whether subhalo indices should be preset when reading merger trees from a file.

Name: tfamily mergerTreeReadPresetSubhaloMasses  
Attached to: tfamily module:Merger_Tree_Read  
File: tfamily merger_trees.construct.read.F90  
Default value: true  
Description: Specifies whether subhalo mass should be preset when reading merger trees from a file.

Name: tfamily mergerTreeReadPresetUnphysicalSpins  
Attached to: tfamily module:Merger_Tree_Read  
File: tfamily merger_trees.construct.read.F90  
Default value: false  
Description: When reading merger trees from file and presetting halo spins, detect unphysical (<=0) spins and preset them using the selected halo spin method.

Name: tfamily mergerTreeReadPresetVelocityDispersions  
Attached to: tfamily module:Merger_Tree_Read  
File: tfamily merger_trees.construct.read.F90  
Default value: false  
Description: Specifies whether node velocity dispersions should be preset when reading merger trees from a file.

Name: tfamily mergerTreeReadPresetVelocityMaxima  
Attached to: tfamily module:Merger_Tree_Read  
File: tfamily merger_trees.construct.read.F90  
Default value: false  
Description: Specifies whether node rotation curve velocity maxima should be preset when reading merger trees from a file.

Name: tfamily mergerTreeReadSubhaloAngularMomentaMethod  
Attached to: tfamily module:Merger_Tree_Read  
File: tfamily merger_trees.construct.read.F90  
Default value: true  
Description: Specifies whether subhalo mass should be preset when reading merger trees from a file.

Name: tfamily mergerTreeReadSubresolutionMergingMethod  
Attached to: tfamily module:Merger_Tree_Read  
File: tfamily merger_trees.construct.read.F90
4. Input Parameters

Default value: null
Description: The name of a satellite merging timescale method to be used for computing the extra time until merging for subhalos.

Name: tfamily mergerTreeReadTreeNodeToRootNodeIndex
Attached to: tfamily module: Merger_Tree_Read
File: tfamily merger_trees.construct.read.F90
Default value: false
Description: Specifies whether tree indices should always be set to the index of their root node.

Name: tfamily mergerTreeRegridCount
Attached to: tfamily module: Merger_Trees_Regrid_Times
File: tfamily merger_trees.regrid_times.F90
Default value: false
Description: Number of points in time to use when regridding merger trees.

Name: tfamily mergerTreeRegridDumpTrees
Attached to: tfamily module: Merger_Trees_Regrid_Times
File: tfamily merger_trees.regrid_times.F90
Default value: false
Description: Specifies whether or not to dump merger trees as they are regridded.

Name: tfamily mergerTreeRegridEndExpansionFactor
Attached to: tfamily module: Merger_Trees_Regrid_Times
File: tfamily merger_trees.regrid_times.F90
Default value: false
Description: Ending expansion factor to use when regridding merger trees.

Name: tfamily mergerTreeRegridRedshifts
Attached to: tfamily module: Merger_Trees_Regrid_Times
File: tfamily merger_trees.regrid_times.F90
Default value: none
Description: The redshifts at which merger trees are to be regridded when the `mergerTreeRegridSpacing` option is selected.

Name: tfamily mergerTreeRegridSpacing
Attached to: tfamily module: Merger_Trees_Regrid_Times
File: tfamily merger_trees.regrid_times.F90
Default value: false
Description: Type of spacing to use in merger tree regridding (linear or logarithmic).

Name: tfamily mergerTreeRegridStartExpansionFactor
Attached to: tfamily module: Merger_Trees_Regrid_Times
File: tfamily merger_trees.regrid_times.F90
Default value: false
Description: Starting expansion factor to use when regridding merger trees.

Name: tfamily mergerTreeRegridTimes
Attached to: tfamily module: Merger_Trees_Regrid_Times
File: tfamily merger_trees.regrid_times.F90
Default value: false
Description: Specifies whether or not to regrid merger tree times.

Name: tfamily mergerTreeStateStoreFile
Attached to: tfamily module:Merger_Trees_State_Store
File: tfamily merger_trees.construct.state_restore.F90
Default value: storedTree.dat
Description: The name of a file from which to restore a merger tree state.

Name: tfamily mergerTreeStructureDump
Attached to: tfamily module:Merger_Tree_Dump_Structure
File: tfamily merger_trees.dump_structure.F90
Default value: false
Description: Specifies whether or not to output the structure of merger trees prior to evolution.

Name: tfamily mergerTreeStructureDumpDirectory
Attached to: tfamily module:Merger_Tree_Dump_Structure
File: tfamily merger_trees.dump_structure.F90
Default value: .
Description: Specifies the directory to which merger tree structure should be dumped.

Name: tfamily mergerTreeStructureDumpMassMaximum
Attached to: tfamily module:Merger_Tree_Dump_Structure
File: tfamily merger_trees.dump_structure.F90
Default value: $10^{30} M_\odot$
Description: Specifies the minimum root mass for which merger tree structure should be dumped.

Name: tfamily mergerTreeStructureDumpMassMinimum
Attached to: tfamily module:Merger_Tree_Dump_Structure
File: tfamily merger_trees.dump_structure.F90
Default value: $0 M_\odot$
Description: Specifies the minimum root mass for which merger tree structure should be dumped.

Name: tfamily mergerTreeStructureOutput
Attached to: tfamily module:Merger_Tree_Output_Structure
File: tfamily merger_trees.output_structure.F90
Default value: false
Description: Specifies whether or not to output the structure of merger trees prior to evolution.

Name: tfamily mergerTreeStructureOutputDarkMatterProfileScale
Attached to: tfamily module:Node_Component_Dark_Matter_Profile_Scale
File: tfamily objects.nodes.components.dark_matter_profile.scale.F90
Default value: false
Description: Determines whether or not dark matter halo scale radius is included in outputs of merger trees.

Name: tfamily mergerTreeStructureOutputDarkMatterProfileShape
Attached to: tfamily module:Node_Component_Dark_Matter_Profile_Scale_Shape
4. Input Parameters

File: tfamily objects.nodes.components.dark_matter_profile.scale_shape.F90
Default value: false
Description: Determines whether or not dark matter halo shape parameter is included in outputs of merger trees.

Name: tfamily mergerTreeStructureOutputVirialQuantities
Attached to: tfamily module:Merger_Tree_Output_Structure
File: tfamily merger_trees.output_structure.F90
Default value: false
Description: Specifies whether or not to output virial quantities (radius and velocity) when outputting the structure of merger trees prior to evolution.

Name: tfamily mergerTreesBuildMassResolutionMethod
Attached to: tfamily module:Merger_Trees_Build_Mass_Resolution
File: tfamily merger_trees.construct.build.mass_resolution.F90
Default value: fixed
Description: The name of the method to be used for computing the mass resolution to use when building merger trees.

Name: tfamily mergerTreesDumpStructure
Attached to: tfamily module:Merger_Trees_Evolve
File: tfamily merger_trees.evolve.F90
Default value: false
Description: Specifies whether merger tree structure should be dumped to a DOT file.

Name: tfamily mergerTreesWrite
Attached to: tfamily module:Merger_Trees_Write
File: tfamily merger_trees.write.F90
Default value: false
Description: Specifies whether or not trees should be written to file.

Name: tfamily mergingTimescaleMultiplier
Attached to: tfamily module:Dynamical_Friction_Timescale_Utilities
File: tfamily satellites.merging.timescale.utilities.F90
Default value: 0.75
Description: A multiplier for the merging timescale in dynamical friction timescale calculations.

Name: tfamily metaCollectTimingData
Attached to: tfamily module:Galacticus_Meta_Tree_Timing
File: tfamily galacticus.meta.tree_timing.F90
Default value: false
Description: Specifies whether or not collect and output data on the time spent processing trees.

Name: tfamily metaProfileTimeStepMaximum
Attached to: tfamily module:Galacticus_Meta_Evolver_Profiler
File: tfamily galacticus.meta.evolver_profiler.F90
Default value: 10 Gyr
Description: The largest timestep to use in profiling ODE solver steps.
Name: tfamily metaProfileTimeStepMinimum
Attached to: tfamily module:Galacticus_Meta_Evolver_Profiler
File: tfamily galacticus.meta.evolver_profiler.F90
Default value: $10^{-6}$ Gyr
Description: The smallest timestep to use in profiling ODE solver steps.

Name: tfamily metaProfileTimeStepPointsPerDecade
Attached to: tfamily module:Galacticus_Meta_Evolver_Profiler
File: tfamily galacticus.meta.evolver_profiler.F90
Default value: 3
Description: The number of bins per decade of timestep to use when profiling ODE solver steps.

Name: tfamily minorMergerGasMovesTo
Attached to: tfamily module:Satellite_Merging_Mass_Movements_Simple
File: tfamily satellites.merging.mass_movements.simple.F90
Default value: spheroid
Description: The component to which satellite galaxy gas moves to as a result of a minor merger.

Name: tfamily modifiedPressSchechterFirstOrderAccuracy
Attached to: tfamily module:Modified_Press_Schechter_Branching
File: tfamily merger_trees.branching_probability.modified_Press_Schechter.F90
Default value: 0.1
Description: Limits the step in $\delta_{\text{crit}}$ when constructing merger trees using the Parkinson et al. [2008] algorithm, so that it never exceeds $\text{modifiedPressSchechterFirstOrderAccuracy} \sqrt{2[\sigma^2(M_2/2) - \sigma^2(M_2)]}$.

Name: tfamily modifiedPressSchechterG0
Attached to: tfamily module:Merger_Tree_Branching_Modifiers_Parkinson
File: tfamily merger_trees.branching_probability.modifier.Parkinson.F90
Default value: 0.57
Description: The parameter $G_0$ appearing in the modified merger rate expression of Parkinson et al. [2008].

Name: tfamily modifiedPressSchechterGamma1
Attached to: tfamily module:Merger_Tree_Branching_Modifiers_Parkinson
File: tfamily merger_trees.branching_probability.modifier.Parkinson.F90
Default value: 0.38
Description: The parameter $\gamma_1$ appearing in the modified merger rate expression of Parkinson et al. [2008].

Name: tfamily modifiedPressSchechterGamma2
Attached to: tfamily module:Merger_Tree_Branching_Modifiers_Parkinson
File: tfamily merger_trees.branching_probability.modifier.Parkinson.F90
Default value: -0.01
Description: The parameter $\gamma_2$ appearing in the modified merger rate expression of Parkinson et al. [2008].

Name: tfamily molecularComplexClumpingFactorKMT09
Attached to: tfamily module:Star_Formation_Rate_Surface_Density_Disks_KMT09
File: tfamily star_formation.rate_surface_density.disks.KMT09.F90
4. Input Parameters

**Default value:** 5  
**Description:** The density enhancement (relative to mean disk density) for molecular complexes in the “Krumholz-McKee-Tumlinson” star formation timescale calculation.

**Name:** tfamily molecularFractionFastKMT09  
**Attached to:** tfamily module:Star_Formation_Rate_Surface_Density_Disks_KMT09  
**File:** tfamily star_formation.rate.surface_density.disks.KMT09.F90  
**Default value:** true  
**Description:** Selects whether the fast (but less accurate) fitting formula for molecular hydrogen should be used in the “Krumholz-McKee-Tumlinson” star formation timescale calculation.

**Name:** tfamily nfw1996ConcentrationC  
**Attached to:** tfamily module:Dark_Matter_Profiles_Concentration  
**File:** tfamily dark_matter_profiles.structure.concentration.F90  
**Default value:** 2000 Navarro et al. [1996]  
**Description:** The parameter $f$ appearing in the halo concentration algorithm of Navarro et al. [1996].

**Name:** tfamily nfw1996ConcentrationF  
**Attached to:** tfamily module:Dark_Matter_Profiles_Concentration  
**File:** tfamily dark_matter_profiles.structure.concentration.F90  
**Default value:** 0.01 Navarro et al. [1996]  
**Description:** The parameter $C$ appearing in the halo concentration algorithm of Navarro et al. [1996].

**Name:** tfamily nodeFormationMassFraction  
**Attached to:** tfamily module:Node_Component_Merging_Statistics_Standard  
**File:** tfamily objects.nodes.components.merging_statistics.standard.F90  
**Default value:** 0.5  
**Description:** The mass fraction in the main branch progenitor used to define the formation time of each halo.

**Name:** tfamily nodeMajorMergerFraction  
**Attached to:** tfamily module:Node_Component_Merging_Statistics_Recent  
**File:** tfamily objects.nodes.components.merging_statistics.recent.F90  
**Default value:** 0.25  
**Description:** The mass ratio ($M_2/M_1$ where $M_2 < M_1$) of merging halos above which the merger should be considered to be “major”.

**Name:** tfamily nodeMergersMethod  
**Attached to:** tfamily module:Merger_Trees_Evolve_Node  
**File:** tfamily merger_trees.evolve.node.F90  
**Default value:** singleLevelHierarchy  
**Description:** Selects the method to be used for handling node merger events.

**Name:** tfamily nodePromotionIndexShift  
**Attached to:** tfamily module:Node_Promotion_Index_Shifts  
**File:** tfamily events.node_promotion.index.shift.F90  
**Default value:** false  
**Description:** Specifies whether or not the index of a node should be shifted to its parent node prior to promotion.
Name: tfamily nodeRecentMajorMergerFromInfall  
Attached to: tfamily module:Node_Component_Merging_Statistics_Recent  
File: tfamily objects.nodes.components.merging_statistics.recent.F90  
Default value: false  
Description: Specifies whether “recent” for satellite galaxies is measured from the current time, or from the time at which they were last isolated.

Name: tfamily nodeRecentMajorMergerInterval  
Attached to: tfamily module:Node_Component_Merging_Statistics_Recent  
File: tfamily objects.nodes.components.merging_statistics.recent.F90  
Default value: 2.0  
Description: The time interval used to define “recent” mergers in the recent merging statistics component. This parameter is in units of Gyr if [nodeRecentMajorMergerIntervalType]=absolute, or in units of the halo dynamical time if [nodeRecentMajorMergerIntervalType]=dynamical.

Name: tfamily nodeRecentMajorMergerIntervalType  
Attached to: tfamily module:Node_Component_Merging_Statistics_Recent  
File: tfamily objects.nodes.components.merging_statistics.recent.F90  
Default value: dynamical  
Description: Specifies the units for the [nodeRecentMajorMergerInterval] parameter. If set to absolute then [nodeRecentMajorMergerInterval] is given in Gyr, while if set to dynamical [nodeRecentMajorMergerInterval] is given in units of the halo dynamical time.

Name: tfamily noninstantHistoryTimesCount  
Attached to: tfamily module:Stellar_Population_Properties_Noninstantaneous  
File: tfamily stellar_populations.properties.noninstantaneous.F90  
Default value: 10  
Description: The number of times at which a galaxy’s stellar properties history is stored.

Name: tfamily odeAlgorithm  
Attached to: tfamily module:Merger_Trees_Evolve_Node  
File: tfamily merger_trees.evolve.node.F90  
Default value: Runge-Kutta-Cash-Karp  
Description: The algorithm to use in the ODE solver.

Name: tfamily odeToleranceAbsolute  
Attached to: tfamily module:Merger_Trees_Evolve_Node  
File: tfamily merger_trees.evolve.node.F90  
Default value: 0.01  
Description: The absolute tolerance used in solving differential equations for node evolution.

Name: tfamily odeToleranceRelative  
Attached to: tfamily module:Merger_Trees_Evolve_Node  
File: tfamily merger_trees.evolve.node.F90  
Default value: 0.01  
Description: The relative tolerance used in solving differential equations for node evolution.

Name: tfamily optimalSamplingDensityOutputFileName
4. Input Parameters

**Attached to:** tfamily program:Optimal_Sampling_SMF  
**File:** tfamily optimal_sampling.stellar_mass_function.F90  
**Default value:** none  
**Description:** The name of a file to which the optimal tree mass sampling density function will be written.

**Name:** tfamily optimalSamplingLogarithmicBinWidth  
**Attached to:** tfamily program:Optimal_Sampling_SMF  
**File:** tfamily optimal_sampling.stellar_mass_function.F90  
**Default value:** none  
**Description:** The logarithmic width of bins in the stellar mass function to use when computing the optimal tree mass sampling density function.

**Name:** tfamily outputColdModeInfallRate  
**Attached to:** tfamily module:Cooling_Cold_Mode_Infall_Rates  
**File:** tfamily cooling.cold_mode.infall_rate.F90  
**Default value:** false  
**Description:** Determines whether or not cold mode infall rates are output.

**Name:** tfamily outputDensityContrastData  
**Attached to:** tfamily module:Galacticus_Output_Trees_Density_Contrasts  
**File:** tfamily galacticus.output.merger_tree.density_contrasts.F90  
**Default value:** false  
**Description:** Specifies whether or not density contrast data (i.e. radius and mass at a given density contrast) should be included in the output.

**Name:** tfamily outputDensityContrastDataDarkOnly  
**Attached to:** tfamily module:Galacticus_Output_Trees_Density_Contrasts  
**File:** tfamily galacticus.output.merger_tree.density_contrasts.F90  
**Default value:** false  
**Description:** Specifies whether or not density contrast data should be computed using the dark matter component alone.

**Name:** tfamily outputDensityContrastHaloLoaded  
**Attached to:** tfamily module:Galacticus_Output_Trees_Density_Contrasts  
**File:** tfamily galacticus.output.merger_tree.density_contrasts.F90  
**Default value:** true  
**Description:** Specifies whether baryonic loading of the halo should be accounted for when outputting density contrast data.

**Name:** tfamily outputDensityContrastValues  
**Attached to:** tfamily module:Galacticus_Output_Trees_Density_Contrasts  
**File:** tfamily galacticus.output.merger_tree.density_contrasts.F90  
**Default value:** none  
**Description:** A list of density contrasts at which to output data.

**Name:** tfamily outputDescendentIndices  
**Attached to:** tfamily module:Galacticus_Output_Trees_Descendents  
**File:** tfamily galacticus.output.merger_tree.descendents.F90  
**Default value:** false
**Description:** Specifies whether or not descendent indices (i.e. index of the node at the next output) should be included in the output.

**Name:** tfamily outputFinalDescendentIndices  
**Attached to:** tfamily module:Galacticus_Output_Trees_Final_Descendents  
**File:** tfamily galacticus.output.merger_tree.final_descendent.F90  
**Default value:** false  
**Description:** Specifies whether or not final descendent indices (i.e. index of the node at the base of the tree) should be included in the output.

**Name:** tfamily outputHalfLightData  
**Attached to:** tfamily module:Galacticus_Output_Tree_Half_Light_Properties  
**File:** tfamily galacticus.output.merger_tree.half_light_properties.F90  
**Default value:** false  
**Description:** Specifies whether or not half-light radius data (i.e. radius and mass) should be included in the output.

**Name:** tfamily outputHalfMassData  
**Attached to:** tfamily module:Galacticus_Output_Tree_Half_Mass_Radii  
**File:** tfamily galacticus.output.merger_tree.half_mass_radius.F90  
**Default value:** false  
**Description:** Specifies whether or not half-mass radii should be included in the output.

**Name:** tfamily outputHaloAccretionMode  
**Attached to:** tfamily module:Accretion_Halos  
**File:** tfamily accretion.halo.F90  
**Default value:** false  
**Description:** Determines whether or not halo accretion rates are output.

**Name:** tfamily outputHaloModelData  
**Attached to:** tfamily module:Galacticus_Output_Halo_Models  
**File:** tfamily galacticus.output.merger_tree.halo_model.F90  
**Default value:** false  
**Description:** Specifies whether or not halo model data (bias, power spectra, etc.) should be included in the output.

**Name:** tfamily outputHotHaloCoolingRadii  
**Attached to:** tfamily module:Cooling_Radii  
**File:** tfamily cooling.cooling_radius.F90  
**Default value:** false  
**Description:** Determines whether or not cooling radii are output.

**Name:** tfamily outputHotHaloCoolingRates  
**Attached to:** tfamily module:Cooling_Rates  
**File:** tfamily cooling.cooling_rate.F90  
**Default value:** false  
**Description:** Determines whether or not cooling rates and radii are output.

**Name:** tfamily outputMainBranchStatus
4. Input Parameters

**Attached to:** tfamily module:Galacticus_Output_Trees_Main_Branch
**File:** tfamily galacticus.output.merger_tree.main_branch.F90
**Default value:** false
**Description:** Controls whether or not the main branch status of each node will be output.

**Name:** tfamily outputMassProfileData
**Attached to:** tfamily module:Galacticus_Output_Tree_Mass_Profiles
**File:** tfamily galacticus.output.merger_tree.mass_profile.F90
**Default value:** false
**Description:** Specifies whether or not half-light radius data (i.e. radius and mass) should be included in the output.

**Name:** tfamily outputMassProfileRadii
**Attached to:** tfamily module:Galacticus_Output_Tree_Mass_Profiles
**File:** tfamily galacticus.output.merger_tree.mass_profile.F90
**Default value:** none
**Description:** A list of radii at which to output the mass profile.

**Name:** tfamily outputMostMassiveProgenitor
**Attached to:** tfamily module:Galacticus_Output_Most_Massive_Progenitors
**File:** tfamily galacticus.output.merger_tree.most_massive_progenitor.F90
**Default value:** false
**Description:** Specifies whether or not most massive progenitor status should be output.

**Name:** tfamily outputNodeRedshifts
**Attached to:** tfamily module:Galacticus_Output_Trees_Redshifts
**File:** tfamily galacticus.output.merger_tree.redshifts.F90
**Default value:** false
**Description:** Controls whether or not the redshifts corresponding to node times should be output.

**Name:** tfamily outputRedshifts
**Attached to:** tfamily module:Halo_Mass_Function_Tasks
**File:** tfamily halo_mass_functions.tasks.F90
**Default value:** 0
**Description:** A list of redshifts at which halo mass functions should be computed.

**Name:** tfamily outputRotationCurveData
**Attached to:** tfamily module:Galacticus_Output_Trees_Rotation_Curve
**File:** tfamily galacticus.output.merger_tree.rotation_curve.F90
**Default value:** false
**Description:** Specifies whether or not rotation curve data should be included in the output file.

**Name:** tfamily outputRotationCurveRadii
**Attached to:** tfamily module:Galacticus_Output_Trees_Rotation_Curve
**File:** tfamily galacticus.output.merger_tree.rotation_curve.F90
**Default value:** none
**Description:** Specifies the radii at which the rotation curve will be output.

**Name:** tfamily outputSatelliteApocenterData
Attached to: tfamily module:Galacticus_Output_Trees_Satellite_Extremum
File: tfamily galacticus.output.merger_tree.satellite_extrema.F90
Default value: false
Description: Specifies whether or not satellite orbital apocenter data (radius, velocity) should be included in the output.

Name: tfamily outputSatelliteHostData
Attached to: tfamily module:Galacticus_Output_Trees_Satellite_Host
File: tfamily galacticus.output.merger_tree.satellite_host.F90
Default value: false
Description: Specifies whether or not satellite host data (node mass) should be included in the output.

Name: tfamily outputSatellitePericenterData
Attached to: tfamily module:Galacticus_Output_Trees_Satellite_Extremum
File: tfamily galacticus.output.merger_tree.satellite_extrema.F90
Default value: false
Description: Specifies whether or not satellite orbital pericenter data (radius, velocity) should be included in the output.

Name: tfamily outputSatelliteStatus
Attached to: tfamily module:Galacticus_Output_Trees_Satellite_Extremum
File: tfamily galacticus.output.merger_tree.satellite_status.F90
Default value: false
Description: Specifies whether or not satellite status (i.e., whether the satellite is orphaned or not) should be included in the output.

Name: tfamily outputTreeIndices
Attached to: tfamily module:Galacticus_Output_Trees_Tree_Indices
File: tfamily galacticus.output.merger_tree.tree_indices.F90
Default value: false
Description: Specifies whether or not descendent indices (i.e., index of the node at the next output) should be included in the output.

Name: tfamily outputVelocityDispersionData
Attached to: tfamily module:Galacticus_Output_Trees_Velocity_Dispersion
File: tfamily galacticus.output.merger_tree.velocity_dispersion.F90
Default value: false
Description: Specifies whether or not velocity dispersion data should be included in the output file.

Name: tfamily outputVelocityDispersionRadii
Attached to: tfamily module:Galacticus_Output_Trees_Velocity_Dispersion
File: tfamily galacticus.output.merger_tree.velocity_dispersion.F90
Default value: none
Description: Specifies the radii at which the velocity dispersion will be output.

Name: tfamily outputVirialData
Attached to: tfamily module:Galacticus_Output_Trees_Virial
File: tfamily galacticus.output.merger_tree.virial.F90
Default value: false
4. Input Parameters

**Description:** Specifies whether or not virial data (radius, velocity) should be included in the output.

**Name:** tfamily powerSpectraPointsPerDecade  
**Attached to:** tfamily module:Power_Spectrum_Tasks  
**File:** tfamily power_spectra.tasks.F90  
**Default value:** 10  
**Description:** The number of points per decade of wavenumber at which to tabulate power spectra.

**Name:** tfamily powerSpectraWavenumberMaximum  
**Attached to:** tfamily module:Power_Spectrum_Tasks  
**File:** tfamily power_spectra.tasks.F90  
**Default value:** $10^3$ Mpc$^{-1}$  
**Description:** The maximum wavenumber at which to tabulate power spectra.

**Name:** tfamily powerSpectraWavenumberMinimum  
**Attached to:** tfamily module:Power_Spectrum_Tasks  
**File:** tfamily power_spectra.tasks.F90  
**Default value:** $10^{-3}$ Mpc$^{-1}$  
**Description:** The minimum wavenumber at which to tabulate power spectra.

**Name:** tfamily powerSpectrumIndex  
**Attached to:** tfamily module:Merger_Trees_Simple  
**File:** tfamily merger_trees.file_maker.simple.F90  
**Default value:** none  
**Description:** The index of the power-law primordial power spectrum.

**Name:** tfamily powerSpectrumMethod  
**Attached to:** tfamily module:Primordial_Power_Spectra  
**File:** tfamily structure_formation.power_spectrum.primordial.F90  
**Default value:** powerLaw  
**Description:** The name of the method to be used for computing the primordial power spectrum.

**Name:** tfamily powerSpectrumNonlinearMethod  
**Attached to:** tfamily module:Power_Spectra_Nonlinear  
**File:** tfamily structure_formation.power_spectrum.nonlinear.F90  
**Default value:** CosmicEmu  
**Description:** The name of the method to be used for computing the nonlinear power spectrum.

**Name:** tfamily powerSpectrumReferenceWavenumber  
**Attached to:** tfamily module:Primordial_Power_Spectrum_Power_Law  
**File:** tfamily structure_formation.power_spectrum.primordial.power_law.F90  
**Default value:** 1  
**Description:** When a running power spectrum index is used, this is the wavenumber at which the index is equal to [powerSpectrumIndex].

**Name:** tfamily powerSpectrumRunning  
**Attached to:** tfamily module:Primordial_Power_Spectrum_Power_Law  
**File:** tfamily structure_formation.power_spectrum.primordial.power_law.F90  
**Default value:** 0
**Description:** The running, $dn_s/d\ln k$, of the power spectrum index.

**Name:** tfamily powerSpectrumWindowFunctionMethod  
**Attached to:** tfamily module:Power_Spectrum_Window_Functions  
**File:** tfamily structure_formation.power_spectrum.variance.window_function.F90  
**Default value:** topHat  
**Description:** The name of the method to be used for computing window functions to estimate variance from the power spectrum.

**Name:** tfamily powerSpectrumWindowFunctionSharpKSpaceNormalization  
**Attached to:** tfamily module:Power_Spectrum_Window_Functions_TH_KSS_Hybrid  
**File:** tfamily structure_formation.power_spectrum.variance.window_function.top_hat_kspace_sharp_.hybrid.F90  
**Default value:** natural  
**Description:** The parameter $a$ in the relation $k_s = a/r_s$, where $k_s$ is the cut-off wavenumber for the sharp $k$-space window function and $r_s$ is the radius of a sphere (in real-space) enclosing the requested smoothing mass. Alternatively, a value of `natural` will be supplied in which case the normalization is chosen such that, in real-space, $W(r = 0) = 1$. This results in a contained mass of $M = 6\pi^2\bar{\rho}k_s^{-3}$.

**Name:** tfamily powerSpectrumWindowFunctionSharpKSpaceTopHatRadiusRatio  
**Attached to:** tfamily module:Power_Spectrum_Window_Functions_TH_KSS_Hybrid  
**File:** tfamily structure_formation.power_spectrum.variance.window_function.top_hat_kspace_sharp_.hybrid.F90  
**Default value:** 1  
**Description:** The parameter $\beta$ in the relation $r_s = \beta r_{th}$ between $k$-space sharp and top-hat window function radii in the hybrid window function used for computing the variance in the power spectrum.

**Name:** tfamily prada2011ConcentrationA  
**Attached to:** tfamily module:Dark_Matter_Profiles_Concentration  
**File:** tfamily dark_matter_profiles.structure.concentration.F90  
**Default value:** 2.881 Prada et al. [2011]  
**Description:** The parameter $A$ appearing in the halo concentration algorithm of Prada et al. [2011].

**Name:** tfamily prada2011ConcentrationAlpha  
**Attached to:** tfamily module:Dark_Matter_Profiles_Concentration  
**File:** tfamily dark_matter_profiles.structure.concentration.F90  
**Default value:** 6.948 Prada et al. [2011]  
**Description:** The parameter $\alpha$ appearing in the halo concentration algorithm of Prada et al. [2011].

**Name:** tfamily prada2011ConcentrationBeta  
**Attached to:** tfamily module:Dark_Matter_Profiles_Concentration  
**File:** tfamily dark_matter_profiles.structure.concentration.F90  
**Default value:** 7.386 Prada et al. [2011]  
**Description:** The parameter $b$ appearing in the halo concentration algorithm of Prada et al. [2011].
4. Input Parameters

**Description:** The parameter $\beta$ appearing in the halo concentration algorithm of Prada et al. [2011].

**Name:** tfamily prada2011ConcentrationC
**Attached to:** tfamily module:Dark_Matter_Profiles_Concentration
**File:** tfamily dark_matter_profiles.structure.concentration.F90
**Default value:** 1.022 Prada et al. [2011]
**Description:** The parameter $c$ appearing in the halo concentration algorithm of Prada et al. [2011].

**Name:** tfamily prada2011ConcentrationC0
**Attached to:** tfamily module:Dark_Matter_Profiles_Concentration
**File:** tfamily dark_matter_profiles.structure.concentration.F90
**Default value:** 3.681 Prada et al. [2011]
**Description:** The parameter $c_0$ appearing in the halo concentration algorithm of Prada et al. [2011].

**Name:** tfamily prada2011ConcentrationC1
**Attached to:** tfamily module:Dark_Matter_Profiles_Concentration
**File:** tfamily dark_matter_profiles.structure.concentration.F90
**Default value:** 5.033 Prada et al. [2011]
**Description:** The parameter $c_1$ appearing in the halo concentration algorithm of Prada et al. [2011].

**Name:** tfamily prada2011ConcentrationD
**Attached to:** tfamily module:Dark_Matter_Profiles_Concentration
**File:** tfamily dark_matter_profiles.structure.concentration.F90
**Default value:** 0.060 Prada et al. [2011]
**Description:** The parameter $d$ appearing in the halo concentration algorithm of Prada et al. [2011].

**Name:** tfamily prada2011ConcentrationInverseSigma0
**Attached to:** tfamily module:Dark_Matter_Profiles_Concentration
**File:** tfamily dark_matter_profiles.structure.concentration.F90
**Default value:** 1.047 Prada et al. [2011]
**Description:** The parameter $\sigma^{-1}_0$ appearing in the halo concentration algorithm of Prada et al. [2011].

**Name:** tfamily prada2011ConcentrationInverseSigma1
**Attached to:** tfamily module:Dark_Matter_Profiles_Concentration
**File:** tfamily dark_matter_profiles.structure.concentration.F90
**Default value:** 1.646 Prada et al. [2011]
**Description:** The parameter $\sigma^{-1}_1$ appearing in the halo concentration algorithm of Prada et al. [2011].

**Name:** tfamily prada2011ConcentrationX0
**Attached to:** tfamily module:Dark_Matter_Profiles_Concentration
**File:** tfamily dark_matter_profiles.structure.concentration.F90
**Default value:** 0.424 Prada et al. [2011]
**Description:** The parameter $x_0$ appearing in the halo concentration algorithm of Prada et al. [2011].

**Name:** tfamily prada2011ConcentrationX1
**Attached to:** tfamily module:Dark_Matter_Profiles_Concentration
**File:** tfamily dark_matter_profiles.structure.concentration.F90
**Default value:** 0.526 Prada et al. [2011]
**Description:** The parameter $x_1$ appearing in the halo concentration algorithm of Prada et al. [2011].
Name: tfamily pressureCharacteristicBlitzRosolowsky
Attached to: tfamily module:Star_Formation_Rate_Surface_Density_Disks_BR
File: tfamily star_formation.rate_surface_density.disks.Blitz-Rosolowsky.F90
Default value: 4.54 [Blitz and Rosolowsky, 2006]
Description: The characteristic pressure (given as \( P_0/k_B \) in units of K cm\(^{-3}\)) in the scaling relation of molecular hydrogen fraction with disk pressure in the “Blitz-Rosolowsky” star formation timescale calculation.

Name: tfamily pressureExponentBlitzRosolowsky
Attached to: tfamily module:Star_Formation_Rate_Surface_Density_Disks_BR
File: tfamily star_formation.rate_surface_density.disks.Blitz-Rosolowsky.F90
Default value: 0.92 [Blitz and Rosolowsky, 2006]
Description: The exponent in the scaling relation of molecular hydrogen fraction with disk pressure in the “Blitz-Rosolowsky” star formation timescale calculation.

Name: tfamily profileOdeEvolver
Attached to: tfamily module:Merger_Trees_Evolve_Node
File: tfamily merger_trees.evolve.node.F90
Default value: false
Description: Specifies whether or not to profile the ODE evolver.

Name: tfamily radiationIGBFileName
Attached to: tfamily module:Radiation_IGB_File
File: tfamily radiation.intergalactic_background.file.F90
Default value: none
Description: The name of the file containing a tabulation of the radiation field.

Name: tfamily radiationIntergalacticBackgroundMethod
Attached to: tfamily module:Radiation_Intergalactic_Background
File: tfamily radiation.intergalactic_background.F90
Default value: file
Description: The name of the method to be used for calculations of the intergalactic background radiation field.

Name: tfamily ramPressureStrippingFormFactor
Attached to: tfamily module:Hot_Halo_Ram_Pressure_Stripping_Font2008
Default value: 2
Description: The form factor appearing in the gravitational binding force (per unit area) in the ram pressure stripping model of Font et al. (2008; their eqn. 4).

Name: tfamily ramPressureStrippingMassLossRateDiskSimpleFractionalRateMaximum
Attached to: tfamily module:Ram_Pressure_Stripping_Mass_Loss_Rate_Disks_Simple
File: tfamily ram_pressure_stripping.mass_loss_rate.disks.simple.F90
Default value: 10
Description: The maximum fractional mass loss rate per dynamical time in the simple model of mass loss from disks due to ram pressure stripping.
4. Input Parameters

Name: tfamily ramPressureStrippingMassLossRateDisksMethod
Attached to: tfamily module:Ram_Pressure_Stripping_Mass_Loss_Rate_Disks
File: tfamily ram_pressure_stripping.mass_loss_rate.disks.F90
Default value: null
Description: The name of the method to be used when computing mass loss rates from disks due to ram pressure stripping.

Name: tfamily ramPressureStrippingMassLossRateSpheroidSimpleFractionalRateMaximum
Attached to: tfamily module:Ram_Pressure_Stripping_Mass_Loss_Rate_Spheroids_Simple
File: tfamily ram_pressure_stripping.mass_loss_rate.spheroids.simple.F90
Default value: 10
Description: The maximum fractional mass loss rate per dynamical time in the simple model of mass loss from spheroids due to ram pressure stripping.

Name: tfamily ramPressureStrippingMassLossRateSpheroidsMethod
Attached to: tfamily module:Ram_Pressure_Stripping_Mass_Loss_Rate_Spheroids
File: tfamily ram_pressure_stripping.mass_loss_rate.spheroids.F90
Default value: null
Description: The name of the method to be used when computing mass loss rates from spheroids due to ram pressure stripping.

Name: tfamily randomSeed
Attached to: tfamily module:Pseudo_Random
File: tfamily numerical.random.F90
Default value: 219
Description: A seed value for the random number generator.

Name: tfamily randomSpinResetMassFactor
Attached to: tfamily module:Node_Component_Spin_Random
File: tfamily objects.nodes.components.spin.random.F90
Default value: 2.0
Description: The factor by which a node must increase in mass before its spin parameter is reset.

Name: tfamily reionizationSuppressionOpticalDepth
Attached to: tfamily module:Accretion_Halos
File: tfamily accretion.halo.F90
Default value: none
Description: The optical depth to electron scattering below which baryonic accretion is suppressed.

Name: tfamily reionizationSuppressionRedshift
Attached to: tfamily module:Accretion_Halos
File: tfamily accretion.halo.F90
Default value: 9.97 (Hinshaw et al. 2012; CMB+$H_0$+BAO)
Description: The redshift below which baryonic accretion is suppressed.

Name: tfamily reionizationSuppressionVelocity
Attached to: tfamily module:Accretion_Halos
File: tfamily accretion.halo.F90
Default value: 35.0
**Description:** The velocity scale below which baryonic accretion is suppressed.

**Name:** tfamily satelliteDynamicalFrictionChandrasekharCoulombLogarithm  
**Attached to:** tfamily module:Dynamical_Friction_Acceleration_Chandrasekhar  
**File:** tfamily satellites.dynamical_friction.acceleration.Chandrasekhar1943.F90  
**Default value:** 2  
**Description:** The Coulomb logarithm, ln Λ, appearing in the Chandrasekhar [1943] formulation of the acceleration due to dynamical friction.

**Name:** tfamily satelliteDynamicalFrictionMethod  
**Attached to:** tfamily module:Satellite_Dynamical_Friction  
**File:** tfamily satellites.dynamical_friction.acceleration.F90  
**Default value:** Chandrasekhar1943  
**Description:** The name of the method to be used to compute satellite dynamical friction acceleration.

**Name:** tfamily satelliteMergingJiang2008Scatter  
**Attached to:** tfamily module:Satellite_Merging_Timescales  
**File:** tfamily satellites.merging.timescale.F90  
**Default value:** 0  
**Description:** Specifies whether or not to add random scatter to the dynamical friction timescales in the Jiang2008 satellite merging time implementation.

**Name:** tfamily satelliteMergingMassMovementsMethod  
**Attached to:** tfamily module:Satellite_Merging_Mass_Movements  
**File:** tfamily satellites.merging.mass_movements.F90  
**Default value:** simple  
**Description:** Selects the method to be used for deciding mass movements during satellite mergers.

**Name:** tfamily satelliteMergingRemnantProgenitorPropertiesMethod  
**Attached to:** tfamily module:Satellite_Merging_Remnant_Sizes_Progenitors  
**File:** tfamily satellites.merging.remnant_sizes.progenitor_properties.F90  
**Default value:** standard  
**Description:** The name of the method to be used for computing progenitor properties in merger remnant calculations.

**Name:** tfamily satelliteMergingRemnantSizeMethod  
**Attached to:** tfamily module:Satellite_Merging_Remnant_Sizes  
**File:** tfamily satellites.merging.remnant_sizes.F90  
**Default value:** Covington2008  
**Description:** The name of the method to be used for computing merger remnant sizes.

**Name:** tfamily satelliteMergingTimescaleVillalobos2013BaseMethod  
**Attached to:** tfamily module:Satellite_Merging_Timescales  
**File:** tfamily satellites.merging.timescale.F90  
**Default value:** boylanKolchin2008  
**Description:** The base satelliteMergingTimescales method to which the Villalobos et al. [2013] modifier for satellite merging timescales should be applied.
4. Input Parameters

**Attached to:** tfamily module: Satellite_Merging_Timescales  
**File:** tfamily satellites.merging.timescale.F90  
**Default value:** 0.44 [Villalobos et al., 2013]  
**Description:** The exponent of $1 + z$ appearing in the Villalobos et al. [2013] modifier for satellite merging timescales.

**Name:** tfamily satelliteMergingTimescalesMethod  
**Attached to:** tfamily module: Satellite_Merging_Timescales  
**File:** tfamily satellites.merging.timescale.F90  
**Default value:** jiang2008  
**Description:** The method to be used for satelliteMergingTimescales.

**Name:** tfamily satelliteOrbitResetOnHaloFormation  
**Attached to:** tfamily module: Node_Component_Satellite_Very_Simple  
**File:** tfamily objects.nodes.components.satellite.very_simple.F90  
**Default value:** false  
**Description:** Specifies whether satellite virial orbital parameters should be reset on halo formation events.

**Name:** tfamily satelliteOrbitStoreOrbitalParameters  
**Attached to:** tfamily module: Node_Component_Satellite_Standard  
**File:** tfamily objects.nodes.components.satellite.standard.F90  
**Default value:** true  
**Description:** Specifies whether satellite virial orbital parameters should be stored (otherwise they are computed again—possibly at random—each time they are requested).

**Name:** tfamily satelliteOrbitingDestructionMassFraction  
**Attached to:** tfamily module: Node_Component_Satellite_Orbiting  
**File:** tfamily objects.nodes.components.satellite.orbiting.F90  
**Default value:** 0.01  
**Description:** The fraction of the satellite’s initial mass below which the satellite is considered to be tidally destroyed and merged with the central halo.

**Name:** tfamily satelliteOutputVirialOrbit  
**Attached to:** tfamily module: Galacticus_Nodes  
**File:** tfamily objects.nodes.F90  
**Default value:** false  
**Description:** Specifies whether the virialOrbit method of the standard implementation of the satellite component class should be output.

**Name:** tfamily satelliteTidalFieldBoostFactor  
**Attached to:** tfamily module: Satellites_Tidal_Fields_Spherical_Symmetry  
**File:** tfamily satellites.tidal_fields.spherical_symmetry.F90  
**Default value:** 1.0  
**Description:** The factor by which to boost satellite tidal fields in the sphericalSymmetry tidal field method.

**Name:** tfamily satelliteTidalHeatingGnedinEpsilon  
**Attached to:** tfamily module: Tidal_Heating_Rate_Gnedin
Default value: 3
Description: Parameter, $\epsilon$, controlling the tidal heating rate of satellites in the Gnedin1999 method.

Name: tfamily satelliteTidalHeatingGnedinGamma
Attached to: tfamily module:Tidal_Heating_Rate_Gnedin
Default value: 2.5
Description: Parameter, $\gamma$, controlling the tidal heating rate of satellites in the Gnedin1999 method.

Name: tfamily satelliteTidalHeatingMethod
Attached to: tfamily module:Satellite_Tidal_Heating
File: tfamily satellites.tidal_heating.rate.F90
Default value: Gnedin1999
Description: The name of the method to be used to compute satellite tidal heating rate.

Name: tfamily satelliteTidalStrippingMethod
Attached to: tfamily module:Satellite_Tidal_Stripping
File: tfamily satellites.tidal_stripping.rate.F90
Default value: Zentner2005
Description: The name of the method to be used to compute satellite tidal stripping rate.

Name: tfamily satelliteTidalStrippingZentner2005Rate
Attached to: tfamily module:Tidal_Stripping_Rate_Zentner2005
Default value: 2.0
Description: The dimensionless rate coefficient appearing in the Zentner et al. [2005] expression for the tidal mass loss rate from subhalos.

Name: tfamily satellitesTidalFieldMethod
Attached to: tfamily module:Satellites_Tidal_Fields
File: tfamily satellites.tidal_fields.F90
Default value: null
Description: The name of the method to be used when computing the tidal field acting on a satellite.

Name: tfamily sigma_8
Attached to: tfamily module:Power_Spectra
File: tfamily structure_formation.power_spectrum.F90
Default value: 0.817 (Hinshaw et al. 2012; CMB+$H_0$+BAO)
Description: The fractional mass fluctuation in the linear density field at the present day in spheres of radius 8 Mpc/h.

Name: tfamily simpleRadiusSolverUseFormationHalo
Attached to: tfamily module:Galactic_Structure_Radii_Simple
File: tfamily galactic_structure.radius_solver.simple.F90
Default value: false
Description: Specifies whether or not the “formation halo” should be used when solving for the radii of galaxies.
4. Input Parameters

Name: tfamily source
Attached to: tfamily module:Merger_Trees_Simple
File: tfamily merger_trees.file_maker.simple.F90
Default value: none
Description: The source of the merger trees.

Name: tfamily spectraPostprocessorMethod
Attached to: tfamily module:Stellar_Population_Spectra_Postprocess
File: tfamily stellar_populations.spectra.postprocess.F90
Default value: null
Description: The method to be used for spectraPostprocessor.

Name: tfamily spheroidAngularMomentumAtScaleRadius
Attached to: tfamily module:Node_Component_Spheroid_Standard
File: tfamily objects.nodes.components.spheroid.standard.F90
Default value: $I_2/I_3$ where $I_n = \int_0^\infty \rho(r)r^n dr$, where $\rho(r)$ is the spheroid density profile, unless either $I_2$ or $I_3$ is infinite, in which case a default of $1/2$ is used instead
Description: The assumed ratio of the specific angular momentum at the scale radius to the mean specific angular momentum of the standard spheroid component.

Name: tfamily spheroidEnergeticOutflowMassRate
Attached to: tfamily module:Node_Component_Spheroid_Standard
File: tfamily objects.nodes.components.spheroid.standard.F90
Default value: 0.01
Description: The proportionality factor relating mass outflow rate from the spheroid to the energy input rate divided by $V_{spheroid}^2$.

Name: tfamily spheroidMassDistribution
Attached to: tfamily module:Node_Component_Spheroid_Standard
File: tfamily objects.nodes.components.spheroid.standard.F90
Default value: hernquist
Description: The type of mass distribution to use for the standard spheroid component.

Name: tfamily spheroidMassToleranceAbsolute
Attached to: tfamily module:Node_Component_Spheroid_Standard
File: tfamily objects.nodes.components.spheroid.standard.F90
Default value: $10^{-6} M_\odot$
Description: The mass tolerance used to judge whether the spheroid is physically plausible.

Name: tfamily spheroidOutflowExponent
Attached to: tfamily module:Star_Formation_Feedback_Spheroids_Power_Law
File: tfamily star_formation.feedback.spheroids.power_law.F90
Default value: 3.5
Description: The velocity scaling of the SNe-driven outflow rate in spheroids.

Name: tfamily spheroidOutflowTimescaleMinimum
Attached to: tfamily module:Node_Component_Spheroid_Standard
File: tfamily objects.nodes.components.spheroid.standard.F90
Default value: $10^{-3}$
**Description:** The minimum timescale (in units of the spheroid dynamical time) on which outflows may deplete gas in the spheroid.

**Name:** tfamily spheroidOutflowVelocity  
**Attached to:** tfamily module:Star_Formation_Feedback_Spheroids_Power_Law  
**File:** tfamily star_formation.feedback.spheroids.power_law.F90  
**Default value:** 100 km s$^{-1}$  
**Description:** The velocity scale at which the SNe-driven outflow rate equals the star formation rate in spheroids.

**Name:** tfamily spheroidOutputStarFormationRate  
**Attached to:** tfamily module:Galacticus_Nodes  
**File:** tfamily objects.nodes.F90  
**Default value:** false  
**Description:** Specifies whether the starFormationRate method of the standard implementation of the spheroid component class should be output.

**Name:** tfamily spheroidSersicIndex  
**Attached to:** tfamily module:Node_Component_Spheroid_Standard  
**File:** tfamily objects.nodes.components.spheroid.standard.F90  
**Default value:** 4  
**Description:** The Sérsic index to use for the spheroid component mass distribution.

**Name:** tfamily spheroidSuperwindMassLoading  
**Attached to:** tfamily module:Star_Formation_Expulsive_Feedback_Spheroids_Superwind  
**File:** tfamily star_formation.feedback.expulsion.spheroids.superwind.F90  
**Default value:** 2  
**Description:** The mass loading of the spheroid superwind.

**Name:** tfamily spheroidSuperwindVelocity  
**Attached to:** tfamily module:Star_Formation_Expulsive_Feedback_Spheroids_Superwind  
**File:** tfamily star_formation.feedback.expulsion.spheroids.superwind.F90  
**Default value:** 200 km/s  
**Description:** The velocity scale of the spheroid superwind.

**Name:** tfamily spinDistributionBett2007Alpha  
**Attached to:** tfamily module:Halo_Spin_Distributions_Bett2007  
**File:** tfamily dark_matter_halos.spins.distributions.Bett2007.F90  
**Default value:** 2.509 [Bett et al., 2007]  
**Description:** The dispersion in a lognormal halo spin distribution.

**Name:** tfamily spinDistributionBett2007Lambda0  
**Attached to:** tfamily module:Halo_Spin_Distributions_Bett2007  
**File:** tfamily dark_matter_halos.spins.distributions.Bett2007.F90  
**Default value:** 0.04326 [Bett et al., 2007]  
**Description:** The median in a lognormal halo spin distribution.

**Name:** tfamily stabilityThresholdGaseous  
**Attached to:** tfamily module:Galactic_Dynamics_Bar_Instabilities_ELN
4. Input Parameters

File: tfamily galactic_dynamics.bar_instability.ELN.F90
Default value: 0.7
Description: The stability threshold in the Efstathiou et al. [1982] algorithm for purely gaseous disks.

Name: tfamily stabilityThresholdStellar
Attached to: tfamily module:Galactic_Dynamics_Bar_Instabilities_ELN
File: tfamily galactic_dynamics.bar_instability.ELN.F90
Default value: 1.1
Description: The stability threshold in the Efstathiou et al. [1982] algorithm for purely stellar disks.

Name: tfamily starFormationDiskEfficiency
Attached to: tfamily module:Star_Formation_Timescale_Disks_Dynamical_Time
File: tfamily star Formation.timescales.disks.dynamical_time.F90
Default value: 0.01
Description: The efficiency of star formation in disks for the dynamical time method.

Name: tfamily starFormationDiskMinimumTimescale
Attached to: tfamily module:Star_Formation_Timescale_Disks_Dynamical_Time
File: tfamily star Formation.timescales.disks.dynamical_time.F90
Default value: $10^{-3}$ Gyr
Description: The minimum timescale for star formation in disks.

Name: tfamily starFormationDiskTimescale
Attached to: unknown
Default value: 8.0
Description: The timescale (in Gyr) for star formation in the Baugh et al. [2005] prescription.

Name: tfamily starFormationDiskVelocityExponent
Attached to: tfamily module:Star_Formation_Timescale_Disks_Dynamical_Time
File: tfamily star Formation.timescales.disks.dynamical_time.F90
Default value: $-1.5$
Description: The velocity exponent for star formation in disks for the dynamical time method.

Name: tfamily starFormationExpansionExponent
Attached to: unknown
Default value: 0.0
Description: The exponent for expansion factor in the Baugh et al. [2005] prescription for star formation in galactic disks.

Name: tfamily starFormationExpulsiveFeedbackDisksMethod
Attached to: tfamily module:Star_Formation_Feedback_Expulsion_Disks
File: tfamily star Formation.feedback_expulsion.disks.F90
Default value: null
Description: The name of the method to be used for calculations of expulsive SNe feedback in disks.

Name: tfamily starFormationExpulsiveFeedbackSpheroidsMethod
Attached to: tfamily module:Star_Formation_Feedback_Expulsion_Spheroids
File: tfamily star_formation.feedback.expulsion.spheroids.F90
Default value: null
Description: The name of the method to be used for calculations of expulsive SNe feedback in spheroids.

Name: tfamily starFormationExtendedSchmidtGasExponent
Attached to: tfamily module:Star_Formation_Rate_Surface_Density_Disks_ExSchmidt
File: tfamily star_formation.rate_surface_density.disks.extended_Schmidt.F90
Default value: 1.0 [Shi et al., 2011]
Description: The exponent of gas surface density in the extended Schmidt star formation law.

Name: tfamily starFormationExtendedSchmidtNormalization
Attached to: tfamily module:Star_Formation_Rate_Surface_Density_Disks_ExSchmidt
File: tfamily star_formation.rate_surface_density.disks.extended_Schmidt.F90
Default value: $10^{-10.28}$ [Shi et al., 2011]
Description: The normalization of the extended Schmidt star formation law $M_\odot \text{yr}^{-1}\text{pc}^{-2}$.

Name: tfamily starFormationExtendedSchmidtStarExponent
Attached to: tfamily module:Star_Formation_Rate_Surface_Density_Disks_ExSchmidt
File: tfamily star_formation.rate_surface_density.disks.extended_Schmidt.F90
Default value: 0.48 [Shi et al., 2011]
Description: The exponent of stellar surface density in the extended Schmidt star formation law.

Name: tfamily starFormationFeedbackDisksCreasy2012Beta0
Attached to: tfamily module:Star_Formation_Feedback_Disks_Creasey2012
File: tfamily star_formation.feedback.disks.Creasey2012.F90
Default value: 13
Description: The factor $\beta_0$ appearing in the Creasey et al. [2012] model for supernovae feedback.

Name: tfamily starFormationFeedbackDisksCreasy2012Mu
Attached to: tfamily module:Star_Formation_Feedback_Disks_Creasey2012
File: tfamily star_formation.feedback.disks.Creasey2012.F90
Default value: 1.15
Description: The factor $\mu$ appearing in the Creasey et al. [2012] model for supernovae feedback.

Name: tfamily starFormationFeedbackDisksCreasy2012Nu
Attached to: tfamily module:Star_Formation_Feedback_Disks_Creasey2012
File: tfamily star_formation.feedback.disks.Creasey2012.F90
Default value: 0.16
Description: The factor $\nu$ appearing in the Creasey et al. [2012] model for supernovae feedback.

Name: tfamily starFormationFeedbackDisksMethod
Attached to: tfamily module:Star_Formation_Feedback_Disks
File: tfamily star_formation.feedback.disks.F90
Default value: powerLaw
Description: The name of the method to be used for calculations of SNe feedback in disks.

Name: tfamily starFormationFeedbackSpheroidsMethod
Attached to: tfamily module:Star_Formation_Feedback_Spheroids
File: tfamily star_formation.feedback.spheroids.F90
4. Input Parameters

- **Name:** tfamily starFormationFrequencyKMT09  
  **Attached to:** tfamily module:Star_Formation_Rate_Surface_Density_Disks_KMT09  
  **File:** tfamily star_formation.rate_surface_density.disks.KMT09.F90  
  **Default value:** 0.385 [Krumholz et al., 2009]  
  **Description:** The star formation frequency (in units of Gyr\(^{-1}\)) in the “Krumholz-McKee-Tumlinson” star formation timescale calculation.

- **Name:** tfamily starFormationFrequencyNormalizationBlitzRosolowsky  
  **Attached to:** tfamily module:Star_Formation_Rate_Surface_Density_Disks_BR  
  **File:** tfamily star_formation.rate_surface_density.disks.Blitz-Rosolowsky.F90  
  **Default value:** \(5.25 \times 10^{-10}\) [Leroy et al., 2008]  
  **Description:** The star formation frequency (in the low-density limit and in units of yr\(^{-1}\)) in the “Blitz-Rosolowsky” star formation timescale calculation.

- **Name:** tfamily starFormationHistoriesMethod  
  **Attached to:** tfamily module:Galacticus_Output_Star_Formation_Histories  
  **File:** tfamily galacticus.output.merger_tree.star_formation.F90  
  **Default value:** null  
  **Description:** The method to use for computing and outputting star formation histories.

- **Name:** tfamily starFormationHistoryFineTime  
  **Attached to:** tfamily module:Star_Formation_Histories_Metallicity_Split  
  **File:** tfamily galacticus.output.merger_tree.star_formation.metallicity_split.F90  
  **Default value:** 0.1  
  **Description:** The period prior to each output for which the fine time step is used in tabulations of star formation histories [Gyr].

- **Name:** tfamily starFormationHistoryFineTimeStep  
  **Attached to:** tfamily module:Star_Formation_Histories_Metallicity_Split  
  **File:** tfamily galacticus.output.merger_tree.star_formation.metallicity_split.F90  
  **Default value:** 0.01  
  **Description:** The fine time step to use in tabulations of star formation histories [Gyr].

- **Name:** tfamily starFormationHistoryMetallicityCount  
  **Attached to:** tfamily module:Star_Formation_Histories_Metallicity_Split  
  **File:** tfamily galacticus.output.merger_tree.star_formation.metallicity_split.F90  
  **Default value:** 10  
  **Description:** The number of bins in metallicity to use when tabulating star formation histories.

- **Name:** tfamily starFormationHistoryMetallicityMaximum  
  **Attached to:** tfamily module:Star_Formation_Histories_Metallicity_Split  
  **File:** tfamily galacticus.output.merger_tree.star_formation.metallicity_split.F90  
  **Default value:** 10\(^1\)  
  **Description:** The upper limit to the metallicity in the highest metallicity bin when tabulating star formation histories [Solar units].
Name: tfamily starFormationHistoryMetallicityMinimum
Attached to: tfamily module:Star_Formation_Histories_Metallicity_Split
File: tfamily galacticus.output.merger_tree.star_formation.metallicity_split.F90
Default value: $10^{-4}$
Description: The upper limit to the metallicity in the lowest metallicity bin when tabulating star formation histories [Solar units].

Name: tfamily starFormationHistoryTimeStep
Attached to: tfamily module:Star_Formation_Histories_Metallicity_Split
File: tfamily galacticus.output.merger_tree.star_formation.metallicity_split.F90
Default value: 0.1
Description: The time step to use in tabulations of star formation histories [Gyr].

Name: tfamily starFormationImfInstantaneousApproximation
Attached to: tfamily module:Star_Formation_IMF
File: tfamily star_formation.IMF.F90
Default value: false
Description: Option controlling whether stellar evolution should follow the instantaneous approximation.

Name: tfamily starFormationImfInstantaneousApproximationEffectiveAge
Attached to: tfamily module:Star_Formation_IMF
File: tfamily star_formation.IMF.F90
Default value: 13.8Gyr
Description: The effective age to use for computing SNeIa yield when using the instantaneous stellar evolution approximation.

Name: tfamily starFormationImfInstantaneousApproximationMassLongLived
Attached to: tfamily module:Star_Formation_IMF
File: tfamily star_formation.IMF.F90
Default value: $1M_{\odot}$
Description: The mass below which stars are assumed to be infinitely long-lived in the instantaneous approximation for stellar evolution.

Name: tfamily starFormationKennicuttSchmidtExponent
Attached to: tfamily module:Star_Formation_Rate_Surface_Density_Disks_KS
File: tfamily star_formation.rate_surface_density.disks.Kennicutt-Schmidt.F90
Default value: 1.4 [Kennicutt, 1998]
Description: The exponent in the Kennicutt-Schmidt star formation law.

Name: tfamily starFormationKennicuttSchmidtExponentTruncated
Attached to: tfamily module:Star_Formation_Rate_Surface_Density_Disks_KS
File: tfamily star_formation.rate_surface_density.disks.Kennicutt-Schmidt.F90
Default value: true
Description: The exponent of the $\Sigma_{gas}/\Sigma_{crit}$ term used in truncating the Kennicutt-Schmidt star formation law.

Name: tfamily starFormationKennicuttSchmidtNormalization
Attached to: tfamily module:Star_Formation_Rate_Surface_Density_Disks_KS

117
4. Input Parameters

File: tfamily star_formation.rate_surface_density.disks.Kennicutt-Schmidt.F90
Default value: 0.147 [Kennicutt, 1998]
Description: The normalization of the Kennicutt-Schmidt star formation law \([M_\odot \text{ Gyr}^{-1}\text{pc}^{-2}]\).

Name: tfamily starFormationKennicuttSchmidtTruncate
Attached to: tfamily module:Star_Formation_Rate_Surface_Density_Disks_KS
File: tfamily star_formation.rate_surface_density.disks.Kennicutt-Schmidt.F90
Default value: true
Description: Specifies whether or not to truncate star formation below a critical surface density in disks.

Name: tfamily starFormationRateSurfaceDensityDisksMethod
Attached to: tfamily module:Star_Formation_Rate_Surface_Density_Disks
File: tfamily star_formation.rate_surface_density.disks.F90
Default value: KMT09
Description: The name of the method to be used for computing star formation timescales in disks.

Name: tfamily starFormationSpheroidEfficiency
Attached to: tfamily module:Star_Formation_Timescale_Spheroids_Dynamical_Time
File: tfamily star_formation.timescales.spheroids.dynamical_time.F90
Default value: 0.04
Description: The efficiency of star formation in spheroids for the dynamical time method.

Name: tfamily starFormationSpheroidMinimumTimescale
Attached to: tfamily module:Star_Formation_Timescale_Spheroids_Dynamical_Time
File: tfamily star_formation.timescales.spheroids.dynamical_time.F90
Default value: 10^{-3} \text{ Gyr}
Description: The minimum timescale for star formation in disks.

Name: tfamily starFormationSpheroidVelocityExponent
Attached to: tfamily module:Star_Formation_Timescale_Spheroids_Dynamical_Time
File: tfamily star_formation.timescales.spheroids.dynamical_time.F90
Default value: 2.0
Description: The velocity exponent for star formation in spheroids for the dynamical time method.

Name: tfamily starFormationTimescaleDisksFixedTimescale
Attached to: tfamily module:Star_Formation_Timescale_Disks_Fixed
File: tfamily star_formation.timescales.disks.fixed.F90
Default value: 1 \text{ Gyr}
Description: The timescale for star formation in the fixed timescale model for disks.

Name: tfamily starFormationTimescaleDisksHaloScalingRedshiftExponent
Attached to: tfamily module:Star_Formation_Timescale_Disks_Halo_Scaling
File: tfamily star_formation.timescales.disks.halo_scaling.F90
Default value: 0
Description: The exponent of redshift in the timescale for star formation in the halo scaling timescale model for disks.

Name: tfamily starFormationTimescaleDisksHaloScalingTimescale
Attached to: tfamily module:Star_Formation_Timescale_Disks_Halo_Scaling
File: tfamily star_formation.timescales.disks.halo_scaling.F90
Default value: 1 Gyr
Description: The timescale for star formation in the halo scaling timescale model for disks.

Name: tfamily starFormationTimescaleDisksHaloScalingVirialVelocityExponent
Attached to: tfamily module:Star_Formation_Timescale_Disks_Halo_Scaling
File: tfamily star_formation.timescales.disks.halo_scaling.F90
Default value: 0
Description: The exponent of virial velocity in the timescale for star formation in the halo scaling timescale model for disks.

Name: tfamily starFormationTimescaleDisksMethod
Attached to: tfamily module:Star_Formation_Timescales_Disks
File: tfamily star_formation.timescales.disks.F90
Default value: integratedSurfaceDensity
Description: The name of the method to be used for computing star formation timescales in disks.

Name: tfamily starFormationTimescaleSpheroidsMethod
Attached to: tfamily module:Star_Formation_Timescales_Spheroids
File: tfamily star_formation.timescales.spheroids.F90
Default value: dynamicalTime
Description: The name of the method to be used for computing star formation timescales in spheroids.

Name: tfamily starveSatellites
Attached to: tfamily module:Node_Component_Hot_Halo_Standard
File: tfamily objects.nodes.components.hot_halo.standard.F90
Default value: false
Description: Specifies whether or not the hot halo should be removed ("starved") when a node becomes a satellite.

Name: tfamily stateFileRoot
Attached to: tfamily module:Galacticus_State
File: tfamily galacticus.state.F90
Default value: none
Description: The root name of files to which the internal state is written (to permit restarts).

Name: tfamily stateRetrieveFileRoot
Attached to: tfamily module:Galacticus_State
File: tfamily galacticus.state.F90
Default value: none
Description: The root name of files to which the internal state is retrieved from (to restart).

Name: tfamily stellarAstrophysicsMethod
Attached to: tfamily module:Stellar_Astrophysics
File: tfamily stellar_astrophysics.F90
Default value: file
Description: The name of the method to be used for stellar astrophysics calculations.

Name: tfamily stellarDensityChangeBinaryMotion
4. Input Parameters

**Attached to:** tfamily module:Black_Hole_Binary_Separations_Standard  
**File:** tfamily black_holes.binaries.separation_growth_rate.standard.F90  
**Default value:** true  
**Description:** The change in density due to the black hole’s motion.

**Name:** tfamily stellarFeedbackMethod  
**Attached to:** tfamily module:Stellar_Feedback  
**File:** tfamily stellar_astrophysics.feedback.F90  
**Default value:** standard  
**Description:** The method to use for computing aspects of stellar feedback.

**Name:** tfamily stellarMassFilterThreshold  
**Attached to:** tfamily module:Galacticus_Merger_Tree_Output_Filter_Stellar_Masses  
**File:** tfamily galacticus.output.merger_tree.filters.stellar_mass.F90  
**Default value:** none  
**Description:** The minimum stellar mass of a galaxy to pass the **stellarMass** output filter (in units of $M_\odot$).

**Name:** tfamily stellarMassMorphologyFilterRatioMaximum  
**Attached to:** tfamily module:Galacticus_Merger_Tree_Output_Stllr_Mss_Mrphlgs  
**File:** tfamily galacticus.output.merger_tree.filters.stellar_mass_morphology.F90  
**Default value:** none  
**Description:** The minimum spheroid-to-total ratio in stellar mass for which to allow output when the “stellarMassMorphology” output filter is active.

**Name:** tfamily stellarMassMorphologyFilterRatioMinimum  
**Attached to:** tfamily module:Galacticus_Merger_Tree_Output_Stllr_Mss_Mrphlgs  
**File:** tfamily galacticus.output.merger_tree.filters.stellar_mass_morphology.F90  
**Default value:** none  
**Description:** The minimum spheroid-to-total ratio in stellar mass for which to allow output when the “stellarMassMorphology” output filter is active.

**Name:** tfamily stellarPopulationLuminosityIntegrationToleranceRelative  
**Attached to:** tfamily module:Stellar_Population_Luminosities  
**File:** tfamily stellar_populations.luminosities.F90  
**Default value:** $10^{-3}$  
**Description:** The relative tolerance used when integrating the flux of stellar populations through filters.

**Name:** tfamily stellarPopulationLuminosityStoreToFile  
**Attached to:** tfamily module:Stellar_Population_Luminosities  
**File:** tfamily stellar_populations.luminosities.F90  
**Default value:** true  
**Description:** Specifies whether or not stellar populations luminosities (integrated under a filter) should be stored to file for rapid reuse.

**Name:** tfamily stellarPopulationPropertiesMethod  
**Attached to:** tfamily module:Stellar_Population_Properties  
**File:** tfamily stellar_populations.properties.F90  
**Default value:** instantaneous
Description: The method to use for computing properties of stellar populations.

Name: tfamily stellarPopulationSpectraFileForceZeroMetallicity
Attached to: tfamily module:Stellar_Population_Spectra_File
File: tfamily stellar_populations.spectra.file.F90
Default value: false
Description: Force the use of zero metallicity (or, lowest metallicity available) for all stellar populations.

Name: tfamily stellarPopulationSpectraMethod
Attached to: tfamily module:Stellar_Population_Spectra
File: tfamily stellar_populations.spectra.F90
Default value: Conroy-White-Gunn2009
Description: The name of the method to be used for calculations of stellar population spectra.

Name: tfamily stellarPopulationSpectraRecentTimeLimit
Attached to: tfamily module:Stellar_Population_Spectra_Postprocess
File: tfamily stellar_populations.spectra.postprocess.F90
Default value: 10⁷ years
Description: The maximum age of stellar populations to retain in the “recent” spectra postprocessing method.

Name: tfamily stellarPropertiesFile
Attached to: tfamily module:Stellar_Astrophysics_File
File: tfamily stellar_astrophysics.file.F90
Default value: data/stellarAstrophysics/Stellar_Properties_Compilation.xml
Description: The name of the XML file from which to read stellar properties (ejected masses, yields, etc.).

Name: tfamily stellarTracksFile
Attached to: tfamily module:Stellar_Astrophysics_Tracks_File
File: tfamily stellar_astrophysics.tracks.file.F90
Default value: data/stellarAstrophysics/Stellar_Tracks_Padova.hdf5
Description: The name of the HDF5 file from which to read stellar tracks.

Name: tfamily stellarTracksMethod
Attached to: tfamily module:Stellar_Astrophysics_Tracks
File: tfamily stellar_astrophysics.tracks.F90
Default value: file
Description: The name of the method to be used for stellar tracks calculations.

Name: tfamily stellarWindsMethod
Attached to: tfamily module:Stellar_Astrophysics_Winds
File: tfamily stellar_astrophysics.winds.F90
Default value: standard
Description: The method to use for computing aspects of stellar winds.

Name: tfamily summedNeutrinoMasses
Attached to: tfamily module:Transfer_Function_Eisenstein_Hu
File: tfamily structure_formation.transfer_function.Eisenstein_Hu.F90
4. Input Parameters

Default value: 0
Description: The summed mass (in electron volts) of all neutrino species.

Name: tfamily supernovaEnergy
Attached to: tfamily module:Stellar_Feedback_Standard
File: tfamily stellar_physics.feedback.standard.F90
Default value: $10^{51}$ ergs
Description: The energy produced by a supernova (in ergs).

Name: tfamily supernovaeIaMethod
Attached to: tfamily module:Supernovae_Type_Ia
File: tfamily stellar_physics.supernovae_type_Ia.F90
Default value: Nagashima
Description: The method to use for computing properties of Type Ia supernovae.

Name: tfamily supernovaePopIIIMethod
Attached to: tfamily module:Supernovae_Population_III
File: tfamily stellar_physics.supernovae_PopulationIII.F90
Default value: Heger-Woosley2002
Description: The method to use for computing properties of Population III supernovae.

Name: tfamily surfaceDensityCriticalBlitzRosolowsky
Attached to: tfamily module:Star_Formation_Rate_Surface_Density_Disks_BR
File: tfamily star_formation.rate_surface_density.disks.Blitz-Rosolowsky.F90
Default value: 200 [Bigiel et al., 2008]
Description: The surface density (in units of $M_\odot$ pc$^{-2}$) in the “Blitz-Rosolowsky” star formation timescale calculation at which low-density truncation begins.

Name: tfamily surfaceDensityExponentBlitzRosolowsky
Attached to: tfamily module:Star_Formation_Rate_Surface_Density_Disks_BR
File: tfamily star_formation.rate_surface_density.disks.Blitz-Rosolowsky.F90
Default value: 0.4 [Bigiel et al., 2008]
Description: The exponent for surface density in the “Blitz-Rosolowsky” star formation timescale calculation at in the high density regime.

Name: tfamily surveyGeometryMethod
Attached to: tfamily module:Geometry_Surveys
File: tfamily geometry.surveys.F90
Default value: none
Description: The name of the method to be used for computing survey geometries.

Name: tfamily tidalStrippingMassLossRateDiskSimpleFractionalRateMaximum
Attached to: tfamily module:Tidal_Stripping_Mass_Loss_Rate_Disks_Simple
File: tfamily tidal_stripping.mass_loss_rate.disks.simple.F90
Default value: 10
Description: The maximum fractional mass loss rate per dynamical time in the simple model of mass loss from disks due to tidal stripping.

Name: tfamily tidalStrippingMassLossRateDisksMethod
Attached to: tfamily module:Tidal_Stripping_Mass_Loss_Rate_Disks
File: tfamily tidal_stripping.mass_loss_rate.disks.F90
Default value: null
Description: The name of the method to be used when computing mass loss rates from disks due to tidal stripping.

Name: tfamily tidalStrippingMassLossRateSpheroidSimpleFractionalRateMaximum
Attached to: tfamily module:Tidal_Stripping_Mass_Loss_Rate_Spheroids_Simple
File: tfamily tidal_stripping.mass_loss_rate.spheroids.simple.F90
Default value: 10
Description: The maximum fractional mass loss rate per dynamical time in the simple model of mass loss from spheroids due to tidal stripping.

Name: tfamily tidalStrippingMassLossRateSpheroidsMethod
Attached to: tfamily module:Tidal_Stripping_Mass_Loss_Rate_Spheroids
File: tfamily tidal_stripping.mass_loss_rate.spheroids.F90
Default value: null
Description: The name of the method to be used when computing mass loss rates from spheroids due to tidal stripping.

Name: tfamily timePerTreeFitFileName
Attached to: tfamily module:Galacticus_Meta_Compute_Times_File
File: tfamily galacticus.meta.compute_times.file.F90
Default value: none
Description: The name of the file which contains fit coefficients for the time per tree fitting function.

Name: tfamily timePerTreeMethod
Attached to: tfamily module:Galacticus_Meta_Compute_Times
File: tfamily galacticus.meta.compute_times.F90
Default value: file
Description: The name of the method to be used for computing the time per tree.

Name: tfamily timestepHistoryBegin
Attached to: tfamily module:Merger_Tree_Timesteps_History
File: tfamily merger_trees.evolve.timesteps.history.F90
Default value: 5% of the age of the Universe
Description: The earliest time at which to tabulate the volume averaged history of galaxies (in Gyr).

Name: tfamily timestepHistoryEnd
Attached to: tfamily module:Merger_Tree_Timesteps_History
File: tfamily merger_trees.evolve.timesteps.history.F90
Default value: The age of the Universe
Description: The latest time at which to tabulate the volume averaged history of galaxies (in Gyr).

Name: tfamily timestepHistorySteps
Attached to: tfamily module:Merger_Tree_Timesteps_History
File: tfamily merger_trees.evolve.timesteps.history.F90
Default value: 30
Description: The number of steps (spaced logarithmically in cosmic time) at which to tabulate the
4. Input Parameters

volume averaged history of galaxies.

**Name**: tfamily timestepHostAbsolute  
**Attached to**: tfamily module:Merger_Trees_Evolve  
**File**: tfamily merger_trees.evolve.F90  
**Default value**: 1  
**Description**: The maximum allowed absolute timestep (in Gyr) for node evolution relative to the time of the host halo.

**Name**: tfamily timestepHostRelative  
**Attached to**: tfamily module:Merger_Trees_Evolve  
**File**: tfamily merger_trees.evolve.F90  
**Default value**: 0.1  
**Description**: The maximum allowed relative timestep for node evolution relative to the time of the host halo.

**Name**: tfamily timestepRecordEvolution  
**Attached to**: tfamily module:Merger_Tree_Timesteps_Record_Evolution  
**File**: tfamily merger_trees.evolve.timesteps.record_evolution.F90  
**Default value**: false  
**Description**: Specifies whether or not the evolution of the main branch galaxy should be recorded.

**Name**: tfamily timestepRecordEvolutionBegin  
**Attached to**: tfamily module:Merger_Tree_Timesteps_Record_Evolution  
**File**: tfamily merger_trees.evolve.timesteps.record_evolution.F90  
**Default value**: 5% of the age of the Universe  
**Description**: The earliest time at which to tabulate the evolution of main branch progenitor galaxies (in Gyr).

**Name**: tfamily timestepRecordEvolutionEnd  
**Attached to**: tfamily module:Merger_Tree_Timesteps_Record_Evolution  
**File**: tfamily merger_trees.evolve.timesteps.record_evolution.F90  
**Default value**: The age of the Universe  
**Description**: The latest time at which to tabulate the evolution of main branch progenitor galaxies (in Gyr).

**Name**: tfamily timestepRecordEvolutionSteps  
**Attached to**: tfamily module:Merger_Tree_Timesteps_Record_Evolution  
**File**: tfamily merger_trees.evolve.timesteps.record_evolution.F90  
**Default value**: 30  
**Description**: The number of steps (spaced logarithmically in cosmic time) at which to tabulate the evolution of main branch progenitor galaxies.

**Name**: tfamily timestepSimpleAbsolute  
**Attached to**: tfamily module:Merger_Tree_Timesteps_Simple  
**File**: tfamily merger_trees.evolve.timesteps.simple.F90  
**Default value**: 1  
**Description**: The maximum allowed absolute change in time (in Gyr) for a single step in the evolution of a node.
Name: tfamily timestepSimpleRelative  
**Attached to:** tfamily module:Merger_Tree_Timesteps_Simple  
**File:** tfamily merger_trees.evolve.timesteps.simple.F90  
**Default value:** 0.1  
**Description:** The maximum allowed relative change in time for a single step in the evolution of a node.

Name: tfamily toomreParameterCritical  
**Attached to:** tfamily module:Star_Formation_Rate_Surface_Density_Disks_KS  
**File:** tfamily star_formation.rate_surface_density.disks.Kennicutt-Schmidt.F90  
**Default value:** 0.4 [Kennicutt, 1989]  
**Description:** The critical Toomre parameter for star formation in disks.

Name: tfamily transferFunction  
**Attached to:** tfamily module:Merger_Trees_Simple  
**File:** tfamily merger_trees.file_maker.simple.F90  
**Default value:** none  
**Description:** The type of transfer function used.

Name: tfamily transferFunctionFile  
**Attached to:** tfamily module:Transfer_Functions_File  
**File:** tfamily structure_formation.transfer_function.file.F90  
**Default value:** none  
**Description:** The name of a file containing a tabulation of the transfer function for the “file” transfer function method.

Name: tfamily transferFunctionMethod  
**Attached to:** tfamily module:Transfer_Functions  
**File:** tfamily structure_formation.transfer_function.F90  
**Default value:** Eisenstein-Hu1999  
**Description:** The name of the method to be used for computing the transfer function.

Name: tfamily transferFunctionWDMFreeStreamingLength  
**Attached to:** tfamily module:Transfer_Function_BBKS  
**File:** tfamily structure_formation.transfer_function.BBKS.F90  
**Default value:** 0  
**Description:** The warm dark matter free streaming length (in Mpc).

Name: tfamily transferFunctionWdmCutOffScale  
**Attached to:** tfamily module:Transfer_Function_Eisenstein_Hu  
**File:** tfamily structure_formation.transfer_function.Eisenstein_Hu.F90  
**Default value:** 0  
**Description:** The cut-off scale in the transfer function due to warm dark matter.

Name: tfamily transferFunctionWdmEpsilon  
**Attached to:** tfamily module:Transfer_Function_Eisenstein_Hu  
**File:** tfamily structure_formation.transfer_function.Eisenstein_Hu.F90  
**Default value:** 0.361 [Barkana et al., 2001]  
**Description:** The parameter $\epsilon$ appearing in the warm dark matter transfer function [Barkana et al.,...
4. Input Parameters

Name: tfamily transferFunctionWdmEta
Attached to: tfamily module:Transfer_Function_Eisenstein_Hu
File: tfamily structure_formation.transfer_function.Eisenstein_Hu.F90
Default value: 5.0 [Barkana et al., 2001]
Description: The parameter $\epsilon$ appearing in the warm dark matter transfer function [Barkana et al., 2001].

Name: tfamily transferFunctionWdmNu
Attached to: tfamily module:Transfer_Function_Eisenstein_Hu
File: tfamily structure_formation.transfer_function.Eisenstein_Hu.F90
Default value: 1.2 [Barkana et al., 2001]
Description: The parameter $\epsilon$ appearing in the warm dark matter transfer function [Barkana et al., 2001].

Name: tfamily treeBranchingMethod
Attached to: tfamily module:Merger_Tree_Branching
File: tfamily merger_trees.branching_probability.F90
Default value: modifiedPress-Schechter
Description: The name of the method to be used for computing merger tree branching probabilities when building merger trees.

Name: tfamily treeBranchingModifierMethod
Attached to: tfamily module:Merger_Tree_Branching_Modifiers
File: tfamily merger_trees.branching_probability.modifier.F90
Default value: null
Description: The name of the method to be used for computing modifiers to merger tree branching probabilities.

Name: tfamily treeEvolveLimitLoadAverage
Attached to: tfamily module:Galacticus_Tasks_Evolve_Tree
File: tfamily galacticus.tasks.evolve_tree.F90
Default value: false
Description: Specifies whether or not to limit the load average

Name: tfamily treeEvolveLoadAverageMaximum
Attached to: tfamily module:Galacticus_Tasks_Evolve_Tree
File: tfamily galacticus.tasks.evolve_tree.F90
Default value: processorCount
Description: The maximum load average for which new trees will be processed.

Name: tfamily treeEvolveThreadLock
Attached to: tfamily module:Galacticus_Tasks_Evolve_Tree
File: tfamily galacticus.tasks.evolve_tree.F90
Default value: false
Description: Specifies whether or not to limit the number of threads across all GALACTICUS processes.

Name: tfamily treeEvolveThreadsMaximum
Attached to: tfamily module:Galacticus_Tasks_Evolve_Tree
File: tfamily galacticus.tasks.evolve_tree.F90
Default value: processorCount
Description: The maximum number of active threads across all GALACTICUS processes.

Name: tfamily treeEvolveWorkerCount
Attached to: tfamily module:Galacticus_Tasks_Evolve_Tree
File: tfamily galacticus.tasks.evolve_tree.F90
Default value: 1
Description: The number of workers that will work on this calculation.

Name: tfamily treeEvolveWorkerNumber
Attached to: tfamily module:Galacticus_Tasks_Evolve_Tree
File: tfamily galacticus.tasks.evolve_tree.F90
Default value: 1
Description: The number of this worker.

Name: tfamily treeNodeMethodAgeStatistics
Attached to: tfamily module:Galacticus_Nodes
File: tfamily objects.nodes.F90
Default value: null
Description: Specifies the implementation to be used for the ageStatistics component of nodes.

Name: tfamily treeNodeMethodBasic
Attached to: tfamily module:Galacticus_Nodes
File: tfamily objects.nodes.F90
Default value: standard
Description: Specifies the implementation to be used for the basic component of nodes.

Name: tfamily treeNodeMethodBlackHole
Attached to: tfamily module:Galacticus_Nodes
File: tfamily objects.nodes.F90
Default value: standard
Description: Specifies the implementation to be used for the blackHole component of nodes.

Name: tfamily treeNodeMethodDarkMatterProfile
Attached to: tfamily module:Galacticus_Nodes
File: tfamily objects.nodes.F90
Default value: scale
Description: Specifies the implementation to be used for the darkMatterProfile component of nodes.

Name: tfamily treeNodeMethodDisk
Attached to: tfamily module:Galacticus_Nodes
File: tfamily objects.nodes.F90
Default value: exponential
Description: Specifies the implementation to be used for the disk component of nodes.

Name: tfamily treeNodeMethodDynamicsStatistics
Attached to: tfamily module:Galacticus_Nodes
127
4. Input Parameters

File: tfamily objects.nodes.F90
Default value: null
Description: Specifies the implementation to be used for the dynamicsStatistics component of nodes.

Name: tfamily treeNodeMethodFormationTime
Attached to: tfamily module:Galacticus_Nodes
File: tfamily objects.nodes.F90
Default value: null
Description: Specifies the implementation to be used for the formationTime component of nodes.

Name: tfamily treeNodeMethodHostHistory
Attached to: tfamily module:Galacticus_Nodes
File: tfamily objects.nodes.F90
Default value: null
Description: Specifies the implementation to be used for the hostHistory component of nodes.

Name: tfamily treeNodeMethodHotHalo
Attached to: tfamily module:Galacticus_Nodes
File: tfamily objects.nodes.F90
Default value: standard
Description: Specifies the implementation to be used for the hotHalo component of nodes.

Name: tfamily treeNodeMethodIndices
Attached to: tfamily module:Galacticus_Nodes
File: tfamily objects.nodes.F90
Default value: null
Description: Specifies the implementation to be used for the indices component of nodes.

Name: tfamily treeNodeMethodInterOutput
Attached to: tfamily module:Galacticus_Nodes
File: tfamily objects.nodes.F90
Default value: null
Description: Specifies the implementation to be used for the interOutput component of nodes.

Name: tfamily treeNodeMethodMassFlowStatistics
Attached to: tfamily module:Galacticus_Nodes
File: tfamily objects.nodes.F90
Default value: null
Description: Specifies the implementation to be used for the massFlowStatistics component of nodes.

Name: tfamily treeNodeMethodMergingStatistics
Attached to: tfamily module:Galacticus_Nodes
File: tfamily objects.nodes.F90
Default value: null
Description: Specifies the implementation to be used for the mergingStatistics component of nodes.

Name: tfamily treeNodeMethodNBody
Attached to: tfamily module:Galacticus_Nodes
File: tfamily objects.nodes.F90
**Default value:** null
**Description:** Specifies the implementation to be used for the nBody component of nodes.

**Name:** tfamily treeNodeMethodPosition
**Attached to:** tfamily module:Galacticus_Nodes
**File:** tfamily objects.nodes.F90
**Default value:** null
**Description:** Specifies the implementation to be used for the position component of nodes.

**Name:** tfamily treeNodeMethodSatellite
**Attached to:** tfamily module:Galacticus_Nodes
**File:** tfamily objects.nodes.F90
**Default value:** standard
**Description:** Specifies the implementation to be used for the satellite component of nodes.

**Name:** tfamily treeNodeMethodSpheroid
**Attached to:** tfamily module:Galacticus_Nodes
**File:** tfamily objects.nodes.F90
**Default value:** standard
**Description:** Specifies the implementation to be used for the spheroid component of nodes.

**Name:** tfamily treeNodeMethodSpin
**Attached to:** tfamily module:Galacticus_Nodes
**File:** tfamily objects.nodes.F90
**Default value:** random
**Description:** Specifies the implementation to be used for the spin component of nodes.

**Name:** tfamily tripleBlackHoleInteraction
**Attached to:** tfamily module:Node_Component_Black_Hole_Standard
**File:** tfamily objects.nodes.components.black_hole.standard.F90
**Default value:** false
**Description:** Determines whether or not triple black hole interactions will be accounted for.

**Name:** tfamily velocityDispersionDiskGas
**Attached to:** tfamily module:Star_Formation_Rate_Surface_Density_Disks_KS
**File:** tfamily star Formation.rate_surface_density.disks.Kennicutt-Schmidt.F90
**Default value:** 10 [Leroy et al., 2008]
**Description:** The velocity dispersion of gas in disks.

**Name:** tfamily verbosityLevel
**Attached to:** tfamily module:Halo_Mass_Function_Tasks
**File:** tfamily halo_mass_functions.tasks.F90
**Default value:** 1
**Description:** The level of verbosity for GALACTICUS (higher values give more verbosity).

**Name:** tfamily virialDensityContrastFixed
**Attached to:** tfamily module:Virial_Density_Contrast
**File:** tfamily structure_formation.virial_density_contrast.F90
**Default value:** 200
4. Input Parameters

**Description:** The virial density contrast to use in the fixed value model.

**Name:** tfamily virialDensityContrastFixedType  
**Attached to:** tfamily module:Virial_Density_Contrast  
**File:** tfamily structure_formation.virial_density_contrast.F90  
**Default value:** criticalDensity  
**Description:** The reference density to use in the fixed value virial density contrast model. Either of critical density and mean density are allowed.

**Name:** tfamily virialDensityContrastFoFDensityRatio  
**Attached to:** tfamily module:Virial_Density_Contrast  
**File:** tfamily structure_formation.virial_density_contrast.F90  
**Default value:** 4.688 (value appropriate for an Navarro-Frenk-White (dark matter halo profile) (NFW) profile with concentration $c = 6.88$ which is the concentration found by Prada et al. [2011] for halos with $\sigma = 1.686$ which is the approximate critical overdensity for collapse).  
**Description:** The ratio of mean virial density to density at the virial radius to assume when setting virial density contrasts in the friends-of-friends model.

**Name:** tfamily virialDensityContrastFoFLinkingLength  
**Attached to:** tfamily module:Virial_Density_Contrast  
**File:** tfamily structure_formation.virial_density_contrast.F90  
**Default value:** 0.2  
**Description:** The friends-of-friends linking length algorithm to use in computing virial density contrast.

**Name:** tfamily virialDensityContrastMethod  
**Attached to:** tfamily module:Virial_Density_Contrast  
**File:** tfamily structure_formation.virial_density_contrast.F90  
**Default value:** sphericalCollapseMatterLambda  
**Description:** The method to be used for virialDensityContrast.

**Name:** tfamily virialDensityContrastSphericalTopHatDarkEnergyFixEnergyAt  
**Attached to:** tfamily module:Spherical_Collapse_Matter_Dark_Energy  
**File:** tfamily structure_formation.spherical_collapse.matter_dark_energy.F90  
**Default value:** turnaround  
**Description:** Selects the epoch at which the energy of a spherical top hat perturbation in a dark energy cosmology should be “fixed” for the purposes of computing virial density contrasts. (See the discussion in Percival 2005; §8.)

**Name:** tfamily virialOrbitsFixedRadialVelocity  
**Attached to:** tfamily module:Virial_Orbits_Fixed  
**File:** tfamily satellites.merging.virial_orbits.fixed.F90  
**Default value:** 0.90  
**Description:** The radial velocity (in units of the host virial velocity) to used for the fixed virial orbits distribution. Default value matches approximate peak in the distribution of Benson [2005].

**Name:** tfamily virialOrbitsFixedTangentialVelocity  
**Attached to:** tfamily module:Virial_Orbits_Fixed  
**File:** tfamily satellites.merging.virial_orbits.fixed.F90  
**Default value:** 0.75
**Description:** The radial velocity (in units of the host virial velocity) to used for the fixed virial orbits distribution. Default value matches approximate peak in the distribution of Benson [2005].

**Name:** tfamily virialOrbitsMethod  
**Attached to:** tfamily module:Virial_Orbits  
**File:** tfamily satellites.merging.virial_orbits.F90  
**Default value:** Benson2005  
**Description:** Selects the method to be used for finding orbital parameters of satellites at virial radius crossing.

**Name:** tfamily warmDarkMatterCriticalOverdensityGX  
**Attached to:** tfamily module:Critical_Overdensity_Mass_Scalings_WDM  
**File:** tfamily structure_formation.critical_overdensity.mass_scaling.warm_dark_matter.F90  
**Default value:** 1.5  
**Description:** The effective number of degrees of freedom for the warm dark matter particle.

**Name:** tfamily warmDarkMatterCriticalOverdensityMX  
**Attached to:** tfamily module:Critical_Overdensity_Mass_Scalings_WDM  
**File:** tfamily structure_formation.critical_overdensity.mass_scaling.warm_dark_matter.F90  
**Default value:** 1.0 keV  
**Description:** The mass (in keV) of the warm dark matter particle.

**Name:** tfamily warmDarkMatterCriticalOverdensityUseFittingFunction  
**Attached to:** tfamily module:Critical_Overdensity_Mass_Scalings_WDM  
**File:** tfamily structure_formation.critical_overdensity.mass_scaling.warm_dark_matter.F90  
**Default value:** true  
**Description:** Specifies whether the warm dark matter critical overdensity mass scaling should be computed from a fitting function or from tabulated data.

**Name:** tfamily zeroCoolingRateAboveVelocity  
**Attached to:** tfamily module:Cooling_Rates_White-Frenk  
**File:** tfamily cooling.cooling_rate.White-Frenk.F90  
**Default value:** 10000  
**Description:** The halo virial velocity (in km/s) above which cooling rates are forced to zero in the White-Frenk1991 cooling rate model.
5. Extracting and Analyzing Results

Galacticus stores its output in an HDF5 file. The contents of this file can be viewed and manipulated using a variety of ways including:

**HDFView** This is a graphical viewer for exploring the contents of HDF5 files;

**HDF5 Command Line Tools** A set of tools which can be used to extract data from HDF5 files ([h5dump](#) and **h5ls** are particularly useful);

**C++ and Fortran 90 APIs** Allow access to and manipulation of data in HDF5 files;

**h5py** A Python interface to HDF5 files.

In the remainder of this section the structure of Galacticus HDF5 files is described and a general-purpose Perl module which we use to extract data in a convenient manner is outlined.

5.1. General Structure of Output File

Figure 5.1 shows the structure of a typical Galacticus output file. The various groups and subgroups are described below.

5.1.1. UUID

The UUID (**Universally Unique Identifier**) is a unique identifier assigned to each Galacticus model that is run. It allows identification of a given model and can be referenced from, for example, an external database. Using the `Galacticus::HDF5` Perl module (see §5.2), the UUID can be loaded into the data structure using:

```perl
&HDF5::Get_UUID($model);
```

The UUID is then available as `$model->'uuid'`.

5.1.2. Build Information

Galacticus automatically stores various information about how it was built in the **Build** group attributes. Currently, included attributes consist of:

- **FGSL_library_version** The version number of the FGSL library;
- **FoX_library_version** The version number of the FoX library;
- **GSL_library_version** The version number of the GSL library;
- **HDF5_library_version** The version number of the HDF5 library;
- **make_CCOMPILER** The C compiler command used;
- **make_CCOMPILER_VERSION** The C compiler version information;
Figure 5.1.: Structure of a Galacticus HDF5 output file. 

<treeCount> is the total number of merger trees present in a given output, and <nodeCount> is the total number of nodes (in all trees) present in an output.
5.1. General Structure of Output File

make_CFLAGS The flags passed to the C compiler;
make_CPPCOMPILER The C++ compiler command used;
make_CPPCOMPILER_VERSION The C++ compiler version information;
make_CPPFLAGS The flags passed to the C++ compiler;
make_FCCOMPILER The Fortran compiler command used;
make_FCCOMPILER_VERSION The Fortran compiler version information;
make_FCFLAGS The flags passed to the Fortran compiler;
make_FCFLAGS_NOOPT The flags passed to the Fortran compiler for unoptimized compiles;
make_MODULETYPE The Fortran module type identifier string;
make_PREPROCESSOR The preprocessor command used.

Additionally, two datasets are included which store details of the GALACTICUS source changeset. sourceChangeSetMerge contains the output of “hg bundle -t none”, that is, it contains a Mercurial changegroup that incorporates any changes made to the current branch relative to the main GALACTICUS branch. sourceChangeSetDiff contains the output of “hg diff”, that is, all differences between the source code in the working directory and that which has been committed to Mercurial. Used together, these two datasets allow the precise source code used to run the model to be recovered from the main branch GALACTICUS source.

5.1.3. Parameters

The Parameters group contains a record of all parameter values (either input or default) that were used for this GALACTICUS run. The group contains a long list of attributes, each attribute named for the corresponding parameter and with a single entry giving the value of that parameter. The scripts/aux/Extract_Parameter_File.pl script can be used to extract these parameter values to an XML file suitable for re-input into GALACTICUS.

5.1.4. Version

The Version group contains a record of the GALACTICUS version used for this model, storing the major and minor version numbers, the revision number and the MERCURIAL revision and hash (if the code is being maintained using MERCURIAL, otherwise a value of −1 is entered or the revision and the hash attribute is empty). Additionally, the time at which the model was run is stored and, if the galacticusConfig.xml file (see §3.1) is present and contains contact details, the name and e-mail address of the person who ran the model.

5.1.5. globalHistory

The globalHistory group stores volume averaged properties of the model universe as a function of time. Currently, the properties stored are:

historyTime Cosmic time (in Gyr);
historyExpansion Expansion factor;
historyStarFormationRate Volume averaged star formation rate (in $M_\odot$/Gyr/Mpc$^3$).
5. Extracting and Analyzing Results

- **historyDiskStarFormationRate**: Volume averaged star formation rate in disks (in \(M_\odot/\text{Gyr}/\text{Mpc}^3\)).
- **historySpheroidStarFormationRate**: Volume averaged star formation rate in spheroids (in \(M_\odot/\text{Gyr}/\text{Mpc}^3\)).
- **historyStellarDensity**: Volume averaged stellar mass density (in \(M_\odot/\text{Mpc}^3\)).
- **historyDiskStellarDensity**: Volume averaged stellar mass density in disks (in \(M_\odot/\text{Mpc}^3\)).
- **historySpheroidStellarDensity**: Volume averaged stellar mass density in spheroids (in \(M_\odot/\text{Mpc}^3\)).
- **historyGasDensity**: Volume averaged cooled gas density (in \(M_\odot/\text{Mpc}^3\)).
- **historyNodeDensity**: Volume averaged resolved node density (in \(M_\odot/\text{Mpc}^3\)).

Dimensional datasets have a `unitsInSI` attribute which gives their units in the SI system.

### 5.1.6. Outputs

The `Outputs` group contains one or more sub-groups corresponding to the output times requested from **GALACTICUS**. Each sub-group contains the following information:

- **outputTime** *(attribute)* The cosmic time (in Gyr) at this output;
- **outputExpansionFactor** *(attribute)* The expansion factor at this output;
- **nodeData** A group of node properties as described below.

#### nodeData group

The `nodeData` group contains all data from nodes in all merger trees. The group consists of a collection of datasets each of which lists a property of all nodes in the trees which exist at the output time. Where relevant, each dataset contains an attribute, `unitsInSI`, which gives the units of the dataset in the SI system.

#### mergerTree datasets

To allow locating of nodes belonging to a given merger tree in the datasets in the `nodeData` group, the `mergerTreeStartIndex` and `mergerTreeCount` datasets list the starting index of each tree’s nodes in the `nodeData` datasets, and the number of nodes belonging to each tree respectively. Additionally, the `mergerTreeWeight` dataset lists the `volumeWeight` property for each tree (see §5.1.6) which gives the weight (in \(\text{Mpc}^{-3}\)) which should be assigned to this tree (and all nodes in it) to create a volume-averaged sample (see §5.3.1). Finally, the `mergerTreeIndex` dataset gives the index of each tree stored in the `nodeData` datasets.

#### mergerTree subgroups

These subgroups will be present if the `[mergerTreeOutputReferences]` parameter is set to true. Each `mergerTree` subgroup contains HDF5 references to all data on a single merger tree. The group consists of a collection of scalar references each of which points to the appropriate region of the corresponding dataset in the `nodeData` group. Additionally, the `volumeWeight` attribute of this group gives the weight (in \(\text{Mpc}^{-3}\)) which should be assigned to this tree (and all nodes in it) to create a volume-averaged sample. (A second attribute, `volumeWeightUnitsInSI`, gives the units of `volumeWeight` in the SI system.)
5.1.7. Optional Outputs

Numerous other quantities can be optionally output. These are documented below:

**Redshifts**

The redshift corresponding to the time at which a node was last isolated can be output by setting \[\text{outputNodeRedshifts}\] to \textbf{true}. This quantity will be output as \textit{basicRedshiftLastIsolated}.

**Mass Accretion Histories**

A mass accretion history (i.e. mass as a function of time) for the main branch in each merger tree can be output by setting \textit{massAccretionHistoryOutput} = \textbf{true}. If requested, a new group \textit{massAccretionHistories} will be made in the GALACTICUS output file. It will contain groups called \textit{mergerTreeN} where \(N\) is the merger tree index. Each such group will contain the following three datasets, defined for the main branch of the tree\(^1\):

\begin{itemize}
  \item \texttt{nodeIndex} The index of the node in the tree;
  \item \texttt{nodeTime} The time at this point in the tree (in Gyr);
  \item \texttt{nodeMass} The mass of the node at this point in the tree (in \(M_\odot\)). The \texttt{nodeMass} property is defined to be the total mass of each node in a merger tree. Therefore, it includes both dark and baryonic mass. Additionally, the mass of a node includes the mass of any satellite nodes that it may contain. The mean density of the node depends on the method selected by the \texttt{virialDensityContrastMethod} parameter.
\end{itemize}

**Merger Tree Dump**

A full dump of merger tree structure by setting \texttt{mergerTreeStructureDump} = \textbf{true}. In this case, files will be dumped to the directory specified by \texttt{[mergerTreeStructureDumpDirectory]} for each merger tree with final mass between \texttt{[mergerTreeStructureDumpMassMinimum]} and \texttt{[mergerTreeStructureDumpMassMaximum]}. Each tree is dumped to a file named “\texttt{mergerTreeDump:<treeIndex>:1.gv}” in the specified directory in \textsc{GraphViz} format.

**Conditional Mass Functions**

Setting \texttt{[mergerTreeComputeConditionalMassFunction]} = \textbf{true} will cause conditional mass functions to be computed and output to the GALACTICUS output file in a group named “\texttt{conditionalMassFunction}”. The mass functions are binned in parent halo mass, and the mass ratio of the progenitor to parent halo. Bins are logarithmically spaced in mass (and mass ratio), with the range and number of bins controlled by the parameters:

\begin{itemize}
  \item \texttt{[mergerTreeComputeConditionalMassFunctionParentMassCount]};
  \item \texttt{[mergerTreeComputeConditionalMassFunctionParentMassMinimum]};
  \item \texttt{[mergerTreeComputeConditionalMassFunctionParentMassMaximum]};
  \item \texttt{[mergerTreeComputeConditionalMassFunctionMassRatioCount]};
  \item \texttt{[mergerTreeComputeConditionalMassFunctionMassRatioMinimum]};
\end{itemize}

\(^1\)“Main branch” is defined by starting from the root node of a tree and repeatedly stepping back to the most massive progenitor of the branch. This does not necessarily pick out the most massive progenitor at a given time.
5. Extracting and Analyzing Results

- \[\text{mergerTreeComputeConditionalMassFunctionMassRatioMaximum}\].

The resulting parent masses and mass ratios are written to datasets \text{massParent} and \text{massRatio} respectively. Parent and progenitor halos are defined at a set of redshifts defined by the arrays \[\text{mergerTreeComputeConditionalMassFunctionParentRedshifts}\] and \[\text{mergerTreeComputeConditionalMassFunctionProgenitorRedshifts}\], which are written to datasets \text{redshiftParent} and \text{redshiftProgenitor}. The resulting conditional masses functions are written to datasets \text{conditionalMassFunction} and \text{conditionalMassFunctionError}.

In addition to standard progenitor mass functions, the progenitor mass function conditioned on progenitor rank (i.e. \(1^{\text{st}}\) most massive, \(2^{\text{nd}}\), ..., \(n^{\text{th}}\) most massive progenitor) is computed and output to the datasets \text{primaryProgenitorMassFunction} and \text{primaryProgenitorMassFunctionError}. The depth (i.e. \(n\)) is specified by \[\text{mergerTreeComputeConditionalMassFunctionPrimaryProgenitorDepth}\].

Finally, the progenitor mass function conditioned on recent formation is computed and output to the datasets \text{formationRateFunction} and \text{formationRateFunctionError}. To be considered “recently formed” a progenitor must have formed between \(t\) and \(t(1 - \Delta)\) where \(t\) is the progenitor time and \(\Delta = \text{mergerTreeConditionalMassFunctionFormationRateTimeFraction}\).

Pre-Evolution Merger Trees

\text{GALACTICUS} can output the full structure of merger trees prior to any evolution. Merger tree structure can be requested by setting \text{mergerTreeStructureOutput=true}. Structures are written to a new group, \text{mergerTreeStructures}, in the \text{GALACTICUS} output file. This group will contain groups called \text{mergerTreeN} where \(N\) is the merger tree index. Each such group will contain the following datasets:

- \text{nodeIndex} The index of the node in the tree;
- \text{childIndex} The index of this node’s first child node;
- \text{parentIndex} The index of this node’s parent node;
- \text{SiblingIndex} The index of this node’s sibling node;
- \text{nodeTime} The time at this point in the tree (in Gyr);
- \text{nodeMass} The mass of the node at this point in the tree (in \(M_\odot\)). The \text{nodeMass} property is defined to be the total mass of each node in a merger tree. Therefore, it includes both dark and baryonic mass. Additionally, the mass of a node includes the mass of any satellite nodes that it may contain. The mean density of the node depends on the method selected by the \text{virialDensityContrastMethod} parameter.

Additional, optional, datasets can be added by setting appropriate input parameters. Currently these include:

- **Virial quantities** If \text{mergerTreeStructureOutputVirialQuantities=true} then two additional datasets are included:
  - \text{nodeVirialRadius} The virial radius of the node (in Mpc);
  - \text{nodeVirialVelocity} The virial velocity of the node (in km/s);
- **Dark matter scale radii** If \text{mergerTreeStructureOutputDarkMatterScaleRadius=true} then an additional dataset is included:
  - \text{darkMatterScaleRadius} The scale radius of this node’s dark matter halo profile (in Mpc);
- **Tree final descendent** If \text{outputFinalDescendentIndices=true} then an additional dataset is included:
  - \text{finalDescendentIndex} The index of the final descendent that this node will reach in its merger trees;
5.2. Perl Module for Data Extraction

A Perl module is provided that allows for easy extraction of datasets from the GALACTICUS output file together with a straightforward way to implement derived properties. To use this Perl module, add

```perl
genuse lib "/.perl";
use PDL;
use Galacticus::HDF5;
```
at the start of your Perl script. The Galacticus::HDF5 module will import data from a GALACTICUS HDF5 file into PDL variables. All data are stored in a single structure, which also specifies the file, output and range of trees to read. An example of reading a dataset from a file is:

```perl
givenmy $model;
$model->{file} = "galacticus.hdf5";
$model->{output} = 1;
$model->{tree} = "all";
$model->{dataRange} = [1,2];
$model->{store} = 0;
&HDF5::Get_Dataset($model, ['nodeMass']);
$ datasets = $model->{datasets};
print $ datasets->{nodeMass} . "\n";
given```

The $model object is initialized with information to specify which file, output and trees should be used. Its settable components are:

- **file** The name of the GALACTICUS output file to be read.
- **output** Specify the output number in the file which should be read.
- **tree** Specify the tree which should be read, or use “all” to specify that all trees be read.
- **dataRange** Gives the first and last entry in the dataset to read—this facilitates reading of partial datasets (and therefore reading datasets in a piecemeal fashion). If this component is missing, the entire dataset is read.
- **store** If set to 1, any derived properties will be stored back in the GALACTICUS output file for later retrieval. If set to 0 (or if this option is not present), derived properties will not be stored. Currently, storing of derived properties in the GALACTICUS file is only possible if the **tree** option is set to “all” and no **dataRange** is specified.

The &HDF5::Get_Dataset($model, ['nodeMass']); call requests that the nodeMass dataset be read. It is return as a PDL variable in the nodeMass element of the datasets element which is itself a member of $model. The final lines in the example simply write out the resulting array of nodeMass values.

5.2.1. Derived Properties

Derived properties can be created by giving defining functions along with a regular expression string that allows them to be matched. For example, the Galacticus::Baryons module implements a hot gas fraction property called hotHaloFraction or hotHaloFrac. It has the following form:

```perl
givenpackage Baryons;
use PDL;
use Galacticus::HDF5;
geiven```
5. Extracting and Analyzing Results

use Data::Dumper;

%HDF5::galacticusFunctions = ( %HDF5::galacticusFunctions,
   "hotHalo(Fraction|Frac)" => \&Baryons::Get_hotHaloFraction
 );

my $status = 1;
$status;

sub Get_hotHaloFraction {
   $model = shift;
   $dataSetName = $_[0];
   &HDF5::Get_Dataset($model, ['hotHaloMass', 'nodeMass']);
   $dataSets = $model->{'dataSets'};
   $dataSets->{$dataSetName} = $dataSets->{'hotHaloMass'}/$dataSets->{'nodeMass'};
}

The module begins by adding an entry to the %HDF5::galacticusFunctions hash. The key gives a
regular expression which matches to the name of the property to be defined. The value of the key gives
a reference to a subroutine to be called to evaluate this expression. The subroutine is defined below.
When called, it receives the $model structure along with the name of the requested property. The
subroutine should then simply evaluate the requested property and store it in the appropriate location
within $model. Note that the subroutine can request additional datasets be loaded (as happens above
where hotHaloMass and nodeMass are requested) if they are needed for its calculations.

Available Derived Properties

mergerTreeIndex The index of the merger tree in which the galaxy is found. Provided by: Galacticus::HDF5.

redshift The redshift at which the galaxy exists. Provided by: Galacticus::Time.

time The cosmic time (in Gyr) at which the galaxy exists. Provided by: Galacticus::Time.

expansionFactor The expansion factor at which the galaxy exists. Provided by: Galacticus::Time.

stellarMass The sum of disk and spheroid stellar masses. Provided by: Galacticus::StellarMass.

massColdGas The sum of disk and spheroid cold gas masses. Provided by: Galacticus::GasMass.

starFormationRate The sum of disk and spheroid star formation rates. Provided by: Galacticus::StellarMass.

hostNodeMass For isolated nodes, the node mass. For non-isolated nodes, the mass of the isolated node
in which the node resides. Provided by: Galacticus::HostNode.

stellarMass The sum of disk and spheroid stellar masses (or, whichever of these exist in the model).
   Provided by: Galacticus::StellarMass.

hotHalo(Fraction|Frac) The fraction the node’s mass in the hot gas halo. Provided by: Galacticus::Baryons.

inclination A randomly selected inclination for the disk (in degrees). Provided by: Galacticus::Inclination.
5.2. Perl Module for Data Extraction

^disk|bulge)StellarLuminosity:.*:dustAtlas\([-faceOn\]\)\$ Dust-extinguished luminosities for disk and bulge found by interpolating in the dust tables of Ferrara et al. [1999]. If the [faceOn] qualifier is present, extinctions are computed assuming that the disk is observed face-on, otherwise a random inclination is used. Optionally, the dust atlas file to used can be specified via $dataSet->{'dustAtlasFile'}. The available dust atlases span a limited range of spheroid sizes and central optical depths in their tabulations. Standard behavior is to extrapolate beyond the ends of these ranges. This can be controlled via $dataSet->{'dustAtlasExtrapolateInSize'} and $dataSet->{'dustAtlasExtrapolateInTau'} respectively, which can be set to yes/no (or, equivalently, 1/0). Provided by: Galacticus::DustAttenuation.

^disk|bulge)StellarLuminosity:.*:dustCharlotFall2000$ Dust-extinguished luminosities for disk and bulge found using the model of Charlot and Fall [2000]. Provided by: Galacticus::DustCharlotFall2000.

^totalStellarLuminosity:.*:dustAtlas\([faceOn\]\)$ (Optionally dust-extinguished) luminosities for disk plus bulge found by adding together the corresponding disk and bulge luminosities. Provided by: Galacticus::Luminosities.

^bulgeToTotalLuminosity:.*:dustAtlas\([faceOn\]\)$ Ratio of bulge to total (optionally dust-extinguished) luminosities. Provided by: Galacticus::Luminosities.

^magnitude\([^-]:([^-]):(\d.\d)\):z\(\d.\d\):\(dust[^-]:\)?:vega|AB\)? Absolute magnitude corresponding to a stellar luminosity, in either Vega or AB systems. Provided by: Galacticus::Magnitudes.

^magnitude\([^-]:\)?:vega|AB\)? Absolute magnitude corresponding to the generic luminosity property ^luminosity:$1, in either Vega or AB systems. Provided by: Galacticus::Magnitudes.

^apparentMagnitude\([^-]:\) Apparent magnitude corresponding to the absolute magnitude ^magnitude:$1. Provided by: Galacticus::Magnitudes.

comovingDistance The comoving distance (in Mpc) to the galaxy—provided by Galacticus::Survey (see §5.3.1 for a full description).

luminosityDistance The luminosity distance (in Mpc) to the galaxy—provided by Galacticus::Survey (see §5.3.1 for a full description).

distanceModulus The distance modulus (including the +2.5 log(1 + z) term to account for squeezing of photon frequencies) to the galaxy—provided by Galacticus::Survey (see §5.3.1 for a full description).

redshift The redshift at which the galaxy is observed—provided by Galacticus::Survey (see §5.3.1 for a full description).

angularWeight The weight (in units of ) which should be assigned to this galaxy in order to build a redshift survey—provided by Galacticus::Survey (see §5.3.1 for a full description).

angularDiameterDistance The angular diameterer distance (in Mpc) to the galaxy—provided by Galacticus::Survey (see §5.3.1 for a full description).

^angularPosition\[12]$ The angular position (in radians measured along two orthogonal axes from the center of the field) of the galaxy—provided by Galacticus::Survey (see §5.3.1 for a full description).

^grasilFlux\(\d.\d\)+microns The flux at the given wavelength (specific in microns) of the galaxy as computed by the Grasil code (see §5.5 for a full description).
5. Extracting and Analyzing Results

^grasilInfraredLuminosity^ The total infrared (8–1000µm) luminosity of the galaxy as computed by the Grasil code (see §5.5 for a full description).

^grasilFlux:([^:]*)^ The flux (in Janskys) of the galaxy as computed by the Grasil code integrated under the specified filter (see §5.5 for a full description).

^luminosity:grasil:([^:]*):([^:]*)^ The luminosity (in units of the zero point of the AB magnitude system) of the galaxy as computed by the Grasil code integrated under the specified filter and in the specified frame (see §5.5 for a full description).

flux850micronHayward The flux of the galaxy at 850µm computed using the fitting formula of Hayward et al. [2010], specifically:

\[
\frac{S_{850\mu m}}{Jy} = A \left( \frac{\dot{M}_*}{100M_\odot \text{Gyr}^{-1}} \right)^\alpha \left( \frac{R_{\text{dust}} M_{\text{metals, gas}}}{10^8 M_\odot} \right)^\beta,
\]

where \( R_{\text{dust}} \) is the dust-to-metals ratio, \( \dot{M}_* \) is the total star formation rate in the galaxy and \( M_{\text{metals, gas}} \) is the total mass of metals in the gas phase of the galaxy. Note that the fit given by Hayward et al. [2010] was computed for galaxy at \( z \approx 2 \). The parameters of the fit can be specified by setting elements of $model->\{'haywardSubMmFit'\}: \{'dustToMetalsRatio'\}≡ R_{\text{dust}}, \{'fitNormalization'\}≡ A, \{'starFormationRateExponent'\}≡ \alpha, and \{'dustMassExponent'\}≡ \beta. If these elements are not present the default values of \( A = 0.65 \times 10^{-3}, R_{\text{dust}} = 0.61, \alpha = 0.42 \) and \( \beta = 0.58 \) Hayward et al. [2010] will be used instead. Provided by: Galacticus::SubMmFluxesHayward.

^columnDensity(disk|spheroid)?^ The column density of hydrogen (in units of \( 10^{-23} \) cm\(^{-2} \)) along the line of sight to the center of the galaxy. If a component is specified the calculation is performed for that component, otherwise the sum of disk and spheroid column densities is computed. Provided by: Galacticus::ColumnDensity. For the exponential disk, the column density is given by:

\[
N_H = \frac{X_H}{m_H} \frac{M_{\text{SM}}}{4\pi hr_d^2} \int_0^{\infty} \exp(-r/hr_d) \text{sech}^2\left(z/hr_d\right)dl,
\]

142
where \(r_d\) is the disk scale length, \(h\) is the ratio of vertical scale height to radial scale length, \(X_H\) is the mass fraction in hydrogen, \(m_H\) is the mass of the hydrogen atom and \(l\) is distance along the line of sight. Writing \(z = r / \tan i\) for a disk at inclination \(i\), and \(l = \sqrt{r^2 + z^2} = r \sqrt{1 + 1 / \tan^2 i}\) this becomes:

\[
N_H = \frac{X_H M_{ISM}}{m_H 4\pi h r_d^2} \sqrt{1 + 1 / \tan^2 i} \int_0^\infty \exp(-x) \text{sech}^2(x/h \tan i) dx.
\]

(5.3)

The integral can be evaluated to give:

\[
N_H = \frac{X_H M_{ISM}}{m_H 8\pi h r_d^2} \sqrt{1 + 1 / \tan^2 i} H \left\{ \psi \left( -\frac{H}{4} \right) - \psi \left( \frac{1}{2} - \frac{H}{4} \right) \right\} - 2
\]

(5.4)

where \(H = h \tan i\) and \(\psi(x)\) is the digamma function.

\[\text{peakSFR}\] The peak star formation rate for each galaxy, measured from the \text{starFormationHistories} output group (see §17.4.3). The peak star formation rate reported is therefore that when averaged over the bins used by the star formation history output method (see §17.4.3). Provided by: \text{Galacticus::SFH}.

\[\text{lensingAmplification}\] The gravitational lensing amplification due to large scale structure for each galaxy. The amplification is drawn at random from the redshift-dependent distribution of Takahashi et al. [2011]. Provided by: \text{Galacticus::LensingAmplification}.

\[(\text{disk|spheroid|total})\text{LineLuminosity}:[^:]+(:[^:]+){0,2}:\text{z}[\d.]+\]$ Returns the luminosity of the named emission line, for the named component, at the given redshift in units of Solar luminosities. Optinally, a filter may be provided in which case the emission line luminosity under that filter is returned in units of AB maggies. For example, \text{totalLineLuminosity:balmerAlpha6563:rest:z0.0000} returns the luminosity of the H\(\alpha\) line at \(z = 0\). See §7.5.3 for more details. Provided by: \text{Galacticus::EmissionLines}.

### 5.2.2. Galaxy Clustering via the Halo Model

Galaxy clustering calculations (currently real and redshift space power spectra and two-point correlation functions) can be computed using the \text{Galacticus::HaloModel} Perl module. To use this module, \text{Galacticus} must be run with \text{[outputHaloModelData]=true} (see §14.7) to output data on halo profiles and power spectra. To perform halo model calculations, simply use this module in a Perl script, initialize the data hash, \%dataHash, used for the \text{Galacticus::HDF5} module, and construct a PDL, \$selectedGalaxies, which contains the indices (not the node indices, but the positions within the PDL arrays read in from the \text{Galacticus} output file) of galaxies for which the clustering is to be computed.

A power spectrum can then be computed using:

\[
($\text{waveNumber}$,$\text{linearPowerSpectrum}$,$\text{galaxyPowerSpectrum}$) = &\text{HaloModel::Compute_Power_Spectrum($model,$selectedGalaxies,space => "redshift"});
\]

The PDLs returned contain a list of comoving wavenumbers, the linear power spectrum of matter at the selected time and the (non-linear) power spectrum of the selected galaxies. If the \text{space} option is set to \text{redshift} then a redshift space power spectrum is computed, otherwise a real space power spectrum is computed.

A two-point correlation function can be computed from the returned power spectrum using:

\[
($\text{separations}$,$\text{galaxyCorrelationFunction}$) = &\text{HaloModel::Compute_Correlation_Function($waveNumber,$galaxyPowerSpectrum,$separationMinimum,$separationMaximum,$separationPointsPerDecade});
\]
5. Extracting and Analyzing Results

The first two PDLs are those returned by the power spectrum calculation. The final three give the minimum and maximum separations at which to compute the correlation function and the number of points per decade of separation at which to tabulate the correlation function. The returned PDLs give the comoving separation (in Mpc) and correlation function corresponding to the input power spectrum.

5.3. Topics in Analysis of Galacticus Outputs

5.3.1. Building Volume Limited Samples

The \texttt{mergerTreeWeight} property (see §5.1.6) property specifies the weight to be assigned to each merger tree in a model to construct a representative (i.e. volume limited) sample of galaxies. Galacticus does not typically generate every merger tree in a fixed volume of the Universe (as an N-body simulation might for example) as it’s generally a waste of time to simulate millions of low mass halos and only a small number of high mass halos. The \texttt{mergerTreeWeight} factors correct for this sampling. If merger trees are being built, then the \texttt{mergerTreeWeight}, \( w_i \), for each tree of mass \( M_i \) (where the trees are ranked in order of increasing mass) is given by

\[
    w_i = \int_{M_{\text{min}}}^{M_{\text{max}}} n(M) \, dM, \quad (5.5)
\]

where \( n(M) \) is the dark matter halo mass function and

\[
    M_{\text{min}} = \sqrt{M_{i-1} M_i}, \quad (5.6)
\]

\[
    M_{\text{min}} = \sqrt{M_i M_{i+1}}. \quad (5.7)
\]

Suppose, for example, that we wish to construct a luminosity function of galaxies. In particular, we consider a luminosity bin \( k \) which extends from \( L_k - \Delta k/2 \) to \( L_k + \Delta k/2 \). If tree \( i \) contains \( N_i \) galaxies with luminosities \( l_{i,j} \), where \( j \) runs from 1 to \( N_i \), then the luminosity function in this bin is given by:

\[
    \phi_k = \sum_i \sum_{j=1}^{N_i} \begin{cases} 
        w_i & \text{if } L_k - \Delta k/2 < l_{i,j} \leq L_k + \Delta k/2 \\
        0 & \text{otherwise.} 
    \end{cases} \quad (5.8)
\]

Building Redshift Catalogs

The \texttt{Galacticus::Survey} module provides several derived properties which are useful for constructing redshift surveys, i.e. samples of galaxies distributed in redshift in a way consistent with the chosen cosmology. This module requires a \texttt{Galacticus} model with at least two outputs. The module will first check if \texttt{Galacticus} was run with lightcone output (see §14.8). If it was, the coordinates and redshifts of each galaxy in the lightcone will be used to determine comoving distance, redshift and angular weight. If \texttt{Galacticus} was run without lightcone output then, for each output, it will use the galaxies at that output to populate the range of redshifts lying between the arithmetic mean of the redshift of the output and the redshifts of the preceeding and succeeding outputs (for the latest output the range is extended to \( z = 0 \), while for the earliest output the range is truncated at the redshift of the output itself).

Within this redshift range, galaxies are assigned a comoving distance (property \texttt{comovingDistance}) by selecting at random from the available comoving volume. From this comoving distance a redshift and luminosity distance (properties \texttt{redshift} and \texttt{luminosityDistance} respectively) are determined. Note that galaxies within an individual host halo are not kept spatially co-located—they can each be assigned different comoving distances within the available range. In addition to these properties, the \texttt{Galacticus::Survey} module provides a \texttt{angularWeight} property. This gives the mean number of each galaxy that would be found in a solid angle of one steradian.
5.4. Postprocessing Scripts

5.5. Reprocessing Through Dust Using GRASIL

GALACTICUS computes the star formation histories and, optionally, the luminosities of stellar populations in galaxies. The effects of dust on galaxy spectra is handled by post-processing of GALACTICUS output. A simple treatment of dust-extinction of starlight is described in §5.2.1. For a more detailed treatment of dust extinction, and the re-emission of starlight by dust, GALACTICUS is able to interface with the GRASIL radiative transfer code described by Silva et al. [1998].

To process a GALACTICUS galaxy through GRASIL use the following method:

1. Run GALACTICUS to generate galaxies. GRASIL requires a detailed star formation history for each galaxy it processes. Therefore, you should set [starFormationHistoriesMethod]=metallicity split in your input parameter file. Other parameters controlling the details of the star formation history recording are discussed in §17.4.3. Note that you should ensure that the history is recorded with sufficient precision to permit an accurate calculation by GRASIL. Additionally, you may want to consider using the same stellar population data in GALACTICUS as is used by GRASIL—suitable files in GALACTICUS format can be downloaded from the GALACTICUS web site.

2. Select a galaxy from the output to process through GRASIL. You will need to know the output number, tree index and node index of the galaxy;

3. Run the Extract_Star_Formation_History_for_Grasil.pl script to extract the star formation history for this galaxy in a format suitable for input into GRASIL:

   scripts/aux/Extract_Star_Formation_History_for_Grasil.pl <inputFile> <outputIndex> <treeIndex> <nodeIndex> <grasilFile> [<plotFile>]

   where inputFile is the name of the GALACTICUS model file, outputIndex, treeIndex and nodeIndex are the quantities described above that identify the galaxy of interest and grasilFile is the name of the file to which the star formation history should be written. GRASIL convention dictates that this file should have the suffix .dat. The optional plotFile is the name of a file to which a plot of the star formation history will be written.

4. Create a suitable input parameter file for GRASIL, with the same name as your star formation file created above, but with the suffix .par. An example of such a file is given in aux/Grasil/grasilExample.par—refer to the GRASIL documentation for details of the parameters and how to control GRASIL.

5. Download the GRASIL executable from here and supporting data files from here and unpack them.

6. Run GRASIL:

   aux/Grasil/grasil <fileNameRoot>

   where fileNameRoot is the name of the parameter file you created without the .par suffix. GRASIL will now process (this will probably take a few minutes) the galaxy and output a set of files describing the spectral energy distribution of the galaxy (possibly as viewed from multiple angles depending on your input parameter file). See the GRASIL documentation for full details on the output data.

---

2You can put these files where ever you want. Usually, we place them into aux/Grasil/.
5. Extracting and Analyzing Results

5.5.1. Using the Galacticus::Grasil Module

A more automated way to compute fluxes using Grasil is to use the Galacticus::Grasil Perl module that is provided with GALACTICUS. This model provides additional derived properties in the usual way (see §5.2.1 for details). Currently, observed fluxes are provided, via a derived property grasilFlux<XXX>microns, which will give the observed flux of the galaxy at wavelength \( \lambda = <XXX> \mu m \).

Additionally, the flux integrated under a filter can be found using the derived property grasilFlux:<filter>, where <filter> is the filter name. Luminosities under a filter can be found using luminosity:grasil:<filter>:<frame>, where frame is either rest or observed. Finally, grasilInfraredLuminosity will give the total infrared (8–1000 \( \mu m \)) luminosity of galaxies. Note that these properties require that the Galacticus::Survey module be used to provide redshifts for galaxies (see §5.3.1).

The module will automatically run GRASIL using the parameters given in data/grasilBaseParameters.txt, subject the modifications specified in the grasilOptions element of $model. Allowed options are:

- \$dataSet-{'grasilOptions'}-{'dustToMetalsRatio'}: Sets the dust to metals ratio used in GRASIL;
- \$dataSet-{'grasilOptions'}-{'includePAHs'}: Set to 0/1 to switch off/on calculations of PAH features in GRASIL;
- \$dataSet-{'grasilOptions'}-{'fluctuatingTemperatures'}: Set to 0/1 to switch off/on calculations of fluctuating dust grain temperatures in GRASIL;
- \$dataSet-{'grasilOptions'}-{'wavelengthCount'}: Specifies the number of wavelengths to use in calculating radiative transfer (i.e. the “nlf” parameter in GRASIL);
- \$dataSet-{'grasilOptions'}-{'radialGridCount'}: Specifies the number of radial grid cells to use in calculating radiative transfer (i.e. the “ndr” parameter in GRASIL);
- \$dataSet-{'grasilOptions'}-{'recomputeSEDS'}: If set to 1, SEDs will be computed for all galaxies even if they have been previously computed. (This can be useful to recompute SEDs with different options passed to GRASIL for example.) Set to 0 to re-use previously computed SEDs;
- \$dataSet-{'grasilOptions'}-{'maxThreads'}: Specifies the number of parallel threads to launch, each of which will run an instance of GRASIL. If not specified this number will default to the number of available cores;
- \$dataSet-{'grasilOptions'}-{'cpuLimit'}: Specifies the maximum time (in seconds) for which a Grasil calculation should be allowed to run before being terminated. Defaults to 3600s.

If necessary, the GRASIL code and data files will be downloaded automatically. Where possible, multiple instances of GRASIL are run in parallel to speed up the calculation.

The computed spectral energy distribution (SED) is stored in the HDF5 output file in dataset grasilSEDS/Output<outputIndex>/mergerTree<treeIndex>/node<nodeIndex>/SED, where outputIndex, treeIndex and nodeIndex are respectively the indices of the output, merger tree and node to which the galaxy belongs. The wavelengths and inclinations at which the SED is tabulated are similarly stored in the same group in datasets wavelength and inclination. If the SED has been previously computed for a given galaxy, it will be read from file instead of recomputing using Grasil. The flux is found by interpolating to the relevant rest-frame wavelength and observed inclination.

The Galacticus::Grasil module supports the selection element of $model. If this element is set to contain a PDL giving the selection of galaxies to process then only those galaxies will have their Grasil fluxes computed, rather than all galaxies in the output. Note that if the resulting dataset is stored back to the HDF5 file then any non-selected galaxies will be assigned zero flux, and these zero fluxes will be reported on future attempts to access the flux.\(^3\)

\(^3\)The selection element of $model will be more generally supported in future versions of GALACTICUS and will more elegantly handle storing of partial datasets to file to avoid this problem.
5.6. Meta-Analysis of GALACTICUS

GALACTICUS contains modules which allow it to analyze and profile its own performance.

5.6.1. Tree Construction/Evolution Timing

The Galacticus_Meta_Tree_Timing module records the time taken to construct and evolve each merger tree. Setting [metaCollectTimingData]=true will cause tree timing data to be recorded and output to the metaData/treeTiming group. Three datasets are written to this group:

- treeMasses: Gives the base node masses of the recorded trees (in units of $M_{\odot}$);
- treeConstructTimes: Gives the time (in seconds) taken to construct each merger tree;
- treeEvolveTimes: Gives the time (in seconds) taken to evolve each merger tree.

5.6.2. ODE Evolver Profiler

The Galacticus_Meta_Evolver_Profiler module records statistics on the performance of the main ODE solver used to advance galaxies through time.

Note: Currently, this profiler requires access to features of the GNU Scientific Library that are not implemented within FGSL. As such, this functionality is normally not compiled with GALACTICUS. If you want to use the profiler, contact Andrew Benson and request a copy of the modified FGSL source code. Once this is installed, the profiler can be activated by including -DPROFILE in the compilation options (e.g. add this to your GALACTICUS_FCFLAGS environment variable).

When active, setting [profileOdeEvolver]=true will activate profiling. Each step taken by the ODE evolver is then analyzed. First, a record of the size of the time step taken is recorded. Second, the property which is currently limiting the time step size (i.e. that which has the largest error over the step as judged using the same heuristics as the ODE solver uses to determine step size) is determined and a record of this is kept.

At the end of a run the accumulated data is written to the GALACTICUS output file, into a group named metaData/evolverProfiler. A histogram of time step sizes is written to metaProfileTimeStepCount with bins specified in metaProfileTimeStep—these bins can be adjusted using [metaProfileTimeStepMinimum], [metaProfileTimeStepMaximum] and [metaProfileTimeStepPointsPerDecade]. A histogram of which properties limited step size is written to metaProfilePropertyHitCount with the associated property names written to [metaProfilePropertyNames]. Property names can only be determined if the component to which they belong supports the decodePropertyIdentifiersTask directive (see §17.4.3). Properties which could not be decoded in this way are listed as unknown.

5.7. Meta-Data in Plots

GALACTICUS writes extensive metadata to the XMP section of plots resulting from analysis of GALACTICUS outputs. Metadata written includes all GALACTICUS parameter values, GALACTICUS version and build information, the source code changeset and the model UUID. The intention is to include sufficient metadata that the original model and analysis can be repeated in complete detail. The scripts/aux/extractMetaData.pl script can be used to extract this metadata from a plot file. For example:

scripts/aux/extractMetaData.pl myPlot.pdf myMetaData

will extract the metadata from file myPlot.pdf, writing a report to screen on GALACTICUS version and build information. It will also output the following files:
myMetaDataParameters.xml A GALACTICUS input parameter file containing all parameters used to run the GALACTICUS model from which myPlot.pdf was made;

myMetaDataScript.pl The script used to create myPlot.pdf;

myMetaData.bundle A bundled changeset for Mercurial containing the committed source changeset used to build GALACTICUS. This can be applied to a GALACTICUS checkout using the hg unbundle command;

myMetaData.patch A bundled diff of the GALACTICUS source against the committed source. This can be applied to a GALACTICUS checkout (after applying myMetaData.bundle) using the hg patch command.

5.8. Perl Statistics Modules

GALACTICUS provides some Perl modules which compute useful statistics. These are described below.

5.8.1. Statistics::Histograms

The Statistics::Histograms module computes histograms from a weighted set of points. The module provides a single function, which is used as follows:

```perl
( my $histogram, my $error ) = &Histogram(
   $binCenters,
   $values,
   $weights,
   normalized => 1,
   differential => 1,
   gaussianSmooth => $sigma
);
```

Given a PDL, $binCenters, containing the positions of the bin centers, this function will construct a histogram of the points in the $values PDL, using weights as given by the $weights PDL. The histogram is returned as $histogram with Poisson errors in $errors. The function currently assumes that the bins are uniformly spaced.

The following options are available:

normalized [Default: 0] If set to 1, then the histogram will be normalized to sum to unity;

differential [Default: 0] If set to 1, then the histogram will be divided through by the bin width, to make it differential;

gaussianSmooth [Default: no smoothing] If present, this option must specify a PDL which gives, for each point, the value of \( \sigma \) in a Gaussian smoothing to be applied to that point before it is added to the histogram. As such, each point will contribute a fraction of its weight to each bin in the histogram.
6. Input Data

In some configurations, GALACTICUS requires additional input data to run. For example, if asked to process galaxy formation through a set of externally derived merger trees, then a file describing those trees must be given. In the remainder of this section we describe the structure of external datasets which can be inputs to GALACTICUS.

6.1. Broadband Filters

To compute luminosities through a given filter, GALACTICUS requires the response function, \( R(\lambda) \), of that filter to be defined. GALACTICUS follows the convention of Hogg et al. [2002] in defining the filter response to be the fraction of incident photons received by the detector at a given wavelength, multiplied by the relative photon response (which will be 1 for a photon-counting detector such as a CCD, or proportional to the photon energy for a bolometer/calorimeter type detector. Filter response files are stored in data/filters/. Their structure is shown below, with the SDSS_g.xml filter response file used as an example:

```xml
<filter>
  <description>SDSS g vacuum (filter+CCD +0 air mass)</description>
  <name>SDSS g</name>
  <origin>Michael Blanton</origin>
  <response>
    <datum>3630.000 0.0000000E+00</datum>
    <datum>3680.000 2.2690000E-03</datum>
    <datum>3730.000 5.4120002E-03</datum>
    <datum>3780.000 9.8719997E-03</datum>
    <datum>3830.000 2.9449999E-02</datum>
  </response>
  <effectiveWavelength>4727.02994472695</effectiveWavelength>
  <vegaOffset>0.107430167298754</vegaOffset>
</filter>
```

The `description` tag should provide a description of the filter, while the `name` tag provides a shorter name. The `origin` tag should describe from where/whom this filter originated. The `response` element contains a list of `datum` tags each giving a wavelength (in Angstroms) and response pair. The normalization of the response is arbitrary. The `effectiveWavelength` tag gives the mean, response-weighted wavelength of the filter and is used, for example, in dust attenuation calculations. The `vegaOffset` tag gives the value (in magnitudes) which must be added to an AB-system magnitude in this system to place it into the Vega system. Both `effectiveWavelength` and `vegaOffset` can be computed by running

```
scripts/filters/vega_offset_effective_lambda.pl data/filters
```

which will compute these values for any filter files that do not already contain them and append them to the files.
6.2. Merger Trees

While Galacticus can build merger trees using analytic methods it is often useful to be able to utilize merger trees from other sources (e.g., extracted from an N-body simulation). To facilitate this, Galacticus allows merger trees to be read from an HDF5 file. To do so, set the [mergerTreeConstructMethod] input parameter to read and specify the filename to read via their [mergerTreeReadFileName] parameter.

The HDF5 file should follow the general purpose format described in §A. An example of how to construct such a file can be found in the tests/nBodyMergerTrees folder. In that folder, the getMillenniumTrees.pl script will retrieve a sample of merger trees from the Millennium Simulation database and use the Merger_Tree_File_Maker.exe code supplied with Galacticus to convert these into an HDF5 file suitable for reading into Galacticus. The getMillenniumTrees.pl script requires you to have a username and password to access the Millennium Simulation database. These can be entered manually or stored in a section of the galacticusConfig.xml file (see §3.1) as follows:

```xml
<millenniumDB>
  <host>
    <name>myHost</name>
    <user>myUserName</user>
    <passwordFrom>kdewallet</passwordFrom>
  </host>
  <host>
    <name>default</name>
    <user>myUserName</user>
    <passwordFrom>input</passwordFrom>
  </host>
</millenniumDB>
```

Here, each host section describes rules for a given computer (with “default” being used if no specific match is found). The user element gives the user name to use, while the passwordFrom element specifies how the password should be obtained. Currently allowed mechanisms are “input”, in which case the password is read from standard input, and “kdewallet”, in which case the password is stored in and retrieved from the KDE wallet utility.

6.2.1. Processing of Merger Tree Files

The “read” merger tree construction method (see §17.4.1) reads these files and processes them into a form suitable for Galacticus to evolve. Merger trees are inherently complex structures, particularly when the possibility of subhalos are considered. Galacticus is currently designed to work with single descendent merger trees, i.e., ones in which the tree structure is entirely defined by specifying which node a given node is physically associated with at a later time. Additionally, Galacticus expects the merger tree file to contain information on the host node, i.e., the node within which a given node is physically located. In the following, these two properties are labelled descendentNode and hostNode. Galacticus assumes that nodes for which descendentNode=hostNode are isolated halos (i.e., they are their own hosts) while other nodes are subhalos (i.e., they are hosted by some other node). An example of a simple tree structure is shown in Fig. 6.1. The particular structure would be represented by the following list of nodes and node properties (a −1 indicates that no descendent node exists):

---

1 If you do not have a username and password for the Millennium Simulation database you can request one from contact@g-vo.org.
The following should be noted when constructing merger tree files:

- Note that GALACTICUS does not require that nodes be placed on a uniform grid of times/redshifts, nor that mass be conserved along a branch of the tree. After processing the tree in this way, GALACTICUS builds additional links which identify the child node of each halo and any sibling nodes. These are not required to specify the tree structure but are computationally convenient.

- It is acceptable for a node to begin its existence as a subhalo (i.e. to have never had an isolated node progenitor). Such nodes will be created as satellites in the merger tree and, providing the selected node components (see §12) initialize their properties appropriately, will be evolved correctly.

- It is acceptable for an isolated node to have progenitors, none of which are a primary progenitor. This can happen if all progenitors descend into subhalos in the isolated node. In such cases, GALACTICUS will create a clone of the isolated node at a very slightly earlier time to act as the primary progenitor. This is necessary to allow the tree to be processed correctly, but does not affect the evolution of the tree.

- Normally, cases where a node’s host node cannot be found in the forest will cause GALACTICUS to exit with an error. Setting [mergerTreeReadMissingHostsAreFatal]=false will instead circumvent this issue by making any such nodes self-hosting (i.e. they become isolated nodes rather than subhalos). Note that this behavior is not a physically correct way to treat such cases—it is intended only to allow trees to be processed in cases where the full forest is not available.

- It is acceptable for nodes to jump between branches in a tree, or even to jump between branches in different trees. In the latter case, all trees linked by jumping nodes (a so-called “forest” of connected trees) must be stored as a single tree (with multiple root-nodes) in the merger tree file. GALACTICUS will process this forest of trees simultaneously, allowing to nodes to move between their branches.

- It is acceptable for a subhalo to later become an isolated halo (as can happen due to three-body interactions; see Sales et al. 2007). If [mergerTreeReadAllowSubhaloPromotions]=true then such cases will be handled correctly (i.e. the subhalo will be promoted back to being an isolated halo). If [mergerTreeReadAllowSubhaloPromotions]=false then subhalos are not permitted to become isolated halos. In this case, the following logic will be applied to remove all such cases from the tree:

   → For any branch in a tree which at some point is a subhalo:

   → Beginning from the earliest node in the branch that is a subhalo, repeatedly step to the next descendent node;

   → If that descendent is not a subhalo then:
Figure 6.1.: An example of a simple merger tree structure. Colored circles represent nodes in the merger tree. Each node has a unique index indicated by the number inside each circle. Black arrows link each node to its descendent node (as specified by the `descendentNode` property. Where a node is not its own host node it is placed inside its host node.
→ If there is not currently any non-subhalo node which has the present node as its descendent then current node is only descendent of a subhalo. Therefore, try to make this node a subhalo, and propose the descendent of the host node of the previous node visited in the branch as the new host:

→ If the proposed host exists:

→ If the mass of the current node is less than that of the proposed host:

→ If the proposed hosts exists before the current node, repeatedly step to its descendants until one is found which exists at or after the time of the current node. This is the new proposed host.

→ If the proposed host is a subhalo, make it an isolated node.

→ The current node is made a subhalo within the proposed host.

→ Otherwise:

→ The current node remains an isolated node, while the proposed host is instead made a subhalo within the current node.

→ Otherwise:

→ The proposed host does not exists, which implies the end of a branch has been reached. Therefore, flag the current node as being a subhalo with a host identical to that of the node from which it descended.

Requirements for Galacticus Input Parameters

The following requirements must be met for the input parameters to Galacticus when using merger trees read from file:

• The cosmological parameters ($\Omega_M$, $\Omega_A$, $\Omega_b$, $H_0$, $\sigma_8$), if defined in the file, must be set identically in the Galacticus input file unless you set [mergerTreeReadMismatchIsFatal]=false in which case you’ll just be warned about any mismatch;

• Galacticus assumes by default that all merger trees exist at the final output time—if this is not the case set [allTreesExistAtFinalTime]=false.

6.2.2. Setting of Halo Properties

Dark Matter Scale Radii

If [mergerTreeReadPresetScaleRadii]=true and the halfMassRadius dataset is available within the haloTrees group (see §A.6) then the half-mass radii of nodes will be used to compute the corresponding scale length of the dark matter halo profile\(^2\). This requires a dark matter profile scale component which supports setting of the scale length (see §12.13).

\(^2\)The scale radius is found by seeking a value which gives the correct half mass radius. It is therefore important that the definition of halo mass (specifically the virial overdensity) in Galacticus be the same as was used in computing the input half mass radii.
6. Input Data

**Satellite Merger Times**

If \[\text{mergerTreeReadPresetMergerTimes} = \text{true}\] then merger times for satellites will be computed directly from the merger tree data read from file. When a subhalo has an isolated halo as a descendent it is assumed to undergo a merger with that isolated halo at that time. Note that this requires a satellite orbit component method which supports setting of merger times (e.g. \[\text{treeNodeMethodSatelliteOrbit} = \text{preset}\]).

**Dark Matter Halo Spins**

If \[\text{mergerTreeReadPresetSpins} = \text{true}\] and the \text{angularMomentum} dataset is available within the \text{haloTrees} group (see §A.6) then the spin parameters of nodes will be computed and set. This requires a dark matter halo spin component which supports setting of the spin (see §12.12).
7. Tutorials

This chapter contains step-by-step guides to performing common tasks with GALACTICUS.

7.1. Running GALACTICUS on N-body Merger Trees

See §A.10 for details of how to build merger tree files suitable for input into GALACTICUS.

7.1.1. Setting Input Parameters

To utilize merger trees from the file that you created in a GALACTICUS run it’s necessary to set two parameters in the input parameter file that you will use for the run:

<!-- Specify that merger trees are to be read from file, and give the name of the file to read -->
<parameter>
   <name>mergerTreeConstructMethod</name>
   <value>read</value>
</parameter>
<parameter>
   <name>mergerTreeReadFileName</name>
   <value>myNBodyTrees.hdf5</value>
</parameter>

The first of these [mergerTreeConstructMethod]=read tells GALACTICUS that merger trees will be constructed by reading them from a file. The second, [mergerTreeReadFileName], gives the name of the file from which to read the trees. In this example, we use the name of the file that was just created.

In addition to specifying that trees should be read from a file, it’s also important to ensure that the values of cosmological parameters in GALACTICUS match those in the merger tree file. (If they don’t match, GALACTICUS will stop with an error message unless you set [mergerTreeReadMismatchIsFatal]=false in which case you’ll just be warned about any mismatch.) In our case of using merger trees from the Millennium Simulation, the correct cosmological parameter values can be set as follows:

<!-- Use Millennium Simulation cosmology. -->
<parameter>
   <name>H_0</name>
   <value>73.0</value>
</parameter>
<parameter>
   <name>Omega_Matter</name>
   <value>0.25</value>
</parameter>
<parameter>
   <name>Omega_DE</name>
   <value>0.75</value>
</parameter>
Normally, Galacticus assumes that all merger trees will exist (i.e. have at least one node present) at the final output time. This may not be true of trees extracted from an N-body simulation—in this case Galacticus can be informed of this fact by setting:

```xml
<parameter>
  <name>allTreesExistAtFinalTime</name>
  <value>false</value>
</parameter>
```

N-body merger trees are often built from “snapshots” of the simulation, i.e. all of the nodes exist at a set of discrete times. Often we want to output nodes at precisely these output times. In such cases it is useful to set:

```xml
<parameter>
  <name>mergerTreeReadOutputTimeSnapTolerance</name>
  <value>1.0d-3</value>
</parameter>
```

which ensures that the times of nodes are adjusted to lie at precisely the output time if that time is within the specified relative tolerance (this avoids any small differences between node times and output times that can arises due to rounding errors when converting from redshifts to times and vice-versa).

Further parameters can be set to control what information from the stored trees will be used in Galacticus. Examples are given below.

**Node Positions**

If position and velocity information for tree nodes is available within the merger tree file then Galacticus can be instructed to use this information by using the “preset” method for tree node positions and telling the merger tree construction method to preset node positions as follows:

```xml
<!-- Use merger tree node positions -->
```
Running Galacticus on N-body Merger Trees

<parameter>
    <name>treeNodeMethodPosition</name>
    <value>preset</value>
</parameter>

<parameter>
    <name>mergerTreeReadPresetPositions</name>
    <value>true</value>
</parameter>

If position information is unavailable, the “null” position method can be selected and the merger tree construction method instructed not to preset positions as follows:

<!-- Do not use merger tree node positions -->
<parameter>
    <name>treeNodeMethodPosition</name>
    <value>null</value>
</parameter>

<parameter>
    <name>mergerTreeReadPresetPositions</name>
    <value>false</value>
</parameter>

Virial Orbits

If position and velocity information for tree nodes is available within the merger tree file then Galacticus can be instructed to use this information to estimate the orbit of each subhalo at the point at which it crosses the virial radius of its host halo. This “virial orbit” may then be used by, for example, calculations of merging timescales.

<!-- Use merger tree node positions to compute orbits at the virial radius -->
<parameter>
    <name>mergerTreeReadPresetOrbits</name>
    <value>true</value>
</parameter>

<parameter>
    <name>mergerTreeReadPresetOrbitsBoundOnly</name>
    <value>true</value>
</parameter>

<parameter>
    <name>mergerTreeReadPresetOrbitsSetAll</name>
    <value>true</value>
</parameter>

<parameter>
    <name>mergerTreeReadPresetOrbitsAssertAllSet</name>
    <value>true</value>
</parameter>

Typically, a merging halo is not seen at precisely the time at which it crosses the virial radius of its host (due to the fact that N-body simulations are output at discretely spaced timesteps). Therefore, Galacticus computes the orbit at the time just prior to merging and assumes that the orbital parameters (energy and angular momentum) remain fixed to propagate the orbit to the virial radius of the host. The second parameter in the above example, [mergerTreeReadPresetOrbitsBoundOnly], specifies whether or not...
only bound orbits should be set. Some calculations (e.g. of subhalo merging times) assume bound orbits and may fail if given an unbound orbit. Setting this option to true causes only bound orbits to be preset—unbound orbits are ignored. Note that some orbits cannot be propagated to the virial radius (i.e. their pericenter is larger than the virial radius). The [mergerTreeReadPresetOrbitsSetAll] option, if true, will cause such orbits to be assigned randomly using the selected XXXXX method, such that all orbits are assigned. The [mergerTreeReadPresetOrbitsAssertAllSet] option requires that all orbits be set—if [mergerTreeReadPresetOrbitsSetAll]=false and [mergerTreeReadPresetOrbitsAssertAllSet]=true then GALACTICUS will exit with an error message if any orbit cannot be set.

Merging Times and Targets

The times at which subhalos merge with their host halo can be determined directly from the merger tree file if subhalo information is included in that file. Merging is assumed to occur when the subhalo no longer has a distinct descendent (i.e. it descends into a non-subhalo). If merging times are to be computed in this way set

```
<parameter>
  <name>treeNodeMethodSatellite</name>
  <value>preset</value>
</parameter>
<parameter>
  <name>mergerTreeReadPresetMergerTimes</name>
  <value>true</value>
</parameter>
```

which select a satellite orbit method that allows merger times to be present and tell the merger tree construction method to preset those merger times respectively. If merger times are not to be computed in this way then instead set, for example,

```
<parameter>
  <name>treeNodeMethodSatellite</name>
  <value>standard</value>
</parameter>
<parameter>
  <name>mergerTreeReadPresetMergerNodes</name>
  <value>false</value>
</parameter>
<parameter>
  <name>satelliteMergingMethod</name>
  <value>Jiang2008</value>
</parameter>
```

which selects a standard satellite orbit method, prevents attempts to preset the merger times and selects the Jiang2008 method for computing merger times instead.

In addition to setting the times of merger events, it is possible to set the target node with which a merging node should merge. By default, GALACTICUS will assume that all merging occurs with the non-subhalo host node in which a subhalo is located. This may not be the desired behavior when using N-body merger trees. For example, such trees may indicate that a subhalo merges with another subhalo. Setting
7.1. Running GALACTICUS on N-body Merger Trees

will cause the target node with which each merger should occur to be determined from the merger tree structure and preset for use in GALACTICUS.

It is possible to add a delay between the last time at which a subhalo was seen in a simulation and the time at which it is considered to merge. This functionality is motivated by the consideration that a subhalo vanishing from a simulation may be simply due to it dropping below resolution rather than it actually having undergone a merger. The parameter `mergerTreeReadSubresolutionMergingMethod` can be used to select a satellite merging timescale method (see §13.44.1) to use in this case. (It is set by default to “null” such that no delay before merging occurs.) The orbit of the subhalo around its parent at the last time it is present in the merger tree is passed to this method and used to estimate a time until merging. This delay is added to the time at which the subhalo merges and, if merge target nodes are being set, the target node is updated accordingly.

**Subhalo Indices**

The indices of subhalos are usually frozen at the index of the halo just prior to becoming a subhalo. The index of the corresponding halo in the original tree (as read from file) can be tracked as follows:

```xml
<parameter>
    <name>treeNodeMethodSatellite</name>
    <value>preset</value>
</parameter>
<parameter>
    <name>mergerTreeReadPresetSubhaloIndices</name>
    <value>true</value>
</parameter>
```

to first select the “preset” satellite orbit method (which allows subhalo indices to be preset) and, second, to instruct the merger tree construction algorithm to preset those indices. The index will then be available in output as `satelliteNodeIndex`.

**Subhalo Masses**

The masses of subhalos (specifically their time evolution after they become subhalos) can be set using the values stored in the merger tree file (if available). To set subhalo masses in this way use

```xml
<parameter>
    <name>treeNodeMethodSatellite</name>
    <value>preset</value>
</parameter>
<parameter>
    <name>mergerTreeReadPresetSubhaloMasses</name>
    <value>true</value>
</parameter>
```

to first select the “preset” satellite orbit method (which allows subhalo masses to be preset) and, second, to instruct the merger tree construction algorithm to preset those masses.
7. Tutorials

Node Spins

If information on the angular momenta of nodes is available in the merger tree file, this can be used to preset the value of the spin parameter in each node\(^1\) by setting:

```
<parameter>
  <name>mergerTreeReadPresetSpins</name>
  <value>true</value>
</parameter>
```

The spin parameter is set using the spin of each node if available, or otherwise using the angular momentum of each node stored in the merger tree file using:

\[
\lambda = \frac{|\mathbf{J}| ||E||^{1/2}}{GM^{5/2}}
\]  
(7.1)

where \(|\mathbf{J}|\) is the magnitude of the node’s angular momentum, \(M\) is the node’s mass and \(E\) is its energy. Additionally, by setting:

```
<parameter>
  <name>mergerTreeReadPresetSpins3D</name>
  <value>true</value>
</parameter>
```

the spin vector of each node will be set (assuming that the vector spin or angular momenta of nodes are available in the merger tree file) using:

\[
\lambda = \frac{\mathbf{J} ||E||^{1/2}}{GM^{5/2}}.
\]  
(7.2)

If spins could not be determined for some halos the spin (or angular momentum) should be set to zero in the merger tree file, and the parameter [mergerTreeReadPresetUnphysicalSpins] set to true. GALACTICUS will then assign a spin to such halos by sampling from the selected spin distribution (see §13.8.7).

Node Scale Radii

If information on the half-mass or scale radii of nodes is available in the merger tree file, it can be used to preset the value of the dark matter halo scale radius in each node by setting:

```
<parameter>
  <name>mergerTreeReadPresetScaleRadii</name>
  <value>true</value>
</parameter>
```

Before doing this, it is important to be sure that the half-mass or scale radii of the nodes are reliable. For example, in low mass nodes extracted from an N-body simulation resolution effect may limit the accuracy of the measured half-mass or scale radius. In such cases, use the [mergerTreeReadPresetScaleRadiiMinimumMass] parameter to specify the lowest mass halos for which the scale radii should be preset—lower mass halos will be assigned a scale radius using the method specified by the [mergerTreeReadConcentrationFallbackMethod] parameter (which will default to the value of [darkMatterConcentrationMethod]; see §13.8.3). It is also possible to specify minimum and maximum allowed concentrations when computing the scale radius.

---

\(^1\)Before doing this, it is important to be sure that the angular momenta of the nodes are reliable. For example, in low mass nodes extracted from an N-body simulation resolution effect may limit the accuracy of the measured angular momentum.
from the half mass radius using the \texttt{mergerTreeReadPresetScaleRadiiConcentrationMinimum} and \texttt{mergerTreeReadPresetScaleRadiiConcentrationMaximum} parameters. If matching the half mass radius would require a concentration outside of this range, \textsc{Galacticus} will abort unless \texttt{mergerTreeReadPresetScaleRadiiFailureIsFatal} = \texttt{false}, in which case it will instead silently use the fallback concentration method described above.

If only half-mass radii are available, the scale radius is set by using a root finding algorithm to ensure that half of the total halo mass is enclosed within the specified half-mass radius.

### Miscellaneous N-body Properties

Several miscellaneous properties often available from N-body merger trees can also be preset by setting the following parameters to \texttt{true}:

- \texttt{mergerTreeReadPresetParticleCounts} Sets the number of particles in each halo (requires the \texttt{particleCount} dataset to be present in the merger tree file);
- \texttt{mergerTreeReadPresetVelocityMaxima} Sets the maxima of halo rotation curves (requires the \texttt{velocityMaximum} dataset to be present in the merger tree file);
- \texttt{mergerTreeReadPresetVelocityDispersions} Sets the velocity dispersion of halos (requires the \texttt{velocityDispersion} dataset to be present in the merger tree file).

### “Fly-by” Halos

In some cases, a halo that is part of one tree can later become part of another tree. This can happen in so-called “fly-by” encounters where a halo may briefly become a subhalo in a halo in tree A then leave that halo and become a subhalo in tree B.

The correct way to handle this issue is to combine trees A and B into a single tree (which will now have multiple base nodes). \textsc{Galacticus} will then process these two trees simultaneously, correctly handling the fly-by, and outputting the trees as two separate trees.

If for some reason this is not possible or desired, the fly-by problem will normally cause \textsc{Galacticus} to complain that the host halo of a node cannot be found (since it exists in a different tree). This problem can be avoided by setting:

```xml
<parameter>
  <name>mergerTreeReadMissingHostsAreFatal</name>
  <value>false</value>
</parameter>
```

In this case, nodes with missing hosts are simply treated as being isolated halos. This will avoid an error condition, but is not a physically correct way to handle such cases, so use with caution.

### 7.1.2. Analyzing the Output

#### Positions and Velocities

Components of the position of each node are output as \texttt{positionX}, \texttt{positionY} and \texttt{positionZ} and can be accessed in the same way as other output properties from \textsc{Galacticus} (see §5.1.6 and §5.2).

#### Subhalo Masses

The current mass of subhalos is available via the \texttt{nodeBoundMass} output dataset and can be accessed in the same way as other output properties from \textsc{Galacticus} (see §5.1.6 and §5.2). For non-subhalos this property is equal to the usual \texttt{nodeMass} property.
7. Tutorials

7.2. Generating Mock Catalogs with Lightcones from the Millennium Simulation

Suppose that you want to create a catalog of galaxies as would be found in a survey of an area of the sky out to some redshift. Such a “mock catalog” can be built by populating with galaxies all of the dark matter halos which happen to lie within the cone which that area makes as it is projected from the observer through the Universe.

Generating such a mock catalog using GALACTICUS involves first extracting the halos (and their merger trees) within this “lightcone” from a suitable N-body simulation, and then processing them through GALACTICUS. In this tutorial, we will specifically make use of the Millennium Simulation database to provide the merger trees, but the same principles apply to any N-body simulation.

The script, scripts/aux/Millennium_Lightcone_Grab.pl can be used to retrieve merger trees that intersect a given lightcone from the Millennium Database and to store them in GALACTICUS’s format (see §A). The script is used as follows:

```
scripts/aux/Millennium_Lightcone_Grab.pl <lightconeDirectory> <fieldSize> <maximumRedshift> --user <myUserName> --password <myPassword> --treesPerFile <treesPerFile>
```

Here, `<lightconeDirectory>` is the name of a (pre-existing) directory into which merger tree data will be stored, `<fieldSize>` is the length (in degrees) of one side of the square field of view of the lightcone, `<maximumRedshift>` is the highest redshift for which halos should be included in the catalog. The `-user` and `-password` options allow you to specify your username and password for accessing the Millennium Simulation database. Finally, the `-treesPerFile` specifies how many merger trees should be stored in each file (the script will split the lightcone between many files—this is primarily so that each request sent to the Millennium Database server is not too large). If no value is specified a default of 200 trees per file will be used.

The script generates multiple SQL queries to the Millennium database in order to first find all halos which intersect the lightcone and second to retrieve the complete merger tree associated with each such halo. These merger trees are then stored in GALACTICUS’s merger tree file format in files named Lightcone_Trees_AAA:BBB.hdf5 in the given `<lightconeDirectory>`, where AAA and BBB are numbers giving the first and last trees in the file.²

Each of the merger tree files created can then be run through GALACTICUS in the usual way (see §7.1). Outputs should be requested at every Millennium snapshot (up to the largest redshift to be considered), and the lightcone filter should be used to cause only those galaxies which intersect the lightcone to be output—for example:

```
<!-- Set output redshifts to the snapshots in the milliMillennium. -->
<parameter>
  <name>outputRedshifts</name>
  <value>
    0.0000 0.0199 0.0414 0.0645 0.0893 0.1159 0.1444 0.1749 0.2075 0.2425
    0.2798 0.3197 0.3623 0.4079 0.4566 0.5086 0.5642 0.6236 0.6871 0.7550
    0.8277 0.9055 0.9887 1.0779 1.1734 1.2758 1.3857 1.5036 1.6303 1.7663
    1.9126 2.0700 2.2395 2.4220 2.6189 2.8312 3.0604 3.3081 3.5759 3.8657
  </value>
</parameter>
```

```
<!-- Add a lightcone filter with the required geometry -->
```

²Note that these are not the ID numbers of the trees, just a sequential count of all trees retrieved.
7.3. Using the Instantaneous Recycling Approximation

Choosing \( \texttt{stellarPopulationPropertiesMethod}=\textit{instantaneous} \) will cause GALACTICUS to use the instantaneous recycling approximation for all calculations of stellar populations. The recyling rate and yield to use are set by the \([\texttt{imfNAMERecycledInstantaneous}]\) and \([\texttt{imfNAMEYieldInstantaneous}]\) parameters respectively, where \texttt{NAME} is the name of the appropriate IMF.

Setting \( \texttt{stellarPopulationPropertiesMethod}=\textit{noninstantaneous} \) causes GALACTICUS to use a fully non-instantaneous, metal-dependent calculation of recycling, metal production and SNe rates. However, it is possible to force this method to operate in the instantaneous recycling approximation limit (which can be useful for testing and comparison) by setting:

\[
\begin{align*}
\text{<parameter>}
&\quad \text{<!-- Force the calculation of recycling, yields etc. to }\text{ be done assuming instantaneous recycling} \quad -->
&\quad \text{<name>starFormationImfInstantaneousApproximation</name>}
&\quad \text{<value>true</value>}
\end{align*}
\]

\[
\begin{align*}
\text{<parameter>}
&\quad \text{<!-- Set the mass of stars which should be used as the }\text{ dividing line between long-lived and instantaneously }\text{ evolving in this approximation.} \quad -->
&\quad \text{<name>starFormationImfInstantaneousApproximationMassLongLived</name>}
&\quad \text{<value>1.0</value>}
\end{align*}
\]

\[
\begin{align*}
\text{<parameter>}
&\quad \text{<!-- Set the effective age of populations to use in this approximation when computing SNe numbers.} \quad -->
&\quad \text{<name>starFormationImfInstantaneousApproximationEffectiveAge</name>}
&\quad \text{<value>13.8</value>}
\end{align*}
\]
7.4. Computing Dust Attenuation and Emission Using Galacticus+Grasil

**Galacticus** can interface with the **Grasil** code to compute the attenuation of starlight by dust, along with the re-emission of absorbed energy by that dust. To do this, it is necessary to store the entire star formation history of galaxies in a **Galacticus** model, as **Grasil** uses this information to determine the attenuation of stellar populations as a function of their age.

Recording star formation histories is as simple as setting the `[starFormationHistoriesMethod]` parameter to `metallicitySplit`. This particular star formation history method stores the star formation in each galaxy as a function of time and metallicity, as required by **Grasil**. The level of detail with which the star formation history is stored is controlled by several parameters:

- **starFormationHistoryTimeStep** The timestep used in discretizing star formation histories.
- **starFormationHistoryFineTimeStep** The timestep to use in discretizing star formation histories just prior to output times. This should typically be smaller than `[starFormationHistoryTimeStep]` to give improved resolution in the star formation history for recently formed stars.
- **starFormationHistoryFineTime** The period before each output for which the `[starFormationHistoryFineTimeStep]` should be used.
- **starFormationHistoryMetallicityCount** The number of bins in metallicity to use when discretizing the star formation history.
- **starFormationHistoryMetallicityMinimum** The upper limit to the metallicity in the lowest metallicity bin (i.e. the lowest metallicity bin will extend from zero to this value).
- **starFormationHistoryMetallicityMaximum** The upper limit to the metallicity in the highest metallicity bin.

Default values set a timestep of 0.1 Gyr, with 0.01 Gyr timesteps for 0.1 Gyr before each output, along with 10 metallicity bins ranging from $10^{-4} Z_\odot$ to $10 Z_\odot$. It is always recommended to check that these values result in a sufficiently well-resolved star formation history for your purposes.

When run with these parameter settings **Galacticus** will output an additional group to the output file called `starFormationHistories`. This contains a hierarchically arranged set of datasets describing the star formation histories. The hierarchy extends through output number, and merger tree index. For example `starFormationHistories/Output5/mergerTree3/` will contain the star formation history for merger tree 3 at output 5. This group will, in general, contain many datasets, e.g.

- `diskSFH7819` Dataset `{11, 34}`
- `diskTime7819` Dataset `{34}`
- `spheroidSFH7819` Dataset `{11, 34}`
- `spheroidTime7819` Dataset `{34}`

In this case, datasets are present for both a disk and bulge component of node 7819. (If a node does not contain one of these components, the corresponding dataset will be missing.) The “Time” datasets give the times at which the star formation history is stored, while the “SFH” datasets give the mass of stars formed in each time/metallicity bin. (The metallicities themselves are available in the `starFormationHistories/metallicities` dataset.)

Properties of the **Grasil** SED can now be accessed using the **Galacticus**:**Grasil** module (see §5.5). When such properties are requested, **Grasil** will be automatically run on each selected galaxy, the SED
7.4. Computing Dust Attenuation and Emission Using Galacticus+Grasil

computed and stored to the GALACTICUS file\(^3\), and the relevant fluxes computed. If necessary, GRASIL and its data files will be downloaded automatically. Multiple GRASIL models will be run simultaneously if multiple cores are available.

For example:

```perl
# Specify model.
my $galacticus;
$galacticus->{\'file\'} = "/galacticus.hdf5";
$galacticus->{\'store\'} = 0;
$galacticus->{\'tree\'} = "all";

# Specify Grasil options.
$galacticus->{\'grasilOptions\'}->{\'includePAHs\'} = 1;
$galacticus->{\'grasilOptions\'}->{\'fluctuatingTemperatures\'} = 1;
$galacticus->{\'grasilOptions\'}->{\'wavelengthCount\'} = 1000;
$galacticus->{\'grasilOptions\'}->{\'radialGridCount\'} = 30;
$galacticus->{\'grasilOptions\'}->{\'recomputeSEDs\'} = 0;

# Read results from model.
&HDF5::Select_Output($galacticus,2.0);
&HDF5::Get_Dataset ($galacticus,

    [ 
        \'grasilFlux850microns\',
        \'grasilFlux250microns\',
        \'grasilFlux350microns\',
        \'grasilFlux500microns\',
        \'grasilInfraredLuminosity\'
    ]
)
```

The \texttt{grasilOptions} block in the above controls the behavior of GRASIL. Here we’ve chosen to include calculations of polycyclic aromatic hydrocarbon (PAH) features, have accounted for fluctuating temperatures in small grains (both of which slow down the calculation but make it more accurate), have specified the number of wavelengths and the size of the radial grid used to model each galaxy. We have also specified that the SED should not be recomputed—if GRASIL fluxes are requested in future for galaxies in this model, they will be computed from the stored GRASIL SED. If you want to change the parameters of the Grasil calculation then set the \texttt{recomputeSED} option to 1 instead\(^4\). Fluxes are returned in units of Janskys, while the total infrared luminosity (\texttt{grasilInfraredLuminosity}) is returned in units of Solar luminosities.

A simple plotting script is provided which illustrates how to access and use the GRASIL SEDs stored in GALACTICUS files. For example:

```bash
scripts/plotting/plotGrasilSpectrum.pl galacticus.hdf5 5 9 217 43.2 SED.pdf
```

will plot the SED of node 217, in merger tree 9, at output 5 from the \texttt{galacticus.hdf5} file. The SED will be shown for an inclination of 43.2° and the plot will be written to \texttt{SED.pdf}.

\(^3\)GRASIL SEDs are stored in the \texttt{grasilSEDs} group in a hierarchy of output, merger tree, and node groups, as for the star formation histories. Within each node group three datasets are stored, giving the wavelength, inclination, and SED of the galaxy.

\(^4\)Exercise caution when using this option. Recomputing SEDs requires deleting the old SED group. The HDF5 library currently does not clean up the space occupied by the datasets in this deleted group, so the file size can grow rapidly if you repeatedly recompute GRASIL SEDs.
7.5. Outputting Stellar Luminosities

GALACTICUS can compute the stellar luminosity of galaxies in any required combination of filter, redshift, and frame. To cause luminosities to be computed add something such as the following to your input parameter file:

```
<parameter>
  <name>{luminosityFilter}</name>
  <value>SDSS_r</value>
</parameter>
<parameter>
  <name>{luminosityRedshift}</name>
  <value>0.1</value>
</parameter>
<parameter>
  <name>{luminosityType}</name>
  <value>observed</value>
</parameter>
```

This would result in a dataset called `diskLuminositiesStellar:SDSS_r:observed:z0.1000` being output (along with a similar dataset for the spheroid component), corresponding to the luminosity in the SDSS r-band filter, as observed at $z = 0.1$. To get the same filter but in the rest-frame of the galaxy, change the `luminosityType` to "rest". If instead of specifying a unique redshift you instead specify "all" for a filter in the `luminosityRedshift` element, then the filter will be replicated to all output redshifts.

Available filters can be found in the `data/filters` folder. Additionally, it is possible to specify top-hat filters (which have unit transmission over a range of wavelengths) without the need to create a filter file for them. A filter named `topHat_L_R` will be interpreted as a top-hat filter where $L = \lambda$ is the central wavelength (in Angstroms) and $R = R$ is the resolution. A top-hat filter is constructed such that the transmission is unity between $\lambda_1$ and $\lambda_2$, and zero outside that range, and such that $\lambda_1 \lambda_2 = \lambda^2$, $\lambda_2 - \lambda_1 = \lambda/R$. Furthermore, a filter specified as `topHat_Llow_Lhigh_R` will be expanded into a set of contiguous top-hat filters with resolution $R$ spanning the wavelength range $Llow$ to $Lhigh$ with the first filter's lower wavelength limit aligned with $Llow$ and continuing until the central wavelength of the filter is no longer below $Lhigh$.

Luminosities are always output in units of the zero-point of the AB magnitude system, such that $-2.5 \log_{10} L$ (where $L$ is the output luminosity) gives the AB absolute magnitude of the galaxy.

You can add additional luminosities by simply adding more entries in these parameter values. For example:

```
<parameter>
  <name>{luminosityFilter}</name>
  <value>SDSS_r SDSS_g</value>
</parameter>
<parameter>
  <name>{luminosityRedshift}</name>
  <value>0.1 0.3</value>
</parameter>
<parameter>
  <name>{luminosityType}</name>
  <value>observed rest</value>
</parameter>
```
7.5. Outputting Stellar Luminosities

would result in datasets diskLuminositiesStellar:SDSS_r:observed:z0.1000 and diskLuminositiesStellar:SDSS_g:rest:z0.3000.

7.5.1. Postprocessing of Stellar Spectra

Stellar luminosities are computed by convolving a library of simple stellar populations with the star formation history of each galaxy. GALACTICUS allows the spectra of those simple stellar populations to be postprocessed (after being read from file or internally generated for example) before they are utilized in the convolution integral. This postprocessing can modify the spectra in arbitrary ways that depend on wavelength, redshift, and age of stellar population. Furthermore, GALACTICUS allows you to chain together stellar spectra postprocessors into a set to allow multiple postprocessings to be applied. Furthermore again, you can define an arbitrary number of sets and apply different sets to different luminosities.

Typical uses of stellar spectra postprocessors include accounting for absorption of galaxy light by the intervening IGM, or capturing only the light from recent star formation. A full list of the available postprocessors can be found in §13.42.

If you don’t specify a postprocessing set, the “default” set (consisting of the inoue2014 postprocessor; see §13.42.1) is applied to each luminosity calculation. To specify other postprocessing sets add the following to your parameter file:

```xml
<parameter>
  <name>luminosityFilter</name>
  <value>default recent unabsorbed recentUnabsorbed</value>
</parameter>
```

where one set must be specified for each luminosity specified in the luminosityFilter parameter. Note that set names can be reused in order to apply the same postprocessor set to multiple luminosities.

The chain of postprocessors to apply for each set is then specified as follows:

```xml
<parameter>
  <name>stellarPopulationSpectraPostprocessRecentMethods</name>
  <value>inoue2014 recent</value>
</parameter>
<parameter>
  <name>stellarPopulationSpectraPostprocessUnabsorbedMethods</name>
  <value>identity</value>
</parameter>
<parameter>
  <name>stellarPopulationSpectraPostprocessRecentUnabsorbedMethods</name>
  <value>recent</value>
</parameter>
```

In this case we’ve constructed three new sets, in addition to the default set (which applies just the inoue2014 postprocessor). The recent set applies both the inoue2014 IGM absorption postprocessor, followed by the recent postprocessor to retain only recently emitted light. The unabsorbed set ignores IGM absorption entirely—it does this by using the identity postprocessor which leaves the spectrum unaffected. Finally, the recentUnabsorbed set applies only the recent filter while ignoring IGM absorption.

In this way it is relatively easy to extract multiple different measures of luminosity from a GALACTICUS model. For example, you could construct four postprocessor sets, each corresponding to one of the four

---

5Perhaps so that additional dust extinction can be applied to the light of recently formed stars.
different IGM absorption models (lycSuppress, madau1995, meiksin2006, and inoue2014) and apply these to the same luminosity filter to assess how luminosity depends on the IGM model used.

### 7.5.2. Migrating Parameter Files to a New Version

The names and allowed values of parameters often change between versions of GALACTICUS. To permit easy and error-free migration between versions a script is provided to translate parameter files from earlier to later versions. To migrate a parameter file simply use:

```
scripts/aux/parametersMigrate.pl parameters.xml newParameters.xml
```

By default, this script will translate from the previous to the current version of GALACTICUS. If your parameter file contains a version element then this will be used to determine which version of GALACTICUS the parameter file was constructed for. The migration script will then migrate the parameter file through all intermediate versions to bring it into compliance with the current version. You can also specify input and output versions directly:

```
scripts/aux/parametersMigrate.pl parameters.xml newParameters.xml --inputVersion 0.9.0 --outputVersion 0.9.3
```

will convert `parameters.xml` from version 0.9.0 syntax to version 0.9.3 syntax.

### 7.5.3. Computing Emission Lines

GALACTICUS can compute emission line luminosities for galaxies. This calculation is based on the methodology of Panuzzo et al. [2003]. Briefly, HII region models are constructed using CLOUDY for a variety of gas densities and metallicities, and HI, HeI, and OII ionizing luminosities. Emission line luminosities are then computed by interpolating in these tables based on the instantaneous properties of model galaxies.

To compute emission line luminosities it is therefore necessary to run GALACTICUS including the following rest-frame luminosity filters at each redshift of interest: Lyc, HeliumContinuum, OxygenContinuum. This causes the ionizing luminosity for each three species to be computed and output. Emission line luminosities can then be accessed as named properties using names such as \texttt{totalLineLuminosity:balmerAlpha6563:rest:0.0000}, which will return the H\textalpha luminosity at $z = 0$. Equivalent properties for disk and spheroid are provided (simply replace “total” with “disk” or “spheroid”). Currently available lines are:

- \texttt{balmerAlpha6563}
- \texttt{balmerBeta4861}
- \texttt{oxygenII3726}
- \texttt{oxygenII3729}
- \texttt{oxygenII4959}
- \texttt{oxygenII5007}
- \texttt{nitrogenII6584}
- \texttt{sulfurII6731}
- \texttt{sulfurII6716}

Additionally, if a line is requested as \texttt{totalLineLuminosity:balmerAlpha6563:<filterName>:rest:0.0000} then the line luminosity is computed under the provided filter, and the luminosity is returned in units of maggies for easy conversion to magnitudes.
7.5.4. Reionization Calculations

GALACTICUS can self-consistently solve for the evolution of the IGM as it becomes photoionized by light emitted by stars and AGN. To activate this calculation, include the following in your parameters file:

```xml
<!-- IGM evolver -->
<parameter>
  <name>intergalacticMediumStateMethod</name>
  <value>internal</value>
</parameter>
<parameter>
  <name>igmPropertiesCompute</name>
  <value>true</value>
</parameter>
<parameter>
  <name>igmPropertiesTimeCountPerDecade</name>
  <value>10</value>
</parameter>

<!-- Background radiation -->
<parameter>
  <name>backgroundRadiationCompute</name>
  <value>true</value>
</parameter>
<parameter>
  <name>radiationIntergalacticBackgroundMethod</name>
  <value>internal</value>
</parameter>
<parameter>
  <name>backgroundRadiationWavelengthCountPerDecade</name>
  <value>50</value>
</parameter>
<parameter>
  <name>backgroundRadiationTimeCountPerDecade</name>
  <value>10</value>
</parameter>

<!-- Halo accretion options -->
<parameter>
  <name>accretionHaloMethod</name>
  <value>naozBarkana2007</value>
</parameter>
```

The first block of parameters switches GALACTICUS to using an internal calculation for the state of the IGM, instructs it to solve for IGM properties as a function of time, and specifies that IGM properties should be updated 10 times per decade of cosmic time. Specifically, at each of these time intervals, solving of galaxy evolution is halted and the IGM evolved up to this time using the currently computed photoionizing background spectrum.

The second block of parameters activates an internal calculation of cosmic background radiation, in which the background is computed from the emissivities of model galaxies and AGN. The number of points at which to tabulate the background per decade of wavelength and cosmic time are specified.
Finally, the third block of parameters tells Galacticus to use the Naoz and Barkana [2007] prescription for computing gas accretion into halos from the IGM. This prescription uses the filtering mass to determine accretion rates, and will take the filtering mass from the internal IGM evolution calculation.

With these three sets of configurations, Galacticus will perform a self-consistent evolution of the IGM—in the sense that the IGM is ionized by photons emitted by model galaxies and AGN, while galaxy evolution is affected by the computed state of the model IGM. Note that, when run in this way, Galacticus needs to keep all merger trees in memory simultaneously (as they are run synchronously to allow the IGM properties to evolve alongside galaxy properties).

Once completed, data on the IGM and background radiation are written to the output file in the igmProperties and backgroundRadiation groups respectively.
8. Troubleshooting

This chapter contains guidance on solving various problems that you might encounter when running Galacticus.

8.1. Low CPU utilization with large numbers of output redshifts

If a Galacticus model is failing to make use of the majority of the available CPU cycles, and you are running a model with a large number of output redshifts the problem may be that I/O to disk is limiting the rate at which merger trees can be processed. I/O occurs through the HDF5 library which provides caching functionality. Therefore, this problem can often be mitigated by expanding the size of the HDF5 library’s cache. Galacticus allows you to do this using a set of input parameters:

[hdf5CacheElementsCount] HDF5 limits the number of objects that it will store in its cache. Increasing this number will allow more data to be cached and potentially make disk I/O more efficient. We have had good results by setting this number to some factor (e.g. 2) times the product of the number of output redshifts and the number of properties being output in each snapshot.

[hdf5CacheSizeBytes] HDF5 also limits the size of the cache in bytes. We have had good results setting this to a factor of a few above the product of [hdf5CacheElementsCount], the chunk size (see below) and the size of each output property (8 bytes).

[hdf5SieveBufferSize] HDF5 uses a sieve buffer to speed reading/writing of partial datasets. Increasing the buffer size (specified here in bytes) may improve I/O performance. We have had good results using a value of 512Kb.

[hdf5UseLatestFormat] Normally, HDF5 selects an internal file format to used based on maximum portability. If you set this option to true HDF5 will instead use the latest format that it supports—typically allowing it to employ optimizations unavailable to older versions of HDF5. Note that this can make the output file unreadable by older versions of the HDF5 library.

Additionally, you can ensure that compression is switched off in the HDF5 output by setting [hdf5CompressionLevel] = −1. Finally, adjusting the HDF5 chunk size via the [hdf5ChunkSize] parameter may make for more efficient I/O. HDF5 datasets are read/written in chunks of this size. Increasing the size may improve I/O performance.
9. Numerical Implementation

9.1. Timestepping Criteria

Galacticus evolves each merger tree by repeatedly walking the tree and evolving each node forward in time by some timestep $\Delta t$. Nodes are evolved individually such that nodes in different branches of a tree may have reached different cosmic times at any given point in the execution of Galacticus. Each node is evolved over the interval $\Delta t$ using an adaptive ordinary differential equation (ODE) solver, which adjusts the smaller timesteps, $\delta t$, taken in evolving the system of ODEs to maintain a specified precision.

The choice of $\Delta t$ then depends on other considerations. For example, a node should not be evolved beyond the time at which it is due to merge with another galaxy. Also, we typically don’t want satellite nodes to evolve too far ahead of their host node, such that any interactions between satellite and host occur (near) synchronously.

In the remainder of this section we list all criteria used to select $\Delta t$ for a node. All criteria are considered and the largest $\Delta t$ consistent with all criteria is selected.

9.1.1. Tree Criteria

The following timestep criteria ensure that tree evolution occurs in a way which correctly preserves tree structure and ordering of interactions between nodes.

“Branch Segment” Criteria

For nodes which are the primary progenitor of their parent, the “branch segment” criterion asserts that

$$\Delta t \leq t_{\text{parent}} - t$$  \hspace{1cm} (9.1)

where $t$ is current time in the node and $t_{\text{parent}}$ is the time of the parent node. This ensures that primary progenitor nodes to not evolve beyond the time at which their parent (which they will replace) exists. If this criterion is the limiting criteria for $\Delta t$ then the node will be promoted to replace its parent at the end of the timestep.

“Parent” Criteria

For nodes which are satellites in a hosting node the “parent” timestep criterion asserts that

$$\Delta t \leq t_{\text{host}},$$  \hspace{1cm} (9.2)

$$\Delta t \leq \epsilon_{\text{host}}(a/\dot{a}),$$  \hspace{1cm} (9.3)

where $t_{\text{host}} = \text{[timestepHostAbsolute]}$, $\epsilon_{\text{host}} = \text{[timestepHostRelative]}$, and $a$ is expansion factor. These criteria are intended to prevent a satellite for evolving too far ahead of the host node before the host is allowed to “catch up”.
“Satellite” Criteria

For nodes which host satellite nodes, the “satellite” criterion asserts that
\[ \Delta t \leq \min(t_{\text{satellite}}) - t, \] (9.4)
where \( t \) is the time of the host node and \( t_{\text{satellite}} \) are the times of all satellite nodes in the host. This criterion prevents a host from evolving ahead of any satellites.

“Sibling” Criteria

For nodes which are primary progenitors, the “sibling” criterion asserts that
\[ \Delta t \leq \min(t_{\text{sibling}}) - t, \] (9.5)
where \( t \) is the time of the host node and \( t_{\text{sibling}} \) are the times of all siblings of the node. This criterion prevents a node from reaching its parent (and being promoted to replace it) before all of its siblings have reach the parent and have become satellites within it.

“Mergee” Criteria

For nodes with mergee nodes, the “mergee” criterion asserts that
\[ \Delta t \leq \min(t_{\text{merge}}) - t, \] (9.6)
where \( t \) is the time of the host node and \( t_{\text{merge}} \) are the times at which the mergees will merge. This criterion prevents a node from evolving past the time at which a merger event takes place.

9.1.2. General Criteria

“Simple” Criteria

The “simple” timestep criteria assert that
\[ \Delta t \leq t_{\text{simple}}, \] (9.7)
\[ \Delta t \leq \epsilon_{\text{simple}}(a/\dot{a}), \] (9.8)
where \( t_{\text{simple}} = [\text{timestepSimpleAbsolute}] \), \( \epsilon_{\text{simple}} = [\text{timestepSimpleRelative}] \), and \( a \) is expansion factor. These criteria are intended to prevent any one node evolving over an excessively large time in one step. In general, these criteria are not necessary, as nodes should be free to evolve as far as possible unless prevented by some physical requirement. These criteria are therefore present to provide a simple example of how timestep criteria work.

“Satellite” Criteria

The “satellite” timestep criteria asserts the following for satellite nodes. If the satellite’s merge target has been advanced to at least a time of \( t_{\text{required}} = t_{\text{satellite}} + \Delta t_{\text{merge}} - \delta t_{\text{merge,maximum}} \) then
\[ \Delta t \leq \Delta t_{\text{merge}}, \] (9.9)
where \( t_{\text{satellite}} \) is the current time for the satellite node, \( \Delta t_{\text{merge}} \) is the time until the satellite is due to merge and \( \delta t_{\text{merge,maximum}} \) is the maximum allowed time difference between merging galaxies. This ensures that the satellite is not evolved past the time at which it is due to merge. If this criterion is the limiting criteria for \( \Delta t \) then the merging of the satellite will be triggered at the end of the timestep.
9.1. Timestepping Criteria

If the merge target has not been advanced to at least \( t_{\text{required}} \) then instead

\[
\Delta t \leq \max(\Delta t_{\text{merge}} - \delta t_{\text{merge,maximum}}/2, 0),
\]  

(9.10)

is asserted to ensure that the satellite does not reach the time of merging until its merge target is sufficiently close (within \( \delta t_{\text{merge,maximum}} \)) of the time of merging.

9.1.3. Output Criteria

“History” Criteria

The “history” timestep criterion asserts that

\[
\Delta t \leq t_{\text{history},i} - \bar{t}
\]  

(9.11)

where \( t \) is the current time, \( t_{\text{history},i} \) is the \( i \)th time at which the global history (see §5.1.5) of galaxies is to be output and \( i \) is chosen to be the smallest \( i \) such that \( t_{\text{history},i} > t \). If there is no \( i \) for which \( t_{\text{history},i} > t \) this criterion is not applied. If this criterion is the limiting criterion for \( \Delta t \) then the properties of the galaxy will be accumulated to the global history arrays at the end of the timestep.

“Main Branch Evolution” Criteria

If \( \text{timestepRecordEvolution} = \text{true} \), then the “main branch evolution” timestep criterion asserts that

\[
\Delta t \leq t_{\text{record},i} - \bar{t}
\]  

(9.12)

where \( t \) is the current time, \( t_{\text{record},i} \) is the \( i \)th time at which the evolution of main branch galaxies is to be output and \( i \) is chosen to be the smallest \( i \) such that \( t_{\text{record},i} > t \). If there is no \( i \) for which \( t_{\text{record},i} > t \) this criterion is not applied. If this criterion is the limiting criterion for \( \Delta t \) then the properties of the galaxy will be recorded at the end of the timestep.
Part II.

Advanced Use
10. Constraining \textsc{Galacticus}

10.1. Model Accuracy

The model accuracy script processes the model described by a standard \textsc{Galacticus} constraints configuration file to assess how accurate the model is. Specifically, it determines the relative contribution to the covariance of each constraint arising from the finite number of merger trees run in the model and the intrinsic covariance of the observations. An accurate model should make a negligible contribution to the covariance.

To run the model accuracy script use

```
constraints/testModelAccuracy.pl <configFile>
```

where `configFile` is the name of the configuration file. The script will run the model multiple times, reducing the number of trees per decade by a factor of two each time (this is done 8 times, such that the smallest model run has a factor 128 times fewer trees than the original model). Furthermore, this sequence of models is run for three different choices for sampling halo masses: `powerLaw`, `haloMassFunction`, and `stellarMassFunction` (see §13.8.6).

For each constraint in the specified constraint compilation and accuracy measure is constructed which is the root mean squared ratio of the error arising from the finite number of trees and the intrinsic error of the constraint data.

Accuracy analysis files are written to:

```
<workDirectory>/accuracy
```

For each constraint in the compilation a plot showing accuracy measure as a function of CPU time is written to:

```
<constraintLabel>_mergerTreeBuildTreesPerDecade.pdf
```

Each point in the plot is labelled with the number of merger trees per decade. An accurate model should have accuracy measure significantly below unity. This plot is also useful to see which sampling method achieves that accuracy in the least amount of CPU time.

Additionally, a report is written to:

```
<constraintLabel>Report.txt
```

This file lists, for each sampling method, the accuracy measure achieved and the CPU time taken for the largest model run.

10.2. Model Convergence

The model convergence script processes the model described by a standard \textsc{Galacticus} constraints configuration file to assess how well converged the model is with respect to several of \textsc{Galacticus}'s numerical parameters. Specifically, it determines the a covariance measure for each constraint in the specified compilation file.

To run the model convergence script use
constraints/testConvergence.pl <configFile>

where **configFile** is the name of the configuration file. The script will run the model multiple times, adjusting the value of a numerical parameter each time.

For each constraint in the specified constraint compilation a convergence measure, \( C \), is constructed which

\[
C = \sum_i \frac{(y_i - y_{\text{ideal},i})^2}{2\sigma_{\text{ideal},i}^2}
\]  

(10.1)

where \( y_i \) is the result of the constraint, \( \sigma_i \) is the error on the result, and subscript “ideal” refers to the model with the most ideal value (i.e. that in the original, unmodified model) of the numerical parameter being tested (which might be the lowest value for a mass resolution, or the highest value for the maximum tree mass simulated for example). To be converged, the convergence measure should remain consistent with unity within a significant distance\(^1\) away from the ideal value.

Convergence analysis files are written to:

<workDirectory>/convergence

For each combination of constraint in the compilation and numerical parameter a plot showing the convergence measure as a function of the numerical parameter is created in:

<constraintLabel>_<numericalParameter>.pdf

Each point in the plot has an error bar since, due to the limited number of merger trees run, the convergence measure is not known with perfect precision. A horizontal line shows the desired convergence measure of unity.

Additionally, a report is written to:

<constraintLabel>Report.txt

This file lists, for each numerical parameter, the convergence measure and its error achieved by the ideal model. Additionally a normalized measure (the measure divided by its error) is listed. This normalized measure can be approximately interpreted as the number of \( \sigma \) deviation from convergence.

### 10.3. Model Discrepancy

Model discrepancy scripts process the model described by a standard GALACTICUS configuration file to produce an output HDF5 file which describes a particular contribution to the model discrepancy. The format of these files is

HDF5 "discrepancy.hdf5" {
GROUP "/" {
  DATASET "additive" {
  }
  DATASET "multiplicative" {
  }
  DATASET "covariance" {
  }
}
}

\(^1\)“Significant distance” here requires some judgement. Typically we would like for the model results to not change significantly as the value of a numerical parameter is adjusted by at least a factor of 2 away from the ideal value.
Each of the three datasets is optional (i.e. not all need be provided for each discrepancy). The *additive* dataset gives an additive offset which will be applied to the relevant model results. The *multiplicative* dataset similarly gives a multiplicative offset which will be applied to the relevant model results. Finally, the *covariance* dataset gives the contribution from this discrepancy to the covariance matrix used in evaluating the model likelihood.

Discrepancy files are written to

\<workDirectory\>/modelDiscrepancy/<discrepancyLabel>/discrepancy<constraintLabel>.hdf5

Constraint scripts (see §10.5) accept a command line option `–modelDiscrepancies` which specifies the path to the `modelDiscrepancy` directory (i.e. `<workDirectory>/modelDiscrepancy`) and will search for any relevant model discrepancy files and apply them in their calculations.

### 10.3.1. Monte Carlo Merger Trees

*Galacticus* typically uses Monte Carlo-generated merger trees when being constrained to fit data. These have the advantage that they can be generated for any cosmological parameters (necessary if the cosmological parameters are to be varied as part of the constraining process) and they can be generated uniquely for each model evaluation which avoids any bias introduced by using a fixed set of halos.

However, these Monte Carlo-generated trees may not precisely capture the properties of merger trees derived from a fully non-linear calculation of gravitational collapse (e.g. as performed by an N-body simulation). Therefore it is important to assess the model discrepancy arising from this limitation.

Model discrepancy files can be generated using:

```
constraints/modelDiscrepancy/monteCarloTrees.pl config.xml
```

where `config.xml` is a standard *Galacticus* constraint configuration file. The script will run two sets of models, one using N-body merger trees derived from the Millennium Simulation, and a second using Monte Carlo-generated merger trees. The number of subvolumes of the Millennium Simulation to use is specified by the `subVolumeCount` option to this script (a default of 32 subvolumes is used if no number is specified). The subvolume data will be downloaded from the Millennium Simulation database if necessary.

To make a fair comparison, Millennium Simulation merger trees have their branches pruned below a mass corresponding to $20$ particles, and the Monte Carlo merger trees are built with the equivalent mass resolution. Additionally, the Monte Carlo merger trees are regridded onto a set of timesteps matched to the Millennium Simulation.

A multiplicative model discrepancy is computed for each constraint included in the compilation (as specified in the configuration file) equal to the ratio of the N-body result to the Monte Carlo result. Additionally, the subvolumes of the Millennium Simulation are used to estimate the covariance in the N-body result due to the finite volume of the simulation. The result is computed for each subvolume separately and the covariance of the result between subvolumes computed. This is repeated using pairs of subvolumes, quads of subvolumes, etc. If $2^n$ subvolumes were used, then the covariance measured from the result combining $2^{n-3}$ subvolumes is used to extrapolate the covariance for all 512 subvolumes assuming that the covariance scales in inverse proportion to the number of subvolume used. Finally, the contribution of the Monte Carlo trees model to the covariance is assumed to be a diagonal matrix with elements equal to the square of the reported errors on the result of the model.

### 10.3.2. Fixed Virial Orbits

The orbital parameters of subhalos at the point of virial orbit crossing are usually drawn from an appropriate cosmological distribution. If instead fixed virial orbital parameters are used instead then term should be included in the model discrepancy accounting for this approximation.

Model discrepancy files can be generated using:
10. Constraining Galacticus

```
constraints/modelDiscrepancy/fixedVirialOrbits.pl config.xml
```

where `config.xml` is a standard Galacticus constraint configuration file. The script will run two models, one using fixed virial orbital parameters, and a second using variable orbital parameters using the Benson2005 method (see §13.44.2). A multiplicative model discrepancy is computed for each constraint included in the compilation (as specified in the configuration file) equal to the ratio of the variable orbits result to the fixed orbits result. Additionally, a model discrepancy covariance is computed. This is assumed to be a diagonal matrix with elements equal to the square of the reported errors on the results of the fixed and variable orbital parameters models.

10.3.3. Jiang et al. (2008) Merger Time Scatter

The Jiang et al. [2008] algorithm for the merging times of dark matter subhalos includes drawing times from a log-normal distribution of width $\sigma = 0.4$ with median equal to their fitting function (see §13.44.1). If instead zero scatter is used then a term should be included in the model discrepancy accounting for this approximation.

Model discrepancy files can be generated using:

```
constraints/modelDiscrepancy/jiang2008MergingTimeScatter.pl config.xml
```

where `config.xml` is a standard Galacticus constraint configuration file. The script will run two models, one using the default scatter specified by the configuration file, and a second using $\sigma = 0.4$. A multiplicative model discrepancy is computed for each constraint included in the compilation (as specified in the configuration file) equal to the ratio of the $\sigma = 0.4$ and default scatter results. Additionally, a model discrepancy covariance is computed. This is assumed to be a diagonal matrix with elements equal to the sum of the square of the reported errors on the result of the default scatter and $\sigma = 0.4$ models.

10.4. Optimal Halo Mass Function Sampling

Suppose we want to fit parameters of the Galacticus model to some dataset. The basic approach is to generate large numbers of model realizations for different parameter values and see which ones best match the data. Galacticus models involve simulating individual merger trees and then adding together their galaxies to produce some overall function. The question we want to answer is, given some finite amount of computing time, what is the optimal distribution of halo masses to run when comparing to a given dataset. For example, is it better to run a volume limited sample (as one would get from an N-body simulation) or is it better to use, say, equal numbers of halos per logarithmic interval of halo mass? The following section describes how to solve this optimization problem in the specific case of fitting to the stellar mass function.

10.4.1. Li & White (2009) Stellar Mass Function

First, some definitions:

- $n(M)d\ln M$ is the dark matter halo mass function, i.e. the number of halos in the range $M$ to $M + Md\ln M$ per unit volume;
- $\gamma(M)d\ln M$ is the number of trees that we will simulate in the range $M$ to $M + Md\ln M$;
- $\alpha(M_*)$ is the error on the observed stellar mass function at mass $M_*$;
- $P(N|M_*, M; \delta\ln M_*)$ is the conditional stellar mass distribution function of galaxies of stellar mass $M_*$ in a bin of width $\delta\ln M_*$ per halo of mass $M$;
10.4. Optimal Halo Mass Function Sampling

$t(M)$ is the CPU time it takes to simulate a tree of mass $M$.

To clarify, $P(N|M_*, \delta \ln M_*; \delta \ln M_*)$ is the probability to find $N$ galaxies of mass between $M_*$ in a bin of width $\delta \ln M_*$ in a halo of mass $M$. The usual conditional stellar mass function is simply the first moment of this distribution:

$$\phi(M_*; M) \delta \ln M_* = \sum_{N=0}^\infty N P(N|M_*, M; \delta \ln M_*)$$  \hspace{1cm} (10.2)

The model estimate of the stellar mass function $\Phi(M_*)$ (defined per unit $\ln M_*$) is

$$\Phi(M_*) = \int_0^\infty \phi(M_*; M) \frac{n(M)}{\gamma(M)} \gamma(M) d \ln M,$$  \hspace{1cm} (10.3)

where the $n(M)/\gamma(M)$ term is the weight assigned to each tree realization—and therefore the weight assigned to each model galaxy when summing over a model realization to construct the stellar mass function.

When computing a model likelihood, we must employ some statistic which defines how likely the model is given the data. Typically, for stellar mass functions we have an estimate of the variance in the data, $\alpha^2(M_*)$, as a function of stellar mass (full covariance matrices are typically not provided but, ideally would be, and can be easily incorporated into this method). In that case, we can define a likelihood

$$\ln L = -\frac{1}{2} \sum_i \frac{[\phi_{\text{obs},i} - \phi_i]^2}{\alpha^2_i + \sigma^2_i}$$  \hspace{1cm} (10.4)

where the sum is taken over all data points, $i$, and $\sigma^2_i$ is the variance in the model estimate and is given by

$$\sigma^2(M_*) = \langle [\phi(M_*) - \bar{\phi}(M_*)]^2 \rangle,$$  \hspace{1cm} (10.5)

where $\phi(M_*)$ is the realization from a single model and $\bar{\phi}(M_*)$ is the model expectation from an infinite number of merger tree realizations and the average is taken over all possible model realizations. Since the contributions from each merger tree are independent,

$$\sigma^2(M_*) = \sum_i \zeta^2_i(M_*; M)$$  \hspace{1cm} (10.6)

where $\zeta^2_i(M_*; M)$ is the variance in the contribution to the stellar mass function from tree $i$. This in turn is given by

$$\zeta^2_i(M_*; M) = \psi^2(M_*; M) \left[ \frac{n(M)}{\gamma(M)} \right]^2,$$  \hspace{1cm} (10.7)

where $\psi^2(M_*; M)$ is the variance in the conditional stellar mass function. In the continuum limit this becomes

$$\sigma^2(M_*) = \int_0^\infty \psi^2(M_*; M) \left[ \frac{n(M)}{\gamma(M)} \right]^2 \gamma(M) d \ln M.$$  \hspace{1cm} (10.8)

Model variance artificially increases the likelihood of a given model. We would therefore like to minimize the increase in the likelihood due to the model variance:

$$\Delta 2 \ln L = \sum_i \frac{[\phi_{\text{obs},i} - \phi_i]^2}{\alpha^2_i} - \frac{[\phi_{\text{obs},i} - \phi_i]^2}{\alpha^2_i + \sigma^2_i}$$  \hspace{1cm} (10.9)

\(^2\)To put it another way, $P(N|M_*, M; \delta \ln M_*)$ is closely related to the commonly used Halo Occupation Distribution.
Of course, we don’t know the model prediction, \( \phi_i \), in advance\(^3\). However, if we assume that a model exists which is a good fit to the data then we would expect that \( [\phi_{\text{obs}, i} - \phi_i]^2 \approx \alpha_i^2 \) on average. In that case, the increase in likelihood due to the model is minimized by minimizing the function\(^4\)

\[
F[\gamma(M)] = \sum_i \frac{\alpha_i^2}{\alpha_i^2 + \sigma_i^2}.
\]  

(10.10)

If the bins all have the same \( \delta \ln M_* \) we can turn the sum into an integral

\[
F[\gamma(M)] = \int_0^\infty \frac{\alpha(M_*)^2}{\alpha(M_*)^2 + \sigma(M_*)^2} \, d \ln M_*.
\]  

(10.11)

Obviously, the answer is to make \( \gamma(M) = \infty \), in which case \( F[\gamma(M)] = 0 \). However, we have finite computing resources. The total time to run our calculation is

\[
\tau = \int_0^\infty t(M) \gamma(M) \, d \ln M.
\]  

(10.12)

We therefore want to minimize \( F[\gamma(M)] \) while keeping \( \tau \) equal to some finite value. We can do this using a Lagrange multiplier and minimizing the function

\[
F[\gamma(M)] = \int_0^\infty \frac{\alpha(M_*)^2}{\alpha(M_*)^2 + \sigma(M_*)^2} \, d \ln M_* + \int_0^\infty \lambda \gamma(M) t(M) \, d \ln M.
\]  

(10.13)

Finding the functional derivative and setting it equal to zero gives:

\[
\gamma(M) = \sqrt{\frac{\xi(M)}{\lambda t(M)}},
\]  

(10.14)

in the limit where\(^5\) \( \sigma(M_*) \ll \alpha(M_*) \), and where

\[
\xi(M) = n^2(M) \int_{-\infty}^\infty \frac{\psi^2(M_*; M)}{\alpha^2(M_*)} \, d \ln M_*. \]  

(10.15)

The values of \( \lambda \) and \( \delta \ln M_* \), and the normalization of \( t(M) \) are unimportant here since we merely want to find the optimal shape of the \( \gamma(M) \) function—we can then scale it up or down to use the available time.

Figure 10.2 shows the function \( \gamma(M) \) obtained by adopting a model conditional stellar mass function which is a sum of central and satellite terms. Specifically, we use the model of Leauthaud et al. \([2011]\) which is constrained to match observations from the COSMOS survey. In their model\(^6\):

\[
\langle N_c(M_*|M) \rangle \equiv \int_{M_*}^{\infty} \phi_c(M'_*|d \ln M'_* = \frac{1}{2} \left[ 1 - \text{erf} \left( \frac{\log_{10} M_* - \log_{10} f_{SHMR}(M)}{\sqrt{2} \sigma_{\log M_*}} \right) \right].
\]  

(10.16)

Here, the function \( f_{SHMR}(M) \) is the solution of

\[
\log_{10} M = \log_{10} M_1 + \beta \log_{10} \left( \frac{M_*}{M_{*,0}} \right) + \frac{(M_* / M_{*,0})^\delta}{1 + (M_* / M_{*,0})^{-\gamma}} - 1/2.
\]  

(10.17)

\(^3\)Below, we will adopt a simple empirical model for \( \phi(M_*) \). However, it should not be used here since we will in actuality be computing the likelihood from the model itself.

\(^4\)This can be seen intuitively: we are simply requiring that the variance in the model prediction is small compared the the variance in the data.

\(^5\)This is the limit in which we would like our results to be.

\(^6\)This integral form of the conditional stellar mass function is convenient here since it allows for easy calculation of the number of galaxies expected in the finite-width bins of the observed stellar mass function.

For satellites,

\[
\langle N_s(M_*, M) \rangle \equiv \int_{M_*}^{\infty} \phi_s(M_*) d \ln M_* = \langle N_s(M_*, M) \rangle \left( \frac{f_{\text{SHMR}}^{-1}(M_*)}{M_{\text{sat}}} \right)^{\alpha_{\text{sat}}} \exp \left( -\frac{M_{\text{cut}}}{f_{\text{SHMR}}^{-1}(M_*)} \right),
\]  

(10.18)

where

\[
\frac{M_{\text{sat}}}{10^{12} M_{\odot}} = B_{\text{sat}} \left( \frac{f_{\text{SHMR}}^{-1}(M_*)}{10^{12} M_{\odot}} \right)^{\beta_{\text{sat}}},
\]  

(10.19)

and

\[
\frac{M_{\text{cut}}}{10^{12} M_{\odot}} = B_{\text{cut}} \left( \frac{f_{\text{SHMR}}^{-1}(M_*)}{10^{12} M_{\odot}} \right)^{\beta_{\text{cut}}},
\]  

(10.20)

We use the best fit parameters from the SIG_MOD1 method of Leauthaud et al. [2011] for their \( z_1 \) sample, but apply a shift of \(-0.2\) dex in masses to bring the fit into line with the \( z = 0.07 \) mass function of Li and White [2009]. The resulting parameter values are shown in Table 10.1.

We assume that \( P_s(N|M_*, M; \Delta \ln M_*) \) is a Poisson distribution while \( P_c(N|M_*, M; \Delta \ln M_*) \) has a Bernoulli distribution, with each distribution’s free parameter fixed by the constraint of eqn. (10.2), and the assumed forms for \( \phi_c \) and \( \phi_s \).

The errors in the Li and White [2009] observed stellar mass function are well fit by (see Fig. 10.1):

\[
\alpha(M_*) = 10^{-3} \left( \frac{M_*}{4.5 \times 10^{10} M_{\odot}} \right)^{-0.3} \exp \left( -\frac{M_*}{4.5 \times 10^{10} M_{\odot}} \right) + 10^{-7},
\]  

(10.21)

and the tree processing time in GALACTICUS can be described by:

\[
\log_{10} t(M) = \sum_{i=0}^{2} C_i [\log_{10} M]^i
\]  

(10.22)

with \( C_0 = -0.73, \) \( C_1 = -0.20 \) and \( C_2 = 0.035. \)

The resulting optimal sampling density curve is shown in Fig. 10.2 and is compared to weighting by the halo mass function (i.e. the result of sampling halos at random from a representative volume). Optimal sampling gives less weight to low mass halos (since a sufficient accuracy can be obtained without the need to run many tens of thousands of such halos) and to high mass halos which are computationally expensive.
Errors on the stellar mass function at $z = 0.1$

Figure 10.1.: Errors on the Li and White [2009] stellar mass function (points) and the fitting function (line) given by eqn. (10.21).
Figure 10.2.: Optimal weighting (yellow line) compared with weighting by the dark matter halo mass function (i.e. sampling halos at random from a representative volume; blue line). Sampling densities have been normalized to unit compute time.
10. Constraining GALACTICUS

10.4.2. Refining by Other Merger Tree Statistics

Since building merger trees is relatively fast, while solving the baryonic physics is slow it may be advantageous to non-uniformly sample the distribution of merger trees at fixed merger tree mass, \( M \). For example, we could assign some measure of formation history to each merger tree, such as the time since the last major merger, \( \tau \). The halo mass function then becomes \( n(M, \tau) \) (which can be computed by simulating large numbers of trees), and the tree sampling function becomes \( \gamma(M, \tau) \). We’d then need to know the stellar mass function conditioned on both \( M \) and \( \tau \), \( \phi_*(M_*|M, \tau) \). Given these, the above approach could be easily generalized to determine an optimal \( \gamma(M, \tau) \). Then, after generating a merger tree, we’d first compute \( \tau \). If a sufficient number of trees in that \( \tau \) interval had already been computed, then we’d simply drop that tree and compute another one. The speed up here would depend on how fast building trees is relative to solving baryonic physics and what fraction of trees you discard. In principle, the trees could be generated, sampled and stored in advance so that we’d already have an optimally distributed set of trees in \( M \) and \( \tau \) that could be used for each model run.

10.5. Constraints

Any constraint which can be applied to GALACTICUS is defined by two files, a configuration file and a likelihood script, which must be placed in constraints/constraints and constraints/scripts respectively.

10.5.1. Configuration File

The configuration file should have the form:

```xml
<!-- Defines a constraint to match some data. -->
<constraint>
  <name>Long-form name of this constraint</name>
  <label>shortLabelForThisConstraint</label>
  <outputRedshift>0.07</outputRedshift>
  <outputRedshift>1.00</outputRedshift>
  <haloMassResolution>5.0e9</haloMassResolution>
  <haloMassMinimum>2.0e10</haloMassMinimum>
  <haloMassMaximum>2.0e14</haloMassMaximum>
  <analysis>constraints/scripts/myAnalysisScript.pl</analysis>
  <luminosity>
    <filter>UKIRT_K</filter>
    <redshift>0.0</redshift>
    <frame>rest</frame>
  </luminosity>
  <luminosity>
    <filter>UKIRT_K</filter>
    <redshift>1.0</redshift>
    <frame>observed</frame>
  </luminosity>
  <optionOn>outputMainBranchStatus</optionOn>
  <optionOn>outputDensityContrastData</optionOn>
  <parameter>
    <name>outputDensityContrastValues</name>
    <value>200.0</value>
  </parameter>
</constraint>
```
10.5. Constraints

The name and label are used to describe the constraint (label is used as a suffix in file names so should not contain spaces or other characters which might cause problems in file names).

The remaining elements describe the requirements for this constraint. haloMassResolution specifies the maximum resolution in mergers trees that still allows this constraint to be computed accurately. Similarly, haloMassMinimum and haloMassMaximum specify the required range of halo masses to simulate to allow this constraint to be computed accurately.

One or more outputRedshift elements may be present, each specifying a redshift at which output is required for this constraint. Similarly, one or more luminosity elements may be present, each of which specifies a luminosity which must be computed for this constraint. Each luminosity must contain a specification of filter, redshift, and frame to define which luminosity is to be computed.

One or more optionOn elements may be present. Each element must specify the name of a Galacticus input parameter. That parameter will be set to true in the Galacticus input parameter file.

Finally, arbitrary other parameter may be set using the standard parameter element which should give the name and value for the parameter. Optionally, an accumulation element may also be specified for each parameter. This controls how values of the parameter are to be accumulated if set by more than one constraint. An accumulation of overwrite will simply overwrite any previously set values. An accumulation of combine will concatenate all values set by different constraints. Finally, an accumulation of unique will concatenate all values set by different constraints and then filter out any duplicates.

When multiple constraints are used, their requirements are automatically combined.

10.5.2. Likelihood Script

The likelihood script for a constraint is required to perform several tasks, controlled by command line options. The script should accept the following command line syntax:

myScript.pl <galacticusFile> [options...]

where galacticusFile is the file name of the Galacticus model for which the likelihood calculation should be performed. The following options must be supported by the script:

-plotFile <fileName> If this option is present, the script should generate a plot showing the constraint and the model result and write it to fileName.

-outputFile <fileName> If this option is present, the script should compute the log-likelihood of the model given the constraint and write it to fileName using the format

<constraint>
<logLikelihood>-123</logLikelihood>
</constraint>

-accuracyFile <fileName> If this option is present, the script should write an XML file giving details of the accuracy of the model results relative to the observational errors using the format

<accuracy>
<x>...</x>
.
.
.
</accuracy>
10. Constraining Galacticus

In this file the \texttt{yModel} and \texttt{yData} elements should give the values of the model result and the comparable data respectively, while \texttt{errorModel} and \texttt{errorData} should give an estimate of the errors on these quantities. In the case of the model error this should include only the contribution arising from the finite number of merger trees simulated. This file will be used to judge whether the model is running sufficient merger trees such that the likelihood is not dominated by these errors. The \texttt{x} elements are optional but can be used to give the parameter values associated with each model result.

\texttt{-resultFile <fileName>} If this option is present, the script should write an XML file giving details of the result of the model using the format

\begin{verbatim}
<accuracy>
  <x>...</x>
  ...
  ...
  <x>...</x>
  <y>...</y>
  ...
  ...
  <y>...</y>
  <error>...</error>
  ...
  ...
  <error>...</error>
</accuracy>
\end{verbatim}
10.5. Constraints

In this file the $y$ elements should give the values of the model result, while the $error$ elements should give an estimate of the errors on these results. The error should include only the contribution arising from the finite number of merger trees simulated. This file will be used to judge whether the model result is converged with respect to various numerical parameters in GALACTICUS. The $x$ elements are optional but can be used to give the parameter values associated with each model result.

`--modelDiscrepancies <path>` If this option is present, the script should scan $\text{path}$. For each directory found in $\text{path}$ the script should check for the existence of a file named $\text{discrepancy<label>.hdf5}$ where $\text{label}$ is the label given for this constraint in its configuration file (see §10.5.1). If present, the model discrepancy given in that file should be applied to the likelihood calculation. See §10.3 for a description of the structure of the discrepancy files.

10.5.3. Available Constraints

**Li & White (2009) SDSS Stellar Mass Function**

This constraint utilizes the stellar mass function for $z \approx 0.07$ galaxies measured by Li and White [2009] from the Sloan Digital Sky Survey (SDSS). The mass function reported by Li and White [2009] is converted to the appropriate Hubble constant for the given GALACTICUS model (assuming that masses scale as $H_0^{-2}$ and volumes as $H_0^3$)—no adjustment is made for cosmological parameters given the low redshift of the sample.

Given a GALACTICUS model, total stellar masses of model galaxies are adjusted using:

$$M_* \rightarrow G M_*$$

where the $S$ operator is a multiplicative factor accounting for systematic errors in stellar mass determination and is equal to [Behroozi et al., 2010]

$$\log_{10} S = \mu + \kappa \log_{10} \left( \frac{M_*}{10^{11.3} M_\odot} \right)$$

where $\mu = [sdssStellarMassFunctionZ0.07StellarMassSystematicMu]$, $\kappa = [sdssStellarMassFunctionZ0.07StellarMassSystematicKappa]$, and the $G$ operator is a multiplicative factor drawn from a log-normal distribution of width 0.07 dex for each galaxy to mimic the effects of random errors on stellar masses (motivated by the discussion of Behroozi et al. [2010]).

The model masses are then used to construct a mass function by binning into a histogram using the masses reported by Li and White [2009] (modified as described above) as the centers of the bins (with bin boundaries placed at the geometric means of consecutive bin centers).

If the `--modelDiscrepancies` option is given, then any multiplicative or additive discrepancies found are applied to the model mass function, and any additional covariance is added to the covariance matrix.

The covariance matrix is computed as

$$C = C_{\text{obs}} + C_{\text{model,random}} + \sum_i C_{\text{discrepancy},i},$$

where $C_{\text{obs}}$ is the covariance matrix of the observational data, $C_{\text{model,random}}$ is the covariance matrix of the model arising from random noise (due to the finite number of trees simulated—see §10.5.3 for a description of how this covariance matrix is estimated), and $C_{\text{discrepancy},i}$ is the covariance due to the $i^{th}$ model discrepancy.

The model likelihood is then computed using:

$$L = \frac{1}{\sqrt{(2\pi)^n|C|}} \exp \left( -\frac{1}{2} \Delta C^{-1} \Delta \right),$$
where $\Delta_i = \Phi_{\text{model},i} - \Phi_{\text{observed},i}$ is the difference between the model and observed mass functions, and $n$ is the number of points in the mass function histogram.

Computing the large-scale structure contribution to the covariance function requires integration of the non-linear matter power spectrum over the Fourier transform of the survey window function. We use the method of Peacock and Dodds [1996] to determine the non-linear matter power spectrum, because of its simplicity and speed. We have checked that using a more accurate non-linear matter power spectrum (e.g. Lawrence et al. 2010) makes negligible difference to our results.

To find a suitable halo occupation distribution (HOD) to describe the galaxies in the Li and White [2009] sample we adopt the model of Behroozi et al. [2010]. This is an 11 parameter model which describes separately the numbers of satellite and central galaxies occupying a halo of given mass—the reader is referred to Behroozi et al. [2010] for a complete description of the functional form of this parametric HOD.

To reproduce the mass function of Li and White [2009] using this HOD we use the Bayesian inference engine (BIE) [Weinberg, 2012] to constrain the HOD parameters. We use a likelihood

$$\ln \mathcal{L} = -\frac{1}{2} \Delta \cdot \mathcal{C}^{-1} \cdot \Delta^T - \frac{N}{2} \ln(2\pi) - \frac{\ln |\mathcal{C}|}{2},$$

(10.27)

where $N$ is the number of bins in the mass function, $\mathcal{C}$ is the covariance matrix of the observed mass function, and $\Delta_i = \phi_i^{(\text{HOD})} - \phi_i^{(\text{observed})}$. Of course, it is precisely this covariance matrix, $\mathcal{C}$, that we are trying to compute. We therefore adopt an iterative approach as follows:

1. make an initial estimate of the covariance matrix, assuming that only Poisson errors contribute (the covariance matrix is therefore diagonal, and the terms are easily computed from the measured mass function and the survey volume as a function of stellar mass);
2. find the maximum likelihood parameters of the HOD given the observed mass function and the current estimate of the covariance matrix;
3. using this HOD and the framework of Smith [2012], compute a new estimate of the covariance matrix, including all three contributions;
4. repeat steps 2 and 3 until convergence in the covariance matrix is achieved.

In practice we find that this procedure leads to an HOD and covariance matrix which oscillate between two states in successive iterations. The differences in the covariance matrix are relatively small however, so we choose to conservatively adopt the covariance matrix with the larger values. In future, adding additional constraints to the HOD (as described below) should help mitigate this problem.

**Martin et al. (2010) ALFALFA HI Mass Function**

This constraint utilizes the HI mass function for $z \approx 0.0$ galaxies measured by Martin et al. [2010] from the ALFALFA survey. The mass function reported by Martin et al. [2010] is converted to the appropriate Hubble constant for the given GALACTICUS model (assuming that masses scale as $H_0^{-2}$ and volumes as $H_0^3$)—no adjustment is made for cosmological parameters given the low redshift of the sample.

Given a GALACTICUS model, total gas masses of model galaxies are adjusted using:

$$M_{\text{HI}} \rightarrow GS M_{\text{gas}}$$

(10.28)

where the $S$ operator is a multiplicative factor accounting for systematic errors in HI mass determination and for the unknown molecular fraction and is equal to:

$$\log_{10} S = \mu + \kappa \log_{10} \left( \frac{M_*}{10^9 M_\odot} \right)$$

(10.29)
10.5. Constraints

Figure 10.3: The observational random error in galaxy HI mass as a function of HI mass for the ALFALFA survey. Points show the errors reported by Haynes et al. [2011], while the line shows a simple functional form fit to these errors.

where $\mu = \text{[alfalfaHiMassFunctionZ0.00MolecularFractionMu]}$, $\kappa = \text{[alfalfaHiMassFunctionZ0.00MolecularFractionKappa]}$, and the $G$ operator is a multiplicative factor drawn from a log-normal distribution. The width of this log-normal is determined from the combination of observational random errors on HI mass and scatter in the $H_2$/HI mass ratio at fixed total gas mass. Observational random errors on HI mass are taken from Fig. 19 of Haynes et al. [2011]. We fit the magnitude of the error as a function of HI mass using a functional form:

$$
\sigma_{\text{obs}} = a + \exp \left( -\frac{\log_{10}(M_{HI}/M_\odot) - b}{c} \right),
$$

(10.30)

where $\sigma_{\text{obs}}$ is the error on $\log_{10}(M_{HI}/M_\odot)$. We find a good fit using values of $a = 0.100$, $b = 5.885$, and $c = 0.505$ as shown in Fig. 10.5.3.

In addition, we expect there to be significant scatter in the $H_2$/HI mass ratio at fixed total gas mass. For example, Figure 5 of Power et al. [2010] shows a broad distribution of such values. We approximate this scatter as a Gaussian random process with standard deviation $\sigma$. This random “error” is added in quadrature to the observational errors when constructing the mass function. For a prior on $\sigma$ we adopt a normal distribution with mean of 0.4 (estimated from Figure 5 of Power et al. [2010]) and standard deviation 0.3.

The model masses are then used to construct a mass function by binning into a histogram using the masses reported by Martin et al. [2010] (modified as described above) as the centers of the bins (with bin boundaries placed at the geometric means of consecutive bin centers).

If the -modelDiscrepancies option is given, then any multiplicative or additive discrepancies found are applied to the model mass function, and any additional covariance is added to the covariance matrix.

The covariance matrix is computed as

$$
C = C_{\text{obs}} + C_{\text{model,random}} + \sum_i C_{\text{discrepancy},i},
$$

(10.31)

where $C_{\text{obs}}$ is the covariance matrix of the observational data, $C_{\text{model,random}}$ is the covariance matrix of the model arising from random noise (due to the finite number of trees simulated, and $C_{\text{discrepancy},i}$ is the covariance due to the $i^{th}$ model discrepancy.
To construct $C_{\text{model, random}}$ we make use of the fact that Galacticus works by sampling a set of tree “root masses” from the $z = 0$ dark matter halo mass function. From each root, a tree is grown, within which the physics of galaxy formation is then solved. Root masses are sampled uniformly from the halo mass function. That is, the cumulative halo mass function, $N(M)$, is constructed between the maximum and minimum halo masses to be simulated. The number of root masses, $N_r$, to be used in a model evaluation is then determined. Root masses are then chosen such that

$$N(M_i) = N(M_{\text{min}}) \frac{i - 1}{N_r - 1}$$

for $i = 1 \ldots N_r$ (noting that $N(M_{\text{max}}) = 0$ by construction).

Consider first those galaxies which form in the main branch of each tree (i.e. those galaxies which are destined to become the central galaxy of the $z = 0$ halo). Suppose that we simulate $N_k$ halos of root mass $M_k$ at $z = 0$. In such halos the main branch galaxies will, at any time, have stellar masses drawn from some distribution $p_k(M_\star | t)$. The number of such galaxies contributing to bin $i$ of the mass function is therefore binomially distributed with success probability $p_{ki} = \int_{M_{\text{min}}}^{M_{\text{max}}} p_k(M_\star | t) dM_\star$ and a sample size of $N_k$. The contribution to the covariance matrix from these main branch galaxies is therefore:

$$C_{ij} = \begin{cases} p_{ki}(1 - p_{ki}) N_k w_k^2 & \text{if } i = j \\ -p_{ki} p_{kj} N_k w_k^2 & \text{otherwise,} \end{cases}$$

(10.33)

where $w_k$ is the weight to be assigned to each tree. To compute this covariance requires knowledge of the probabilities, $p_{ki}$. We estimate these directly from the model. To do this, we bin trees into narrow bins of root mass and assume that $p_{ki}$ does not vary significantly across the mass range of each bin. Using all realizations of trees that fall within a given bin, $k$, we can directly estimate $p_{ki}$.

In addition to the main branch galaxies, each tree will contain a number of other galaxies (these will be “satellite” galaxies at $z = 0$, but at higher redshifts may still be central galaxies in their own halos). Tests have established that the number of satellites in halos is well described by a Poisson process. Note that each galaxy contributes Gaussian distribution to the mass function due to modelling of random errors in stellar mass determinations. For main branch galaxies this is simply accounted for when accumulating the probabilities, $p_{ki}$. For satellite galaxies, off-diagonal contributions to the covariance matrix arise as a result, $C_{ij} = w_k f_i f_j$, where $f_i$ is the fraction of the galaxy contributing to bin $i$ of the mass function.

The model likelihood is then computed using:

$$\mathcal{L} = \frac{1}{\sqrt{(2\pi)^n |C|}} \exp \left[ -\frac{1}{2} \Delta C^{-1} \Delta \right],$$

(10.34)

where $\Delta_i = \Phi_{\text{model, } i} - \Phi_{\text{observed, } i}$ is the difference between the model and observed mass functions, and $n$ is the number of points in the mass function histogram.

Computing the large-scale structure contribution to the covariance function requires integration of the non-linear matter power spectrum over the Fourier transform of the survey window function. We use the method of Peacock and Dodds [1996] to determine the non-linear matter power spectrum, because of its simplicity and speed. We have checked that using a more accurate non-linear matter power spectrum (e.g. Lawrence et al. 2010) makes negligible difference to our results.

To find a suitable HOD to describe the galaxies in the Martin et al. [2010] sample we adopt the model of Behroozi et al. [2010]. This is an 11 parameter model which describes separately the numbers of satellite and central galaxies occupying a halo of given mass—the reader is referred to Behroozi et al. [2010] for a complete description of the functional form of this parametric HOD.

To reproduce the mass function of Martin et al. [2010] using this HOD we use the BIE [Weinberg, 2012] to constrain the HOD parameters. We use a likelihood

$$\ln \mathcal{L} = -\frac{1}{2} \Delta \cdot C^{-1} \cdot \Delta^T - \frac{N}{2} \ln(2\pi) - \frac{\ln |C|}{2},$$

(10.35)
where \( N \) is the number of bins in the mass function, \( \mathcal{C} \) is the covariance matrix of the observed mass function, and \( \Delta_i = \phi_i^{\text{HOD}} - \phi_i^{\text{observed}} \). Of course, it is precisely this covariance matrix, \( \mathcal{C} \), that we are trying to compute. We therefore adopt an iterative approach as follows:

1. make an initial estimate of the covariance matrix, assuming that only Poisson errors contribute (the covariance matrix is therefore diagonal, and the terms are easily computed from the measured mass function and the survey volume as a function of stellar mass);

2. find the maximum likelihood parameters of the HOD given the observed mass function and the current estimate of the covariance matrix;

3. using this HOD and the framework of Smith [2012], compute a new estimate of the covariance matrix, including all three contributions;

4. repeat steps 2 and 3 until convergence in the covariance matrix is achieved.

In practice we find that this procedure leads to an HOD and covariance matrix which oscillate between two states in successive iterations. The differences in the covariance matrix are relatively small however, so we choose to conservatively adopt the covariance matrix with the larger values. In future, adding additional constraints to the HOD (as described below) should help mitigate this problem.

Shen et al. (2003) Late-Type Galaxy Size Distribution

This constraint utilizes the distribution of Petrosian half-light radii for \( z \approx 0.07 \) late-type galaxies measured by Shen et al. [2003] from the SDSS. The size function reported by Shen et al. [2003] is converted to the appropriate cosmology for the given GALACTICUS model (assuming that sizes scale as the angular diameter distance, and masses as the square of the luminosity distance).

Given a GALACTICUS model, total stellar masses of model galaxies are adjusted using:

\[
M_\star \rightarrow G S M_\star
\]

where the \( S \) operator is a multiplicative factor accounting for systematic errors in stellar mass determination and is equal to [Behroozi et al., 2010]

\[
\log_{10} S = \mu + \kappa \log_{10} \left( \frac{M_\star}{10^{11.3} M_\odot} \right)
\]

(10.37)

where \( \mu = [\text{diskGalaxySizesSDSSZ0.07MassSystematic0}] \), \( \kappa = [\text{diskGalaxySizesSDSSZ0.07MassSystematic1}] \), and the \( G \) operator is a multiplicative factor drawn from a log-normal distribution of width 0.0806 dex for each galaxy to mimic the effects of random errors on stellar masses (motivated by the statement from Shen et al. [2003] who quote the 95% confidence interval on masses as being \( \pm 40\% \)).

Note: This analysis currently assumes that model galaxies have disk Petrosian half-mass radii of

\[
R_{50} = 1.6676 \frac{1}{\sqrt{2}} \lambda R_{\text{vir}}.
\]

(10.38)

Disk sizes of model galaxies are then adjusted using:

\[
R_{50} \rightarrow G S R_{50}
\]

(10.39)

where the \( S \) operator is a multiplicative factor accounting for systematic errors in radius determination and in determination of radius from halo virial radius and spin and is equal to

\[
\log_{10} S = \mu + \kappa \log_{10} \left( \frac{R_{50}}{1 \text{kpc}} \right)
\]

(10.40)
where $\mu = [\text{iskGalaxySizesSDSSZ0.07RadiusSystematic0}], \kappa = [\text{iskGalaxySizesSDSSZ0.07RadiusSystematic1}]$, and the $G$ operator is a multiplicative factor drawn from a log-normal distribution of width 0.0128 dex for each galaxy to mimic the effects of random errors on disk radii (estimated from the fractional errors reported in the SDSS database).

The model sizes and masses are then used to construct a mass-dependent radius function by binning into a 2-D histogram using the size and mass bins reported by Shen et al. [2003] (modified as described above) as the centers of the bins (with bin boundaries placed at the geometric means of consecutive bin centers).

If the `modelDiscrepancies` option is given, then any multiplicative or additive discrepancies found are applied to the model mass function, and any additional covariance is added to the covariance matrix.

The covariance matrix is computed as

$$C = C_{\text{obs}} + C_{\text{model, random}} + \sum_i C_{\text{discrepancy},i},$$

where $C_{\text{obs}}$ is the covariance matrix of the observational data, $C_{\text{model, random}}$ is the covariance matrix of the model arising from random noise (due to the finite number of trees simulated, and $C_{\text{discrepancy},i}$ is the covariance due to the $i^{th}$ model discrepancy.

The model covariance matrix is estimated using the sample methods as described in §10.5.3. The only difference is that in this case we have a 2-D histogram. This 2-D histogram is “flattened” into a 1-D vector for purposes of likelihood computation however, so covariance matrix estimation proceeds unchanged. (Note that correlations between mass bins are accounted for, in additional to correlations between radius bins.) Since the radius functions of Shen et al. [2003] are normalized to unity at each mass, we must account for this in the covariance matrix. The radius function transforms as:

$$f_{ik} \rightarrow \frac{f_{ik}}{\Delta \log_{10} R \sum_i f_{ik}},$$

where $i$ indexes radius bins, $k$ indexes mass bins, and $\Delta \log_{10} R$ is the width of the radius bin. The Jacobian of this transformation is simply

$$J_{ij} = \frac{\delta_{ij} - f_i}{\Delta \log_{10} R \sum_i f_{ik}}.$$

Therefore, the covariance matrix is modified according to $C \rightarrow JCJ^T$. The same transformation is applied to the covariance matrix of the observed data (for which the reported errors are simply the Poisson errors on each bin).

The model likelihood is then computed using:

$$L = \frac{1}{\sqrt{(2\pi)^n|C|}} \exp \left[ -\frac{1}{2} \Delta C^{-1} \Delta \right],$$

where $\Delta_i = \Phi_{\text{model},i} - \Phi_{\text{observed},i}$ is the difference between the model and observed mass functions, and $n$ is the number of points in the mass function histogram.

### 10.6. Constraint Compilations

To specify which constraints will be applied to a particular model, a compilation file is used. These must be stored in `constraints/compilations`. An example of such a file follows:

```
<constraintCompilation>
```
10.7. Constraint File

Each constraint element specifies one constraint that will be included in this compilation, and must contain a definition element, giving the path of the configuration file for this constraint, and a weight element which allows the relative weight given to each constraint to be varied\(^7\).

10.7. Constraint File

\textsc{Galacticus}'s constraints infrastructure is currently designed to work with a modified version of the \textsc{BIE} to analyze the posterior probability distribution of the model given some compilation of constraints. Note that the standard version of \textsc{BIE} \textit{will not work}\(^8\). To obtain the modified version please contact us. Additionally, the infrastructure currently assumes that you will be performing the analysis on a PBS queue system.

To perform a constraint calculation simply execute the launch script:

```
constraints/bieGalacticus.pl <constraintFile>
```

where constraintFile is a file which describes the details of the calculation to be performed. An example of such a script follows:

```
<constraint>
  <name>verySimplisticToStellarMassFunction</name>
  <workDirectory>my/work/path</workDirectory>
  <scratchDirectory>/scratch/my/scratch/path</scratchDirectory>
  <report>no</report>
  <cpulimit>1200</cpulimit>
  <memoryLimit>32gb</memoryLimit>
  <environment>LD_LIBRARY_PATH=/my/lib:$LD_LIBRARY_PATH</environment>
  <environment>PATH=/my/path:$PATH</environment>
  <baseParameters>parameters.xml</baseParameters>
  <randomize>no</randomize>

  <!-- Compilation of constraints to use -->
  <compilation>stellarMassFunction_SDSS_z0.07.xml</compilation>
  <storeResults>no</storeResults>

  <!-- MCMC method -->
  <threadsPerNode>12</threadsPerNode>
  <threads>300</threads>
```

\(^7\)Note that, if your constraints are computing correct likelihoods, re-weighting them may not be a good idea. \textit{Caveat constrainor}.

\(^8\)The modified version adds new likelihood methods that launch and analyze \textsc{Galacticus} models.

    <prior>
      <distribution>uniform</distribution>
      <mapping>logarithmic</mapping>
      <lowerLimit>1.0e-1</lowerLimit>
      <upperLimit>1.0e+1</upperLimit>
    </prior>
  </parameter>

</parameters>

<!-- Include the standard WMAP-9 cosmological parameters and priors -->
<x:include href="../../constraints/parameters/wmap9Cosmology.xml"
The following subsections describe each entry in this file.

10.7.1. Computing Environment

- **name**  A name to use for this calculation. It will be used as the name for jobs submitted to the PBS queue for example.

- **workDirectory**  The full path to a directory in which the results (e.g. Markov Chain Monte Carlo (MCMC) chains) will be stored.

- **scratchDirectory** *(Optional)*  The full path to a scratch directory where GALACTICUS model outputs and other temporary data will be written.

- **report**  If set to `yes`, reports additional debugging information during the run.

- **cpulimit**  A CPU time limit for each model evaluation. This can be useful if certain obscure regions of the surveyed parameter space result in unacceptably long run times. Models will be killed after this time and a very low likelihood returned.

- **memoryLimit**  A memory limit to be passed to PBS.

- **environment**  One of more such element can appear. Each specifies the value of an environment variable to be set prior to launching the BIE.

- **storeResults**  If `yes` then the full results (e.g. the quantities computed to compare with observational data) from each model evaluation will be stored. Otherwise, they are discarded after each evaluation. Use `yes` with caution—a typical run might include millions of model evaluations which can quickly lead to huge amounts of data being written to disk.

- **threadsPerNode**  The number of threads to use per node. Typically this would be set to the number of available cores on each node.

- **threads**  The total number of threads (i.e. parallel chains) to use.

- **galacticusThreads**  The number of parallel OpenMP threads to use for each GALACTICUS model. It is recommended that this be set to the number of available cores on each node, and semaphoring (see §sec:Semaphores) be used. In this way, each copy of GALACTICUS on a node will share resources, but as one instance finishes, the others will be able to make use of the freed resources.

- **galacticusSaveState**  If `yes` then GALACTICUS will save its internal state prior to beginning evolution of each merger tree. This is intended for debugging purposes and so should normally be set to `no`.

- **checkpoint**  If present, BIE will be instructed to checkpoint its calculations. The interval (in number of steps) between checkpoints is specified by the `interval` sub-element. If the `autoRestart` sub-element is set to `true` then a second PBS script will be submitted which will restart the calculation once the original job finishes. This second script will submit a further script to take over once it
finishes and so on. This can be useful if your PBS queue has a time limit and you want to keep restarting the calculation until it is done. Use with caution however, some systems forbid automated restarts.

10.7.2. Model Specification

baseParameters Specifies the path to a GALACTICUS parameter file which will be used as the base set of parameter on top of which any parameter variations will be applied.

randomize If yes then each model evaluation will be performed with a different random number seed. Otherwise, the same seed is used in all cases. Experiment shows that changing the random number seed between evaluations can seriously limit the ability of MCMC algorithms to converge.

10.7.3. Constraints

compilation Specifies the path to a compilation file to be used for this analysis.

10.7.4. MCMC Method

method Specifies the MCMC algorithm to be used. Currently accepted values are differentialEvolution and metropolisHastings. See the BIE documentation for full details of these two algorithms.

monteCarlo Specifies the behavior of the MCMC algorithm:
  steps The maximum number of steps to take.
  stepsSkip The number of initial steps to skip before beginning to measure convergence.
  goodSteps The number of steps to perform after convergence is attained.
  temperingFrequency The number of steps between successive temperings (in which the likelihood function is “heated up” to help get chains out of local minima).
  maxTemperature The maximum temperature to use when tempering.
  minTemperatureStates The minimum number of temperatures states when tempering.
  proposalWidth Used for the metropolisHastings algorithm, specifies the width of proposals.
  gamma Used for the differentialEvolution algorithm, specifies the fraction of the vector connecting to chain state to be used as the proposal for another chain.
  epsWidth Used for the differentialEvolution algorithm, specifies the width of the Cauchy distribution added to each proposal to ensure that the chains are positively recurrent.
  grAlpha Set Gelman-Rubin convergence outlier detection confidence, $1 - \alpha$.
  grNOutlier Set number of iterations before applying an outlier test in the Gelman-Rubin convergence statistic.
  grMaxOut Set the maximum number of outliers allowed in the Gelman-Rubin convergence statistic.
  grRhatMax The correlation coefficient threshold for the Gelman-Rubin convergence statistic.

10.7.5. Post-prior

If present, the postPrior block allows the use of the statelog from a previous calculation as the prior on a new calculation (in addition to any explicitly defined priors).

stateLog The full path to the statelog file containing the results of the prior calculation.
10.7. Constraint File
restart If “yes” then the posterior of the previous calculation is used only to sample the initial states of
the new chains. It is not used as a prior on the new calculation. If “no” then the previous posterior
is used as the new prior.
burn The number of steps from the statelog to burn.

10.7.6. Parameters and Priors
The parameters section contains a list of all parameters to be varied in the analysis. Each parameter is
described by one parameter element. That element must contain a name element, which gives the name
of the parameter, and a prior element
distribution The type of distribution to be used for the prior. Currently accepted values are uniform and
normal.
mapping The mapping of the parameter to which the prior should be applied. Currently allowed values are
linear (the prior is on the parameter itself), and logarithmic (the prior is on the logarithm of
the parameter).
lowerLimit The lower limit for the prior.
upperLimit The upper limit for the prior.
mean For normal priors, the mean of the normal distribution.
variance For normal priors, the variance (not the standard deviation) of the normal distribution.
Loading External Parameters/Priors
It is also possible to load parameters and their priors from external files. This is useful to add common
sets of parameters, such as cosmological parameter. To do so, add an element of the form:
<xi:include href="../../constraints/parameters/wmap9Cosmology.xml"
xmlns:xi="http://www.w3.org/2001/XInclude" />
after the parameters section of the constraint file. The href attribute must give the path (relative to the
constraint file, or absolute) to the external parameter file. This file should contain its own parameters
block, describing all parameters to be varied along with their priors.
Derived Parameter Values
It is possible to define parameters in terms of other parameters. Common uses for this include:
• Setting ΩΛ from the value of ΩM to enforce a flat Universe;
• Setting the values of parameters with correlated priors as linear combinations of dummy parameters
for which the priors are independent.
To define a parameter in this way include a parameter element of the form:
<parameter>
<name>sigma_8</name>
<define>0.8178+%cosmology0*0.003817+%cosmology1*0.007931+%cosmology2*0.01002
+%cosmology3*0.001584+%cosmology4*0.002931+%cosmology5*0.001727</define>
</parameter>
Here the define element gives an equation for the parameter in terms of other parameters. All standard mathematical operators and functions (as recognized by Perl) can be used, and other parameters
referenced by using their name prefixed with a “%”.

201


Including External Parameters

Predefined sets of parameters (along with their priors) can be included using the `xi:include` element. For example,

```xml
<xi:include href="../../constraints/parameters/wmap7Cosmology.xml"
  xmlns:xi="http://www.w3.org/2001/XInclude" />
```

will include a set of parameters from the file `../../constraints/parameters/wmap7Cosmology.xml` which defines priors on cosmological parameters consistent with the covariance matrix of the WMAP-7 cosmological constraints [Komatsu et al., 2010].
Part III.

Physical Implementation
In this Part we describe the physical implementation of galaxy formation in GALACTICUS, including all components and their properties and additional output quantities from the code.
11. Definitions and Conventions Used in
GALACTICUS

GALACTICUS adopts various definitions and conventions internally. These are explained below.

11.1. Luminosity Units

Galaxy luminosities are output in the AB magnitude system, such that a luminosity of 1 corresponds to an object of $0^h$ absolute magnitude in the AB magnitude system. This implies that the luminosities are in units of $4.4659 \times 10^{13} \text{ W/Hz}$. 

11.2. Peculiar Velocities

Velocities in GALACTICUS are always physical velocities. When reading merger tree properties (including velocities) from file it is often convenient to store velocities without the Hubble flow contribution, as “peculiar velocities”, in the file—see §A.6 for how to specify whether or not the velocities included in the file include the Hubble flow or not.

If peculiar velocities are stored it is important to use the same definition of peculiar velocity as is used by GALACTICUS. Defining $t$ to be physical time and $x$ to be comoving position, GALACTICUS uses the conventional definition of peculiar velocity in a cosmological context, namely that it is the deviation of the physical velocity from the Hubble flow. Physical coordinates are given by $r = ax$, so the peculiar velocity is

$$v_{pec} = \frac{dr}{dt} - Hr = a \frac{dx}{dt} = \frac{dx}{d\eta}, \quad (11.1)$$

where $d\eta = dt/\alpha$ is conformal time.
12. Node Components

In addition to the implementations described here, each component class has a “null” implementation. Selecting this implementation—which has no properties and does not respond to any events—effectively switches off the relevant component class. Of course, this is safe only if none of the other active implementations expect to get or set properties of the component class (or if they rely on a sensible implementation of that class).

12.1. (Supermassive) Black Hole

12.1.1. “Standard” Implementation

Properties

The standard black hole implementation defines the following properties:

- **mass** The mass of the black hole: \( M_\bullet \) [blackHoleMass].
- **spin** The spin of the black hole, \( j_\bullet \) [blackHoleSpin].
- **radialPosition** The radial position of the black hole: \( r_\bullet \) [blackHoleRadialPosition].

Initialization

Black holes are not initialized, they are created (with a seed mass given by blackHoleSeedMass and zero spin) as needed.

Differential Evolution

In the standard black implementation the mass and spin evolve as:

\[
\begin{align*}
\dot{M}_\bullet &= (1 - \epsilon_{\text{radiation}} - \epsilon_{\text{jet}}) \dot{M}_0 \quad \text{(12.1)} \\
\dot{j}_\bullet &= \dot{j}(M_\bullet, j_\bullet, \dot{M}_0) \quad \text{(12.2)}
\end{align*}
\]

where \( \dot{M}_0 \) is the rest mass accretion rate, \( \epsilon_{\text{radiation}} \) is the radiative efficiency of the accretion flow feeding the black hole, \( \epsilon_{\text{jet}} \) is the efficiency with which accretion power is converted to jet power and \( \dot{j}(M_\bullet, j_\bullet, \dot{M}_0) \) is the spin-up function of that accretion flow (see §17.4.1). The rest mass accretion rate is computed assuming Bondi-Hoyle-Lyttleton accretion from the spheroid gas reservoir (with an assumed temperature of [bondiHoyleAccretionTemperatureSpheroid]) enhanced by a factor of [bondiHoyleAccretionEnhancementSpheroid] and from the host halo (with whatever temperature that hot halo temperature profile specifies; see §13.21) enhanced by a factor of [bondiHoyleAccretionEnhancementHotHalo]. For accretion from the hot halo, the Bondi radius is limited to the outer radius of the hot halo. Additionally, the accretion rate is limited to:

\[
\dot{M}_0, \text{ hot halo, maximum} = \frac{M_{\text{hot}}}{\tau_{\text{sound crossing}}}, \quad \text{(12.3)}
\]

where \( \tau_{\text{sound crossing}} = r_{\text{hot halo outer}}/c_s \) where \( r_{\text{hot halo outer}} \) is the outer radius of the hot halo and \( c_s \) is the speed of sound in the hot halo.
If \[\text{bondiHoyleAccretionHotModeOnly}=\text{true}\] then the accretion occurs only from that fraction of the hot halo gas which was accreted in the “hot mode”, otherwise accretion occurs from the entirety of the hot halo reservoir. In the first case a simple estimate of the hot mode fraction is made:

\[
f_{\text{hot}} = \begin{cases} 
1 & \text{if } x < 0.9 \\
y(x)^2[2y(x) - 3] + 1 & \text{if } 0.9 \leq x \leq 1.0 \\
0 & \text{if } x > 1.0, 
\end{cases} 
\] (12.4)

where \(x = r_{\text{cool}}/r_{\text{virial}}\) and \(y(x) = |x - 0.9|/|1.0 - 0.9|\).

The rest mass accretion rate is removed (as a mass sink) from the spheroid and hot halo components appropriately. The black hole is assumed to cause feedback in two ways:

**Radio-mode** If \[\text{blackHoleHeatsHotHalo}=\text{true}\] then any jet power from the black hole-accretion disk system (see §13.3) is included in the hot halo heating rate providing that the halo is in the slow cooling regime\(^1\) (i.e. if the cooling radius is smaller than the virial radius; see, for example, Benson and Bower 2010);

**Quasar-mode** A mechanical wind luminosity of [Ostriker et al., 2010]

\[
L_{\text{wind}} = \epsilon_{\text{wind}}H(\epsilon_{\text{radiation}}, 1, s)M_0 c^2, 
\] (12.5)

where \(\epsilon_{\text{wind}}=\text{blackHoleWindEfficiency}\) is the black hole wind efficiency, \(s=\text{blackHoleWindEfficiencyScalesWithRadiativeEfficiency}\), and

\[
H(a, b, c) = \begin{cases} 
a & \text{if } c = \text{true} \\
b & \text{if } c = \text{false}, 
\end{cases} 
\] (12.6)

is added to the gas component of the spheroid (which, presumably, will respond with an outflow for example—see §12.5 for details of how specific implementations of the spheroid component respond to the addition of energy) if and only if the wind pressure (at the spheroid characteristic radius) is less than the typical thermal pressure in the spheroid gas [Ciotti et al., 2009], i.e.

\[
\frac{1}{2} \rho_{\text{wind}} V_{\text{wind}}^2 < \frac{3k_B T_{\text{ISM}} \langle \rho_{\text{ISM}} \rangle}{2m_H}. 
\] (12.7)

Since \(\Omega^2 \rho_{\text{wind}} V_{\text{wind}}^2 = L_{\text{wind}}\) where \(\Omega\) is the solid angle of the wind flow, this can be rearranged to give \(\langle \rho_{\text{ISM}} \rangle > \rho_{\text{wind,critical}}\) where

\[
\rho_{\text{wind,critical}} = \frac{2m_H L_{\text{wind}}}{3\Omega^2 V_{\text{wind}} k_B T_{\text{ISM}}}. 
\] (12.8)

This critical wind density is computed at the characteristic radius of the spheroid, \(r_{\text{spheroid}}\), assuming \(V_{\text{wind}} = 10^4\text{km/s}, T_{\text{ISM}} = 10^4\text{K}\) and \(\Omega = \pi\), and the interstellar medium (ISM) density is approximated by

\[
\langle \rho_{\text{ISM}} \rangle = \frac{3M_{\text{gas,spheroid}} r_{\text{spheroid}}^3}{4\pi}. 
\] (12.9)

For numerical ease, the fraction, \(f_{\text{wind}}\), of the wind luminosity added to the spheroid is adjusted smoothly through the \(\rho_{\text{ISM}} \approx \rho_{\text{wind,critical}}\) region according to

\[
f_{\text{wind}} = \begin{cases} 
0 & \text{if } x < 0, \\
3x^2 - 2x^3 & \text{if } 0 \leq x \leq 1, \\
1 & \text{if } x > 1, 
\end{cases} 
\] (12.10)

\(^1\)Specifically, the jet power multiplied by \(f_{\text{hot}}(M_{\text{hot}}/M_{\text{total}})(\Omega_{\text{M}}/\Omega_{\text{h}})^2\) is added to the hot halo heating rate. The dependence on the gas fraction in the hot halo ensures that the heating rate goes smoothly to zero as the hot halo becomes depleted of gas.
where \( x = \rho_{SM}/\rho_{wind,critical} - 1/2 \).

The radial position, \( r_\bullet \), evolves according to the selected radial migration method (see §17.4.1).

Interactions between black hole triplets are accounted for if \( \text{[tripleBlackHoleInteraction]} = \text{true} \) (and if at least three black holes exist within the node of course). In this case the triple is treated as consisting of an inner binary (assumed to be the central black hole and the black hole closest to it) and a third, singleton black hole. When the tertiary black hole reaches a separation of

\[
a_h = \frac{G(M_{\bullet,1} + M_{\bullet,2})}{4\sigma^2} \tag{12.11}
\]

it is assumed to undergo a triple interaction with the binary. Once a triple interaction occurs, no further triple interaction for the specific tertiary black hole can occur unless the host galaxy merges with another galaxy, at which point the black holes from the merging galaxy are eligible for another triple interaction in their new host.

The logic of what happens in a triple black hole interaction is taken from Volonteri et al. [2003]. Labelling the central black hole as 1, its binary partner as 2 and the tertiary black hole as 3, and defining

\[
q_3 = \frac{M_{\bullet,3}}{M_{\bullet,1} + M_{\bullet,2}} \tag{12.12}
\]

then if \( q_3 \leq 2 \) then, if \( M_{\bullet,3} \leq M_{\bullet,2} \) we set

\[
a_3 = \frac{a_2}{1 + 0.4q_3} \tag{12.13}
\]

and define

\[
E_{\text{bind}} = \frac{GM_{\bullet,3}M_{\bullet,1}}{a_3} \tag{12.14}
\]

and

\[
\Delta K = 0.4q_3E_{\text{bind}} \tag{12.15}
\]

\( i = 3 \) and \( j = 2 \).

Otherwise if \( q_3 \leq 2 \) and \( M_{\bullet,3} > M_{\bullet,2} \) we set

\[
a_3 = \frac{a_3}{1 + 0.4q_3} \tag{12.16}
\]

and define

\[
E_{\text{bind}} = \frac{GM_{\bullet,2}M_{\bullet,1}}{a_2} \tag{12.17}
\]

and

\[
\Delta K = 0.4q_3E_{\text{bind}} \tag{12.18}
\]

\( i = 2 \) and \( j = 3 \).

Finally, if \( q_3 > 2 \), then we set

\[
a_3 = 0.53a_3 \tag{12.19}
\]

and define

\[
E_{\text{bind}} = \frac{GM_{\bullet,2}M_{\bullet,1}}{a_2} \tag{12.20}
\]

and

\[
\Delta K = 0.9q_3E_{\text{bind}} \tag{12.21}
\]

\( i = 2, j = 3 \).
Black hole $i$ is identified as the “ejected” hole, with black hole $j$ becoming the new binary member. Therefore

$$M_{\text{\textbullet ejected}} = M_{\text{\textbullet i}}.$$  \hfill (12.22)

and

$$M_{\text{binary}} = M_{\text{\textbullet j}} + M_{\text{\textbullet 1}}.$$  \hfill (12.23)

The imparted velocities of these two systems are

$$V_{\text{\textbullet ejected}} = \left[\frac{2\Delta K}{(1 + M_{\text{\textbullet ejected}}/M_{\text{binary}})M_{\text{\textbullet ejected}}}\right]^{1/2}$$  \hfill (12.24)

and

$$V_{\text{binary}} = \left[\frac{2\Delta K}{(1 + M_{\text{binary}}/M_{\text{\textbullet ejected}})M_{\text{binary}}}\right]^{1/2}.$$  \hfill (12.25)

If

$$\frac{1}{2}V_{\text{\textbullet ejected}}^2 + \Phi(\text{\textbullet ejected}) \geq 0$$  \hfill (12.26)

for either velocity, then that system is ejected from the node. Ejected black holes are removed from the node. If the binary is ejected the central black hole is replaced with a “null”, zero mass placeholder.

**Event Evolution**

*Node mergers:* None.

*Satellite merging:* The black holes in the two merging galaxies can be instantaneously merged, or taken at an initial separation (see §13.47), it is then evolved until reaching zero separation whereupon it is assumed to undergo merger. Properties are computed using the selected black hole binary merger method (see §17.4.1). In addition, the recoil velocity of the new black hole due to gravitational wave emission is computed using the selected method (see §13.49), and if greater than the potential at the center of the galaxy, is assumed to have escaped the galaxy. Black holes which escape the galaxy are simply discarded and no longer tracked. For computational purposes, they are replaced with a “null”, zero mass black hole at the center of the galaxy. If any other black hole comes within a distance

$$a_h = \frac{GM_{\text{\textbullet}}}{4\sigma^2},$$  \hfill (12.27)

where $\sigma$ is approximated to be the virial velocity of the dark matter halo, it is promoted to being the new “central” black hole of the node.

*Node promotion:* None.

**Additional Output**

If the \texttt{[blackHoleOutputAccretion\]} input parameter is set to true, then rest mass accretion rate (in \(M_\odot\) Gyr\(^{-1}\)), jet power (in \(M_\odot\) km\(^2\) s\(^{-1}\) Gyr\(^{-1}\)) and radiative efficiency of the black hole\(^2\) are output as \texttt{blackHoleAccretionRate}, \texttt{blackHoleJetPower} and \texttt{blackHoleRadiativeEfficiency} respectively.

If the \texttt{[blackHoleOutputData\]} input parameter is set to true, then the Masses (in \(M_\odot\)), Spins (for now just a scalar with no direction), final Radius (in Mpc), timescales (in Gyr) until merger, accretion rates (in \(M_\odot\) per Gyr) and radiative Efficiencies of all the black holes in the galaxy are given as outputs.

\(^2\)Technically of the black hole plus accretion disk system.
12.1. (Supermassive) Black Hole

in the `blackHole` section of the output hdf5. This also saves the tree node and merger tree index for further use when using the data.

The outputs of mergers are also automatically saved, as outputs in the `blackHoleMergers` section of the output hdf5. Those outputs are the time at which mergers happened and the mass ratio between the two merging black holes.

12.1.2. “Simple” Implementation

Properties

The simple black hole implementation defines the following property:

mass The mass of the black hole: $M_{\bullet}$.

Initialization

Black holes are not initialized, they are created (with a seed mass given by `blackHoleSeedMass`) as needed.

Differential Evolution

In the simple black hole implementation the mass evolves as:

$$\dot{M}_\bullet = (1 - \epsilon_{\text{wind}}) \epsilon_{BH} \dot{M}_{s,\text{spheroid}}$$

(12.28)

$$\dot{M}_\bullet = \epsilon_{\text{jet}} \dot{M}_{\text{Eddington}}$$

(12.29)

where $\epsilon_{BH}$ is the ratio of rates at which the black hole and stellar spheroid grow. The black hole is assumed to cause feedback in two ways:

**Radio-mode** If $[\text{blackHoleHeatsHotHalo]=true}$ and $[\text{blackHoleAccretesFromHotHalo]=false}$ then a power $\epsilon_{\text{heat}} \epsilon_{BH} \dot{M}_{s,\text{spheroid}} c^2$ where $\epsilon_{\text{heat}} = [\text{blackHoleHeatingEfficiency}]$ is included in the hot halo heating rate providing that the halo is in the slow cooling regime (i.e. if the cooling radius is smaller than the virial radius; see, for example, Benson and Bower 2010) and the accretion rate onto the black hole is reduced by $\epsilon_{\text{heat}} \epsilon_{BH} \dot{M}_{s,\text{spheroid}}$. If $[\text{blackHoleHeatsHotHalo]=true}$ and $[\text{blackHoleAccretesFromHotHalo]=true}$ then a power $\epsilon_{\text{heat}} \dot{M}_{\text{Eddington}} c^2$ is included in the hot halo heating rate providing that the halo is in the slow cooling regime and the accretion rate onto the black hole is increased$^3$ by $\dot{M}_{\text{Eddington}} \epsilon_{\text{heat}} (1 - \epsilon_{\text{jet}})/\epsilon_{\text{jet}}$, where $\epsilon_{\text{jet}} = [\text{blackHoleJetEfficiency}]$;

**Quasar-mode** A mechanical wind luminosity of [Ostriker et al., 2010]

$$L_{\text{wind}} = \epsilon_{\text{wind}} \dot{M}_0 c^2,$$

(12.30)

where $\epsilon_{\text{wind}} = [\text{blackHoleWindEfficiency}]$ is the black hole wind efficiency, is added to the gas component of the spheroid (which, presumably, will respond with an outflow for example).

Event Evolution

**Node mergers:** None.

---

$^3$Note that mass is not removed from the hot halo to compensate, since the accretion rate is independent of the hot halo mass this could lead to negative mass in the halo.
12. Node Components

Satellite merging: The black holes in the two merging galaxies are instantaneously merged. Properties are computed using the selected black hole binary merger method (see §17.4.1).

Node promotion: None.

Additional Output

If the [blackHoleOutputAccretion] input parameter is set to true, then rest mass accretion rate (in $M_\odot/\text{Gyr}$) is output as blackHoleAccretionRate.

12.2. Dynamics Statistics

This class collects statistics related to galaxy dynamics.

12.2.1. “Bars” Implementation

Properties

The “bars” dynamics statistics implementation defines the following properties:

- time: An array of times at which bar statistics are recorded.
- barInstabilityTimescale: The timescale of bar instability at each tabulated time.
- adiabaticRatio: The adiabatic ratio, $a$, of the galaxy at each tabulated time defined as:

$$ a = \left( \frac{r_{\text{peri}}}{v_{\text{peri}}} \right) \left( \frac{2\pi r_{\text{disk}}}{v_{\text{disk}}} \right)^{-1}, \tag{12.31} $$

where $r_{\text{peri}}$ is the pericentric distance of the galaxies orbit, $v_{\text{peri}}$ is the orbital velocity at pericenter, $r_{\text{disk}}$ is the characteristic radius of the disk, and $v_{\text{disk}}$ is the circular velocity at that radius. For non-satellite galaxies the adiabatic ratio is set to $-1$.

Bar statistics are recorded at a frequency given by [dynamicsStatisticsBarsFrequency] times the host halo dynamical time.

Initialization

Component is not initialized, it is created as soon as a disk exists.

Differential Evolution

N/A.

Event Evolution

Node mergers: None.

Satellite merging: None.

Node promotion: None.
12.3. Hot Halo

Additional Output

Bar statistics time series are output for each node to a group Outputs/Output<Ω>/dynamicsStatistics/tree<T> (where <Ω> is the output number and <T> is the tree index) into datasets named time<Ω>, timeScale<Ω>, and adiabaticRatio<Ω> (where <Ω> is the node index).

12.3. Hot Halo

12.3.1. “Very Simple” Implementation

Properties

The very simple hot halo implementation defines the following properties:

- **mass**: The mass of gas in the hot halo: $M_{hot}$ [hotHaloMass].

and the following pipes:

- **Hot_Halo_Cooling_Mass_To**: The net cooling rate of gas mass is sent through this pipe. Any component may claim this pipe and connect to it, allowing it to receive the cooling gas.

- **Hot_Halo_Outflow_Mass_To**: Galactic components that wish to expel gas due to an outflow can send that mass through this pipe, where it will be received into the hot halo component.

Initialization

At initialization, nodes are assigned a mass of gas equal to their own mass, minus the mass of any progenitors, multiplied by $\Omega_b/\Omega_{Matter}$.

Differential Evolution

In the very simple hot halo implementation the hot gas mass and heavy element mass(es) evolves as:

$$\dot{M}_{hot} = -\dot{M}_{cooling} + \dot{M}_{outflow},$$  \hspace{1cm} (12.32)

where $\dot{M}_{cooling}$ is the rate of mass loss from the hot halo due to cooling (see §13.6.2. In the above $\dot{M}_{outflow}$ is the net rate of outflow from any components in the node. For satellite galaxies, the outflow is instead directed to the hot halo of the host node.

Event Evolution

- **Node mergers**: Any hot gas from the merging halo is transferred to its host halo.

- **Satellite merging**: Any hot halo of the satellite node is added to that of the host node and the hot halo component removed from the satellite node.

- **Node promotion**: Any hot halo of the parent node is added to that of the node prior to promotion.

- **Halo formation**: None.
12. Node Components

12.3.2. “Standard” Implementation

Properties

The standard hot halo implementation defines the following properties:

unaccretedMass The mass of gas which could have accreted onto the halo if it always accreted baryons and dark matter in the universal proportion, but which failed to do so (e.g., perhaps due to being photoheated to a high temperature and so being resistant to accretion into shallow potential wells): $M_{\text{failed}}$.

mass The mass of gas in the hot halo: $M_{\text{hot}}$ [hotHaloMass].

angularMomentum The angular momentum of the gas in the hot halo, $J_{\text{hot}}$ [hotHaloAngularMomentum].

abundances The mass(es) of heavy elements in gas in the hot halo, $M_{Z,\text{hot}}$ [hotHalo{abundanceName}].

outflowedMass The mass of gas from outflows in the hot halo: $M_{\text{outflowed}}$ [hotHaloOutflowedMass].

outflowedAngularMomentum The angular momentum of the outflowed gas in the hot halo, $J_{\text{outflowed}}$ [hotHaloOutflowedAngularMomentum].

outflowedAbundances The mass(es) of heavy elements in outflowed gas, $M_{Z,\text{outflowed}}$ [hotHaloOutflowed{abundanceName}].

chemicals The mass(es) of molecules in the hot gas, $M_{\text{chemical}}$ [hotHaloChemicals{chemicalName}].

outerRadius The outer boundary radius of the hot halo: $r_{\text{hot,outer}}$ [hotHaloOuterRadius].

strippedMass The mass of gas which has been stripped from the hot halo (by ram pressure or tidal forces for example): $M_{\text{hot,stripped}}$. This property is computed only if [hotHaloTrackStrippedGas]=true.

strippedAbundances The mass(es) of heavy elements in gas that has been stripped from the hot halo (by ram pressure or tidal forces for example), $M_{Z,\text{hot,stripped}}$. These properties are computed only if [hotHaloTrackStrippedGas]=true.

and the following pipes:

heatSource Energy sent through this pipe is added to the hot halo and used to offset the cooling rate (see below; heat pushed should be in units if $M_{\odot} (\text{km/s})^2 \text{Gyr}^{-1}$).

cooling[Mass|Angular_Momentum|Abundances].To The net cooling rate of gas mass (and metal content and magnitude of angular momentum) is sent through this pipe. Any component may claim this pipe and connect to it, allowing it to receive the cooling gas.

outflowing[Mass|AngularMomentum|Abundances].To Galactic components that wish to expel gas due to an outflow can send that mass (plus metals and angular momentum) through this pipe, where it will be received into the hot halo component.

massSink Removes gas (and proportionate amounts of angular momentum and elements) from the hot gas halo.

Initialization

At initialization, any nodes with no children are assigned a hot halo mass, and failed accreted mass as dictated by the baryonic accretion method (see §13.1) and angular momentum based on the accreted mass and the halo spin parameter.
12.3. Hot Halo

Differential Evolution

In the standard hot halo implementation the hot gas mass and heavy element mass(es) evolves as:

\[
\dot{M}_{\text{failed}} = \dot{M}_{\text{failed accretion}} \\
\dot{M}_{\text{hot}} = \dot{M}_{\text{accretion}} - \dot{M}_{\text{cooling}} + \dot{M}_{\text{outflow, return}} - \dot{M}_{\text{expelled}} - \dot{M}_{\text{hot, stripped}},
\]

\[
\dot{M}_{Z,\text{hot}} = -M_{\text{cooling}} \frac{M_{Z,\text{hot}}}{M_{\text{hot}}} + \dot{M}_{Z,\text{outflow, return}} - \dot{M}_{Z,\text{expelled}} - \dot{M}_{Z,\text{hot, stripped}},
\]

\[
\dot{M}_{\text{chemical}} = -\left[\dot{M}_{\text{cooling}} + \dot{M}_{\text{expelled}} + \dot{M}_{\text{hot, stripped}}\right] \frac{M_{\text{chemical}}}{M_{\text{hot}}} + f_{\text{chemical, outflow}} \dot{M}_{\text{outflow, return}}
\]

\[
\dot{r}_{\text{hot, outer}} = \begin{cases} 
\frac{\rho_{\text{virial}}}{\rho_{\text{hot, outer}}} & \text{if } r_{\text{rp}} < r_{\text{hot, outer}} \\
0 & \text{otherwise.}
\end{cases}
\]

\[
\dot{M}_{\text{hot, stripped}} = -4\pi p_{\text{hot}}(r_{\text{hot, outer}}) r_{\text{hot, outer}}^2 \dot{r}_{\text{hot, outer}} + \dot{M}_{\text{outflows}} f_{\text{outflow, stripped}}
\]

\[
\dot{M}_{Z,\text{hot, stripped}} = -4\pi p_{\text{hot}}(r_{\text{hot, outer}}) r_{\text{hot, outer}}^2 \dot{r}_{\text{hot, outer}}(M_{Z,\text{hot}}/M_{\text{hot}})
\]

\[
+ \dot{M}_{Z,\text{outflows}} f_{\text{outflow, stripped}}
\]

where \( r_{\text{rp}} \) is the ram pressure stripping radius as computed by the \texttt{hotHaloRamPressureStrippingMethod} method (see §13.19), \( \dot{M}_{\text{accretion}} \) is the rate of growth of the hot component due to accretion from the IGM and \( \dot{M}_{\text{failed accretion}} \) is the rate of failed accretion from the IGM (these may include a component due to transfer of mass from the failed to accreted reservoirs) and \( \dot{M}_{\text{cooling}} \) is the rate of mass loss from the hot halo due to cooling (see §13.6.2—cooling rates are computed using the current node if \texttt{hotHaloCoolingFromNode} = \texttt{current node} or from the formation node if that parameter is set to \texttt{formation node} minus any heating rate defined as

\[
\dot{M}_{\text{heating}} = \dot{E}_{\text{input}} / V_{\text{virial}}^2,
\]

where \( \dot{E}_{\text{input}} \) is the rate at which energy is being sent through the “energy input” pipe and \( V_{\text{virial}} \) is the virial velocity of the halo. The net cooling rate is never allowed to drop below zero. If the mass heating rate exceeds the mass cooling rate and \([\texttt{hotHaloExcessHeatDrivesOutflow}] = \texttt{false} \) then the excess energy is not used and \( \dot{M}_{\text{expelled}} = 0 \). Alternatively, if \([\texttt{hotHaloExcessHeatDrivesOutflow}] = \texttt{true} \) then

\[
\dot{M}_{\text{expelled}} = \begin{cases} 
\alpha_{\text{expel}} \dot{M}_{\text{hot}} / \tau_{\text{dynamical}} & \text{if } \dot{M}_{\text{heating}} - \dot{M}_{\text{cool}} > \alpha_{\text{expel}} \dot{M}_{\text{hot}} / \tau_{\text{dynamical}} \\
\dot{M}_{\text{heating}} - \dot{M}_{\text{cool}} & \text{otherwise,}
\end{cases}
\]

where \( \dot{M}_{\text{cool}} \) is the intrinsic cooling rate in the halo (i.e. the cooling rate in the absence of any heating) and \( \alpha_{\text{expel}} = [\texttt{hotHaloExpulsionRateMaximum}] \) limits the maximum rate at which mass can be expelled from the halo.

In the above, \( f_{\text{chemical, return}} \) if the mass fraction of each chemical species in the outflowed gas and is assumed to be equal to that given by the atomic ionization state functions (see §13.24) at the virial temperature and mean density of the halo. Finally, \( \dot{M}_{\text{chemical, reactions}} \) represents the rate of change of masses of chemical species due to chemical and atomic processes and is computed using the chemical rates functions (see §13.32). The angular momentum of the hot gas evolves as:

\[
\dot{J}_{\text{hot}} = \dot{J}_{\text{node}} - M_{\text{cool}} \dot{r}_{\text{cool}} V_{\text{rotate}} + \dot{J}_{\text{outflow, return}} - \dot{M}_{\text{expelled}} J_{\text{hot}} / M_{\text{hot}}.
\]

\[
\text{(12.42)}
\]
where $\dot{M}_{\text{node}}$ and $\dot{J}_{\text{node}}$ are defined in §12.8. For the outflowed components:

\begin{align*}
\dot{M}_{\text{outflowed}} &= -\dot{M}_{\text{outflow,return}} + \dot{M}_{\text{outflows}}(1 - f_{\text{outflow,stripped}}), \quad (12.43) \\
\dot{M}_{Z,\text{outflowed}} &= -\dot{M}_{Z,\text{outflow,return}} + \dot{M}_{Z,\text{outflows}}(1 - f_{\text{outflow,stripped}}) \quad (12.44)
\end{align*}

and:

\[ \dot{J}_{\text{outflowed}} = -\dot{J}_{\text{outflow,return}} + \dot{J}_{\text{outflows}}. \quad (12.46) \]

In the above

\[ \dot{M}|M_{Z}|J_{\text{outflow,return}} = \alpha_{\text{outflow return rate}} \frac{M|M_{Z}|J_{\text{outflows}}}{\tau_{\text{dynamical,halo}}}, \quad (12.47) \]

where $\alpha_{\text{outflow return rate}} = (\text{hotHaloOutflowReturnRate})$ is an input parameter controlling the rate at which gas flows from the outflowed to hot reservoirs, and $\dot{M}|M_{Z}|J_{\text{outflows}}$ are the net rates of outflow from any components in the node.

In the above, $f_{\text{outflow,stripped}}$ is the fraction of outflowing material assumed to be stripped from the halo. The is computed following the algorithm of Font et al. [2008], namely

\[ f_{\text{outflow,stripped}} = \epsilon_{\text{strip}} \frac{M_{\text{hot,outer}}}{M_{\text{hot,virial}}}, \quad (12.48) \]

where $\epsilon_{\text{strip}} = (\text{hotHaloOutflowStrippingEfficiency})$ is an input parameter, $M_{\text{hot,outer}}$ is the mass of hot gas contained within the outer radius of the hot halo and $M_{\text{hot,virial}}$ is the mass of hot gas that would be present if the hot halo extended to the virial radius (i.e. if no stripping had occurred).

A fraction $1 - (\text{hotHaloAngularMomentumLossFraction})$ of the cooling angular momentum rate, $\dot{M}_{\text{cooling}}r_{\text{cool}}V_{\text{rotate}}$, is sent through the Hot_Halo_Cooling_Angular_Momentum pipe.

**Event Evolution**

**Node mergers:** If the starveSatellites parameter is true, then any hot halo properties of the minor node are added to those of the major node and the hot halo component removed from the minor node. Additionally in this case, any material outflowed or stripped from the the satellite galaxy to its hot halo is transferred to the hot halo of the host dark matter halo after each timestep. If stripped mass is being tracked (i.e. if [hotHaloTrackStrippedGas]=true) then any stripped mass is transferred from the satellite galaxy to the hot halo of the host dark matter halo after each timestep. If [hotHaloNodeMergerLimitBaryonFraction]=true then the hot gas content of the merged node is limited such that the total baryon content of the node (including satellites) does not exceed the universal baryon fraction, if possible. Any gas removed to enforce this limit is placed into the unaccreted gas reservoir, from which is may eventually be reaccreted.

**Satellite merging:** If the starveSatellites parameter is false, then any hot halo properties of the satellite node are added to those of the host node and the hot halo component removed from the satellite node.

**Node promotion:** Any hot halo properties of the parent node are added to those of the node prior to promotion.

**Halo formation:** If [hotHaloOutflowReturnOnFormation]=true then all outflowed gas is returned to the hot gas reservoir on halo formation events (see §17.4.3).
12.3.3. “Outflow Tracking” Implementation

Properties
The outflow tracking hot halo implementation extends the “standard” implementation by adding the following properties:

- trackedOutflowMass The mass of gas in the hot halo which arrived there directly via outflow: \( M_{\text{outflow,track}} \) [hotHaloTrackedOutflowMass].
- trackedOutflowAbundances The mass of elements in the hot halo which arrived there directly via outflow: \( M_{Z,\text{outflow,track}} \) [hotHaloTrackedOutflowAbundances].

Initialization
Outflowed masses and element masses are initialized to zero.

Differential Evolution
The tracked outflow masses evolve according to:

\[
\dot{M}_{Z,\text{outflow,track}} = \alpha_{\text{outflow return rate}} \frac{M_{|Z_{\text{outflowed}}}}{\tau_{\text{dynamical,halo}}} - M_{Z,\text{outflow,track}} \dot{M}_{\text{expelled}} / M \tag{12.49}
\]

\[
\dot{M}_{Z,\text{outflow,track}} = \alpha_{\text{outflow return rate}} \frac{M_{|Z_{\text{outflowed}}}}{\tau_{\text{dynamical,halo}}} - M_{Z,\text{outflow,track}} \dot{M}_{\text{expelled}} / M \tag{12.50}
\]

Event Evolution
Node mergers: None.
Satellite merging: None.
Node promotion: None.
Halo formation: None.

12.4. Galactic Disk

12.4.1. “Very Simple” Implementation
This implementation assumes a disk with no structural properties—it consists of just gas and stellar masses.

Properties
The very simple galactic disk implementation defines the following properties:

- massGas The mass of gas in the disk: \( M_{\text{disk.gas}} \) [diskMassGas];
- massStellar The mass of stars in the disk: \( M_{\text{disk.stars}} \) [diskMassStellar].

Initialization
No initialization is performed—disks are created as needed.
12. Node Components

Differential Evolution

In the very simple galactic disk implementation the gas mass evolves as:

\[
\dot{M}_{\text{disk,gas}} = \dot{M}_{\text{cooling}} - \dot{M}_{\text{outflow,disk}} - \dot{M}_{\text{stars,disk}},
\]

where the rate of change of stellar mass is

\[
\dot{M}_{\text{stars,disk}} = \Psi,
\]

with

\[
\Psi = \frac{M_{\text{disk,gas}}}{\tau_{\text{disk,star formation}}}
\]

with \(\tau_{\text{disk,star formation}}\) being the greater of the star formation timescale and \(\Gamma_{\text{disk,star formation,minimum}} \tau_{\text{dyn}}\), where \(\tau_{\text{dyn}}\) is the dynamical time of the halo, and \(\Gamma_{\text{disk,star formation,minimum}} = [\text{diskStarFormationTimescaleMinimum}]\). The outflow rate, \(\dot{M}_{\text{outflow,disk}}\), is computed for the current star formation rate and gas properties by the prescriptions for non-expulsive supernova feedback (see §13.45), but is limited to a maximum of \(\dot{M}_{\text{disk,gas}} / \Gamma_{\text{disk,outflow,minimum}} \tau_{\text{dyn}}\), where \(\Gamma_{\text{disk,outflow,minimum}} = [\text{diskOutflowTimescaleMinimum}]\). This outflow is piped to the hot halo component.

Event Evolution

Node mergers: None

Satellite merging: Disks may be destroyed (or, potentially, created or otherwise modified) as the result of a satellite merging event, as dictated by the selected merger remnant mass movement method (see §13.15.1).

Node promotion: None

12.4.2. “Exponential” Implementation

This implementation assumes a disk with an exponential surface density profile in which stars trace gas.

Properties

The exponential galactic disk implementation defines the following properties:

- **massGas** The mass of gas in the disk: \(M_{\text{disk,gas}}[\text{diskMassGas}]\).
- **abundancesGas** The mass of elements in the gaseous disk: \(M_{Z,\text{disk,gas}}[\text{diskAbundancesGas\{abundanceName\}}]\).
- **massStellar** The mass of stars in the disk: \(M_{\text{disk,stars}}[\text{diskMassStellars}]\).
- **abundancesStellar** The mass of elements in the stellar disk: \(M_{Z,\text{disk,stars}}[\text{diskAbundancesStellar\{abundanceName\}}]\).
- **luminositiesStellar** The luminosities (in multiple bands) of the stellar disk: \(L_{\text{disk,stars}}[\text{diskLuminositiesStellar\{luminosityName\}}]\).
- **angularMomentum** The angular momentum of the disk, \(J_{\text{disk}}[\text{diskAngularMomentum}]\).
- **radius** The radial scale length of the disk, \(R_{\text{disk}}[\text{diskRadius}]\).
- **velocity** The circular velocity of the disk at \(R_{\text{disk}}, V_{\text{disk}}[\text{diskVelocity}]\).
12.4. Galactic Disk

Initialization

No initialization is performed—disks are created as needed.

Differential Evolution

In the exponential galactic disk implementation the gas mass evolves as:

\[ \dot{M}_{\text{disk},\text{gas}} = \dot{M}_{\text{cooling}} - \dot{M}_{\text{outflow, disk}} - \dot{M}_{\text{stars, disk}} - \frac{M_{\text{disk, gas}}}{\tau_{\text{bar}}} - \dot{M}_{\text{ram pressure}} - \frac{M_{\text{disk, gas}}}{M_{\text{disk, gas}} + M_{\text{disk, stars}}} \dot{M}_{\text{tidal}}, \]  

(12.54)

where the rate of change of stellar mass is

\[ \dot{M}_{\text{stars, disk}} = \Psi - \dot{R} - \frac{M_{\text{stars, disk}}}{\tau_{\text{bar}}} - \frac{M_{\text{disk, stars}}}{M_{\text{disk, gas}} + M_{\text{disk, stars}}} \dot{M}_{\text{tidal}}, \]  

(12.55)

with

\[ \Psi = \frac{M_{\text{disk, gas}}}{\tau_{\text{disk, star formation}}} \]  

(12.56)

with \( \tau_{\text{disk, star formation}} \) being the star formation timescale and \( \dot{R} \) is the rate of mass recycling from stars and \( \tau_{\text{bar}} \) is a bar instability timescale (see §13.9). The mass removed from the disk by the bar instability mechanism is added to the active spheroid component. Element abundances (including total metals) evolve according to:

\[ \dot{M}_{Z, \text{disk, gas}} = \dot{M}_{Z, \text{cooling}} - \dot{M}_{Z, \text{outflow, disk}} - \dot{M}_{Z, \text{stars, disk}} + \dot{y} - \frac{M_{Z, \text{disk, gas}}}{M_{\text{disk, gas}}} \dot{M}_{\text{ram pressure}} - \frac{M_{Z, \text{disk, gas}}}{M_{\text{disk, gas}} + M_{\text{disk, stars}}} \dot{M}_{\text{tidal}}, \]  

(12.57)

and

\[ \dot{M}_{Z, \text{stars, disk}} = \Psi \frac{M_{Z, \text{disk, gas}}}{M_{\text{disk, gas}}} - \dot{R}_Z - \frac{M_{Z, \text{disk, stars}}}{M_{\text{disk, gas}} + M_{\text{disk, stars}}} \dot{M}_{\text{tidal}}, \]  

(12.58)

where \( \dot{y} \) is the rate of element yield from stars and \( \dot{R}_Z \) is the rate of element recycling. The angular momentum evolves as:

\[ \dot{J}_{\text{disk}} = \dot{J}_{\text{cooling}} - \left[ \dot{M}_{\text{outflow, disk}} + \frac{M_{\text{disk, gas}} + M_{\text{disk, stars}}}{\tau_{\text{bar}}} + \dot{M}_{\text{ram pressure}} + \dot{M}_{\text{tidal}} \right] \frac{J_{\text{disk}}}{M_{\text{disk, gas}}}, \]  

(12.59)

The outflow rate, \( \dot{M}_{\text{outflow, disk}} \), is computed for the current star formation rate and gas properties by the stellar properties subsystem (see §13.40) and prescriptions for expulsive and non-expulsive supernova feedback (see §13.46 and §13.45 respectively), but is not allowed to exceed \( M_{\text{gas, disk}}/\alpha_{\text{outflow minimum, disk}} \tau_{\text{disk, dynamical}} \), where \( \tau_{\text{disk, dynamical}} = R_{\text{disk}}/V_{\text{disk}} \) is the dynamical time of the disk and \( \alpha_{\text{outflow minimum, disk}} \) is the shortest timescale (in units of the dynamical timescale) on which gas can be removed from the disk. This limit prevents the disk being depleted on arbitrarily short timescales. The non-expulsive component of the outflow is piped to the hot halo component. The ram pressure and tidal mass loss rates, \( \dot{M}_{\text{ram pressure}} \) and \( \dot{M}_{\text{tidal}} \), are computed using the selected methods (see §13.33 and §13.51 respectively).

Event Evolution

Node mergers: None

Satellite merging: Disks may be destroyed (or, potentially, created or otherwise modified) as the result of a satellite merging event, as dictated by the selected merger remnant mass movement method (see §13.15.1).

Node promotion: None
12. Node Components

Additional Output

If the [diskOutputStarFormationRate] input parameter is set to true, then the instantaneous star formation rate in the disk (in units of \(M_\odot \text{ Gyr}^{-1}\)) will be included in the output, as diskStarFormationRate.

Structure

The radial size of the disk is found solving for equilibrium (i.e. the radius is such that the angular momentum of material at that radius is sufficient to provide rotational support) at the specified [diskStructureSolverRadius] which is given in units of the disk scale length. In converting from the mean specific angular momentum of the disk to the angular momentum at that radius, a flat rotation curve is assumed, i.e.:

\[
j(r)/\langle j \rangle = rV/\int_0^\infty 2\pi r'\Sigma(r')r'Vdr'
\]

\[
j(r)/\langle j \rangle = r/2r_{\text{disk}}.
\]

(12.60)

The option [diskRadiusSolverCole2000Method], if set to true, alters this behavior to match that of the structure solver used by Cole et al. [2000], in which adiabatic contraction of the dark matter halo is solved for assuming that the disk has a spherical mass distribution. The specific angular momentum passed to the structure solver will be modified as follows in this case:

\[
j(r) \rightarrow [j^2(r) - (V_{\text{disk}}^2(r)r^2 - GM_{\text{disk}}(<r)r)]^{1/2},
\]

(12.61)

where \(V_{\text{disk}}\) is the rotation curve in the plane of an infinitely thin exponential disk. This adjustment accounts for the difference between a thin disk and spherical mass distribution. Note that in this case (as in Cole et al. 2000) the resulting disk will not precisely satisfy \(j(r) = rV_c(r)\) where \(V_c(r)\) is the net rotation curve.

12.5. Galactic Spheroid

12.5.1. “Standard” Implementation

The standard spheroid implementation assumes a spheroid density profile described by a single length scale in which stars trace gas. Currently, two options for the density profile are allowed:

- hernquist: Assumes a Hernquist profile [Hernquist, 1990] for the spheroidal component of a galaxy.
- sersic: Assumes a Sérsic profile (Sérsic 1963; see also Mazure and Capelato 2002) for the spheroidal component of a galaxy in which stars trace gas. The projected density profile of the spheroid is given by:

\[
\Sigma(R) \propto \exp\left(-b_nR^{1/n}\right),
\]

(12.62)

where the Sérsic index, \(n = [\text{spheroidSersicIndex}]\) and the coefficient \(b_n = 2.303(0.8689n - 0.1447)\) Wadadekar et al. [1999]. The 3D density distribution for a given \(n\) is inferred by solving the relevant inverse Abel integral.

\[\text{4}\text{The spheroid density distribution is handled internally using a massDistribution object (see §17.5.4). As such, any mass distribution implemented as an extension of the massDistribution class (and which is described by a single length scale) could be trivially added to the standard spheroid component.}\]
Properties

The standard galactic spheroid implementation defines the following properties:

- **masGas** The mass of gas in the spheroid: \( M_{_{\text{spheroid,gas}}} \)
- **abundancesGas** The mass of elements in the gaseous spheroid: \( M_{_{\text{Z,spheroid,gas}}} \)
- **massStellar** The mass of stars in the spheroid: \( M_{_{\text{spheroid,stars}}} \)
- **abundancesStellar** The mass of elements in the stellar spheroid: \( M_{_{\text{Z,spheroid,stars}}} \)
- **luminositiesStellar** The luminosities (in multiple bands) of the stellar spheroid: \( L_{_{\text{spheroid,stars}}} \)
- **angularMomentum** The pseudo-angular momentum\(^5\) of the spheroid, \( J_{_{\text{spheroid}}} \)
- **radius** The radial scale length of the spheroid, \( r_{_{\text{spheroid}}} \)
- **velocity** The circular velocity of the spheroid at \( r_{_{\text{spheroid}}} \), \( V_{_{\text{spheroid}}} \)
- **energyInput** Energy sent through this pipe is added to the gas of the spheroid and will result in an outflow (see below). Input energy should be in units of \( M_\odot \text{ km}^2 \text{ s}^{-2} \text{ Gyr}^{-1} \) and must be positive (energy cannot be removed from the gas via this pipe).
- **massGasSink** Removes gas (and proportionate amounts of angular momentum and elements) from the spheroid gas. Removed mass should be in units of \( M_\odot \) and must be positive (a negative mass sink would add mass to the spheroid which is not allowed via this pipe).

Initialization

No initialization is performed—spheroids are created as needed.

---

\(^5\) Effectively the angular momentum that the spheroid would have, were it rotationally supported rather than pressure supported.
Differential Evolution

In the standard galactic spheroid implementation the gas mass evolves as:

\[
\dot{M}_{\text{gas, sph}} = -\dot{M}_{\text{outflow, sph}} - \dot{M}_{\text{stars, sph}} - \dot{M}_{\text{rampressure}} - \frac{\dot{M}_{\text{gas, sph}}}{\dot{M}_{\text{gas}} + \dot{M}_{\text{stars, sph}}} \dot{M}_{\text{tidal}},
\]

where the rate of change of stellar mass is

\[
\dot{M}_{\text{stars, sph}} = \Psi - \dot{R} - \frac{\dot{M}_{\text{stars, sph}}}{\dot{M}_{\text{gas}} + \dot{M}_{\text{stars, sph}}} \dot{M}_{\text{tidal}},
\]

with

\[
\Psi = \frac{\dot{M}_{\text{gas, sph}}}{\tau_{\text{star formation, sph}}},
\]

with \(\tau_{\text{star formation, sph}}\) being the star formation timescale and \(\dot{R}\) is the rate of mass recycling from stars. Element abundances (including total metals) evolve according to:

\[
\dot{M}_{Z,\text{gas, sph}} = -\dot{M}_{Z,\text{outflow, sph}} - \dot{M}_{Z,\text{stars, sph}} + \dot{y} - \frac{\dot{M}_{Z,\text{gas, sph}}}{\dot{M}_{\text{gas}}} \dot{M}_{\text{rampressure}} - \frac{\dot{M}_{Z,\text{gas, sph}}}{\dot{M}_{\text{gas}} + \dot{M}_{\text{stars, sph}}} \dot{M}_{\text{tidal}},
\]

and

\[
\dot{M}_{Z,\text{stars, sph}} = \Psi \frac{\dot{M}_{Z,\text{gas, sph}}}{\dot{M}_{\text{gas}}} - \dot{R} Z - \frac{\dot{M}_{Z,\text{stars, sph}}}{\dot{M}_{\text{gas}} + \dot{M}_{\text{stars, sph}}} \dot{M}_{\text{tidal}},
\]

where \(\dot{y}\) is the rate of element yield from stars and \(\dot{R} Z\) is the rate of element recycling. The angular momentum evolves as:

\[
J_{\text{sph}} = -(\dot{M}_{\text{outflow, sph}} + \dot{M}_{\text{rampressure}} + \dot{M}_{\text{tidal}}) \frac{J_{\text{sph}}}{\dot{M}_{\text{gas}} + \dot{M}_{\text{stars, sph}}} + |T| (\dot{M}_{\text{gas}} + \dot{M}_{\text{stars, sph}}) R_{\text{sph}}^2.
\]

The outflow rate, \(\dot{M}_{\text{outflow, sph}}\), is computed for the current star formation rate and gas properties by the stellar properties subsystem (see §13.40) and prescriptions for expulsive and non-expulsive supernova feedback (see §13.46 and §13.45 respectively), with an additional contribution given by

\[
\dot{M}_{\text{outflow, sph}} = \beta_{\text{energy, sph}} \frac{\dot{E}_{\text{gas, sph}}}{V_{\text{sph}}^2},
\]

where \(\beta_{\text{energy, sph}}\) is an input parameter, and \(\dot{E}_{\text{gas, sph}}\) is any input energy sent through the Tree_Node_Spheroid_Gas_Energy_Input pipe, but is not allowed to exceed \(M_{\text{gas, sph}}/\alpha_{\text{outflow, min, sph}}\), where \(\tau_{\text{dynamical, sph}} = R_{\text{sph}}/V_{\text{sph}}\) is the dynamical time of the spheroid and \(\alpha_{\text{outflow, min, sph}}\) is the shortest timescale (in units of the dynamical timescale) on which gas can be removed from the spheroid. This limit prevents the spheroid being depleted on arbitrarily short timescales. The non-expulsive component of the outflow is piped to the hot halo component. The ram pressure and tidal mass loss rates, \(\dot{M}_{\text{rampressure}}\) and \(\dot{M}_{\text{tidal}}\), are computed using the selected methods (see §13.33 and §13.51 respectively). The final term in 12.69 accounts for tidal heating of the spheroid due to the tidal field, \(T\).

\footnote{There may be an additional contribution to the mass and angular momentum rates of change in the spheroid due to material transferred from the disk component via the bar instability mechanism (see §12.4.2). This is not included here as it is not intrinsic to this specific spheroid implementation—it is handled explicitly by the disk component and so applies equally to any spheroid component implementation.}
12.6. Host History

Event Evolution

Node mergers: None

Satellite merging: Spheroids may be created as the result of a satellite merging event, as dictated by the selected merger remnant mass movement method (see §17.4.1).

Node promotion: None.

Additional Output

If the \([\text{spheroidOutputStarFormationRate}]\) input parameter is set to true, then the instantaneous star formation rate in the spheroid (in units of \(M_\odot \text{Gyr}^{-1}\)) will be included in the output, as \(\text{spheroidStarFormationRate}\).

12.6. Host History

This component class tracks various properties of the host halo of each node over time.

12.6.1. “Standard” Implementation

Properties

The standard host history implementation defines the following properties:

- \(\text{hostMassMaximum}\): The maximum mass of the host halo in which this node has ever been hosted: \(M_{\text{host,maximum}}\).

Initialization

The maximum host mass is initialized to the initial host mass, or to \(-1\) for initially isolated nodes.

Differential Evolution

N/A.

Event Evolution

Post evolution: Immediately after evolution of the node, the maximum host mass is set to the maximum of the current host mass and the previous maximum host mass.

Node mergers: As for “post evolution”.

Satellite merging: None.

Node promotion: As for “post evolution”.

12.7. Mass Flow Statistics

This component class tracks the flow of mass between different components of a node.
12.7.1. “Standard” Implementation

Properties
The standard mass flow statistics implementation defines the following properties:

\textbf{cooledMass} The cumulative mass of gas which has cooled directly onto this galaxy: \( M_{\text{cooled}} \).

Initialization
The cooled mass is initialized to zero.

Differential Evolution
The cooled mass increases at a rate equal to the cooling rate onto the galaxy:
\[
\dot{M}_{\text{cooled}} = \dot{M}_{\text{cool}}.
\] (12.71)

Event Evolution
Post evolution: None.

Node mergers: None.

Satellite merging: None.

Node promotion: None.

12.8. Basic Properties

Basic properties are the total mass of a \textit{node} and the cosmic time at which it currently exists.

12.8.1. “Non-evolving” Implementation

Properties
The non-evolving basic properties implementation defines the following properties:

mass The total mass of the node: \( M_{\text{node}} \).

time The time at which the node is defined: \( t_{\text{node}} \).

timeLastIsolated The time at which the node was last an isolated halo (i.e. not a subhalo): \( t_{\text{node}} \).

Initialization
All basic properties are required to be initialized by the merger tree construction routine.

Differential Evolution
Properties are evolved according to:
\[
\dot{M}_{\text{node}} = 0 \quad \text{ (12.72)}
\]
\[
\dot{t}_{\text{node}} = 1. \quad \text{ (12.73)}
\]
Event Evolution

Node mergers: None.

Satellite merging: None.

Node promotion: $M_{\text{node}}$ is updated to the node mass of the parent prior to promotion.

12.8.2. “Standard Implementation

Properties

The standard basic properties implementation defines the following properties:

- **mass** The total mass of the node: $M_{\text{node}} \ [\text{basicMass}]$.
- **time** The time at which the node is defined: $t_{\text{node}}$.
- **timeLastIsolated** The time at which the node was last an isolated halo (i.e. not a subhalo): $[\text{basicTimeLastIsolated}]$.

Initialization

All basic properties are required to be initialized by the merger tree construction routine.

Differential Evolution

Properties are evolved according to:

\[
\dot{M}_{\text{node}} = \begin{cases} 
\frac{M_{\text{node, parent}} - M_{\text{node}}}{t_{\text{node, parent}} - t_{\text{node}}} & \text{if primary progenitor} \\
0 & \text{otherwise}, 
\end{cases} 
\]  

(12.74)

\[
\dot{t}_{\text{node}} = 1, 
\]  

(12.75)

where the “parent” subscript indicates a property of the parent node in the merger tree.

Event Evolution

Node mergers: None.

Satellite merging: None.

Node promotion: $M_{\text{node}}$ is updated to the node mass of the parent prior to promotion.

12.8.3. “Standard-Tracking Implementation

Properties

The standard-tracking basic properties implementation extends the standard implementation and defines the following additional properties:

- **massMaximum** The maximum total mass of the node achieved prior to the current time along this node’s branch: $M_{\text{node, maximum}} \ [\text{basicMassMaximum}]$. 

12. Node Components

**Initialization**
The maximum mass along each branch is computed from the merger tree structure at initialization time.

**Differential Evolution**
None.

**Event Evolution**

*Node mergers:* None.

*Satellite merging:* None.

*Node promotion:* $M_{\text{node, maximum}}$ is updated to the node maximum mass of the parent prior to promotion.

12.9. Position
The position component implements the position and velocity of each galaxy. See §11.2 for important notes on velocity definitions in **Galacticus**.

12.9.1. “Preset” Implementation

**Properties**
The preset position implementation defines the following properties:

*position* The 3-D position of the node: $x \{\text{positionPosition}[X|Y|Z]\}.$

*velocity* The 3-D velocity of the node: $v \{\text{positionVelocity}[X|Y|Z]\}.$

*positionHistory* The history of the node’s position in 6-D phase space, usually used for satellite nodes.

**Initialization**
None—all properties are assumed to have been preset, usually by the merger tree construction routine.

**Differential Evolution**
None. Positions and velocities do not evolve for a given node. When output, if a 6-D position history is available than the position and velocity from the history entry closest to the output time will be used.

**Event Evolution**

*Node mergers:* None.

*Satellite merging:* None.

*Node promotion:* The position and velocity are updated to those of the parent node.

---

7While interpolation could be used this is usually a bad idea. For nodes that are satellites in a halo for example, no simple interpolation algorithm can correctly account for the complex orbital dynamics by which the position and velocity is actually evolving.
12.10. Satellite Orbit

This component tracks the orbital properties of subhalos.

12.10.1. “Preset” Implementation

Properties

The preset satellite orbit implementation defines the following properties:

mergeTime The time until the satellite will merge with its host: \( t_{\text{satellite,merge}} \) [\( \text{satelliteMergeTime} \)].

timeOfMerging The cosmological time at which the satellite will merge with its host: \( T_{\text{satellite,merge}} \).

boundMass The remaining, total bound mass of the satellite (this property is read only—it is determined from the \( \text{boundMassHistory} \) property).

boundMassHistory A history time-series of the total bound mass of the satellite.

virialOrbit The orbit (a \( \text{keplerOrbit} \) object; see §17.5.1) of the satellite at virial orbit crossing.

Note that the mergeTime and timeOfMerging effectively provide the same information. For that reason, setting one of them will automatically set the other accordingly.

Initialization

None. This method assumes that merging times and bound mass histories will be set externally (usually when the merger tree is constructed).

Differential Evolution

None.

Event Evolution

Node mergers: None.

Satellite merging: None.

Node promotion: None.

12.10.2. “Very Simple” Implementation

Properties

The simple satellite orbit implementation defines the following properties:

mergeTime The time until the satellite will merge with its host: \( t_{\text{satellite,merge}} \) [\( \text{satelliteMergeTime} \)].

Initialization

None.
### Differential Evolution

Properties are evolved according to:

\[
\dot{t}_{\text{satellite,merge}} = -1.
\]  

(12.76)

### Event Evolution

**Node mergers:** The *component* is created and the time to merging is assigned a value.

**Satellite merging:** None.

**Node promotion:** Not applicable (component only exists for satellite nodes).

---

#### 12.10.3. “Simple” Implementation

**Properties**

The simple satellite orbit implementation defines the following properties:

- **mergeTime** The time until the satellite will merge with its host: \(t_{\text{satellite,merge}} = \text{satelliteMergeTime}\).
- **boundMass** The remaining, total bound mass of the satellite: \(M_{\text{node,bound}} = \text{satelliteBoundMass}\).
- **virialOrbit** The orbit (returned as a *keplerOrbit* object; see §17.5.1) of the satellite at the point of virial radius crossing.

**Initialization**

None.

**Differential Evolution**

Properties are evolved according to:

\[
\dot{t}_{\text{satellite,merge}} = -1,
\]  

(12.77)

with \(\dot{M}_{\text{node,bound}}\) set to the rate given by the darkMatterHaloMassLossRateMethod method (see §17.4.1). The virial orbit is a fixed quantity and does not evolve.

**Event Evolution**

**Node mergers:** The *component* is created and the time to merging is assigned a value. The bound mass is set to the current total mass of the node. If satelliteOrbitStoreOrbitalParameters=true then a virial orbit is selected (unless one has already been set for the node) using the virialOrbitsMethod (see §17.4.1) and stored (otherwise, a new virial orbit will be computed—possibly at random—each time the virial orbit is requested). If [satelliteOrbitResetOnHaloFormation]=true then satellite orbits will be reset on halo formation events (see §12.16).

**Satellite merging:** None.

**Node promotion:** Not applicable (component only exists for satellite nodes).
12.10.4. “Orbiting” Implementation

Properties

The orbiting satellite orbit implementation defines the following properties:

position The 3-dimensional position of the satellite relative to its host: \( r = (x, y, z) \).

velocity The 3-dimensional velocity of the satellite relative to its host: \( v = (v_x, v_y, v_z) \).

mergeTime The time until the satellite will merge with its host: \( t_{\text{satellite,merge}} [\text{satelliteMergeTime}] \).

boundMass The remaining, total bound mass of the satellite: \( M_{\text{node,bound}} [\text{satelliteBoundMass}] \).

virialOrbit The orbit (returned as a \textit{keplerOrbit} object; see §17.5.1) of the satellite at the point of virial radius crossing.

tidalTensorPathIntegrated The time integral of the tidal tensor along the orbit of the satellite from initialization: \( G_{ij} \).

tidalHeatingNormalized The tidal heating energy per radius squared desposited into the satellite: \( Q_{\text{tidal}} \).

Initialization

The satellite position, if not already assigned, is selected such that its magnitude is set according to its virial orbit parameters and its direction is chosen at random assuming an isotropic distribution. The satellite velocity is similarly selected. The integrated tidal tensor, \( G_{ij} \), is initialized to the null tensor, while \( Q_{\text{tidal}} \) is initialized to zero.

Differential Evolution

Properties are evolved according to:

\[
\begin{align*}
\dot{r} &= v \quad (12.78) \\
\dot{v} &= -\frac{GM_{\text{host}}(<r)r}{r^3} + a_{DF} \quad (12.79) \\
\dot{G}_{ij} &= g_{ij} - G_{ij}/T_{\text{orb}} \quad (12.80)
\end{align*}
\]

with \( r = |r| \), \( a_{DF} \) set to the rate given by the \textit{satelliteDynamicalFrictionMethod} (see §13.34), \( g_{ij} \) being the tidal tensor, \( T_{\text{orb}} \) being the satellite’s orbital period, \( M_{\text{node,bound}} \) set to the rate given by the \textit{satelliteTidalStrippingMethod} (see §13.36), and \( Q_{\text{tidal}} \) set to the rate given by the \textit{satelliteTidalHeatingMethod} (see §13.37). Note that in the evolution of \( G_{ij} \) a decay term is artificially introduced such that the integration of \( g_{ij} \) is effectively over just the previous orbit (i.e. over the previous tidal shock).

Event Evolution

Node mergers: The component is created and the time to merging is given a value of -1 to indicate that the satellite is not about to merge as unmerged. Once the satellite satisfies one of the two merging conditions:

\[
\begin{align*}
 r &< R_{\text{host}} + R_{\text{satellite}} \quad (12.81) \\
 M_{\text{node,bound}} &< f_d M_{\text{node,basic}} \quad (12.82)
\end{align*}
\]
with $R$ being the node’s half-mass radius, $M_{node,\text{basic}}$ being the node’s initial mass, and $f_d = \text{[satelliteOrbitingDestructionMassFraction]}$, the node is considered merged and the time to merging is set to zero. The bound mass is set to the current total mass of the node. A virial orbit is selected using the \text{virialOrbitsMethod} (see §17.4.1).

\textit{Satellite merging:} None.

\textit{Node promotion:} Not applicable (component only exists for satellite nodes).

### 12.11. N-body Halo Properties

This component is intended for tracking of miscellaneous properties derived from N-body simulation merger trees.

#### 12.11.1. “Standard” Implementation

\textbf{Properties}

The standard N-body component implementation defines the following properties:

- \texttt{particleCount} The number of particles in the N-body halo [\texttt{nbodyParticleCount}].
- \texttt{velocityMaximum} The maximum of the N-body halo’s rotation curve (in units of km/s) [\texttt{nbodyVelocityMaximum}].
- \texttt{velocityDispersion} The velocity dispersion of the N-body halo (in units of km/s) [\texttt{nbodyVelocityDispersion}].

\textbf{Initialization}

The N-body properties of each node are assumed to have been preset prior to merger tree initialization. They are assumed to remain constant along each branch of the tree.

\textbf{Differential Evolution}

None.

\textbf{Event Evolution}

- \textit{Node mergers:} None.
- \textit{Satellite merging:} None.
- \textit{Node promotion:} The properties are updated to equal those of the parent node.

### 12.12. Dark Matter Halo Spin

#### 12.12.1. “Random” Implementation

\textbf{Properties}

The random dark matter halo spin implementation defines the following properties:

- \texttt{spin} The spin parameter of the halo: $\lambda$ [\texttt{spinSpin}].
12.12. Dark Matter Halo Spin

**Initialization**

The spin parameter of each node, if not already assigned, is selected at random from a distribution of spin parameters. This value is assigned to the earliest progenitor of the halo traced along its primary branch. The value is then propagated forward along the primary branch until the node mass exceeds that of the node for which the spin was selected by a factor of \([\text{randomSpinResetMassFactor}]\), at which point a new spin is selected at random, and the process repeated until the end of the branch is reached.

**Differential Evolution**

The spin parameter does not evolve.

**Event Evolution**

*Node mergers:* None.

*Satellite merging:* None.

*Node promotion:* The spin is updated to equal that of the parent node. (The two will differ only if this is a case where the new halo node was sufficiently more massive than the node for which a spin was last selected that a new spin value was chosen.)

12.12.2. “Preset” Implementation

**Properties**

The preset dark matter halo spin implementation defines the following properties:

- **spin**  The spin parameter of the halo: \(\lambda [\text{spinSpin}]\).
- **spinGrowthRate**  The growth rate spin parameter of the halo (in units of Gyr\(^{-1}\)).

**Initialization**

The spin parameter of each node is assumed to have been preset prior to merger tree initialization. The growth rate is computed assuming linear growth with time along each branch.

**Differential Evolution**

The spin parameter evolves linearly with time between node and parent node.

**Event Evolution**

*Node mergers:* None.

*Satellite merging:* None.

*Node promotion:* The spin and growth rate are updated to equal those of the parent node.
12. Node Components

12.12.3. “Preset3D” Implementation

The type extends the preset spin component implementation, and so provides all properties of that implementation plus those described below.

Properties

The preset dark matter halo spin implementation defines the following properties:

- `spinVector` The spin vector of the halo: \( \lambda \) [spinSpinVector].

- `spinVectorGrowthRate` The growth rate of the spin vector of the halo (in units of Gyr\(^{-1}\)).

Initialization

The spin vector of each node is assumed to have been preset prior to merger tree initialization. The growth rate is computed assuming linear growth with time along each branch.

Differential Evolution

The spin parameter evolves linearly with time between node and parent node.

Event Evolution

- **Node mergers:** None.

- **Satellite merging:** None.

- **Node promotion:** The spin vector and growth rate are updated to equal those of the parent node.

12.13. Dark Matter Profile

This component stores dynamic properties associated with dark matter halo density profiles.

12.13.1. “Scale” Implementation

Properties

The scale dark matter profile implementation defines the following properties:

- `scale` The scale length of the density profile [darkMatterProfileScale];

- `scaleGrowthRate` The growth rate of the scale length of the density profile.

Initialization

The scale length of each node, if not already assigned, is assigned using the concentration parameter function (see §13.8.3), but is not allowed to drop below [darkMatterProfileMinimumConcentration], such that the scale length is equal to the virial radius divided by that concentration.

Differential Evolution

The scale radius grows linearly with time to interpolate between the scale radii of child and parent halos.
Event Evolution

Node mergers: None.

Satellite merging: None.

Node promotion: None.

12.13.2. “Scale Preset” Implementation

Properties

The “scale preset” dark matter profile implementation defines the following properties:

- **scale** The scale length of the density profile [darkMatterProfileScale];
- **scaleGrowthRate** The growth rate of the scale length of the density profile.

Initialization

The scale length of each node is assumed to be assigned during tree construction.

Differential Evolution

The scale radius grows linearly with time to interpolate between the scale radii of child and parent halos.

Event Evolution

Node mergers: None.

Satellite merging: None.

Node promotion: None.

12.13.3. “Scale+Shape” Implementation

Properties

The scale+shape dark matter profile implementation defines the following properties:

- **scale** The scale length of the density profile [darkMatterProfileScale];
- **scaleGrowthRate** The growth rate of the scale length of the density profile.
- **shape** A shape parameter describing the density profile [darkMatterProfileShape];
- **shapeGrowthRate** The growth rate of the shape parameter of the density profile.

Initialization

The scale length of each node, if not already assigned, is assigned using the concentration parameter function (see §13.8.3), but is not allowed to drop below [darkMatterProfileMinimumConcentration], such that the scale length is equal to the virial radius divided by that concentration. The shape parameter of each node is assigned using the dark matter profile shape function (see §17.4.1).
12. Node Components

**Differential Evolution**

The scale radius and shape parameter of each node grow linearly with time to interpolate between the scale radii and shape parameters of child and parent halos.

**Event Evolution**

*Node mergers:* None.

*Satellite merging:* None.

*Node promotion:* None.

This component records statistics associated with galaxy merging.

**Properties**

The standard merging statistics implementation defines the following properties:

- `galaxyMajorMergerTime` The time of the last major merger associated with this galaxy, output as the time since the last major merger [mergingStatisticsGalaxyMajorMergerTime];

- `nodeMajorMergerTime` The time of the last major merger (as defined by the [nodeMajorMergerFraction] parameter) between this node and another, output as the time since the last major merger [mergingStatisticsNodeMajorMergerTime];

- `nodeFormationTime` The time at which the node is judged to have “formed”, defined as the time at which its main branch progenitor had a mass equal to a fraction [nodeFormationMassFraction] of the node’s initial mass in the merger tree [mergingStatisticsNodeFormationTime];

- `nodeHierarchyLevel` The depth of this node in the initial merger tree hierarchy. For example, a node on the main branch has level 0. A node which merges directly onto the main branch has level 1. A node that merges onto a node that merges directly onto the main branch has level 2, etc. [mergingStatisticsNodeHierarchyLevel];

**Initialization**

The times of the last mergers are stored each time a major merger occurs and this component is created (if necessary) the first time such a merger occurs. Formation times and hierarchy levels are computed during merger tree initialization.

**Differential Evolution**

The times of the last mergers do not evolve.
Event Evolution

Node mergers: The time of the last node merger in the parent node is reset to the current time if the merger is major.

Satellite merging: The time of the last merger is reset to the current time if the merger is major.

Node promotion: The time of the last major node merger is updated to that of the parent if that time is more recent.

12.14.2. “Recent” Implementation

Properties

The recent merging statistics implementation defines the following properties:

- `recentMajorMergerTime`: The number of node major mergers (defined as a merger with mass ratio in excess of `nodeMajorMergerFraction`) occurring within a recent interval, \( \Delta t \) where \( \Delta t = [\text{nodeRecentMajorMergerInterval}] \) if \( \text{nodeRecentMajorMergerIntervalType} = \text{absolute} \), or \( \Delta t = [\text{nodeRecentMajorMergerInterval}] \tau_{\text{dyn}} \) (where \( \tau_{\text{dyn}} \) is the halo dynamical time) if \( \text{nodeRecentMajorMergerIntervalType} = \text{dynamical} \).

Initialization

The number of recent mergers for each output time are initialized to zero.

Differential Evolution

The number of recent mergers do not evolve.

Event Evolution

Node mergers: If the merger is major and occurs within \( \Delta t \) of an output time, the number of recent major mergers is increased by one.

Satellite merging: N/A.

Node promotion: N/A.

12.15. Age Statistics

This component records statistics associated with galaxy or halo age.

12.15.1. “Standard” Implementation

Properties

The standard age statistics implementation defines the following properties:

- `(disk|spheroid)TimeWeightedIntegratedSFR`: A time-weighted integral over the star formation rate of the specified component `ageStatistics(Disk|Spheroid)TimeWeightedIntegratedSFR);`
12. Node Components

\( (\text{disk|spheroid})\text{IntegratedSFR} \) A unweighted integral over the star formation rate of the specified component \( \text{ageStatistics(Disk|Spheroid)IntegratedSFR} \);

**Initialization**

The integrals are all initialized to zero.

**Differential Evolution**

The time-weighted integrals evolve as:

\[
\frac{d(M_t)}{dt} = t\phi(t),
\]  

(12.83)

where \( t \) is cosmic time and \( \phi(t) \) is the star formation rate in the component. The unweighted integrals evolve as:

\[
\frac{dM_*}{dt} = \phi(t).
\]  

(12.84)

The mean cosmic time of formation for the stars in either component can be found by taking the ratio of time-weighted to unweighted integrals. The mean age can then be found by subtracting the mean cosmic time of formation from the present time.

**Event Evolution**

*Node mergers:* N/A.

*Satellite merging:* The values of the integrals are removed from the merging galaxy and transferred to the appropriate component of the target galaxy. Additionally, in a major merger, the values of the integral are transferred between components in the target galaxy as dictated by the merging rules.

*Node promotion:* N/A.

### 12.16. Formation Times

This component implements “formation times” of dark matter halos.

#### 12.16.1. “Cole2000” Implementation

**Properties**

The “Cole2000” formation times implementation defines the following properties:

*formationTime* The time at which the halo last “formed”. Formation is defined as an increase in the mass of the halo by a factor \([\text{haloReformationMassFactor}]\).

**Initialization**

The formation time is set to the current time and this component is created the first time such a merger occurs.
**Differential Evolution**

The formation time does not evolve. When the node mass exceeds the mass at the formation time by a factor \([\text{haloReformationMassFactor}]\) evolution is interrupted and the formation time reset to the current time.

**Event Evolution**

*Node mergers:* None.

*Satellite merging:* None.

*Node promotion:* None.

### 12.17. Indices

This component tracks various indices associated with nodes.

#### 12.17.1. “Standard” Implementation

**Properties**

The ‘standard’ indices implementation defines the following properties:

*branchTip* The index of the node at the tip of the branch to which the node belongs.

**Initialization**

The branch tip index is set to equal the index of each branch tip node in the tree.

**Differential Evolution**

The indices do not evolve.

**Event Evolution**

*Node mergers:* None.

*Satellite merging:* None.

*Node promotion:* None.

### 12.18. Inter-Output Quantities

This component tracks various quantities averaged between successive outputs.
12.18.1. “Standard” Implementation

Properties

The “standard” inter-output implementation defines the following properties:

**diskStarFormationRate** The mean star formation rate (in units of $M_\odot \text{ Gyr}^{-1}$) in the disk between the previous and current output times.

**spheroidStarFormationRate** The mean star formation rate (in units of $M_\odot \text{ Gyr}^{-1}$) in the spheroid between the previous and current output times.

Initialization

No initialization is carried out—component is created as needed.

Differential Evolution

The disk and spheroid star formation rates, $\langle \dot{M}_* \rangle$, evolve according to:

$$\frac{d}{dt} \langle \dot{M}_* \rangle = \frac{\dot{M}_*}{\Delta t},$$

where $\dot{M}_*$ is the instantaneous star formation rate in the corresponding component and $\Delta t$ is the time between the previous and next output times.

Event Evolution

**Node mergers:** None.

**Satellite merging:** The mean star formation rates from the satellite are added to those of the parent.

**Node promotion:** None.

**Output:** All quantities are zeroed after each output.
13. Physical Implementations

13.1. Accretion of Gas into Halos

The accretion rate of gas from the IGM into a dark matter halo is expected to depend on (at least) the rate at which that halo mass is growing, the depth of its potential well and the thermodynamical properties of the accreting gas. GALACTICUS implements the following calculations of gas accretion from the IGM, which can be selected via the `accretionHalosMethod` input parameter.

13.1.1. Simple Method

Selected using `accretionHalosMethod=simple`, this method sets the accretion rate of baryons into a halo to be:

\[
\dot{M}_{\text{accretion}} = \begin{cases} 
  (\Omega_b/\Omega_M)\dot{M}_{\text{halo}} & \text{if } V_{\text{virial}} > V_{\text{reionization}} \text{ or } z > z_{\text{reionization}} \\
  0 & \text{otherwise,}
\end{cases}
\]

(13.1)

where \(z_{\text{reionization}} = [\text{reionizationSuppressionRedshift}]\) is the redshift at which the Universe is reionized and \(V_{\text{reionization}} = [\text{reionizationSuppressionVelocity}]\) is the virial velocity below which accretion is suppressed after reionization. Setting \(V_{\text{reionization}}\) to zero will effectively switch off the effects of reionization on the accretion of baryonics. This algorithm attempts to offer a simple prescription for the effects of reionization and has been explored by multiple authors (e.g. Benson et al. 2002). In particular, Font et al. [2010] show that it produces results in good agreement with more elaborate treatments of reionization. For halos below the accretion threshold, any accretion rate that would have otherwise occurred is instead placed into the “failed” accretion rate. For halos which can accrete, and which have some mass in their “failed” reservoir, that mass will be added to the regular accretion rate at a rate equal to the mass of the “failed” reservoir times the specific growth rate of the halo. The gas accreted is assumed to be from a pristine IGM and so has zero abundances. Chemical abundances are computed from the chemical state functions (see §13.24).

Note that, if \(\dot{M}_{\text{halo}} < 0\) then negative accretion rates of gas into the node can result. This can be prevented by setting \([\text{accretionHalosSimpleNegativeAccretionAllowed}]=\text{false}\).

By default, gas is accreted whenever the halo is growing in total mass. However, setting \([\text{accretionHalosSimpleAccreteNewGrowthOnly}]=\text{true}\) causes accretion to occur only if the node mass is growing and exceeds the previous maximum node mass achieved along this branch of the merger tree. This requires use of a basic component which tracks the maximum mass along the branch (i.e. the `massMaximum` property).

13.1.2. Null Method

Selected using `accretionHalosMethod=null`, this method sets the accretion rate of baryons into a halo to be zero always.

13.2. Cosmology Functions

The background cosmology describes the evolution of an isotropic, homogeneous Universe within which our calculations are carried out. For the purposes of GALACTICUS, the background cosmology is used to
relate expansion factor/redshift to cosmic time and to compute the density of various components (e.g. dark matter, dark energy, etc.) at different epochs. Background cosmological models are specified via the `cosmologyMethod`, and the physics that must be implemented for each cosmological model is describe in more detail in §17.4.1. Currently implemented cosmological models are as follows.

### 13.2.1. Matter + Lambda

Selected with `cosmologyMethod=matter-lambda`, in this implementation cosmological relations are computed assuming a universe that contains only collisionless matter and a cosmological constant.

### 13.2.2. Matter + Dark Energy

Selected with `cosmologyMethod=matter-darkEnergy`, in this implementation cosmological relations are computed assuming a universe that contains only collisionless matter and dark energy with an equation of state $w(a) = w_0 + w_1 a (1 - a)$ [Jassal et al., 2005], with $w_0 = \text{[darkEnergyEquationOfStateW0]}$, and $w_1 = \text{[darkEnergyEquationOfStateW1]}$.

### 13.3. Circumnuclear Accretion Disks

Circumnuclear accretion disks surrounding supermassive black holes at the centers of galaxies influence the evolution of both the black hole (via accretion rates of mass and angular momentum and possibly by extracting rotational energy from the black hole) and the surrounding galaxy if they lead to energetic outflows (e.g. jets) from the nuclear region. Accretion disk type is specified via the `accretionDisksMethod`, and the physics that must be implemented for each accretion disk type is describe in more detail in §17.4.1. Current implementations of accretion disks are as follows.

#### 13.3.1. Shakura-Sunyaev Geometrically Thin, Radiatively Efficient Disks

Selected with `accretionDisksMethod=Shakura-Sunyaev`, this implementation assumes that accretion disks are always described by a radiatively efficient, geometrically thin accretion disk as described by Shakura and Sunyaev [1973]. The radiative efficiency of the flow is computed assuming that material falls into the black hole without further energy loss from the innermost stable circular orbit (ISCO), while the spin-up rate of the black hole is computed assuming that the material enters the black hole with the specific angular momentum of the ISCO (i.e. there are no torques on the material once it begins to fall in from the ISCO; Bardeen 1970). For these thin disks, jet power is computed, using the expressions from Meier (2001; his equations 4 and 5).

#### 13.3.2. Advection Dominated, Geometrically Thick, Radiatively Inefficient Flows (ADAFs)

Selected with `accretionDisksMethod=ADAF`, this implementation assumes that accretion is via an advection-dominated accretion flow (ADAF) [Narayan and Yi, 1994] which is radiatively inefficient and geometrically thick. The radiative efficiency of the flow, which will be zero for a pure ADAF, is controlled by `adafRadiativeEfficiencyType`. If set to `fixed`, then the radiative efficiency is set to the value of the input parameter `adafRadiativeEfficiency`. Alternatively, if set to `thinDisk` the radiative efficiency will be set to that of a Shakura-Sunyaev thin disk. The spin up rate of the black hole and the jet power produced as material accretes into the black hole are computed using the method of Benson and Babul [2009]. The maximum efficiency of the jet (in units of the accretion power $\dot{M}c^2$) is set by `adafJetEfficiencyMaximum`—in the model of Benson and Babul [2009] the jet efficiency diverges as
j → 1, setting a maximum is important to avoid numerical instabilities. The energy of the accreted material can be set equal to the energy at infinity (as expected for a pure ADAF) or the energy at the ISCO by use of the [adafEnergyOption] parameter (set to pureADAF or ISCO respectively). The ADAF structure is controlled by the adiabatic index, \( \gamma \), and viscosity parameter, \( \alpha \), which are specified via the [adafAdiabaticIndex] and [adafViscosityOption] input parameters respectively. The field-enhancing shear, \( g \), is computed using

\[
g = \exp(\omega \tau)
\]

if [adafFieldEnhanceType] is set to “exponential” where \( \omega \) is the frame-dragging frequency and \( \tau \) is the smaller of the radial inflow and azimuthal velocity timescales. If [adafFieldEnhanceType] is set to “linear” then the alternative version,

\[
g = 1 + \omega \tau
\]

is used instead. [adafViscosityOption] may be set to “fit”, in which case the fitting function for \( \alpha \) as a function of black hole spin is used:

\[
a(j) = 0.015 + 0.02j^4 \quad \text{if} \quad g = \exp(\omega \tau) \quad \text{and} \quad E = E_{\text{ISCO}},
\]

(13.2)

\[
a(j) = 0.025 + 0.08j^4 \quad \text{if} \quad g = 1 + \omega \tau \quad \text{and} \quad E = E_{\text{ISCO}},
\]

(13.3)

\[
a(j) = 0.010 + 0.00j^4 \quad \text{if} \quad g = \exp(\omega \tau) \quad \text{and} \quad E = 1,
\]

(13.4)

\[
a(j) = 0.025 + 0.02j^4 \quad \text{if} \quad g = 1 + \omega \tau \quad \text{and} \quad E = 1.
\]

(13.5)

### 13.3.3. “Switched” Disks

Selected with [accretionDisksMethod]=switched, this method allows for accretion disks to switched between radiatively efficient (Shakura-Sunyaev) and inefficient (ADAF) modes. The properties of the switched disk (e.g. radiative efficiency, jet power), are a linear combination of those of the Shakura-Sunyaev and ADAF modes, with the ADAF fraction being given by:

\[
f_{\text{ADAF}} = [1 + \exp(y_{\text{min}})]^{-1} + [1 + \exp(y_{\text{max}})]^{-1},
\]

(13.6)

where

\[
y_{\text{min}} = + \log(x/x_{\text{min}})/\Delta x,
\]

(13.7)

\[
y_{\text{max}} = - \log(x/x_{\text{max}})/\Delta x,
\]

(13.8)

and,

\[
x = \dot{M}/\dot{M}_{\text{Eddington}}.
\]

(13.9)

Here, \( x_{\text{min}} = [\text{accretionRateThinDiskMinimum}] \), \( x_{\text{max}} = [\text{accretionRateThinDiskMaximum}] \), and \( \Delta x = [\text{accretionRateTransitionWidth}] \). If either [accretionRateThinDiskMinimum] or [accretionRateThinDiskMaximum] is set to “none” then the corresponding term in eqn. (13.6) is excluded.

Additionally, if [accretionDiskSwitchedScaleAdafRadiativeEfficiency] is set to true then the radiative efficiency of the ADAF component is reduced by a factor \( x/x_{\text{min}} \) when \( x < x_{\text{min}} \).

### 13.3.4. Eddington-limited Disks

Selected with [accretionDisksMethod]=eddingtonLimited, this method does not assume any physical model for the accretion disk, but merely assumes that jets are powered at a fixed fraction \( [\text{accretionDiskJetPowerEddington}] \) of the Eddington luminosity. The radiative efficiency is similarly set at a fixed value of \( [\text{accretionDiskRadiativeEfficiencyEddington}] \). Since no physical model for the disk is assumed, the black hole spin up rate is always set to zero.

### 13.4. Dark Matter Structure Formation

A variety of functions are used to describe structure formation in dark matter dominated universes. These are described below.
13. Physical Implementations

13.4.1. Primordial Power Spectrum

The functional form of the primordial dark matter power spectrum is selected via the `powerSpectrumMethod` parameter. The power spectrum is computed from the specified primordial power spectrum and the transfer function (see §13.4.5) and normalized to a value of $\sigma_8$ specified by $[\text{sigma}_8]$.

(Running) Power Law Spectrum

Selected via `powerSpectrumMethod=powerLaw`, this method implements a primordial power spectrum of the form:

$$ P(k) \propto k^{n_{\text{eff}}(k)}, $$

where

$$ n_{\text{eff}}(k) = n_s + \frac{1}{2} \frac{dn}{d \ln k} \ln \left( \frac{k}{k_{\text{ref}}} \right), $$

where $n_s = \text{powerSpectrumIndex}$ is the power spectrum index at wavenumber $k_{\text{ref}} = \text{powerSpectrumReferenceWavenumber}$ and $dn/d \ln k = \text{powerSpectrumRunning}$ describes the running of this index with wavenumber.

13.4.2. Cosmological Mass Root Variance

The method used to compute the root variance of the cosmological mass field, $\sigma(M)$, is selected via the `cosmologicalMassVarianceMethod` parameter.

Filtered Power Spectrum

Selected via `cosmologicalMassVarianceMethod=filteredPowerSpectrum`, this method computes the mass root variance using:

$$ \sigma^2(M) = \frac{1}{2\pi^2} \int_0^\infty P(k)T^2(k)W^2(k)k^2 dk $$

where $P(k)$ is the primordial power spectrum (see §13.4.1), $T(k)$ is the transfer function (see §13.4.5), and $W(k)$ is the power spectrum variance window function (see §13.4.3).

13.4.3. Power Spectrum Variance Window Function

The functional form of the window function used in computing the variance of the power spectrum is selected via the `powerSpectrumWindowFunctionMethod` parameter. Note that when computing the normalization of the power spectrum to match the specified value of $\sigma_8$ a top-hat real-space window function is always used (as per the definition of $\sigma_8$).

Top-hat

Selected via `powerSpectrumWindowFunctionMethod=topHat`, this method implements a top-hat window function in real-space:

$$ W(k) = \frac{3(\sin(x) - x \cos(x))}{x^3}, $$

where $x = kR$ and $R = (3M/4\pi\bar{\rho})^{1/3}$ for a smoothing scale $M$ and mean matter density $\bar{\rho}$.
13.4. Dark Matter Structure Formation

Sharp in \( k \)-space

Selected via `powerSpectrumWindowFunctionMethod=kSpaceSharp`, this method implements a top-hat window function in \( k \)-space:

\[
W(k) = \begin{cases} 
1 & \text{if } k < k_s \\
0 & \text{if } k > k_s,
\end{cases}
\]

(13.14)

where if \([\text{powerSpectrumWindowFunctionSharpKSpaceNormalization}]=\text{natural}\) then \(k_s = (6\pi^2\bar{\rho}/M)^{1/3}\) for a smoothing scale \(M\) and mean matter density \(\bar{\rho}\). Otherwise, \([\text{powerSpectrumWindowFunctionSharpKSpaceNormalization}]=\text{natural}\) must be set to a numerical value, \(\alpha\), in which case \(k_s = \alpha/R_{th}\) with \(R_{th} = 3M/4\pi\bar{\rho}\) for a smoothing scale \(M\) and mean matter density \(\bar{\rho}\).

Hybrid of Top-hat and Sharp in \( k \)-space

Selected via `powerSpectrumWindowFunctionMethod=topHatKSpaceSharpHybrid`, this method implements a convolution of a top-hat window function and sharp \( k \)-space window function in \( k \)-space:

\[
W(k) = W_{th}(k)W_s(k),
\]

(13.15)

where

\[
W(k) = \frac{3(\sin(x) - x \cos(x))}{x^3},
\]

(13.16)

where \(x = kR_{th}\), and

\[
W_s(k) = \begin{cases} 
1 & \text{if } k < k_s \\
0 & \text{if } k > k_s,
\end{cases}
\]

(13.17)

where \(k_s = \alpha/R_s\) if \([\text{powerSpectrumWindowFunctionSharpKSpaceNormalization}]=\text{natural}\) is assigned a numerical value. Alternatively, if \([\text{powerSpectrumWindowFunctionSharpKSpaceNormalization}]=\text{natural}\) then the value of \(\alpha\) is chosen such that \(k_s = (6\pi^2\bar{\rho}/M)^{1/3}\) if \(R_s = 3M/4\pi\bar{\rho}\).

The radii, \(R_{th}\) and \(R_s\), are chosen such that:

\[
R_{th}^2 + R_s^2 = (3M/4\pi\bar{\rho})^{2/3}
\]

(13.18)

\[
R_s = \beta R_{th},
\]

(13.19)

where \(\beta = [\text{powerSpectrumWindowFunctionSharpKSpaceTopHatRadiiRatio}]\).

13.4.4. Non-linear Matter Power Spectrum

The non-linear matter power spectrum method is selected via the `powerSpectrumNonlinearMethod` parameter.

Linear

Selected via `powerSpectrumNonlinearMethod=linear`, this method simply returns the linear matter power spectrum. It is intended primarily for testing purposes.

Peacock & Dodds (1996)

Selected via `powerSpectrumNonlinearMethod=Peacock-Dodds1996`, this method uses the fitting function of Peacock and Dodds [1996] to compute the non-linear matter power spectrum.
13. Physical Implementations

**CosmicEmu**

Selected via `powerspectrumNonlinearMethod=CosmicEmu`, this method uses the cosmic emulator ("CosmicEmu") code of Lawrence et al. [2010] to evaluate the non-linear matter power spectrum. The CosmicEmu code will be downloaded, compiled and run as necessary if this option is utilized.

### 13.4.5. Transfer Function

The functional form of the cold dark matter transfer function is selected via the `transferFunctionMethod` parameter. The power spectrum is computed from the specified transfer function and the primordial power spectrum (see §13.4.1) and normalized to a value of $\sigma_8$ specified by $[\sigma_8]$.

**Null**

Selected with `transferFunctionMethod=null`, this method assumes $T(k) = 1$ for all $k$.

**BBKS**

Selected with `transferFunctionMethod=BBKS`, this method uses the fitting function of Bardeen et al. [1986] to compute the CDM transfer function. The BBKS warm dark matter transfer function can be used by specifying the appropriate streaming length (in Mpc) via the `[transferFunctionWDMFreeStreamingLength]` parameter.

**Eisenstein & Hu**

Selected with `transferFunctionMethod=Eisenstein-Hu1999`, this method uses the fitting function of Eisenstein and Hu [1999] to compute the CDM transfer function. It requires that the effective number of neutrino species be specified via the `effectiveNumberNeutrinos` parameter and summed mass of all neutrino species (in eV) be specified via the `summedNeutrinoMasses` parameter. Additionally, the transfer function can be modified to model warm dark matter using the fitting function given by Barkana et al. [2001]:

$$T(k) \rightarrow T(k)(1 + [\epsilon k R_0^c]^{2\nu})^{-\eta/\nu},$$

where $R_0^c = [transferFunctionWdmCutOffScale]$, $\epsilon = [transferFunctionWdmEpsilon]$, $\eta = [transferFunctionWdmEta]$, $\nu = [transferFunctionWdmNu]$.

**CAMB**

Selected with `transferFunctionMethod=CAMB`, this method uses the CAMB code to compute the CDM transfer function. It requires that the mass fraction of helium in the early Universe be specified via the $Y_{He}$ parameter. CAMB will be downloaded and run if the transfer function needs to be computed. It will then be stored in a file for future reference.

**File**

Selected with `transferFunctionMethod=file`, this method reads a tabulated transfer function from an XML file (specified via the `transferFunctionFile` parameter), interpolating between tabulated points. The structure of the transfer function file is described in §17.4.1.

### 13.4.6. Linear Growth Function

The function describing the amplitude of linear perturbations is selected via the `linearGrowthMethod` parameter.
Simple

Selected with `linearGrowthMethod=simple`, this method calculates the growth of linear perturbations using standard perturbation theory in a Universe consisting of matter and a cosmological constant. Perturbations in the baryons are treated just as for dark matter (i.e. pressure forces are ignored), while perturbations in the radiation are assumed not to grow.

13.4.7. Critical Overdensity

The method used to compute the critical linear overdensity at which overdense regions virialize is selected via the `criticalOverdensityMethod` parameter.

Spherical Collapse (Matter + Cosmological Constant)

Selected with `criticalOverdensityMethod=sphericalTopHat` this method calculates critical overdensity using a spherical top-hat collapse model assuming a Universe which contains matter and a cosmological constant (see, for example, Percival 2005).

Kitayama & Suto (1996)

Selected with `criticalOverdensityMethod=Kitayama-Suto1996` this method calculates critical overdensity using the fitting formula of Kitayama and Suto [1996], and so is valid only in flat cosmological models (an error will be reported in non-flat models). Specifically,

\[
\delta_{\text{crit}}(t) = \frac{3(12\pi)^{2/3}}{20} \left[ 1 + 0.0123 \log_{10} \left( \Omega_{\text{matter}}(t) \right) \right] / D(t). \tag{13.21}
\]

13.4.8. Critical Overdensity Mass Scaling

The method used to compute the scaling with mass of the critical linear overdensity at which overdense regions virialize is selected via the `criticalOverdensityMassScalingMethod` parameter.

Null

Selected with `criticalOverdensityMassScalingMethod=null` this method assumes that the critical overdensity is independent of mass.

Warm Dark Matter

Selected with `criticalOverdensityMassScalingMethod=warmDarkMatter` this method assumes that the critical overdensity scales with mass as expected for warm dark matter using the results of Barkana et al. [2001]. Specifically, the critical overdensity is multiplied by a factor

\[
\exp \left[ \left( \frac{M_J}{8M} \right)^{1.40} + \left( \frac{M_J}{8M} \right)^{0.45} \right], \tag{13.22}
\]

where \( M \) is the mass in question, \( M_J \) is the effective Jeans mass of the warm dark matter as defined by Barkana et al. [2001; their eqn. 10]:

\[
M_J = 3.06 \times 10^8 \left( \frac{1 + \frac{z_{eq}}{3000}}{0.15} \right)^{1.5} \left( \frac{\Omega M h^2}{0.15} \right)^{1/2} (\frac{9X}{1.5})^{-1} (m_X/1.0\text{keV})^{-4}, \tag{13.23}
\]
13. Physical Implementations

the redshift of matter-radiation equality is given by

$$z_{eq} = 3600 \left( \frac{\Omega_M h^2_0}{0.15} \right) - 1,$$

(13.24)

and $g_X$ and $m_X$ are the effective number of degrees of freedom and the mass of the warm dark matter particle respectively. This fitting function has been found the fit the numerical results of Barkana et al. [2001] well.

13.4.9. Virial Density Contrast

The method used to compute the mean density contrast of virialized dark matter halos is selected via the `virialDensityContrastMethod` parameter.

**Bryan & Norman (1998) Fitting Function**

Selected with `virialDensityContrastMethod=Bryan-Norman1998` this method calculates virial density contrast using the fitting functions given by Bryan and Norman [1998]. As such, it is valid only for $\Omega_\Lambda = 0$ or $\Omega_M + \Omega_\Lambda = 1$ cosmologies and will abort on other cosmologies.

**Fixed**

Selected with `virialDensityContrastMethod=fixed` this method uses a fixed virial density contrast of $[\text{virialDensityContrastFixed}]$, defined relative to `criticalDensity` and `meanDensity` as specified by $[\text{virialDensityContrastFixedType}]$.

**Spherical Collapse (Matter + Cosmological Constant)**

Selected with `virialDensityContrastMethod=sphericalTopHat` this method calculates virial density contrast using a spherical top-hat collapse model assuming a Universe which contains matter and a cosmological constant (see, for example, Percival 2005).

**Kitayama & Suto (1996)**

Selected with `virialDensityContrastMethod=Kitayama-Suto1996` this method calculates virial density contrast using the fitting formula of Kitayama and Suto [1996], and so is valid only in flat cosmological models (an error will be reported in non-flat models). Specifically,

$$\Delta_{\text{virial}}(t) = 18\pi^2 [1 + 0.4093 \left\{ \frac{1}{\Omega_{\text{matter}}(t)} - 1 \right\} (t)^{0.9052}].$$

(13.25)

**Friends-of-Friends**

Selected with `virialDensityContrastMethod=friendsofFriends` this method computes the virial density contrast consistent with a given friends-of-friends algorithm linking length. According to Lacey and Cole [1994], the friends-of-friends algorithm selects objects bounded by an isodensity contour of density contrast

$$\Delta_{\text{iso}} = \frac{3}{2\pi b^3},$$

(13.26)

where $b = [\text{virialDensityContrastFoFLinkingLength}]$ is the dimensionless linking length of the algorithm (i.e. the linking length in units of the mean interparticle spacing). The virial density contrast is then given by:

$$\Delta_{\text{vir}} = \frac{\bar{\rho}_{\text{vir}}}{\rho(\bar{r}_{\text{vir}})} \Delta_{\text{iso}},$$

(13.27)
where $\bar{\rho}_{\text{vir}}$ is the mean density inside the virial radius and $\rho(r_{\text{vir}})$ is the density at the virial radius. The ratio $\bar{\rho}_{\text{vir}}/\rho(r_{\text{vir}})$ is specified via the parameter $[\text{virialDensityContrastForDensityRatio}]$. Its default value of 4.688 is appropriate for an NFW halo of concentration $c = 6.88$ which is the concentration found by Prada et al. [2011] for halos with $\sigma = 1.686$ which is the approximate critical overdensity for collapse).

13.4.10. Halo Bias

The dark matter halo linear bias method is selected via the `darkMatterHaloBiasMethod` parameter.

**Press-Schechter**

Selected with `darkMatterHaloBiasMethod=Press-Schechter` this method uses a bias consistent with the halo mass function of Press and Schechter [1974] (see [Mo and White, 1996]).

**Sheth-Tormen**

Selected with `darkMatterHaloBiasMethod=SMT` this method uses a bias consistent with the halo mass function of Sheth et al. [2001].

**Tinker**

Selected with `darkMatterHaloBiasMethod=Tinker2010` this method uses the functional form proposed by Tinker et al. [2010] to compute the halo bias. The bias is computed at the appropriate virial overdensity (see §13.4.9).

13.4.11. Halo Mass Function

The dark matter halo mass function (i.e. the number of halos per unit volume per unit mass interval) is selected via the `haloMassFunctionMethod` parameter.

**Press-Schechter**

Selected with `haloMassFunctionMethod=Press-Schechter` this method uses the functional form proposed by Press and Schechter [1974] to compute the halo mass function.

**Sheth-Tormen**

Selected with `haloMassFunctionMethod=Sheth-Tormen` this method uses the functional form proposed by Sheth et al. [2001] to compute the halo mass function. Specifically,

$$n(M,t) = 2\Omega M \rho_{\text{crit}} \sigma^2(M) f[S(M,t)],$$

(13.28)

where $\alpha = d\ln \sigma/d\ln M$ and $f[S]$ is the excursion set barrier first crossing distribution for variance $S(M) = \sigma^2(M)$, computed using the selected `excursionSetFirstCrossingMethod` (see §17.4.1).

**Tinker**

Selected with `haloMassFunctionMethod=Tinker2008` this method uses the functional form proposed by Tinker et al. [2008] to compute the halo mass function. The mass function is computed at the appropriate virial overdensity (see §13.4.9).
13.5. Conditional Mass Functions

The method to be used for computing the conditional mass function (for use in data modelling) is specified by the conditionalMassFunctionMethod parameter.

13.5.1. Behroozi et al. (2010)

Selected with conditionalMassFunctionMethod=Behroozi2010, this method uses the functional form given by Behroozi et al. (2010; see also Leauthaud et al. 2011). The mean number of central galaxies of stellar mass, $M_\star$, in halos of mass $M_h$ is given by:

$$\log_{10} \left[ f_{SHMR}^{-1}(M_\star) \right] = \log_{10}(M_h) = \log_{10}(M_1) + \beta \log_{10} \left( \frac{M_\star}{M_{\star,0}} \right) + \frac{(M_\star/M_{\star,0})^\delta}{1 + (M_\star/M_{\star,0})^{-\gamma}} - \frac{1}{2},$$

(13.29)

where

$$\langle n_{cen}(M_h|M_\star) \rangle = \frac{1}{2} \left[ 1 - \text{erf} \left( \frac{\log_{10}(M_\star) - \log_{10}[f_{SHMR}(M_h)]}{\sqrt{2} \sigma_{\log M_\star}} \right) \right].$$

(13.30)

The mean number of satellite galaxies of stellar mass, $M_\star$, in halos of mass $M_h$ is given by:

$$\langle N_{sat}(M_h|M_\star) \rangle = \langle n_{cen}(M_h|M_\star) \rangle \left( \frac{f_{SHMR}^{-1}(M_\star)}{M_{sat}} \right)^{\alpha_{sat}} \exp \left( -\frac{M_{cut}}{f_{SHMR}(M_\star)} \right),$$

(13.31)

where

$$\frac{M_{sat}}{10^{12} M_\odot} = B_{sat} \left( \frac{f_{SHMR}^{-1}(M_\star)}{10^{12} M_\odot} \right)^{\beta_{sat}},$$

(13.32)

and

$$\frac{M_{cut}}{10^{12} M_\odot} = B_{cut} \left( \frac{f_{SHMR}^{-1}(M_\star)}{10^{12} M_\odot} \right)^{\beta_{cut}}.$$

(13.33)

The number of centrals in a given halo is assumed to be Bernoulli distributed (0 or 1), while the number of satellites is assumed to be Poisson distributed with the above mean. The parameters of the distribution are controlled by the input parameters as listed in Table 13.1.

13.6. Cooling of Gas Inside Halos

The cooling of gas within dark matter halos is controlled by a number of different algorithms which will be described below.

13.6.1. Cooling Function

The cooling function of gas, $\Lambda(\rho, T, Z)$, is implemented by the algorithm(s) selected using the coolingFunctionMethods parameter. If more than one cooling function is specified, then the net cooling function is a sum over all of those selected.

Atomic Collisional Ionization Equilibrium Using CLOUDY

Selected using coolingFunctionMethods=atomic_CIE_Cloudy, this method computes the cooling function using the CLOUDY code and under the assumption of collisional ionization equilibrium with no molecular contribution. Abundances are Solar, except for zero metallicity calculations which use CLOUDY’s “primordial” metallicity. The helium abundance for non-zero metallicity is scaled between primordial and...

Solar values linearly with metallicity. The CLOUDY code will be downloaded and run to compute the cooling function as needed, which will then be stored for future use. As this process is slow, a precomputed table is provided with GALACTICUS. If metallicities outside the range tabulated in this file are required it will be regenerated with an appropriate range.

**Collisional Ionization Equilibrium From File**

Selected using `coolingFunctionMethods=CIE_from_file`, in this method the cooling function is read from a file specified by the `coolingFunctionFile` parameter. The format of this file is specified in §17.4.1. The cooling function is assumed to be computed under conditions of collisional ionization equilibrium and therefore to scale as $\rho^2$.

**CMB Compton Cooling**

Selected using `coolingFunctionMethods=CMB_Compton`, this method computes the cooling function due to Compton scattering off of CMB photons:

$$
\Lambda = \frac{4\sigma_T a k_B n_e}{m_e c} T_{CMB}^4 (T - T_{CMB}),
$$

where $\sigma_T$ is the Thompson cross-section, $a$ is the radiation constant, $k_B$ is Boltzmann’s constant, $n_e$ is the number density of electrons, $m_e$ is the electron mass, $c$ is the speed of light, $T_{CMB}$ is the CMB temperature at the current cosmic epoch and $T$ is the temperature of the gas. The electron density is computed from the selected chemical state method (see §13.24).

**Molecular Hydrogen (Galli-Palla)**

Selected using `coolingFunctionMethods=molecularHydrogenGalliPalla`, this method computes the cooling function due to molecular hydrogen using the results of Galli and Palla [1998]. For the $\text{H}^-\text{H}_2$ cooling function, the fitting functions from Galli and Palla [1998] are used. For the $\text{H}^+_2-e^-$ and $\text{H}--\text{H}_2^+$ cooling functions fitting functions to the results plotted in Suchkov and Shchekinov [1978] are used:

$$
\log_{10} \left( \frac{\Lambda(T)}{\text{erg s}^{-1}\text{cm}^3} \right) = C_0 + C_1 \log_{10} \left( \frac{T}{K} \right) + C_2 \left[ \log_{10} \left( \frac{T}{K} \right) \right]^2,
$$
Table 13.2.: Coefficients of $H^+_2$ cooling functions as appearing in the fitting function, eq. 13.35.

</tbody>
</table>

where the coefficients $C_{0-2}$ are given in Table 13.2.

13.6.2. Cooling Rate

The algorithm used to compute the rate at which gas drops out of the hot halo due to cooling is selected with the coolingRateMethod parameter.

**Cole et al. (2000)**

Selected with coolingRateMethod=Cole2000, this method computes the cooling rate using the algorithm of Cole et al. [2000]. The cooling rate is given by

$$
\dot{M}_{\text{cool}} = \begin{cases} 
4\pi r_{\text{infall}}^2 \rho(r_{\text{infall}}) \dot{r}_{\text{infall}} & \text{if } r_{\text{infall}} < r_{\text{hot,outer}} \\
0 & \text{if } r_{\text{infall}} \geq r_{\text{hot,outer}},
\end{cases}
$$

(13.36)

where $\rho(r)$ is the density profile of the hot halo, and $r_{\text{infall}}$ is the infall radius (see §13.6.6). The cooling rate is also set to zero in halos with virial velocities below $[\text{coolingCutOffVelocity}]$ at redshifts below $[\text{coolingCutOffRedshift}]$.

**Simple**

Selected with coolingRateMethod=simple, this method computes the cooling rate using

$$
\dot{M}_{\text{cool}} = \frac{M_{\text{hot}}}{\tau_{\text{cool}}},
$$

(13.37)

where $\tau_{\text{cool}} = [\text{coolingRateSimpleTimescale}]$.

**Simple Scaling**

Selected with coolingRateMethod=simpleScaling, this method computes the cooling rate using

$$
\dot{M}_{\text{cool}} = \frac{M_{\text{hot}}}{\tau_{\text{cool}}(M_{\text{halo}}, z)},
$$

(13.38)

where

$$
\tau_{\text{cool}} = \tau_{\text{cool,0}}(1 + z)^{\beta_{\text{cool}}} \exp \left( \left[ \frac{M_{\text{halo}}}{M_{\text{transition}}} \right]^{\gamma_{\text{cool}}} \right),
$$

(13.39)

$\tau_{\text{cool,0}} = [\text{coolingRateSimpleScalingTimescale}]$, $\beta_{\text{cool}} = [\text{coolingRateSimpleScalingTimescaleExponent}]$, $M_{\text{transition}} = [\text{coolingRateSimpleScalingTransitionMass}]$, and $\gamma_{\text{cool}} = [\text{coolingRateSimpleScalingCutoffExponent}]$. 

252
White & Frenk

Selected with `coolingRateMethod=White-Frenk1991`, this method computes the cooling rate using the expression given by White and Frenk [1991], namely

\[
\dot{M}_{\text{cool}} = \begin{cases} 
4\pi r_{\text{infall}}^2 \rho(r_{\text{infall}}) r_{\text{infall}} & \text{if } r_{\text{infall}} < r_{\text{hot,outer}} \\
M_{\text{hot}} / \tau_{\text{halo,dynamical}} & \text{if } r_{\text{infall}} \geq r_{\text{hot,outer}}, 
\end{cases}
\]

(13.40)

where \( r_{\text{infall}} \) is the infall radius (see §13.6.6) in the hot halo and \( \rho(r) \) is the density profile of the hot halo.

13.6.3. Cooling Rate Modifier

Algorithms that modify the rate of cooling of gas are specified via the `coolingRateModifierMethod` directive.

Cut-Off

This method sets the cooling rate to zero in halos with virial velocities below \([coolingCutOffVelocity]\) at redshifts below/above \([coolingCutOffRedshift]\) for \([coolingCutOffWhen]=after/before\). In other halos the cooling rate is not modified.

13.6.4. Cooling Radius

The algorithm used to compute the cooling radius is selected via the `coolingRadiusMethod` parameter.

Simple

Selected with `coolingRadiusMethod=simple`, this method computes the cooling radius by seeking the radius at which the time available for cooling (see §13.6.9) equals the cooling time (see §13.6.8). The growth rate is determined consistently based on the slope of the density profile, the density dependence of the cooling function and the rate at which the time available for cooling is increasing. This method assumes that the cooling time is a monotonic function of radius.

Isothermal

Selected with `coolingRadiusMethod=isothermal`, this method computes the cooling radius by assuming an isothermal density profile, and a cooling rate proportional to density squared. This implies a cooling time:

\[
t_{\text{cool}} \equiv \frac{E}{\dot{E}} \propto \rho(r)^{-1}.
\]

(13.41)

The cooling radius is then derived using

\[
\rho(r_{\text{cool}}) \propto t^{-1}_{\text{available}}
\]

(13.42)

which implies

\[
r_{\text{cool}} = r_{\text{virial}} \left( \frac{t_{\text{available}}}{t_{\text{cool,virial}}} \right)^{1/2},
\]

(13.43)

where \( t_{\text{cool,virial}} \) is the cooling time at the virial radius.
13. Physical Implementations

13.6.5. Cooling: Freefall Radius

The algorithm used to compute the freefall radius for cooling is selected via the \texttt{freefallRadiusMethod} parameter.

**Dark Matter Halo**

Selected with \texttt{freefallRadiusMethod=darkMatterHalo}, this method assumes that the freefall radius corresponds to the radius at which the freefall time in the dark matter halo equals the time available for freefall (see §13.6.10).

13.6.6. Cooling: Infall Radius

The algorithm used to compute the infall radius for cooling is selected via the \texttt{infallRadiusMethod} parameter.

**Cooling Radius**

Selected with \texttt{infallRadiusMethod=coolingRadius}, this method assumes that the infall radius equals the cooling radius (see §13.6.4).

**Cooling and Freefall Radii**

Selected with \texttt{infallRadiusMethod=cooling and freefall}, this method assumes that the infall radius is equal to the smaller of the cooling and freefall radii (see §13.6.4 and §13.6.5).

**Dark Matter Halo**

Selected with \texttt{freefallRadiusMethod=darkMatterHalo}, this method computes the freefall radius by finding the radius in the dark matter halo profile from which a test particle could have free-fallen to zero radius (assuming it began at rest) in the time available for freefall (see §13.6.10).

13.6.7. Cooling Specific Angular Momentum

The algorithm used to compute the specific angular momentum of cooling gas is selected via the \texttt{coolingSpecificAngularMomentumMethod} parameter.

**Constant Rotation**

Selected with \texttt{coolingSpecificAngularMomentumMethod=constantRotation}, this implementation assumes that the specific angular momentum of cooling gas is given either by

\[
j_{\text{cool}} = \langle j \rangle r_{\text{cool}} A, \tag{13.44}\]

where \( r_{\text{cool}} \) is the cooling radius, \( A \) is the rotation normalization (see ) and \( \langle j \rangle \) is the mean specific angular momentum of the cooling gas, if \texttt{[coolingAngularMomentumUseInteriorMean]=false}, or by

\[
j_{\text{cool}} = \langle j \rangle I_n(r_{\text{cool}})/I_2(r_{\text{cool}}) A, \tag{13.45}\]

where \( I_n(r) \) is the \( n^{th} \) radial moment of the hot gas density profile from 0 to \( r \) (this therefore gives the mean specific angular momentum interior to radius \( r \)), if \texttt{[coolingAngularMomentumUseInteriorMean]=true}.

If \texttt{[coolingMeanAngularMomentumFrom]=darkMatter} then \( \langle j \rangle \) is the mean specific angular momentum of the dark matter halo, computed from its spin parameter, while if \texttt{[coolingMeanAngularMomentumFrom]=hotGas}
then \( \langle j \rangle \) is equal to the mean specific angular momentum of gas currently in the hot gas reservoir. If \([\text{coolingRotationVelocityFrom}] = \text{darkMatter}\) then the rotation normalization \( A \) is computed using the dark matter density profile, while if \([\text{coolingRotationVelocityFrom}] = \text{hotGas}\) it is computed using the density profile of the hot gas reservoir.

**Mean**

Selected with \texttt{coolingSpecificAngularMomentumMethod=mean}, this assumes that the specific angular momentum of cooling gas is given by

\[
j_{cool} = J_{hot}/M_{hot},
\]

where \( J_{hot} \) and \( M_{hot} \) are the total angular momentum and mass of the hot halo respectively.

**13.6.8. Cooling Time**

The algorithm used to compute the time taken for gas to cool (i.e. the cooling time) is selected via the \texttt{coolingTimeMethod} parameter.

**Simple**

Selected with \texttt{coolingTimeMethod=simple}, this method assumes that the cooling time is simply

\[
t_{cool} = \frac{N k_B T n_{tot}}{2 \Lambda},
\]

where \( N = \text{coolingTimeSimpleDegreesOfFreedom} \) is the number of degrees of freedom in the cooling gas which has temperature \( T \) and total particle number density (including electrons) \( n_{tot} \) and \( \Lambda \) is the cooling function.

**13.6.9. Time Available for Cooling**

The method used to determine the time available for cooling (i.e. the time for which gas in a halo has been able to cool) is selected by the \texttt{coolingTimeAvailableMethod} parameter.

**Halo Formation**

Selected with \texttt{coolingTimeAvailableMethod=haloFormation}, this method assumes that the time available for cooling is equal to

\[
t_{available} = t - t_{form},
\]

where \( t_{form} \) is the time at which the halo formed (see §12.16).

**White & Frenk (1991)**

Selected with \texttt{coolingTimeAvailableMethod=White-Frenk1991}, this method assumes that the time available for cooling is equal to

\[
t_{available} = \exp [f \ln t_{Universe} + (1 - f) \ln t_{dynamical}],
\]

where \( f = \text{coolingTimeAvailableAgeFactor} \) is an interpolating factor, \( t_{Universe} \) is the age of the Universe and \( t_{dynamical} \) is the dynamical time in the halo. The original White and Frenk [1991] algorithm corresponds to \( f = 1 \).
13. Physical Implementations

13.6.10. Time Available for Freefall During Cooling

The method used to determine the time available for freefall during cooling calculations (i.e. the time for which gas in a halo has been able to freefall) is selected by the `freefallTimeAvailableMethod` parameter.

**Halo Formation**

Selected with `freefallTimeAvailableMethod=haloFormation`, this method assumes that the time available for freefall is equal to

\[ t_{\text{available}} = t - t_{\text{form}}, \]

(13.50)

where \( t_{\text{form}} \) is the time at which the halo formed (see §12.16).

13.7. Cosmology

The method used to compute cosmological relations (e.g. expansion factor as a function of time) is selected by the `cosmologyMethod` parameter.

13.7.1. Matter + Cosmological Constant Universes

Selected with `cosmologyMethod=matter-lambda`, this method assumes a universe which contains only matter and a cosmological constant.

13.8. Dark Matter Halos

Several algorithms are used to implement dark matter halos.

13.8.1. Mass Accretion History

The method used to compute mass accretion histories of dark matter halos is selected via the `darkMatterAccretionHistoryMethod` parameter.

**Wechsler et al. (2002)**

Selected with `darkMatterAccretionHistoryMethod=Wechsler2002`, under this method the mass accretion history is given by [Wechsler et al., 2002]:

\[ M(t) = M(t_0) \exp \left( -2a_c \left[ \frac{a(t_0)}{a(t)} - 1 \right] \right), \]

(13.51)

where \( t_0 \) is some reference time and \( a_c \) is a characteristic expansion factor defined by Wechsler et al. [2002] to correspond to the formation time of the halo (using the formation time definition of Bullock et al. 2001).

**Zhao et al. (2009)**

Selected with `darkMatterAccretionHistoryMethod=Zhao2009`, under this method the algorithm given by Zhao et al. [2009] to compute mass accretion histories. In particular, Zhao et al. [2009] give a fitting
function for the quantity \( \frac{d \ln \sigma(M)}{d \ln \delta_c(t)} \) for the dimensionless growth rate in a mass accretion history at time \( t \) and halo mass \( M \). This is converted to a dimensionful growth rate using

\[
\frac{dM}{dt} = \left( \frac{d \ln \sigma(M)}{d \ln M} \right)^{-1} \left( \frac{M}{\delta_c(t)} \right) \left( \frac{d \ln \sigma(M)}{d \ln \delta_c(t)} \right).
\] (13.52)

This differential equation is then solved numerically to find the mass accretion history.

### 13.8.2. Density Profile

The method uses to compute density profiles of dark matter halos is selected via the \texttt{darkMatterProfileMethod} parameter.

**Isothermal**

Selected with \texttt{darkMatterProfileMethod=isothermal}, under this method the density profile is given by:

\[
\rho_{dark\text{matter}}(r) \propto r^{-2},
\] (13.53)

normalized such that the total mass of the node is enclosed with the virial radius.

**NFW**

Selected with \texttt{darkMatterProfileMethod=NFW}, under this method the NFW density profile [Navarro et al., 1997] is used

\[
\rho_{dark\text{matter}}(r) \propto \left( \frac{r}{r_s} \right)^{-1} \left[ 1 + \left( \frac{r}{r_s} \right) \right]^{-2},
\] (13.54)

normalized such that the total mass of the node is enclosed with the virial radius and with the scale length \( r_s = r_{\text{virial}}/c \) where \( c \) is the halo concentration (see §13.8.3).

**Einasto**

Selected with \texttt{darkMatterProfileMethod=Einasto}, under this method the Einasto density profile (e.g. Cardone et al. 2005) is used

\[
\rho_{dark\text{matter}}(r) = \rho_{-2} \exp \left( -\frac{\alpha}{2} \left[ \left( \frac{r}{r_s} \right)^\alpha - 1 \right] \right),
\] (13.55)

normalized such that the total mass of the node is enclosed with the virial radius and with the characteristic length \( r_{-2} = r_{\text{virial}}/c \) where \( c \) is the halo concentration (see §13.8.3). The shape parameter, \( \alpha \), is set using the density profile shape method (see §13.8.4).

### 13.8.3. Dark Matter Halo Profile Concentration

The method uses to compute the concentrations of dark matter profiles is selected via the \texttt{darkMatterProfileConcentrationMethod} parameter.
Navarro, Frenk & White (1996)

Selected with `darkMatterProfileConcentrationMethod=NFW1996`, under this method the concentration is computed using the algorithm from Navarro et al. [1996]. In this algorithm, for a given halo of mass $M$ at time $t_0$, a formation time is defined as the epoch at which there is a 50% probability (according to extended Press-Schechter theory) for a progenitor halo to have a mass greater than $fM$, where $f=[\text{nfw96ConcentrationF}]$ is a parameter of the algorithm. This implies formation when the critical overdensity for collapse is

$$
\delta_{\text{crit}}(t_{\text{form}}) = \left[ 2\nu_{1/2}^2 \left\{ \sigma(fM)^2 - \sigma(M)^2 \right\} \right]^{1/2} + \delta_{\text{crit}}(t_0),
$$

(13.56)

where $\nu_{1/2} = [\text{erfc}^{-1}(1/2)]^{1/2}$. Navarro et al. [1996] then assume an overdensity at collapse of

$$
\Delta(t_{\text{form}}) = C \left[ \frac{a(t_0)}{a(t_{\text{form}})} \right]^3
$$

(13.57)

where $C=[\text{nfw96ConcentrationC}]$ is a parameter of the algorithm. The concentration is then determined by solving

$$
\frac{\Delta(t_{\text{form}})}{\Delta_{\text{virial}}(t_0)} = \frac{c^3}{3\ln(1+c) - c/(1+c)}.
$$

(13.58)

Gao (2008)

Selected with `darkMatterProfileConcentrationMethod=gao2008`, under this method the concentration is computed using a fitting function from Gao et al. [2008]:

$$
\log_{10} c = A \log_{10} M_{\text{halo}} + B.
$$

(13.59)

The parameters are a function of expansion factor, $a$. We use the following fits to the Gao et al. [2008] results:

$$
A = -0.140 \exp \left[ - (\log_{10} a + 0.05)^2 / 0.35 \right],
$$

(13.60)

$$
B = 2.646 \exp \left[ - (\log_{10} a/0.50)^2 \right].
$$

(13.61)

Zhao (2009)

Selected with `darkMatterProfileConcentrationMethod=zhao2009`, under this method the concentration is computed using a fitting function from Zhao et al. [2009]:

$$
c = 4 \left( 1 + \left[ \frac{t}{3.75t_{\text{form}}} \right]^{8.4} \right)^{1/8},
$$

(13.62)

where $t$ is the time for the halo and $t_{\text{form}}$ is a formation time defined by Zhao et al. [2009] as the time at which the main branch progenitor of the halo had a mass equal to 0.04 of the current halo mass. This formation time is computed directly from the merger tree branch associated with each halo. If the no branch exists or does not extend to the formation time then the formation time is computed by extrapolating the mass of the earliest resolved main branch progenitor to earlier times using the selected mass accretion history method (see §17.4.1).
13.8. Dark Matter Halos

Muñoz-Cuartas (2011)

Selected with darkMatterProfileConcentrationMethod=munozCuartas2011, under this method the concentration is computed using a fitting function from Muñoz-Cuartas et al. [2011]:

\[
\log_{10} c = a \log_{10} \left( \frac{M_{\text{halo}}}{h^{-1}M_{\odot}} \right) + b.
\] (13.63)

The parameters are a function of redshift, \( z \), given by

\[
a = wz - m,
\] (13.64)

\[
b = \frac{\alpha}{(z + \gamma)} + \frac{\beta}{(z + \gamma)^2},
\] (13.65)

where \( w = 0.029 \), \( m = 0.097 \), \( \alpha = -110.001 \), \( \beta = 2469.720 \), \( \gamma = 16.885 \).

Prada et al. (2011)

Selected with darkMatterProfileConcentrationMethod=prada2011, under this method the concentration is computed using a fitting function from Prada et al. [2011]:

\[
c(M, t) = B_0(x)C(\sigma'),
\] (13.66)

where

\[
\begin{align*}
\sigma'(M, t) &= B_1(x)\sigma(M, t), \\
B_0(x) &= \frac{c_{\min}(x)}{c_{\min}(1.393)}, \\
B_1(x) &= \frac{\sigma^{-1}_{\min}(x)}{\sigma^{-1}_{\min}(1.393)}, \\
c_{\min}(x) &= c_0 + (c_1 - c_0)[\tan^{-1}\{\alpha(x - x_0)/\Pi + 1/2\}], \\
\sigma^{-1}_{\min}(x) &= \sigma_0^{-1} + (\sigma_1^{-1} - \sigma_0^{-1})[\tan^{-1}\{\beta(x - x_1)/\Pi + 1/2\}], \\
C(\sigma') &= A[(\sigma'/b)^{c + 1}] \exp(d/\sigma'^2), \\
x &= (\Omega_M/\Omega_f)^{1/3}a(t),
\end{align*}
\] (13.67-13.73)

with the following parameters (default values taken from Prada et al. [2011] given in []): \( A = [\text{prada2011ConcentrationA}] = 2.881 \), \( b = [\text{prada2011ConcentrationB}] = 1.257 \), \( c = [\text{prada2011ConcentrationC}] = 1.022 \), \( d = [\text{prada2011ConcentrationD}] = 0.060 \), \( c_0 = [\text{prada2011ConcentrationC0}] = 3.081 \), \( c_1 = [\text{prada2011ConcentrationC1}] = 5.033 \), \( x_0 = [\text{prada2011ConcentrationX0}] = 0.424 \), \( x_1 = [\text{prada2011ConcentrationX1}] = 0.526 \), \( \sigma_0^{-1} = [\text{prada2011ConcentrationInverseSigma1}] = 1.047 \), \( \sigma_1^{-1} = [\text{prada2011ConcentrationInverseSigma1}] = 1.646 \), \( \alpha = [\text{prada2011ConcentrationAlpha}] = 6.948 \), and \( \beta = [\text{prada2011ConcentrationBeta}] = 7.386 \).

Dutton & Macciò (2014)

Selected with darkMatterProfileConcentrationMethod=duttonMaccio2014, under this method the concentration is computed using a fitting function from Dutton and Macciò [2014]:

\[
\log_{10} c = A + B \log_{10} M_{\text{halo}}.
\] (13.74)

The parameters are a function of redshift, \( z \). We use the following fit suggested by Dutton and Macciò [2014] results:

\[
A = A_1 + (A_2 - A_1) \exp[A_3 z^{A_4}]
\]

\[
B = B_1 + B_2 z.
\] (13.75)

The coefficients are chosen from one of the three sets given by Dutton and Macciò [2014], controlled via the [duttonMaccio2014FitType] parameter, as described in Table 13.3.
Table 13.3.: Coefficients appearing in the dark matter halo profile concentration fitting functions of Dutton and Macciò [2014]. The “fit type” is specified by the [duttonMaccio2014FitType] parameter.

Diemer & Kravtsov (2014)

Selected with [darkMatterProfileConcentrationMethod=diemerKravtsov2014], under this method the concentration is computed using a fitting function from Diemer and Kravtsov [2014]:

$$c = \frac{c_{\text{min}}}{2} \left[ \left( \frac{\nu}{\nu_{\text{min}}} \right)^{-\alpha} + \left( \frac{\nu}{\nu_{\text{min}}} \right)^{\beta} \right],$$

(13.76)

where $c_{\text{min}} = \phi_0 + \phi_1 n$, $\nu_{\text{min}} = \eta_0 + \eta_1 n$, $n$ is the logarithmic slope of the linear power spectrum at wavenumber $k = \kappa 2\pi / R$, $R$ is the comoving Lagrangian radius of the halo, $R = [3M/4\pi \rho_M(z = 0)]^{1/3}$, and $\nu = \delta_{\text{crit}}(t)/\sigma(M)$ is the peak height parameter. The numerical parameters $(\kappa, \phi_0, \phi_1, \eta_0, \eta_1, \alpha, \beta)$ are set by the parameters [darkMatterProfileConcentrationDiemerKravtsov2014Kappa], [darkMatterProfileConcentrationDiemerKravtsov2014Phi0], [darkMatterProfileConcentrationDiemerKravtsov2014Phi1], [darkMatterProfileConcentrationDiemerKravtsov2014Eta0], [darkMatterProfileConcentrationDiemerKravtsov2014Eta1], [darkMatterProfileConcentrationDiemerKravtsov2014Alpha], [darkMatterProfileConcentrationDiemerKravtsov2014Beta], respectively, and default to the values given in Table 3 of Diemer and Kravtsov [2014] for the median relation, namely (0.69, 6.58, 1.37, 6.82, 1.42, 1.12, 1.69).

WDM

Selected with [darkMatterProfileConcentrationMethod=WDM], under this method the concentration is computed by applying the correction factor of Schneider et al. [2012]:

$$c_{\text{WDM}} = c_{\text{CDM}} \left[ 1 + \gamma_1 \left( \frac{M_{1/2}}{M_{\text{halo}}} \right)^{\gamma_2} \right]^{-1},$$

(13.77)

where $\gamma_1 = 15$, $\gamma_2 = 0.3$, $M_{1/2}$ is the mass corresponding to the wavenumber at which the WDM transfer function is suppressed below the CDM transfer function by a factor of 2, and $M_{\text{halo}}$ is the mass of the dark matter halo, to a CDM concentration algorithm as specified by [darkMatterProfileConcentrationCDMMethod].

13.8.4. Density Profile Shape

The method used to compute any shape parameter of dark matter profiles is selected via the [darkMatterShapeMethod] parameter.

Gao (2008)

Selected with [darkMatterShapeMethod=Gao2008], under this method the shape parameter for Einasto density profiles is computed using a fitting function from Gao et al. [2008]:

$$\alpha = \begin{cases} 0.155 + 0.0095\nu^2 & \text{if } \nu < 3.907 \\ 0.3 & \text{if } \nu \geq 3.907, \end{cases}$$

(13.78)
where \( \nu = \delta_c(t) / \sigma(M) \) is the peak height of the halo. The truncation at \( \alpha = 0.3 \) is included since Gao et al. [2008]'s fits do not probe this region and extremely large values of \( \alpha \) are numerically troublesome.

### 13.8.5. Mass Loss Rates

The method used to compute the rate of mass loss from dark matter (sub)halos is selected via the `darkMatterHaloMassLossRateMethod` parameter.

**Null**

Selected with `darkMatterHaloMassLossRateMethod=Null`, this method assumes a zero rate of mass loss from dark matter halos.

**van den Bosch et al. (2005)**

Selected with `darkMatterHaloMassLossRateMethod=vanDenBosch2005`, this method uses the algorithm of van den Bosch et al. [2005] to compute the rate of mass loss. Specifically:

\[
\dot{M}_{\text{node,bound}} = -\frac{M_{\text{node,bound}}}{\tau} (M_{\text{node,bound}}/M_{\text{node,parent}})^\zeta, \tag{13.79}
\]

where \( M_{\text{node,parent}} \) is the mass of the parent node in which the halo lives and

\[
\tau = \tau_0 \left( \frac{\Delta_{\text{vir}}(t)}{\Delta(t_0)} \right)^{-1/2} a^{3/2}, \tag{13.80}
\]

where \( \Delta_{\text{vir}}(t) \) is the virial overdensity of halos at time \( t \) and \( a \) is the expansion factor. The fitting parameters, \( \tau_0 \) and \( \zeta \) have values of 0.13 Gyr and 0.36 respectively as determined by van den Bosch et al. [2005]. Note that van den Bosch et al. [2005] write this expression in a slightly different form since their \( \Delta_{\text{vir}} \) is defined relative to the critical density rather than the mean density as it is in Galacticus. In both cases, the timescale \( \tau \) simply scales as \( \langle \rho_{\text{vir}} \rangle^{-1/2} \) where \( \langle \rho_{\text{vir}} \rangle \) is the mean virial overdensity of halos.

### 13.8.6. Mass Sampling Density Function

The method used to compute the halo mass density function is selected via the `haloMassFunctionSamplingMethod` parameter.

**Power Law**

Selected with `haloMassFunctionSamplingMethod=powerLaw`, under this method the sampling density function is given by

\[
\gamma(M) = \log_{10}(M/M_{\text{minimum}})^{-\alpha/(1+\alpha)}, \tag{13.81}
\]

The resulting distribution of halo masses is such that the mass of the \( i^{th} \) halo is

\[
M_{\text{halo,}i} = \exp \left[ \ln(M_{\text{halo,min}}) + \ln \left( M_{\text{halo,max}}/M_{\text{halo,min}} \right) x_i^{1+\alpha} \right]. \tag{13.82}
\]

Here, \( x_i \) is a number between 0 and 1 and \( \alpha \) = `mergerTreeBuildTreesHaloMassExponent` is an input parameter that controls the relative number of low and high mass tree produced.
13. **Physical Implementations**

### Halo Mass Function

Selected with `haloMassFunctionSamplingMethod=haloMassFunction`, this method sets the sampling density function equal to the halo mass function, \( \gamma(M) = \text{minmax}(\phi_{\text{min}}, \phi_{\text{max}}, \frac{\text{dn}(M)}{d \log M}) \), where \( \phi_{\text{min}} = \text{[haloMassFunctionSamplingAbundanceMinimum]} \), \( \phi_{\text{max}} = \text{[haloMassFunctionSamplingAbundanceMaximum]} \), and

\[
\text{minmax}(a, b, x) = \begin{cases} 
  a & \text{if } x < a \\
  x & \text{if } a \leq x \leq b \\
  b & \text{if } x > b,
\end{cases}
\]

resulting in a sample of halos representative of a volume of space.

### Stellar Mass Function

Selected with `haloMassFunctionSamplingMethod=stellarMassFunction`, in this case the sampling density is chosen to give optimally minimal errors on the model stellar mass function (see §10.4.1 for full details). This calculation requires the observational errors on the stellar mass function to be known. A simple model of the form

\[
\sigma^2(M) = \left[ \phi_0 \left( \frac{M}{M_*} \right)^\alpha \exp \left( - \left[ \frac{M}{M_*} \right]^\beta \right) \right]^2 + \sigma_0^2
\]

is used to model the error, \( \sigma(M) \), on the observed stellar mass function as a function of stellar mass, \( M \), where \( \phi_0 = \text{[haloMassFunctionSamplingStellarMassFunctionErrorPhi0]} \), \( M_* = \text{[haloMassFunctionSamplingStellarMassFunctionErrorMstar]} \), \( \alpha = \text{[haloMassFunctionSamplingStellarMassFunctionErrorAlpha]} \), \( \beta = \text{[haloMassFunctionSamplingStellarMassFunctionErrorBeta]} \), and \( \sigma_0 = \text{[haloMassFunctionSamplingStellarMassFunctionErrorConstant]} \).

### 13.8.7. Spin Parameter Distribution

The method used to compute the distribution of dark matter halo spin parameters is selected via the `haloSpinDistributionMethod` parameter.

#### Lognormal

Selected with `haloSpinDistributionMethod=lognormal`, under this method the spin is drawn from a lognormal distribution with median \([lognormalSpinDistributionMedian]\) and width \([lognormalSpinDistributionSigma]\).

#### Bett et al. (2007)

Selected with `haloSpinDistributionMethod=Bett2007`, under this method the spin is drawn from the distribution found by Bett et al. [2007]. The \( \lambda_0 \) and \( \alpha \) parameter of Bett et al.'s distribution are set by the \([spinDistributionBett2007Lambda0]\) and \([spinDistributionBett2007Alpha]\) input parameters.

#### Delta Function

Selected with `haloSpinDistributionMethod=deltaFunction`, under this method the spin is drawn from a delta function distribution, \( P(\lambda) = \delta(\lambda - \lambda_0) \), where \( \lambda_0 = \text{[deltaFunctionSpinDistributionSpin]} \), i.e. a fixed value of spin equal to \( \lambda_0 \) is returned.

### 13.9. Disk Stability/Bar Formation

The method uses to compute the bar instability timescale for galactic disks is selected via the `barInstabilityMethod` parameter.
13.9.1. Null

Selected with `barInstabilityMethod=null`, this method assumes no instability and so returns an infinite timescale, and no external driving torque.

13.9.2. Efstathiou, Lake & Negroponte

Selected with `barInstabilityMethod=ELN`, this method uses the stability criterion of Efstathiou et al. [1982] to estimate when disks are unstable to bar formation:

\[ \epsilon \left( \equiv \frac{V_{\text{peak}}}{\sqrt{GM_{\text{disk}}/r_{\text{disk}}}} \right) < \epsilon_c, \]  

(13.85)

for stability, where \( V_{\text{peak}} \) is the peak velocity in the rotation curve (computed here assuming an isolated exponential disk), \( M_{\text{disk}} \) is the mass of the disk and \( r_{\text{disk}} \) is its scale length (assuming an exponential disk). The value of \( \epsilon_c \) is linearly interpolated in the disk gas fraction between values for purely gaseous and stellar disks as specified by `stabilityThresholdStellar` and `stabilityThresholdGaseous` respectively. For disks which are judged to be unstable, the timescale for bar formation is estimated to be

\[ t_{\text{bar}} = t_{\text{disk}} \frac{\epsilon_c - \epsilon_{\text{iso}}}{\epsilon_c - \epsilon}, \]

(13.86)

where \( \epsilon_{\text{iso}} \) is the value of \( \epsilon \) for an isolated disk and \( t_{\text{disk}} \) is the disk dynamical time, defined as \( r/V \), at one scale length. This form gives an infinite timescale at the stability threshold, reducing to a dynamical time for highly unstable disks. This method returns zero external driving torque.

13.9.3. Efstathiou, Lake & Negroponte + Tidal Forces

Selected with `barInstabilityMethod=ELN+tidal`, this method uses the stability criterion of Efstathiou et al. [1982] to estimate when disks are unstable to bar formation, but includes an additional term due to external tidal forces:

\[ \epsilon \left( \equiv \frac{V_{\text{peak}}}{\sqrt{GM_{\text{disk}}/r_{\text{disk}}} + \max(T, 0)} \right) < \epsilon_c, \]  

(13.87)

for stability, where \( V_{\text{peak}} \) is the peak velocity in the rotation curve (computed here assuming an isolated exponential disk), \( M_{\text{disk}} \) is the mass of the disk, \( r_{\text{disk}} \) is its scale length (assuming an exponential disk), \( T = FR^2_{\text{disk}} \) is the external driving specific torque, and \( F \) is the external tidal field (evaluated using the selected method; see §13.35). The value of \( \epsilon_c \) is linearly interpolated in the disk gas fraction between values for purely gaseous and stellar disks as specified by `stabilityThresholdStellar` and `stabilityThresholdGaseous` respectively. For disks which are judged to be unstable, the timescale for bar formation is estimated to be

\[ t_{\text{bar}} = t_{\text{disk}} \frac{\epsilon_c - \epsilon_{\text{iso}}}{\epsilon_c - \epsilon}, \]

(13.88)

where \( \epsilon_{\text{iso}} \) is the value of \( \epsilon \) for an isolated disk and \( t_{\text{disk}} \) is the disk dynamical time, defined as \( r/V \), at one scale length. This form gives an infinite timescale at the stability threshold, reducing to a dynamical time for highly unstable disks.

13.10. Excursion Set Barrier

The functional form of the excursion set barrier is selected via the `excursionSetBarrierMethod` parameter.
13. Physical Implementations

13.10.1. Linear Barrier
Selected with `excursionSetBarrierMethod=linear` this method assumes a barrier:

\[ B(S) = B_0 + B_1 S, \]  
(13.89)

where \( B_0 = \text{[excursionSetBarrierConstantCoefficient]} \), and \( B_0 = \text{[excursionSetBarrierLinearCoefficient]} \).

13.10.2. Quadratic Barrier
Selected with `excursionSetBarrierMethod=quadratic` this method assumes a barrier:

\[ B(S) = B_0 + B_1 S + B_2 S^2, \]  
(13.90)

where \( B_0 = \text{[excursionSetBarrierConstantCoefficient]} \), \( B_0 = \text{[excursionSetBarrierLinearCoefficient]} \), and \( B_2 = \text{[excursionSetBarrierQuadraticCoefficient]} \).

13.10.3. Critical Overdensity Barrier
Selected with `excursionSetBarrierMethod=criticalOverdensity` this method assumes a barrier equal to the critical linear theory overdensity for halo collapse (see §13.4.7).

13.11. Excursion Set Barrier First Crossing Distribution
The algorithm to be used when solving the excursion set barrier first crossing distribution problem is selected via the `excursionSetFirstCrossingMethod` parameter.

13.11.1. Linear Barrier
Selected with `excursionSetFirstCrossingMethod=linearBarrier` this method assumes the solution for a linear barrier. Specifically, the first crossing distribution is

\[ f(S,t) = B(0,t) \exp(-B(S,t)^2/2S)/\sqrt{2\pi S}, \]  
(13.91)

where \( B(S,t) \) is the (assumed-to-be-linear-in-\( S \)) barrier at time \( t \) and variance \( S \). The first crossing rate is computed using a finite difference approximation between two closely-spaced times. The non-crossing rate is zero.

13.11.2. Farahi
Selected with `excursionSetFirstCrossingMethod=Farahi` this method solves the barrier first crossing problem using the method of Farahi (see Benson et al. 2012), which proceeds by finding the solution to the integral equation:

\[ 1 = \int_0^S f(S')dS' + \int_{-\infty}^{B(S)} P(\delta,S)d\delta, \]  
(13.92)

where \( P(\delta,S)d\delta \) is the probability for a trajectory to lie between \( \delta \) and \( \delta + d\delta \) at variance \( S \). In the absence of a barrier, \( P(\delta,S) \) would be equal to \( P_0(\delta,S) \) which is simply a Gaussian distribution with variance \( S \):

\[ P_0(\delta,S) = \frac{1}{\sqrt{2\pi S}} \exp\left(-\frac{\delta^2}{2S}\right). \]  
(13.93)
Since the barrier absorbs any random walks which cross it at smaller $S$, the actual $P(\delta, S)$ must therefore be given by:

$$P(\delta, S) = P_0(\delta, S) - \int_0^S f(S')P_0[\delta - B(S'), S - S'] dS'.$$

(13.94)

In the second term on the right hand side of eqn. (13.94) represents the $P_0[\delta - B(S'), S - S']$ term represents the distribution of random trajectories originating from the point $(S, B(S))$. The integral therefore gives the fraction of trajectories which crossed the barrier at $S < S'$ and which can now be found at $(S, \delta)$.

Using this result, we can rewrite eqn. (13.92):

$$1 = \int_0^S f(S')dS' + \int_{-\infty}^{B(S)} \left[ P_0(\delta, S) - \int_0^S f(S')P_0[\delta - B(S'), S - S']dS' \right] d\delta,$$

(13.95)

in general and, for the Gaussian distribution of eqn. (13.93):

$$1 = \int_0^S f(S')dS' + \int_{-\infty}^{B(S)} \left[ \frac{1}{\sqrt{2\pi S}} \exp \left( -\frac{\delta^2}{2S} \right) - \int_0^S f(S') \frac{1}{\sqrt{2\pi (S - S')}} \exp \left( -\frac{[\delta - B(S')]^2}{2(S - S')} \right) dS' \right] d\delta.$$

(13.96)

The integral over $d\delta$ can be carried out analytically to give:

$$1 = \int_0^S f(S')dS' + \text{erf} \left[ \frac{B(S)}{\sqrt{2S}} \right] - \int_0^S f(S') \text{erf} \left[ \frac{B(S) - B(S')}{\sqrt{2(S - S')}} \right] dS''.$$

(13.97)

We now discretize eqn. (13.97). Specifically, we divide the $S$ space into $N$ intervals defined by the points:

$$S_i = \begin{cases} 0 & \text{if } i = 0 \\ \sum_{j=0}^{i-1} \Delta S_i & \text{if } i > 1. \end{cases}$$

(13.98)

Note that $f(0) = 0$ by definition, so $f(S_0) = 0$ always. We choose $\Delta S_i = S_{\max}/N$ (i.e. uniform spacing in $S$) when computing first crossing distributions, and $\Delta S_i \propto S_i$ (i.e. uniform spacing in $\log(S)$) when computing first crossing rates.

Discretizing the integrals in eqn. (13.97) gives:

$$\int_0^{S_j} f(S')dS' = \sum_{i=0}^{j-1} \frac{f(S_i) + f(S_{i+1})}{2} \Delta S_i,$$

(13.99)

and:

$$\int_0^{S_j} f(S') \text{erf} \left[ \frac{B(S) - B(S')}{\sqrt{2(S - S')}} \right] dS' = \sum_{i=0}^{j-1} \frac{1}{2} \left( f(S_i) \text{erf} \left[ \frac{B(S_i) - B(S_j)}{\sqrt{2(S_j - S_i)}} \right] + f(S_{i+1}) \text{erf} \left[ \frac{B(S_j) - B(S_{i+1})}{\sqrt{2(S_j - S_{i+1})}} \right] \right) \Delta S_i.$$

(13.100)

We can now rewrite eqn. (13.97) in discretized form:

$$1 = \sum_{i=0}^{j-1} \frac{f(S_i) + f(S_{i+1})}{2} \Delta S_i + \text{erf} \left[ \frac{B(S_j)}{\sqrt{2S_j}} \right] - \frac{1}{2} \sum_{i=0}^{j-1} \left( f(S_i) \text{erf} \left[ \frac{B(S_i) - B(S_j)}{\sqrt{2(S_j - S_i)}} \right] + f(S_{i+1}) \text{erf} \left[ \frac{B(S_j) - B(S_{i+1})}{\sqrt{2(S_j - S_{i+1})}} \right] \right) \Delta S_i.$$

(13.101)
Solving eqn. (13.101) for $f(S_j)$:
\[
\left(\frac{1}{2} - \frac{1}{2} \text{erf} \left[ \frac{B(S_j) - B(S_j)}{\sqrt{2(S_j - S_j)}} \right] \right) \Delta S_{j-1} f(S_j) = 1 - \sum_{i=0}^{j-2} f(S_i) \frac{f(S_{i+1})}{2} \Delta S_i - \frac{f(S_{j-1})}{2} \Delta S_{j-1} - \text{erf} \left[ \frac{B(S_j)}{\sqrt{2S_j}} \right] \\
+ \frac{1}{2} \sum_{i=0}^{j-2} \left( f(S_i) \text{erf} \left[ \frac{B(S_j) - B(S_i)}{\sqrt{2(S_j - S_i)}} \right] + f(S_{i+1}) \text{erf} \left[ \frac{B(S_j) - B(S_{i+1})}{\sqrt{2(S_j - S_{i+1})}} \right] \right) \Delta S_i \\
+ \frac{1}{2} f(S_{j-1}) \text{erf} \left[ \frac{B(S_j) - B(S_{j-1})}{\sqrt{2(S_j - S_{j-1})}} \right] \Delta S_{j-1}.
\] (13.103)

For all barriers that we consider:
\[
\text{erf} \left[ \frac{B(S_j) - B(S_j)}{\sqrt{2(S_j - S_j)}} \right] = 0.
\] (13.104)

We can then simplify eqn. (13.102):
\[
f(S_j) = \frac{2}{\Delta S_{j-1}} \left[ 1 - \sum_{i=0}^{j-2} f(S_i) \frac{f(S_{i+1})}{2} \Delta S_i - \frac{f(S_{j-1})}{2} \Delta S_{j-1} - \text{erf} \left[ \frac{B(S_j)}{\sqrt{2S_j}} \right] \\
+ \frac{1}{2} \sum_{i=0}^{j-2} \left( f(S_i) \text{erf} \left[ \frac{B(S_j) - B(S_i)}{\sqrt{2(S_j - S_i)}} \right] + f(S_{i+1}) \text{erf} \left[ \frac{B(S_j) - B(S_{i+1})}{\sqrt{2(S_j - S_{i+1})}} \right] \right) \Delta S_i \\
+ \frac{1}{2} f(S_{j-1}) \text{erf} \left[ \frac{B(S_j) - B(S_{j-1})}{\sqrt{2(S_j - S_{j-1})}} \right] \Delta S_{j-1} \right].
\] (13.105)

Consolidating terms in the summations:
\[
f(S_j) = \frac{2}{\Delta S_{j-1}} \left[ 1 - \text{erf} \left[ \frac{B(S_j)}{\sqrt{2S_j}} \right] - \sum_{i=0}^{j-1} \left( 1 - \text{erf} \left[ \frac{B(S_j) - B(S_i)}{\sqrt{2(S_j - S_i)}} \right] \right) f(S_i) \frac{\Delta S_{i+1} + \Delta S_i}{2} \right].
\] (13.106)

In the case of constant $\Delta S_i (= \Delta S)$ this can be simplified further:
\[
f(S_j) = \frac{2}{\Delta S} \left[ 1 - \text{erf} \left[ \frac{B(S_j)}{\sqrt{2S_j}} \right] \right] - \sum_{i=0}^{j-1} \left( 1 - \text{erf} \left[ \frac{B(S_j) - B(S_i)}{\sqrt{2(S_j - S_i)}} \right] \right) f(S_i).
\] (13.107)

In either case (i.e. eqns. 13.105 and 13.106) solution proceeds recursively: $f(S_0) = 0$ by definition, $f(S_1)$ depends only on the known barrier and $f(S_0)$, $f(S_j)$ depends only on the known barrier and $f(S_{<j})$.

The first crossing rate is computed using the same method but with an effective barrier which is offset by the position of the progenitor in the ($\delta, S$) plane, plus a small shift in time. The non-crossing rate is computed directly by integrating over the first crossing rate distribution.

Selected with excursionSetFirstCrossingMethod=ZhangHui2006 this method solves the barrier first crossing problem using the method of Zhang and Hui [2006]. First crossing (and non-crossing) rates are not supported by this method.

Selected with excursionSetFirstCrossingMethod=ZhangHui2006HighOrder this method solves the barrier first crossing problem using a higher-order extension of the method of Zhang and Hui [2006]. First crossing (and non-crossing) rates are not supported by this method.

In this method we discretize the first-crossing distribution function, and use a closed Newton-Cotes method to perform integrations. First, we mesh the $S$ space using uniform spacing in $S$:

$$S_i = i \times \Delta S, i = 0, 1, \ldots, N, \Delta S = \frac{S}{N}. \quad (13.107)$$

Then we discretize the integral equation by Boole’s rule. The integral equation becomes a set of linear algebraic equations:

$$f(S_i) = g_1(S_i) + \frac{\Delta S}{90} \sum_{j=0}^{i-4} \{7f(S_j)g_2(S_i, S_j) + 32f(S_{j+1})g_2(S_i, S_{j+1}) + 12f(S_{j+2})g_2(S_i, S_{j+2}) + 32f(S_{j+3})g_2(S_i, S_{j+3}) + 7f(S_{j+4})g_2(S_i, S_{j+4})\} \quad (13.108)$$

Since $g_2(S, S')$ approaches infinity when $S$ approaches $S'$, one needs to define $g_2(S_i, S_i)$ carefully when $j = i$. We can rewrite the equation:

$$f(S_i) = g_1(S_i) + \frac{4\Delta S}{90} \sum_{j=0}^{i-8} \{7f(S_j)g_2(S_i, S_j) + 32f(S_{j+1})g_2(S_i, S_{j+1}) + 12f(S_{j+2})g_2(S_i, S_{j+2}) + 32f(S_{j+3})g_2(S_i, S_{j+3}) + 7f(S_{j+4})g_2(S_i, S_{j+4})\} + \frac{4\tilde{g}_2(S_i)\Delta S}{90} \left(7f(S_{i-4}) + 32f(S_{i-3}) + 12f(S_{i-2}) + 32f(S_{i-1}) + 7f(S_i)\right) \quad (13.109)$$

For $\tilde{g}_2(S_i)$ we have:

$$\tilde{g}_2(S_i) = \frac{1}{\delta S} \int_{S-\delta S}^{S} g_2(S, S')dS'. \quad (13.110)$$

In the above, $\delta S$ depends on the range of the previous integral part. Generally, $\delta S$ is equal to $4\Delta S$. The above equation can be solved for $f(S_i)$, giving:

$$f(S_i) = \left( g_1(S_i) + \frac{4\Delta S}{90} \sum_{j=0}^{i-8} \{7f(S_j)g_2(S_i, S_j) + 32f(S_{j+1})g_2(S_i, S_{j+1}) + 12f(S_{j+2})g_2(S_i, S_{j+2}) + 32f(S_{j+3})g_2(S_i, S_{j+3}) + 7f(S_{j+4})g_2(S_i, S_{j+4})\} + \frac{4\tilde{g}_2(S_i)\Delta S}{90} \left(7f(S_{i-4}) + 32f(S_{i-3}) + 12f(S_{i-2}) + 32f(S_{i-1})\right) \right) \times \left(1 - \frac{4\tilde{g}_2(S_i)\Delta S}{90}\right)^{-1}. \quad (13.111)$$

Not all of the $i$'s are divisible by 4. So, for the first $m^{th}$ spaces, we need to calculate the integral part, separately, where $m$ is the remainder of $i$ by the modulus of 4. It is a good approximation to calculate
the first part linearly. Consequently, the final formula for the general problem is:

\[
f(S_i) = \left( g_1(S_i) + \frac{\Delta S}{2} \sum_{j=0}^{m-1} \left( f(S_j)g_2(S_i, S_j) + f(S_{j+1})g_2(S_i, S_{j+1}) \right) \right. \\
+ \frac{4\Delta S}{90} \sum_{i-8}^{i-1} \{7f(S_j)g_2(S_i, S_j) + 32f(S_{j+1})g_2(S_i, S_{j+1}) \\
+ 12f(S_{j+2})g_2(S_i, S_{j+2}) + 32f(S_{j+3})g_2(S_i, S_{j+3}) + 7f(S_{j+4})g_2(S_i, S_{j+4}) \} \\
+ \frac{4\tilde{g}_2(S_i)\Delta S}{90} \left( 7f(S_{i-4}) + 32f(S_{i-3}) + 12f(S_{i-2}) + 32f(S_{i-1}) \right) \\
\left. \times \left( 1 - \frac{4\tilde{g}_2(S_i)\Delta S}{90} \right)^{-1} \right) \\
\tag{13.112}
\]

Finally, we can solve the first-crossing distribution function, giving:

\[
f(S_0) = g_1(S_0) = 0 \\
f(S_1) = g_1(S_1) \left( 1 - \frac{\tilde{g}_2(S_1)\Delta S}{2} \right)^{-1} \\
f(S_2) = \left( g_1(S_2) + \frac{\Delta S}{2}2\tilde{g}_2(S_2)f(S_1) \right) \left( 1 - \frac{\tilde{g}_2(S_2)\Delta S}{2} \right)^{-1} \\
f(S_3) = \left( g_1(S_3) + \frac{\Delta S}{2}2\tilde{g}_2(S_3)(f(S_1) + f(S_2)) \right) \left( 1 - \frac{\tilde{g}_2(S_3)\Delta S}{2} \right)^{-1} \\
f(S_i) = \left( g_1(S_i) + \frac{\Delta S}{2} \sum_{j=0}^{m-1} \left( f(S_j)\tilde{g}_2(S_i, S_j) + f(S_{j+1})\tilde{g}_2(S_i, S_{j+1}) \right) \\
+ \frac{4\Delta S}{90} \sum_{i-8}^{i-1} \{7f(S_j)\tilde{g}_2(S_i, S_j) + 32f(S_{j+1})\tilde{g}_2(S_i, S_{j+1}) \\
+ 12f(S_{j+2})\tilde{g}_2(S_i, S_{j+2}) + 32f(S_{j+3})\tilde{g}_2(S_i, S_{j+3}) + 7f(S_{j+4})\tilde{g}_2(S_i, S_{j+4}) \} \\
+ \frac{4\tilde{g}_2(S_i)\Delta S}{90} \left( 7f(S_{i-4}) + 32f(S_{i-3}) + 12f(S_{i-2}) + 32f(S_{i-1}) \right) \\
\times \left( 1 - \frac{4\tilde{g}_2(S_i)\Delta S}{90} \right)^{-1}, \\
\tag{13.117}
\]

where \( \tilde{g}_2(S_1) \) is defined as:

\[
\tilde{g}_2(S_1) = \frac{1}{\Delta S} \int_0^{S_1} g_2(S, S')dS' \text{ if } i = 1 \\
\tilde{g}_2(S_2) = \frac{1}{2\Delta S} \int_0^{S_2} g_2(S, S')dS' \text{ if } i = 0 \\
\tilde{g}_2(S_3) = \frac{1}{3\Delta S} \int_0^{S_3} g_2(S, S')dS' \text{ if } i = 0 \\
\tilde{g}_2(S_i) = \frac{1}{4\Delta S} \int_{S_{i-4}\Delta S}^{S_i} g_2(S, S')dS' \text{ if } i > 3. \\
\tag{13.118-13.121}
\]
The error term for this method of discretization is:

\[ \epsilon = \frac{(\delta S)^7}{1935360} f^{(6)}(\xi), \]  

(13.122)

where \( f^{(6)}(\xi) \) is the absolute maximum of the sixth derivative in the range of \([S_i, S_i + \delta S]\). For this problem, \( \delta S = 4\Delta S \), so:

\[ \epsilon \leq \frac{(\Delta S)^7}{118.125} f^{(6)}(\xi). \]  

(13.123)

Since there are \( N/4 \) intervals, the maximum deviation from the real value of the function is:

\[ \epsilon \leq \sum_{i=1}^{N} \frac{N}{4} \frac{(\Delta S)^7}{118.125} f^{(6)}(\xi_i) \leq N\frac{4}{472.5} (\Delta S)^7 f^{(6)}(\xi), \]

where \( f^{(6)}(\xi) \) is the absolute maximum of the sixth derivative in the domain, \([0, S]\).

### 13.12. Excursion Set Barrier Remapping

Remappings of the excursion set barrier are selected via the `excursionSetBarrierRemapMethods` (for calculations of first crossing distributions) and `excursionSetBarrierRatesRemapMethods` (for calculations of first crossing rate distributions) parameters. The parameters may specify multiple remappings—these will be applied to the barrier in order.

#### 13.12.1. Null Remapping

Selected with `excursionSetBarrier(Rates)RemapMethods=null` this method leaves the barrier unmodified.

#### 13.12.2. Scale Remapping

Selected with `excursionSetBarrier(Rates)RemapMethods=scale` this method multiplies the barrier by [`excursionSetBarrierRemapScalingFactor`].

#### 13.12.3. Sheth-Mo-Tormen Remapping

Selected with `excursionSetBarrier(Rates)RemapMethods=Sheth-Mo-Tormen` this method remaps the barrier according to the algorithm of Sheth et al. [2001]:

\[ B(S) \rightarrow \sqrt{A}B(S) \left( 1 + b \left[ \frac{S}{AB^2(S)} \right]^c \right), \]  

(13.124)

where \( A = 0.707 \), \( b = 0.5 \), and \( c = 0.6 \).

### 13.13. Galactic Structure

The algorithm to be used when solving for galactic structure (specifically, finding radii of galactic components) is selected via the `galacticStructureRadiusSolverMethod` parameter.
13. Physical Implementations

13.13.1. Fixed

Selected with `galacticStructureRadiusSolverMethod=fixed` this method determines the sizes of galactic components by assuming that radius equals

\[ r = f_r \lambda r_{\text{vir}} \]  \hspace{1cm} (13.125)

where \( r_{\text{vir}} \) is the virial radius of the node, \( \lambda \) is its spin parameter and \( f_r = [\text{galacticStructureRadiiFixedFactor}] \) is a parameter.

13.13.2. Linear

Selected with `galacticStructureRadiusSolverMethod=linear` this method determines the sizes of galactic components by assuming that radius scales linearly with specific angular momentum such that

\[ r = r_{\text{vir}} j / j_{\text{vir}} \]  \hspace{1cm} (13.126)

where \( j \) is the specific angular momentum of the component (at whatever point in the profile is to be solved for), \( r \) is radius, \( r_{\text{vir}} \) is the virial radius of the node and \( j_{\text{vir}} = r_{\text{vir}} v_{\text{vir}} \) with \( v_{\text{vir}} \) being the virial velocity of the node.

13.13.3. Simple

Selected with `galacticStructureRadiusSolverMethod=simple` this method determines the sizes of galactic components by assuming that their self-gravity is negligible (i.e. that the gravitational potential well is dominated by dark matter) and that, therefore, baryons do not modify the dark matter density profile. The radius of a given component is then found by solving

\[ j = \sqrt{G M_{\text{DM}}(r) r} \]  \hspace{1cm} (13.127)

where \( j \) is the specific angular momentum of the component (at whatever point in the profile is to be solved for), \( r \) is radius and \( M(r) \) is the mass of dark matter within radius \( r \). The parameter \([\text{adiabaticContractionUseFormationHalo}]\) controls whether the structure of the galaxy will be solved for using the properties of its present node or those of its node at the time of node formation (which requires that “node formation” has been suitably defined and implemented by a component).

13.13.4. Adiabatic

Selected with `galacticStructureRadiusSolverMethod=adiabatic`, this method takes into account the baryonic self-gravity of all galactic components when solving for structure and additionally accounts for backreaction of the baryons on the dark matter density profile. Solution proceeds via an iterative procedure to find equilibrium radii for all galaxies in a consistently contracted halo. To account for adiabatic contraction the mass of dark matter within a given radius \( r_f \) is taken to be equal to that originally within radius \( r_i \) in the uncontracted halo. This initial radius is computed using the selected galactic structure solver initial radius algorithm (see §13.14). The parameter \([\text{adiabaticContractionUseFormationHalo}]\) controls whether the structure of the galaxy will be solved for using the properties of its present node or those of its node at the time of node formation (which requires that “node formation” has been suitably defined and implemented by a component).

The algorithm to be used when solving for the initial radius in the dark matter halo when computing galactic structure is selected via the `galacticStructureRadiusSolverInitialRadiusMethod` parameter.

Selected with \texttt{galacticStructureRadiusSolverInitialRadiusMethod=static} this method assumes that the dark matter halo is static and so sets the initial radius equal to the final radius.

13.14.2. Adiabatic

Selected with \texttt{galacticStructureRadiusSolverInitialRadiusMethod=adiabatic} this method assumes that adiabatic contraction follows the algorithm of Gnedin et al. [2004]. The parameters $A$ and $\omega$ of that model are specified via input parameters \texttt{adiabaticContractionGnedinA} and \texttt{adiabaticContractionGnedinOmega} respectively.

Given the final radius, $r_f$, the corresponding initial radius, $r_i$, is found by solving:

\[
 f_i M_{\text{total,}0}(\bar{r}_i) r_i = f_i M_{\text{total,}0}(\bar{r}_i) r_i + V_b^2(\bar{r}_i) \bar{r}_i r_i / G,
\]

(13.128)

where $M_{\text{total,}0}(r)$ is the initial total matter profile, $V_b(r)$ is the baryonic contribution to the rotation curve, $f_i$ is the fraction of mass within the virial radius compared to the node mass\footnote{In \texttt{Galacticus} the “node mass” refers to the total mass of the node, assuming it has the universal complement of baryons. Since some halos may contain less than the complete complement of baryons it is possible that $f_i < 1.$}, $f_i = (\Omega_M - \Omega_b) / \Omega_M + M_{\text{satellite,baryonic}} / M_{\text{total}}$, $M_{\text{satellite,baryonic}}$ is the baryonic mass in any satellite halos, $M_{\text{total}}$ is the node mass, and

\[
 \frac{\bar{r}}{r_{\text{vir}}} = A \left( \frac{r}{r_{\text{vir}}} \right)^{\omega - 1},
\]

(13.129)

where $r_{\text{vir}}$ is the virial radius. Note that we explicitly assume that the initial, uncontracted total density profile has the same shape as the initial dark matter density profile, that contraction of the halo occurs with no shell crossing, and that satellite halos trace the dark matter profile of their host halo.

The derivative, $d\bar{r}/d\bar{r}_f \equiv r_i'$ is found by taking the derivative of eqn. (13.128) to give:

\[
 f_i M_{\text{total,}0}(\bar{r}_i) r_i' + f_i 4\pi \bar{r}_i^2 \rho_{\text{total,}0}(\bar{r}_i) \frac{d\bar{r}_i}{dr} r_i' = f_i M_{\text{total,}0}(\bar{r}_i) + f_i 4\pi \bar{r}_i^2 \rho_{\text{total,}0}(\bar{r}_i) \frac{d\bar{r}_i}{dr} r_i' + V_b^2(\bar{r}_i) \bar{r}_i / G + V_b^2(\bar{r}_i) \frac{d\bar{r}_i}{dr} (\bar{r}_i) \bar{r}_i / G + \bar{r}_i / G,
\]

(13.130)

where

\[
 \frac{d\bar{r}}{dr} = A \left( \frac{r}{r_{\text{vir}}} \right)^{-1},
\]

(13.131)

and which can then be solved numerically for $r_i'$.

13.15. Galaxy Merging

The process of merging two galaxies currently involves two algorithms: one which decides how the merger causes mass components from both galaxies to move and one which determines the size of the remnant galaxy spheroid.

13.15.1. Mass Movements

The movement of mass elements in the merging galaxies is determined by the \texttt{satelliteMergingMassMovementsMethod} parameter.
13. Physical Implementations

**Very Simple**

Selected with `satelliteMergingMassMovementsMethod=verySimple`, this method assumes that the satellite material is always added to the disk of the host, while the host mass is not moved.

**Simple**

Selected with `satelliteMergingMassMovementsMethod=simple`, this method implements mass movements according to:

- If \( M_{\text{satellite}} > f_{\text{major}} M_{\text{central}} \) then all mass from both satellite and central galaxies moves to the spheroid component of the central galaxy;
- Otherwise: Gas from the satellite moves to the component of the central specified by the \( \text{minorMergerGasMovesTo} \) parameter (either “disk” or “spheroid”), stars from the satellite moves to the spheroid of the central and mass in the central does not move.

Here, \( f_{\text{major}} = [\text{majorMergerMassRatio}] \) is the mass ratio above which a merger is considered to be “major”.

**Baugh et al. (2005)**

Selected with `satelliteMergingMassMovementsMethod=Baugh2005`, this method implements mass movements according to:

- If \( M_{\text{satellite}} > f_{\text{major}} M_{\text{central}} \) then all mass from both satellite and central galaxies moves to the spheroid component of the central galaxy;
- Otherwise:
  - If \( M_{\text{central, spheroid}} < f_{\text{burst}} M_{\text{central}} \) and the gas fraction in the host equals or exceeds \( f_{\text{gas, crit}} \) then all gas is moved to the host spheroid, while the host stellar disk remains in place.
  - Otherwise, gas from the satellite moves to the component of the central specified by the \( \text{minorMergerGasMovesTo} \) parameter (either “disk” or “spheroid”), stars from the satellite moves to the spheroid of the central and mass in the central does not move.

Here, \( f_{\text{major}} = [\text{majorMergerMassRatio}] \) is the mass ratio above which a merger is considered to be “major”, while \( f_{\text{burst}} = [\text{burstMassRatio}] \) and \( f_{\text{gas, crit}} = [\text{burstCriticalGasFraction}] \).

13.15.2. Remnant Sizes

The method used to calculate the sizes of merger remnant spheroids is selected by the `satelliteMergingRemnantSizeMethod` parameter.

**Null**

Selected using `satelliteMergingRemnantSizeMethod=null`, this is a null method which does nothing at all. It is useful, for example, when running GALACTICUS to study dark matter only (i.e. when no galaxy properties are computed).
13.15. Galaxy Merging

Cole et al. (2000)
Selected using satelliteMergingRemnantSizeMethod=Cole2000, this method uses the algorithm of Cole et al. [2000] to compute merger remnant spheroid sizes. Specifically

\[
\frac{(M_1 + M_2)^2}{r_{new}} = \frac{M_1^2}{r_1} + \frac{M_2^2}{r_2} + \frac{f_{\text{orbit}} M_1 M_2}{c (r_1 + r_2)},
\]

(13.132)

where \(M_1\) and \(M_2\) are the baryonic masses of the components of the merging galaxies that will end up in the spheroid component of the remnant and \(r_1\) and \(r_2\) are the half mass radii of those same components of the merging galaxies, \(r_{\text{new}}\) is the half mass radius of the spheroidal component of the remnant galaxy and \(c\) is a constant which depends on the distribution of the mass. For a Hernquist spheroid \(c = 0.40\) can be found by numerical integration while for an exponential disk \(c = 0.49\). For simplicity a value of \(c = 0.5\) is adopted for all components. The parameter \(f_{\text{orbit}} = \text{mergerRemnantSizeOrbitalEnergy}\) depends on the orbital parameters of the galaxy pair. For example, a value of \(f_{\text{orbit}} = 1\) corresponds to point mass galaxies in circular orbits about their center of mass.

A subtlety arises because the above expression accounts for only the baryonic mass of material which becomes part of the spheroid component of the remnant. In reality, there are additional terms in the energy equation due to the interaction of this material with any dark matter mass in each galaxy and any baryonic mass of each galaxy which does not become part of the spheroid component of the remnant. To account for this additional matter, an effective boost factor, \(f_{\text{boost}}\), to the specific angular momentum of each component of each merging galaxy is computed:

\[
f_{\text{boost}} = \frac{j}{\sqrt{GM r_{1/2}}},
\]

(13.133)

where \(j\) is the specific angular momentum of the component, \(M\) is its total baryonic mass and \(r_{1/2}\) is its half-mass radius. The mass-weighted mean boost factor is found by combining those of all components which will form part of the spheroid of the remnant. The final specific angular momentum of the remnant spheroid is then given by:

\[
\dot{j}_{\text{new}} = \langle f_{\text{boost}} \rangle r_{\text{new}} V_{\text{new}},
\]

(13.134)

where

\[
V_{\text{new}}^2 = \frac{G(M_1 + M_2)}{r_{\text{new}}}.
\]

(13.135)

Covington et al. (2008)
Selected using satelliteMergingRemnantSizeMethod=Covington2008, this method uses the algorithm of Covington et al. [2008] to compute merger remnant spheroid sizes. Specifically

\[
\frac{(M_1 + M_2)^2}{r_{\text{new}}} = \left[ \frac{M_1^2}{r_1} + \frac{M_2^2}{r_2} + \frac{f_{\text{orbit}} M_1 M_2}{c (r_1 + r_2)} \right] (1 + f_{\text{gas}} C_{\text{rad}}),
\]

(13.136)

where \(M_1\) and \(M_2\) are the baryonic masses of the merging galaxies and \(r_1\) and \(r_2\) are their half mass radii, \(r_{\text{new}}\) is the half mass radius of the spheroidal component of the remnant galaxy and \(c\) is a constant which depends on the distribution of the mass. For a Hernquist spheroid \(c = 0.40\) can be found by numerical integration while for an exponential disk \(c = 0.49\). For simplicity a value of \(c = 0.5\) is adopted for all components. The parameter \(f_{\text{orbit}} = \text{mergerRemnantSizeOrbitalEnergy}\) depends on the orbital

\(^2\)Depending on the merging rules (see §13.15.1) not all mass may be placed into the spheroid component of the remnant.

\(^3\)In practice, GALACTICUS computes a weighted average of the disk and spheroid half-mass radii of each galaxy, with weights equal to the masses of each component (disk and spheroid) which will become part of the spheroid component of the remnant.
parameters of the galaxy pair. For example, a value of \( f_{\text{orbit}} = 1 \) corresponds to point mass galaxies in circular orbits about their center of mass. The final term on the right hand side of eqn. (13.136) gives a correction to the final energy of the remnant due to dissipational losses based on the results of Covington et al. [2011], with

\[
  f_{\text{gas}} = \frac{M_{1,\text{gas}} + M_{2,\text{gas}}}{M_1 + M_2}
\]

begin the gas fraction of the progenitor galaxies. By default, \( C_{\text{rad}} = 2.75 \) [Covington et al., 2011]. To account for the effects of dark matter and non-spheroid baryonic matter the same approach is used as in the Cole et al. [2000] algorithm (see §13.15.2).

13.15.3. Progenitor Properties

The method used to calculate the properties of merger progenitor galaxies is selected by the \texttt{satelliteMergingRemnantProgenitorPropertiesMethod} parameter.

\textbf{Cole et al. (2000)}

Selected using \texttt{satelliteMergingRemnantProgenitorPropertiesMethod=}Cole2000, this method uses the algorithms of Cole et al. [2000] to compute progenitor properties. Masses of progenitors are set to

\[
  M_{\text{host}|\text{satellite}} = \sum_{i=\text{disk}|\text{spheroid}} \sum_{j=\text{stars}|\text{gas}} M_{i,j},
\]

where \( M_{i,j} \) is the mass of mass type \( j \) in component \( i \). Masses of progenitors that will end up in the remnant spheroid are set to

\[
  M_{\text{spheroid host}|\text{satellite}} = \sum_{i=\text{disk}|\text{spheroid}} \sum_{j=\text{stars}|\text{gas}} M_{i,j} \delta_{i,j},
\]

where \( \delta_{i,j} = 0 \) of mass type \( j \) in component \( i \) will end up in the remnant spheroid and 0 otherwise. Radii of material that will end up in the spheroid are set by finding the solution to:

\[
  \sum_{i=\text{disk}|\text{spheroid}} \sum_{j=\text{stars}|\text{gas}} M_{i,j}(r) \delta_{i,j} = \frac{1}{2} \sum_{i=\text{disk}|\text{spheroid}} \sum_{j=\text{stars}|\text{gas}} M_{i,j} \delta_{i,j},
\]

such that the radii are the half-mass radii of the material that will end up in the remnant spheroid. Finally, the angular momentum factor is set to

\[
  f_{\text{AM host}|\text{satellite}} = \frac{1}{M_{\text{spheroid host}|\text{satellite}}} \sum_{i=\text{disk}|\text{spheroid}} \sum_{j=\text{stars}|\text{gas}} M_{i,j} \frac{J_{i,j}}{G M_{i,j}^{3/2} r_{1/2} i,j} \delta_{i,j},
\]

where \( J_{i,j} \) is the angular momentum or pseudo-angular momentum of mass type \( j \) in component \( i \).\footnotemark

\footnotetext{This is technically not quite what Cole et al. [2000] do. Instead, when computing the masses of the material which ends up in the spheroid they include twice the mass of dark matter (accounting for the effects of adiabatic contraction) within the half-mass radius of each galaxy (as calculated above). The final angular momentum is then \( j = \sqrt{G M_{\text{remnant}} r_{1/2}} \) (where \( M_{\text{remnant}} \) includes the contribution from dark matter and the factor of 2 appears to make this the half-mass). This approach is currently not used in \textsc{Galacticus} since there is no way to get the mass of dark matter enclosed accounting for adiabatic contraction in the general case. This is a solvable problem, and so this algorithm is expected to be modified to match that of Cole et al. [2000] precisely in a future version of \textsc{Galacticus}.}
13.16. Hot Halo Mass Distribution

Standard

Selected using satelliteMergingRemnantProgenitorPropertiesMethod=standard, this is the standard method to compute progenitor properties. Masses of progenitors are set to

\[ M_{\text{host|satellite}} = \sum_{i=\text{disk|sph}eroid} \sum_{j=\text{stars|gas}} M_{i,j}, \]  

(13.142)

where \( M_{i,j} \) is the mass of mass type \( j \) in component \( i \). Masses of progenitors that will end up in the remnant spheroid are set to

\[ M_{\text{spheroid host|satellite}} = \sum_{i=\text{disk|sph}eroid} \sum_{j=\text{stars|gas}} M_{i,j} \delta_{i,j}, \]  

(13.143)

where \( \delta_{i,j} = 0 \) of mass type \( j \) in component \( i \) will end up in the remnant spheroid and 0 otherwise. Radii of material that will end up in the spheroid are set to

\[ r_{\text{host|satellite}} = \frac{1}{M_{\text{spheroid host|satellite}}} \sum_{i=\text{disk|sph}eroid} \sum_{j=\text{stars|gas}} M_{i,j} r_{1/2 \text{i,j}} \delta_{i,j}. \]  

(13.144)

Finally, the angular momentum factor is set to

\[ f_{\text{AM host|satellite}} = \frac{1}{M_{\text{spheroid host|satellite}}} \sum_{i=\text{disk|sph}eroid} \sum_{j=\text{stars|gas}} M_{i,j} \frac{J_{i,j}}{G M_{i,j}^{3/2} r_{1/2 \text{i,j}}} \delta_{i,j}, \]  

(13.145)

where \( J_{i,j} \) is the angular momentum or pseudo-angular momentum of mass type \( j \) in component \( i \).

13.16. Hot Halo Mass Distribution

The algorithm to be used when determining the hot halo mass distribution is selected via the hotHaloMassDistributionMethod parameter.

13.16.1. \( \beta \)-profile

Selected with hotHaloMassDistributionMethod=betaProfile this method adopts a spherically symmetric \( \beta \)-profile density profile for the hot halo. Specifically,

\[ \rho_{\text{hot halo}}(r) \propto \left[ r^2 + r_{\text{core}}^2 \right]^{3\beta/2}, \]  

(13.146)

where the core radius, \( r_{\text{core}} \), is set using the selected cored profile core radius method (see §13.17). The value of \( \beta \) is specified by the [hotHaloMassDistributionBeta] parameter. The profile is normalized such that the current mass in the hot gas profile is contained within the outer radius of the hot halo, \( r_{\text{hot,outer}} \).

Selected with hotHaloMassDistributionMethod=ricotti2000 this method adopts a spherically symmetric \( \beta \)-profile density profile for the hot halo with parameters selected using the fitting function of Ricotti and Shull [2000] who found these by solving for hydrostatic equilibrium in an NFW density profile. Specifically, \( \beta = 0.96 \) where

\[ b = \frac{2c}{9} \left[ \log(1+c) - \frac{c}{1+c} \right]^{-1}, \]  

(13.147)
13. Physical Implementations

c is the concentration parameter of the dark matter halo, and $\Gamma$ is the ratio of virial and gas temperatures, which is assumed to be unity. The core radius is $r_{\text{core}} = 0.22r_s$ where $r_s$ is the scale radius of the dark matter profile. The profile is normalized such that the current mass in the hot gas profile is contained within the outer radius of the hot halo, $r_{\text{hot,outer}}$.

13.16.3. Null

Selected with $\text{hotHaloMassDistributionMethod} = \text{null}$ this method assumes no hot halo mass distribution. It is useful, for example, when performing dark matter-only calculations.

13.17. Hot Halo Mass Distribution Profile: Cored Profile Core Radius

The algorithm to be used when determining the core radius of cored isothermal hot halo density profiles is selected via the $\text{hotHaloMassDistributionCoreRadiusMethod}$ parameter.

13.17.1. Growing Core

Selected with $\text{hotHaloMassDistributionCoreRadiusMethod} = \text{growingCore}$, this method implements a core radius equal to a fraction $[\text{coreRadiusOverScaleRadius}]$ of the node’s dark matter profile scale radius for nodes containing a mass of hot gas equal to the universal baryon fraction times their total mass. For nodes containing less hot gas mass, the core radius is expanded to maintain the same gas density at the virial radius, with a maximum core radius of $[\text{coreRadiusOverVirialRadiusMaximum}]$ times the node’s virial radius.

13.17.2. Virial Fraction

Selected with $\text{hotHaloMassDistributionCoreRadiusMethod} = \text{virialRadiusFraction}$, this method implements a core radius equal to a fraction $[\text{coreRadiusOverVirialRadius}]$ of the node’s virial radius.

13.18. Hot Halo Ram Pressure Force

The algorithm to be used when determining the ram pressure force due to the hot halo is selected via the $\text{hotHaloRamPressureForceMethod}$ parameter.

13.18.1. Null

Selected with $\text{hotHaloRamPressureForceMethod} = \text{null}$ this method assumes a zero ram pressure force due to the hot halo.

13.18.2. Font et al. (2008)

Selected with $\text{hotHaloRamPressureForceMethod} = \text{Font2008}$ this method computes the ram pressure force using the algorithm of Font et al. [2008]. Specifically, the ram pressure force is

$$F_{\text{ram,hot,host}} = \rho_{\text{hot,host}}(r_{\text{peri}}) v^2(r_{\text{peri}}),$$

(13.148)

where $\rho_{\text{hot,host}}(r)$ is the hot halo density profile of the node’s host halo, $v(r)$ is the orbital velocity of the node in that host, and $r_{\text{peri}}$ is the pericentric radius of the node’s orbit.
13.19. Hot Halo Ram Pressure Stripping Radius

The algorithm to be used when determining the radius to which the hot halo is stripped by ram pressure forces is selected via the hotHaloRamPressureStrippingMethod parameter.

13.19.1. Virial Radius

Selected with hotHaloRamPressureStrippingMethod= virialRadius this method sets the ram pressure stripping radius equal to the virial radius of the halo. The effectively results in no ram pressure stripping.

Selected with hotHaloRamPressureStrippingMethod= Font2008 this method computes the ram pressure stripping radius using the algorithm of Font et al. [2008]. Specifically, the radius, \( r_p \), is computed as the solution of

\[
\alpha r_p \frac{G M_{\text{satellite}}(r_p) \rho_{\text{hot, satellite}}(r_p)}{r_p} = F_{\text{ram, hot, host}},
\]

where \( M_{\text{satellite}}(r) \) is the total mass of the satellite within radius \( r \), \( F_{\text{ram, hot, host}} \) is the ram pressure force due to the hot halo (computed using the selected hot halo ram pressure force method; see §13.18). The parameter \( \alpha_r \approx [\text{ramPressureStrippingFormFactor}] \) is a geometric factor of order unity.

13.20. Hot Halo Ram Pressure Stripping Timescale

The algorithm to be used when determining the timescale on which the hot halo is stripped by ram pressure forces is selected via the hotHaloRamPressureStrippingTimescaleMethod parameter.

13.20.1. Halo Dynamical Timescale

Selected with hotHaloRamPressureStrippingTimescaleMethod= haloDynamicalTime this method sets the ram pressure stripping timecale equal to the dynamical time of the associated halo.

13.20.2. Ram Pressure Acceleration

Selected with hotHaloRamPressureStrippingTimescaleMethod= ramPressureAcceleration this method computes the ram pressure stripping timescale from the acceleration imparted by the ram pressure force. Following Roediger and BrÃČÅŠggen [2007] this is approximated as:

\[
a_{\text{rampressure}} = \frac{P_{\text{rampressure}}}{\Sigma},
\]

where \( P_{\text{rampressure}} \) is the ram pressure force per unit area, and \( \Sigma \) is the surface density of gas. The associated timescale to accelerate gas over a distance \( r_{\text{outer}} \) (the current outer radius of the hot halo) is then:

\[
\tau_{\text{rampressure}} = \sqrt{\frac{2r_{\text{outer}} \Sigma_{\text{outer}}}{P_{\text{rampressure}}}}.
\]

13.21. Hot Halo Temperature Profile

The algorithm to be used when determining the hot halo temperature profile is selected via the hotHaloTemperatureMethod parameter.
13. Physical Implementations

13.21.1. Virial Temperature

Selected with `hotHaloTemperatureMethod=virial` this method assumes an isothermal halo with a temperature equal to the virial temperature of the halo.

13.22. Initial Mass Functions

The stellar IMF subsystem supports multiple IMFs and extensible algorithms to select which IMF to use based on the physical conditions of star formation.

13.22.1. Initial Mass Function Selection

The method to use for selecting which IMF to use is specified by the `imfSelectionMethod` parameter.

**Fixed**

Selected by `imfSelectionMethod=fixed`, this method uses a fixed IMF irrespective of physical conditions. The IMF to use is specified by the `imfSelectionFixed` parameter (e.g. setting this parameter to `Salpeter` selects the Salpeter IMF).

**Disk and Spheroid**

Selected by `imfSelectionMethod=diskSpheroid`, this method uses different IMFs for star formation in disks and spheroids irrespective of other physical conditions. The IMFs to use are specified by the `imfSelectionDisk` and `imfSelectionSpheroid` parameters (e.g. setting one of these parameters to `Salpeter` selects the Salpeter IMF).

13.22.2. Initial Mass Functions

A variety of different IMFs are available. Each IMF registers itself with the GALACTICUS IMF subsystem and can then be looked-up by name or internal index. All IMFs are assumed to be continuous in $M$, unless otherwise noted and normalized to unit mass. Each IMF supplies a recycled fraction and metal yield for use in the instantaneous recycling approximation. These can be set via the parameters `imf[imfName]RecycledInstantaneous` and `imf[imfName]YieldInstantaneous` where `[imfName]` is the name of the IMF. Their default values were computed using GALACTICUS’s internal stellar astrophysics modules for a Solar metallicity population with age of 13.8 Gyr.

Baugh et al. (2005) Top-Heavy

The Baugh2005TopHeavy IMF is defined by [Baugh et al., 2005]:

$$\phi(M) \propto M^{-1} \text{ for } 0.15M_\odot < M < 125M_\odot$$

(13.152)

Chabrier

The Chabrier IMF is defined by [Chabrier, 2001]:

$$\phi(M) \propto \begin{cases} M^{-1} \exp\left(-[\log_{10}(M/M_c)/\sigma_c]^2/2\right) \text{ for } 0.1M_\odot < M < 1M_\odot \\ M^{-2.3} \text{ for } 1M_\odot < M < 125M_\odot \\ 0 \text{ otherwise,} \end{cases}$$

(13.153)

where $\sigma_c = 0.69$ and $M_c = 0.08M_\odot$. 

278
Kennicutt

The Kennicutt IMF is defined by [Kennicutt, 1983]:

\[
\phi(M) \propto \begin{cases} 
    M^{-1.25} & \text{for } 0.10 M_\odot < M < 1.00 M_\odot \\
    M^{-2.00} & \text{for } 1.00 M_\odot < M < 2.00 M_\odot \\
    M^{-2.30} & \text{for } 2.00 M_\odot < M < 125 M_\odot \\
    0 & \text{otherwise.} 
\end{cases} 
\] (13.154)

Kroupa

The Kroupa IMF is defined by [Kroupa, 2001]:

\[
\phi(M) \propto \begin{cases} 
    M^{-0.3} & \text{for } 0.01 M_\odot < M < 0.08 M_\odot \\
    M^{-1.8} & \text{for } 0.08 M_\odot < M < 0.5 M_\odot \\
    M^{-2.7} & \text{for } 0.5 M_\odot < M < 1 M_\odot \\
    M^{-2.3} & \text{for } 1 M_\odot < M < 125 M_\odot \\
    0 & \text{otherwise.} 
\end{cases} 
\] (13.155)

Miller-Scalo

The Miller-Scalo IMF is defined by [Miller and Scalo, 1979]:

\[
\phi(M) \propto \begin{cases} 
    M^{-1.25} & \text{for } 0.10 M_\odot < M < 1.00 M_\odot \\
    M^{-2.00} & \text{for } 1.00 M_\odot < M < 2.00 M_\odot \\
    M^{-2.30} & \text{for } 2.00 M_\odot < M < 10.0 M_\odot \\
    M^{-3.30} & \text{for } 10.0 M_\odot < M < 125 M_\odot \\
    0 & \text{otherwise.} 
\end{cases} 
\] (13.156)

Piecewise Power-law

Arbitrary piecewise power-law IMFs can be defined using the PiecewisePowerLaw method. The IMF will be constructed such that:

\[
\phi(M) \propto M^{\alpha_i} \text{ if } M_i \leq M < M_{i+1}, 
\] (13.157)

where \( i = 1 \ldots N \), the \( M_i \) are given by [imfPiecewisePowerLawMassPoints] and the \( \alpha_i \) are given by [imfPiecewisePowerLawExponents]. (Note that [imfPiecewisePowerLawMassPoints] must contain \( N+1 \) elements, while [imfPiecewisePowerLawExponents] contains only \( N \) elements.) The normalization of each power-law piece is chosen to ensure a continuous IMF that is normalized to unit mass overall.

Salpeter

The Salpeter IMF is defined by [Salpeter, 1955]:

\[
\phi(M) \propto \begin{cases} 
    M^{-2.35} & \text{for } 0.1 M_\odot < M < 125 M_\odot \\
    0 & \text{otherwise.} 
\end{cases} 
\] (13.158)
13. Physical Implementations

Scalo

The Scalo IMF is defined by [Scalo, 1986]:

\[ \phi(M) \propto \begin{cases} 
M^{+1.60} & \text{for } 0.10M_\odot < M < 0.18M_\odot \\
M^{-1.01} & \text{for } 0.18M_\odot < M < 0.42M_\odot \\
M^{-2.75} & \text{for } 0.42M_\odot < M < 0.62M_\odot \\
M^{-2.08} & \text{for } 0.62M_\odot < M < 1.18M_\odot \\
M^{-3.50} & \text{for } 1.18M_\odot < M < 3.50M_\odot \\
M^{-2.63} & \text{for } 3.50M_\odot < M < 125M_\odot \\
0 & \text{otherwise.} 
\end{cases} \] (13.159)

13.23. Intergalactic Medium State

The thermal and ionization state of the intergalactic medium is implemented by the algorithm selected using the `intergalacticMediumStateMethod` parameter.

13.23.1. Simple

Selected using `intergalacticMediumStateMethod=simple`, this method provides a simple model of reionization in which the universe is assumed to be fully neutral prior to the redshift given by \([igmStateSimpleReionizationRedshift]\) and fully ionized thereafter. The temperature is given by \([igmStateSimplePreReionizationTemperature]\) before reionization, and \([igmStateSimpleReionizationTemperature]\) thereafter.

13.23.2. RecFast

Selected using `intergalacticMediumStateMethod=RecFast`, this method computes the state of the intergalactic medium using the RecFast code Seager et al. [2000], Wong et al. [2008]. The RecFast code will be downloaded and run to compute the intergalactic medium state as needed, which will then be stored for future use.

13.23.3. File

Selected using `intergalacticMediumStateMethod=file`, this method reads the state of the intergalactic medium from a file and interpolates in the tabulated results. The XML file containing the table should have the following form:

```xml
<igm>
  <electronFraction>
    <datum>1.1590278</datum>
    <datum>1.1590278</datum>
  .
  .
  .
  </electronFraction>
  <hIonizedFraction>
    <datum>1.0000000</datum>
    <datum>1.0000000</datum>
  .
  .
  .
</igm>
```
13.24. Chemical State

The `electronFraction`, `hIonizedFraction`, `heIonizedFraction`, and `matterTemperature` elements should contain `datum` elements listing the relevant quantity for each redshift listed in the `redshift` element.

13.24. Chemical State

The chemical state of gas is implemented by the algorithm selected using the `ionizatonStateMethod` parameter.

13.24.1. Atomic Collisional Ionization Equilibrium Using CLOUDY

Selected using `ionizatonStateMethod=atomic_CIE_Cloudy`, this method computes the chemical state using the CLOUDY code and under the assumption of collisional ionization equilibrium with no molecular contribution. Abundances are Solar, except for zero metallicity calculations which use CLOUDY's “primordial” metallicity. The helium abundance for non-zero metallicity is scaled between primordial and Solar values linearly with metallicity. The CLOUDY code will be downloaded and run to compute the cooling function as needed, which will then be stored for future use. As this process is slow, a precomputed table is provided with GALACTICUS. If metallicities outside the range tabulated in this file are required it will be regenerated with an appropriate range.

13.24.2. Collisional Ionization Equilibrium From File

Selected using `ionizatonStateMethod=CIE_from_file`, in this method the chemical state is read from a file specified by the `chemicalStateFile` parameter. The format of this file is specified in §17.4.1. The chemical state is assumed to be computed under conditions of collisional ionization equilibrium and
therefore densities scale as $\rho$. Optional HI and HII densities, if present in the file, will be read and used when returning the densities of “chemical” species.

13.25. Merger Tree Construction

Merger trees are “constructed\(^5\)” by the method specified by the $\text{mergerTreeConstructMethod}$ parameter.

13.25.1. Read From File

Selected with $\text{mergerTreeConstructMethod} = \text{read}$, this method reads merger tree structures from file by the designated importer (see §13.30).

13.25.2. Build

Selected with $\text{mergerTreeConstructMethod} = \text{build}$, this method first creates a distribution of tree root halo masses and then builds a merger tree using the algorithm specified by the $\text{mergerTreeBuildMethod}$ parameter.

If $\text{[mergerTreeBuildTreesHaloMassDistribution]} = \text{read}$, then these masses will be read from a file specified by $\text{[mergerTreeBuildTreeMassesFile]}$. Otherwise, the root halo masses are selected to range between $\text{mergerTreeBuildHaloMassMinimum}$ and $\text{mergerTreeBuildHaloMassMaximum}$ with $\text{mergerTreeBuildTreesPerDecade}$ trees per decade of root halo mass on average. Trees are rooted at $\text{mergerTreeBuildTreesBaseRedshift}$ and tree building will begin with the $\text{mergerTreeBuildTreesBeginAtTree}^{th}$ tree\(^6\). The root halo masses are usually drawn from the density function specified by the halo mass function sampling density method (see §13.8.6). The distribution of $x$ is determined by the input parameter $\text{mergerTreeBuildTreesHaloMassDistribution}$ with options:

- **uniform** $x$ is distributed uniformly between 0 and 1;
- **quasi** $x$ is distributed using a quasi-random sequence;
- **random** $x$ is distributed using a pseudo-random sequence;
- **read** halos masses are instead read from a file.

In the case of reading root halo masses from a file, the file can be either an XML or HDF5 file. An XML file should have the following form:

```xml
<mergerTrees>
  <treeRootMass>13522377303.5998</treeRootMass>
  <treeRootMass>19579530191.8709</treeRootMass>
  <treeRootMass>21061025282.9613</treeRootMass>
  ...
  ...
  <treeWeight>13522377303.5998</treeWeight>
  <treeWeight>19579530191.8709</treeWeight>
  <treeWeight>21061025282.9613</treeWeight>
  ...
</mergerTrees>
```

\(^5\)By “construct” we mean any process of creating a representation of a merger tree within \textsc{Galacticus}.

\(^6\)This will normally be set to 1 to begin with the first tree. Other values allow to begin on later trees for debugging purposes.
where each `treeRootMass` element gives the mass (in Solar masses) of the root halo of a tree to generate, and the (optional) `treeWeight` elements give the corresponding weight (in units of Mpc\(^{-3}\)) to assign to each tree. An HDF5 file should have the following structure:

```hdf5
HDF5 {
  GROUP '/' {
    DATASET 'treeRootMass' {
      DATATYPE H5T_IEEE_F64BE
      DATASPACE SIMPLE { ( * ) / ( * ) }
    }
    DATASET 'treeWeight' {
      DATATYPE H5T_IEEE_F64BE
      DATASPACE SIMPLE { ( * ) / ( * ) }
    }
  }
}
```

where the `treeRootMass` dataset contains the mass (in Solar masses) of the root halo of a tree to generate, and the (optional) `treeWeight` dataset contains the weight (in units of Mpc\(^{-3}\)) to assign to each tree.

### 13.25.3. Fully Specified

Selected with `mergerTreeConstructMethod=fullySpecified`, this method will construct a merger tree, and set properties of components in each node, using a description read from an XML document. The document is specified via the `[mergerTreeConstructFullySpecifiedFileName]` input parameter.

The tree specification document looks as follows:

```xml
<!-- Simple initial conditions test case -->
<initialConditions>
  <node>
    <index>2</index>
    <parent>1</parent>
    <firstChild>-1</firstChild>
    <sibling>-1</sibling>
    <basic>
      <time>1.0</time>
      <timeLastIsolated>1.0</timeLastIsolated>
      <mass>1.0e12</mass>
      <accretionRate>7.9365079e9</accretionRate>
    </basic>
    <spin>
      <spin>0.1</spin>
    </spin>
    <disk>
      <massGas>1.0e10</massGas>
      <angularMomentum>1.0e10</angularMomentum>
    </disk>
  </node>
</initialConditions>
```
13. Physical Implementations

The document consists of a set of node elements, each of which defines a single node in the merger tree. Each node element must specify the index of the node, along with the index of the node’s parent, firstChild, and sibling.

Each node element may contain elements which specify the properties of a component in the node. For example, a basic element will specify properties of the “basic” component. If multiple elements for a given component type are present, then multiple instances of that component will be created in the node.

Within a component definition element scalar properties are set using an element with the same name as that property (e.g. mass in the basic components in the above example). Rank-1 properties are set using a list of elements with the same name as the property (e.g. position in the position component in the above example).

For composite properties (e.g. abundances), the specification element should contain sub-elements that specify each property of the composite. Currently only the abundances object supports specification in this way, as detailed below:

abundances (See abundancesGas in the above example.) The total metal content is specified via a metals element. If other elements are being tracked, their content is specified via an element with the short-name of the element (e.g. Fe for iron).

13.25.4. Smooth Accretion

Selected with mergerTreeConstructMethod=smoothAccretion, this method builds a branchless merger tree with a smooth accretion history using the selected mass accretion history method (see §17.4.1). The tree has a final mass of mergerTreeHaloMass (in units of $M_\odot$) at redshift mergerTreeBaseRedshift and
is continued back in time by decreasing the halo mass by a factor \texttt{mergerTreeHaloMassDeclineFactor} at each new node until a specified \texttt{mergerTreeHaloMassResolution} (in units of $M_\odot$) is reached.

### 13.25.5. State Restore

Selected with \texttt{mergerTreeConstructMethod=stateRestore}, this method will restore a merger tree whose complete internal state was written to file. It is intended primarily for debugging purposes to allow a tree to begin processing just prior to the point of failure. To use this method, the following procedure should be followed:

1. Identify a point in the evolution of the tree suitably close to, but before, the point of failure;

2. Insert appropriate code into \texttt{GALACTICUS} to have it call the function to store the state of the file and then stop, e.g.:

   ```
   use Merger_Trees_State_Store
   
   if (<conditions are met>) then
     call Merger_Trees_State_Store(thisTree,’storedTree.dat’)
     stop ’tree internal state was stored’
   end if
   ```

3. Run the model ensuring that \texttt{[stateFileRoot]} is set to a suitable file root name to allow the internal state of \texttt{GALACTICUS} to be stored;

4. Remove the code inserted above and recompile;

5. Run \texttt{GALACTICUS} with an input parameter file identical to the one used previously except with \texttt{[mergerTreeConstructMethod]=stateRestore}, \texttt{[stateFileRoot]} removed, \texttt{[stateRetrieveFileRoot]} set to the value previously used for \texttt{[stateFileRoot]} and \texttt{[mergerTreeStateStoreFile]=storedTree.dat}.

This should restore the tree and the internal state of \texttt{GALACTICUS} precisely from the point where they were saved and produce the same subsequent evolution.

Note that currently this method does not support storing and restoring of trees which contain components that have more than one instance.

### 13.26. Merger Tree Building Mass Resolution

The method to be used for computing the mass resolution to use when building merger trees is specified by the \texttt{mergerTreesBuildMassResolutionMethod} parameter.

#### 13.26.1. Fixed

Selected with \texttt{mergerTreesBuildMassResolutionMethod=fixed}, this method assumes a fixed mass resolution of \texttt{[mergerTreeBuildMassResolutionFixed]} for all merger trees.
13. Physical Implementations

13.26.2. Scaled

Selected with `mergerTreesBuildMassResolutionMethod=scaled`, this method computes the mass resolution to be the larger of `[mergerTreeBuildMassResolutionScaledMinimum]` and `[mergerTreeBuildMassResolutionScaledFraction] \times M_{\text{base}}`, where $M_{\text{base}}$ is the base mass of the merger tree.

13.27. Merger Tree Branching

The method to be used for computing branching probabilities in merger trees is specified by the `treeBranchingMethod` parameter.

13.27.1. Modified Press-Schechter

Selected with `treeBranchingMethod=modifiedPress-Schechter`, this method uses the algorithm of Parkinson et al. [2008] to compute branching ratios. The parameters $G_0$, $\gamma_1$ and $\gamma_2$ of their algorithm are specified by the input parameters `modifiedPressSchechterG0`, `modifiedPressSchechterGamma1` and `modifiedPressSchechterGamma2` respectively. Additionally, the parameter `modifiedPressSchechterFirstOrderAccuracy` limits the step in $\delta_{\text{crit}}$ so that it never exceeds $\text{modifiedPressSchechterFirstOrderAccuracy} \sqrt{2}[\sigma^2(M_2/2) - \sigma^2(M_2)]$, which ensures the first order expansion of the merging rate that is assumed is accurate.

13.27.2. Generalized Press-Schechter

Selected with `treeBranchingMethod=generalizedPress-Schechter`, this method computes branching probabilities from solutions to the excursion set barrier first crossing rate problem (using the selected `excursionSetFirstCrossingMethod`; see §17.4.1). Specifically, the branching probability per unit time is:

$$\frac{df}{dt} = \frac{dt}{d\omega} \int_{M_{\text{min}}}^{M/2} M \frac{df}{d\omega} \frac{dS}{dM'} \frac{dt}{d\omega} G[\omega, \sigma(M), \sigma(M')] \, dM', \tag{13.160}$$

where $\omega = \delta_{\text{crit}} / D(t)$. The rate of accretion of mass in halos below the resolution limit of the merger tree is

$$\frac{dR}{dt} = \frac{dt}{d\omega} \int_{0}^{M_{\text{min}}} \frac{df}{d\omega} \frac{dS}{dM'} \frac{dt}{d\omega} G[\omega, \sigma(M), \sigma(M')] \, dM'. \tag{13.161}$$

In the above, $G[\omega, \sigma(M), \sigma(M')]$ is a modification to the merger rate as computed by the selected `treeBranchingModifierMethod` (see §17.4.1). If `[generalizedPressSchechterSmoothAccretion]=true` then smooth accretion (i.e. accretion of matter not in dark matter halos) is accounted for at the rate:

$$\frac{dR_s}{dt} = \frac{dt}{d\omega} G[\omega, \sigma_{\text{max}}, \sigma(M')] \frac{df}{dt}, \tag{13.162}$$

where $\sigma_{\text{max}}$ is the peak value of $\sigma(M)$ (for the lowest mass halos) and $d\tilde{f} / dt$ is the rate at which excursion set trajectories fail to cross the barrier on any mass scale.

13.28. Merger Tree Branching Modifier

The method to be used for modifying branching probabilities in merger trees is specified by the `treeBranchingModifierMethod` parameter.
13.28.1. Null

Selected with `treeBranchingModifierMethod=null`, this method makes no change to the branching probability.

Selected with `treeBranchingModifierMethod=Parkinson-Cole-Helly2008`, this method modifies branching probabilities according to the prescription of Parkinson et al. [2008]. Specifically, the branching probability is multiplied by:

\[
G(\delta_p, \sigma_c, \sigma_p) = G_0 \left( \frac{\sigma_p}{\sigma_p} \right)^{\gamma_1} \left( \frac{\delta_p}{\sigma_p} \right)^{\gamma_2}
\]

where \( \delta_p \) is the current critical overdensity for collapse for the parent halo, and \( \sigma_c \) and \( \sigma_p \) are the root-variance of the smooth mass-density field on scales corresponding to the masses of child and parent halos respectively. The parameters of the fit can be adjusted via input parameters: \( G_0 = [\text{modifiedPressSchechterG0}] \), \( \gamma_1 = [\text{modifiedPressSchechterGamma1}] \), and \( \gamma_2 = [\text{modifiedPressSchechterGamma2}] \).

13.29. Merger Tree Building

The method to be used for building merger trees is specified by the `mergerTreeBuildMethod` parameter.

Selected with `mergerTreeBuildMethod=Cole2000`, this method uses the algorithm described by Cole et al. [2000], with a branching probability method selected via the `treeBranchingMethod` parameter. This action of this algorithm is controlled by the following parameters:

- `mergerTreeBuildCole2000MergeProbability` The maximum probability for a binary merger allowed in a single timestep. This allows the probability to be kept small, such the the probability for multiple mergers within a single timestep is small.

- `mergerTreeBuildCole2000AccretionLimit` The maximum fractional change in mass due to sub-resolution accretion allowed in any given timestep when building the tree.

- `mergerTreeBuildCole2000HighestRedshift` The highest redshift to which the tree should be built. Any branch reaching this redshift will be terminated. Typically this should be set to a high value such that branches terminate when the resolution limit it reached, but specifying a maximum redshift can be useful in some situations.

The minimum halo mass that the algorithm will follow is determined by the selection merger tree building mass resolution method (see §13.26). Mass accretion below this scale is treated as smooth accretion and branches are truncated once they fall below this mass.

13.30. Merger Tree Importing

When merger trees are to be read from file, a number of different file formats are supported. An “importer” class is used to read these files and place the contents into internal data structures that GALACTICUS can then manipulate. The importer class to use is specified by the `[mergerTreeImporterMethod]` parameter.
13. Physical Implementations

13.30.1. Galacticus

Selected with `mergerTreeImporterMethod=galacticus`, this method reads merger tree structures from an HDF5 file specified by the `mergerTreeReadFileName` parameter. The structure of these HDF5 files is described in §6.2.

13.30.2. Sussing Merger Trees

Selected with `mergerTreeImporterMethod=sussing`, this method reads merger tree structures from files following the format designed for the “Sussing Merger Trees” workshop [Srisawat et al., 2013], along with Amiga’s Halo Finder (AHF) format halo catalogs. A descriptor file must be specified via the `mergerTreeReadFileName` parameter. This descriptor file should have the following format:

```plaintext
simulation.txt
MergerTree+AHF.txt
snapidzred.txt
AHF/62.5_dm_000.z50.000.AHF_halos
AHF/62.5_dm_001.z30.000.AHF_halos
AHF/62.5_dm_002.z19.916.AHF_halos
.
.
AHF/62.5_dm_061.z0.000.AHF_halos
```

in which each line specifies a file to be read (by default path names are relative to the location of the descriptor file—fully-qualified path names can also be given).

The first line identifies a file which specifies properties of the simulation. This file should look like:

```plaintext
WMAP7 cosmology:
----------------
Omega0 = 0.272
OmegaLambda0 = 0.728
h = 0.704
```

The second line identifies the merger tree file which must be in the format specified by Srisawat et al. [2013].

The third line of the descriptor file specifies a snapshot file which should have the following format:

```plaintext
# snapnum a z t(t0) t(year)
0 0.0196080 49.9996 0.00354284 4.87485e+07
1 0.0322580 30.0001 0.00747572 1.02864e+08
2 0.0478110 19.9157 0.0134888 1.85602e+08
3 0.0519650 18.2437 0.0152842 2.10306e+08
4 0.0564190 16.7245 0.0172905 2.37912e+08
5 0.0611880 15.3431 0.0195280 2.68700e+08
```

Currently only the cosmological parameter and box length are read from this file.

The second line identifies the merger tree file which must be in the format specified by Srisawat et al. [2013].

The third line of the descriptor file specifies a snapshot file which should have the following format:
13.31. Merger Tree Pre-evolution Processing

This file must contain one line for each snapshot of the simulation, giving the snapshot number, expansion factor, redshift, fractional time (relative to present day), and age of the universe (in years).

Subsequent lines identify the AHF halo files for each snapshot (files can be listed in any order).

Merger tree files of this type can be split into subvolumes before processing. This is useful if the file is too large to read into memory in one go. The number of subvolumes to use (in each of the three dimensions of the simulation cube) is specified by the [mergerTreeImportSussingSubvolumeCount] parameter. The specific subvolume to process is specified by the [mergerTreeImportSussingSubvolumeIndex] parameter, which should give the index (running from 0 to [mergerTreeImportSussingSubvolumeCount]−1) in each dimension (whitespace separated). To ensure that no halos are missed from trees near the edge of the subvolume, a buffer region around the subvolume is also read. The width of this buffer (in units of Mpc/h to follow the format convention) is specified via the [mergerTreeImportSussingSubvolumeBuffer] parameter.

13.31. Merger Tree Pre-evolution Processing

Arbitrary processing of merger trees prior to their evolution can be carried out using the mergerTreePreEvolveTask directive (see §17.4.3). Currently defined tasks are defined below.

13.31.1. Enforce Monotonic Mass Growth

This task enforces monotonic growth a halo mass along each branch of each merger tree. It does this by searching the tree for nodes which are less massive than the sum of the masses of their immediate progenitors, and increasing the mass of such nodes to equal the sum of the masses of their immediate progenitors. To enforce monotonic mass growth along branches set [mergerTreeEnforceMonotonicGrowth]=true.

13.31.2. Interpolate Tree to Time Grid

This task will interpolate the merger tree structure onto a new array of timesteps if [mergerTreeRegridTimes]=true. The timestep array is specified via the parameters:

[mergerTreeRegridSpacing] The spacing of the timesteps. Five options are available: linear will space timesteps uniformly in expansion factor, logarithmic will space timesteps uniformly in the logarithm of expansion factor, log critical density will space timesteps uniformly in the logarithm of critical density, δₖ, millennium will use times corresponding to the redshifts of snapshots in the Millennium Simulation database, while read will use times corresponding to the redshifts specified in the mergerTreeRegridRedshifts parameter;

[mergerTreeRegridStartExpansionFactor] The smallest expansion factor in the array (ignored for millennium and read spacings);

[mergerTreeRegridEndExpansionFactor] The largest expansion factor in the array (ignored for millennium and read spacings);

[mergerTreeRegridCount] The number of timesteps in the array;

Along each branch of the tree, new halos are inserted at times corresponding to the times in the resulting array. The masses of these nodes are linearly interpolated between the existing nodes on the branch.
Once these new nodes have been added, all other nodes are removed from the tree. The processing is useful to construct representations of trees as they would be if only sparse time sampling were available. As such, it is useful for exploring how the number of snapshots in merger trees extracted from N-body simulations affects the properties of galaxies that form in them.

13.31.3. Mass Accretion History Output

Output of the mass accretion history (i.e. the mass of the node on the primary branch as a function of time) for each merger tree can be requested by setting \( \text{massAccretionHistoryOutput} = \text{true} \). If requested, an additional group, massAccretionHistories, is made in the GALACTICUS output file. This group will contain a subgroup for each merger tree (mergerTreeN where N is the merger tree index) within which three datasets, nodeId, nodeTime and nodeMass, can be found. These give the index, time and mass of the node on the primary branch of the tree at all times for which the tree is defined.

13.31.4. Tree Pruning By Mass

This task allows for branches of merger trees to be pruned—i.e. nodes below a specified mass limit are removed from the tree prior to any evolution. This can be useful for convergence studies for example. To prune branches set \( \text{mergerTreePruneBranches} = \text{true} \) and set \( \text{mergerTreePruningMassThreshold} \) to the desired mass threshold below which nodes will be pruned.

13.31.5. Tree Pruning By Hierarchy

This task allows for branches of merger trees to be pruned by hierarchy—i.e. nodes below a given depth in the hierarchy are removed from the tree prior to any evolution. To prune branches by hierarchy depth set \( \text{mergerTreePruneHierarchyAtDepth} \) to the desired depth at which to prune. For example, a value of 1 will result in all branches except for the main branch being removed, while a value of 2 will remove all branches that do not merge directly onto the main branch. (Note that setting \( \text{mergerTreePruneHierarchyAtDepth} \) to zero will result in no pruning.)

13.31.6. Tree Pruning By Essential Node

This task allows for branches of merger trees to be pruned to leave only the branch occupied by an “essential” node, along with any progenitor branches of that node. This is intended primarily for debugging purposes where it can be convenient to cut away all non-essential branches of the tree. This pruning task is activated by setting \( \text{mergerTreePruneNonEssential} = \text{true} \). The essential node is specified by \( \text{mergerTreePruningNonEssentialID} \) and \( \text{mergerTreePruningNonEssentialTime} \), which specify the index of the node, and the time at which its properties are required. Specifying the time is important—if the node is a satellite at this time, then the pruning will not remove any progenitors of the parent node in which the essential node lives at the specified time.

13.32. Chemical Reaction Rates

Methods for computing chemical reaction rates are selected via the \( \text{chemicalReactionRatesMethods} \) parameter. Multiple methods can be selected—their rates are cumulated.

---

7 The base node of the tree is never removed, even if it does not lie on one of the times in the constructed array.
8 The main branch is defined as depth 0. Other branches are assigned a depth equal to the depth of the branch onto which they merge plus 1. For example, any branch which merges directly onto the main branch is defined as depth 1.
13.33. Ram Pressure Induced Mass Loss Rates in Disks/Spheroids

13.33.1. Null
Selected with \texttt{chemicalReactionRatesMethods=null} this is a null method which does not set any rates.

13.33.2. Hydrogen Network
Selected with \texttt{chemicalReactionRatesMethods=hydrogenNetwork} this method computes rates using the network of reactions and fitting functions from Abel et al. [1997] and Tegmark et al. [1997]. The parameter \texttt{[hydrogenNetworkFast]} controls the approximations made. If set true then H\textsuperscript{−} is assumed to be at equilibrium abundance, H\textsuperscript{2} reactions are ignored and other slow reactions are ignored (see Abel et al. 1997).

13.33. Ram Pressure Induced Mass Loss Rates in Disks/Spheroids

The methods for computing ram pressure induced rates of mass loss in disks/spheroids are selected via the \texttt{ramPressureStrippingMassLossRate(Disks|Spheroids)Method} parameter.

13.33.1. Simple
Selected with \texttt{ramPressureStrippingMassLossRate(Disks|Spheroids)Method=simple} this method computes the mass loss rate to be, for disks:

\[
\dot{M}_{\text{gas}, \text{disk}} = \min \left( \frac{F_{\text{hot}, \text{host}}}{2\pi G \Sigma_{\text{gas}}(r_{\text{half}}) \Sigma_{\text{total}}(r_{\text{half}})}, \frac{R_{\text{maximum}}}{\tau_{\text{dyn, disk}}} \right) \frac{M_{\text{gas, disk}}}{\tau_{\text{dyn, disk}}}, \tag{13.164}
\]

where \(F_{\text{hot, host}}\) is the ram pressure force due to the hot halo of the node’s host (computed using the selected hot halo ram pressure force method; see §13.18), \(\Sigma_{\text{gas}}(r)\) is the gas surface density in the disk, \(\Sigma_{\text{total}}(r)\) is the total surface density in the disk, \(r_{\text{half}}\) is the disk half-mass radius, \(M_{\text{gas, disk}}\) is the total gas mass in the disk, \(\tau_{\text{dyn, disk}} = r_{\text{disk}}/v_{\text{disk}}\) is the dynamical time in the disk, and \(R_{\text{maximum}} = \texttt{[ramPressureStrippingMassLossRateDisksSimpleFractionalRateMaximum]}\) controls the maximum allowed rate of mass loss. For spheroids the mass loss rate is:

\[
\dot{M}_{\text{gas}} = -\max(\alpha, R_{\text{maximum}}) M_{\text{gas}}/\tau_{\text{spheroid}}, \tag{13.165}
\]

where \(R_{\text{maximum}} = \texttt{[ramPressureStrippingMassLossRateSpheroidSimpleFractionalRateMax]}\)

\[
\alpha = \frac{F_{\text{hot, host}}}{F_{\text{gravity}}}, \tag{13.166}
\]

and,

\[
F_{\text{gravity}} = \frac{4}{3} \rho_{\text{gas}}(r_{1/2}) \frac{GM_{\text{total}}(r_{1/2})}{r_{1/2}} \tag{13.167}
\]

is the gravitational restoring force in the spheroid at the half-mass radius, \(r_{1/2}\) [Takeda et al., 1984].

13.33.2. Null
Selected with \texttt{ramPressureStrippingMassLossRate(Disks|Spheroids)Method=null} this method assumes zero mass loss rate always.

13.34. Satellite Dynamical Friction

The method to be used for computing the satellite vector acceleration due to dynamical friction is specified by the \texttt{satelliteDynamicalFrictionMethod} parameter.
13. Physical Implementations

13.34.1. Null

Selected with `satelliteDynamicalFrictionMethod=null`, this method assumes that there is no dynamical friction in the system.

13.34.2. Chandrasekhar (1943)

Selected with `satelliteDynamicalFrictionMethod=Chandrasekhar1943`, this method uses the Chandrasekhar [1943] formula to compute the acceleration of a satellite at radius $r$ from the center of the host due to dynamical friction:

$$a_{DF} = -\frac{4\pi G^2 M_{\text{sat}} \rho_{\text{host}}(r)}{v_{\text{sat}}^3} \ln \Lambda \left[ \text{erf}(x) - \frac{2x}{\sqrt{\pi}} \exp(-x^2) \right] v_{\text{sat}},$$  \hspace{1cm} (13.168)

where $M_{\text{sat}}$ and $v_{\text{sat}}$ are the satellite’s mass and velocity, respectively, $v_{\text{sat}} = |v_{\text{sat}}|$, $\rho_{\text{host}}(r)$ is the host’s density profile, $\ln \Lambda = \text{satelliteDynamicalFrictionChandrasekharCoulombLogarithm}$ is the Coulomb logarithm, and $x \equiv v_{\text{sat}}/\sqrt{2}\sigma(r)$, where $\sigma(r)$ is the velocity dispersion of the host halo at radius $r$, approximated to be equal to the host virial velocity, $v_{\text{vir}}$.

13.35. Satellite Tidal Fields

The method for computing the tidal field experienced by satellite galaxies is selected via `satellitesTidalFieldMethod`.

13.35.1. Null

Selected with `satellitesTidalFieldMethod=null` this method assumes a zero tidal field always.

13.35.2. Spherical Symmetry

Selected with `satellitesTidalFieldMethod=sphericalSymmetry` this method assumes a spherically-symmetric host halo, and computes the tidal field accordingly using:

$$F = \frac{GM_{\text{host}}(<r_p)}{r_p^3} - 4\pi G \rho_{\text{host}}(r_p) + \omega_p^2,$$  \hspace{1cm} (13.169)

where $r_p$ is the pericentric radius, $M_{\text{host}}(<r)$ is the mass of the host halo enclosed within a sphere of radius $r$, $\rho_{\text{host}}(r)$ is the host density at radius $r$, and $\omega_p$ is the orbital angular velocity at pericenter.

13.36. Satellite Tidal Stripping

The method to be used for computing the satellite mass loss rate due to tidal stripping is specified by the `satelliteTidalStrippingMethod` parameter.

13.36.1. Null

Selected with `satelliteTidalStrippingMethod=null`, this method assumes that there is no tidal stripping in the system.
13.36.2. Zentner (2005)

Selected by default with \texttt{satelliteTidalStrippingMethod=Zentner2005}, this method uses the formalism of Zentner et al. [2005] to compute the mass loss rate $\dot{M}_\text{sat}$:

$$\dot{M}_\text{sat} = -\alpha \frac{M_\text{sat}(>r_\text{tidal})}{T_\text{orb}},$$

(13.170)

where $\alpha = \texttt{[satelliteTidalStrippingZentnerRate]}$, $T_\text{orb}$ is the orbital period of the satellite, and $r_\text{tidal}$ is the tidal radius of the satellite, given by the King [1962] formula:

$$r_\text{tidal} = \left(\frac{GM_\text{sat}}{\omega^2 - d^2 \Phi/dr^2}\right)^{1/3},$$

(13.171)

where $\omega$ is the orbital angular velocity of the satellite, and $\Phi(r)$ is the gravitational potential due to the host.

13.37. Satellite Tidal Heating

The method to be used for computing the integrated, normalized (i.e. the energy divided by radius squared) tidal heating energy, $Q_\text{tidal}$, for subhalos is specified by the \texttt{satelliteTidalHeatingMethod} parameter.

13.37.1. Null

Selected with \texttt{satelliteTidalHeatingMethod=null}, this method assumes that there is no tidal heating.

Selected by default with \texttt{satelliteTidalHeatingMethod=Gnedin1999}, this method uses the formalism of Gnedin et al. [1999] to compute the heating rate:

$$Q_\text{tidal} = \frac{1}{3} \epsilon \left[1 + \left(\frac{T_\text{shock}}{T_\text{orb}}\right)^2\right]^{-\gamma} g_{ij} G_{ij}$$

(13.172)

where $T_\text{orb}$ and $T_\text{shock}$ are the orbital period and shock duration, respectively, of the satellite, $\epsilon = \texttt{[satelliteTidalHeatingGnedinEpsilon]}$ and $\gamma = \texttt{[satelliteTidalHeatingGnedinGamma]}$ are model parameters, $g_{ij}$ is the tidal tensor, and $G_{ij}$ is the integral with respect to time of $g_{ij}$ along the orbit of the satellite. Upon tidal heating, a mass element at radius $r_i$ expands to radius $r_f$, according to the equation

$$\frac{1}{r_f} = \frac{1}{r_i} - \frac{2\gamma^3 Q_\text{tidal}}{GM_\text{sat}(<r_i)},$$

(13.173)

13.38. Star Formation Rate Surface Densities

The method for computing surface densities of star formation rate in disks is selected via \texttt{starFormationRateSurfaceDensityDisksMethod}.
13. Physical Implementations

13.38.1. Kennicutt-Schmidt

Selected with starFormationRateSurfaceDensityDisksMethod=Kennicutt-Schmidt this method assumes that the Kennicutt-Schmidt law holds [Schmidt, 1959, Kennicutt, 1998]:

$$\dot{\Sigma}_* = A \left( \frac{\Sigma_{H \text{I}}}{M_\odot \text{pc}^{-2}} \right)^N,$$

(13.174)

where $A = \text{[starFormationKennicuttSchmidtNormalization]}$ and $N = \text{[starFormationKennicuttSchmidtExponent]}$ are parameters. Optionally, if the [starFormationKennicuttSchmidtTruncate] parameter is set to true, then the star formation rate is truncated below a critical surface density such that

$$\dot{\Sigma}_* = \begin{cases} A \left( \frac{\Sigma_{H \text{I}}}{M_\odot \text{pc}^{-2}} \right)^N & \text{if } \Sigma_{\text{gas,disk}} > \Sigma_{\text{crit}} \\ A \left( \frac{\Sigma_{H \text{I}}}{M_\odot \text{pc}^{-2}} \right)^N (\Sigma_{\text{gas,disk}}/\Sigma_{\text{crit}})^\alpha & \text{otherwise} \end{cases}$$

(13.175)

Here, $\alpha = \text{[starFormationKennicuttSchmidtExponentTruncated]}$ and $\Sigma_{\text{crit}}$ is a critical surface density for star formation which we specify as

$$\Sigma_{\text{crit}} = \frac{q_{\text{crit}} \kappa \sigma_{\text{gas}}}{\pi G},$$

(13.176)

where $\kappa$ is the epicyclic frequency in the disk, $\sigma_{\text{gas}}$ is the velocity dispersion of gas in the disk and $q_{\text{crit}} = \text{[toomreParameterCritical]}$ is a dimensionless constant of order unity which controls where the critical density occurs. We assume that $\sigma_{\text{gas}}$ is a constant equal to [velocityDispersionDiskGas] and that the disk has a flat rotation curve such that $\kappa = \sqrt{2V/R}$.

13.38.2. Extended Schmidt

Selected with starFormationRateSurfaceDensityDisksMethod=extendedSchmidt this method assumes that the extended Schmidt law holds [Shi et al., 2011]:

$$\dot{\Sigma}_* = A \left( \frac{\Sigma_{\text{gas}}}{M_\odot \text{pc}^{-2}} \right)^{N_1} \left( \frac{\Sigma_*}{M_\odot \text{pc}^{-2}} \right)^{N_2},$$

(13.177)

where $A = \text{[starFormationExtendedSchmidtNormalization]}$, $N_1 = \text{[starFormationExtendedSchmidtGasExponent]}$ and $N_2 = \text{[starFormationExtendedSchmidtStarExponent]}$ are parameters.

13.38.3. Blitz-Rosolowsky

Selected with starFormationRateSurfaceDensityDisksMethod=Blitz-Rosolowsky2006 this method assumes that the star formation rate is given by [Blitz and Rosolowsky, 2006]:

$$\dot{\Sigma}_*(R) = \nu_{\text{SF}}(R) \Sigma_{\text{H_2,disk}}(R),$$

(13.178)

where $\nu_{\text{SF}}$ is a frequency given by

$$\nu_{\text{SF}}(R) = \nu_{\text{SF,0}} \left[ 1 + \left( \frac{\Sigma_{\text{H}_2}}{\Sigma_0} \right)^q \right],$$

(13.179)

where $q = \text{[surfaceDensityExponentBlitzRosolowsky]}$ and $\Sigma_0 = \text{[surfaceDensityCriticalBlitzRosolowsky]}$ are parameters and the surface density of molecular gas $\Sigma_{\text{H}_2} = (P_{\text{ext}}/R_0)^{\alpha} \Sigma_{\text{H}_I}$, where $\alpha = \text{[pressureExponentBlitzRosolowsky]}$.
and \( P_0 = \text{[pressureCharacteristicBlitzRosolowsky]} \) are parameters and the hydrostatic pressure in the disk plane assuming location isothermal gas and stellar components is given by

\[
P_{\text{ext}} \approx \frac{\pi}{2} G \Sigma_{\text{gas}} \left[ \Sigma_{\text{gas}} + \left( \frac{\sigma_{\text{gas}}}{\sigma_\star} \right) \Sigma_\star \right]
\]  

(13.180)

where we assume that the velocity dispersion in the gas is fixed at \( \sigma_{\text{gas}} = \text{[velocityDispersionDiskGas]} \) and, assuming \( \Sigma_\star \gg \Sigma_{\text{gas}} \), we can write the stellar velocity dispersion in terms of the disk scale height, \( h_\star \), as

\[
\sigma_\star = \sqrt{\pi G h_\star \Sigma_\star}
\]

(13.181)

where we assume \( h_\star / R_{\text{disk}} = \text{[heightToRadialScaleDiskBlitzRosolowsky]} \).

13.39. Star Formation Timescales

The methods for computing star formation timescales in disks and spheroids are selected via the \text{starFormationTimescaleDisksMethod} and \text{starFormationTimescaleSpheroidsMethod} respectively.

13.39.1. Fixed

Selected with \text{starFormationTimescaleDisksMethod=fixed} this method assumes a fixed timescale for star formation \text{[starFormationTimescaleDisksFixedTimescale]} (in Gyr).
13. Physical Implementations

13.39.2. Halo Scaling
Selected with starFormationTimescaleDisksMethod=haloScaling this method assumes a timescale for star formation of

\[ \tau_\star = \tau_{\star,0} \left( \frac{V_{\text{vir}}}{200 \text{km/s}} \right)^{\alpha_*} (1 + z)^{\beta_*}, \]  \hspace{1cm} (13.188)

where \( \tau_{\star,0} = \text{[starFormationTimescaleDisksHaloScalingTimescale]} \), \( \alpha_* = \text{[starFormationTimescaleDisksHaloScalingVirialVelocityExponent]} \) and \( \beta_* = \text{[starFormationTimescaleDisksHaloScalingRedshiftExponent]} \).

13.39.3. Dynamical Time
Selected with starFormationTimescale[Disks|Spheroids]Method=dynamicalTime this method computes the star formation timescale to be:

\[ \tau_\star = \epsilon_{\star}^{-1} \tau_{\text{dynamical}} \left( \frac{V}{200 \text{km/s}} \right)^{\alpha_*}, \]  \hspace{1cm} (13.189)

where \( \epsilon_{\star} = \text{[starFormation[Disks|Spheroids]Efficiency]} \) and \( \alpha_* = \text{[starFormation[Disks|Spheroids]VelocityExponent]} \) are input parameters, \( \tau_{\text{dynamical}} \equiv r/V \) is the dynamical timescale of the component and \( r \) and \( V \) are the characteristic radius and velocity respectively of the component. The timescale is not allowed to fall below a minimum value specified by starFormation[Disks|Spheroids]MinimumTimescale (in Gyr).

13.39.4. Integrated Surface Density
Selected with starFormationTimescaleDisksMethod=integratedSurfaceDensity this method computes the star formation timescale to be:

\[ \tau_\star = \frac{M_{\text{cold}}}{\int_0^\infty 2\pi r \dot{\Sigma}_\star(r) dr}. \]  \hspace{1cm} (13.190)

where \( \dot{\Sigma}_\star(r) \) is the surface density of star formation rate (see §13.38).

Selected with starFormationTimescaleDisksMethod=Baugh2005 this method assumes that the star formation rate is given by a modified version of the Baugh et al. [2005] prescription:

\[ \tau_\star = \tau_0 (V_{\text{disk}}/200 \text{km/s})^{\alpha a^\beta}, \]  \hspace{1cm} (13.191)

where \( \tau_0 = \text{[starFormationDiskTimescale]} \), \( \alpha = \text{[starFormationDiskVelocityExponent]} \) and \( \beta = \text{[starFormationExpansionExponent]} \).

13.40. Stellar Population Properties

Algorithms for determining stellar population properties—essentially the rates of change of stellar and gas mass and abundances given a star formation rate and fuel abundances (and perhaps a historical record of star formation in the component)—are selected by the stellarPopulationPropertiesMethod parameter.
13.40.1. Instantaneous

Selected with `stellarPopulationPropertiesMethod=instantaneous` this method uses the instantaneous recycling approximation. Specifically, given a star formation rate $\phi$, this method assumes a rate of increase of stellar mass of $M_* = (1 - R)\phi$, a corresponding rate of decrease in fuel mass. The rate of change of the metal content of stars follows from the fuel metallicity, while that of the fuel changes according to

$$\dot{M}_{\text{fuel},Z} = -(1 - R)Z_{\text{fuel}}\phi + p\phi. \quad (13.192)$$

In the above $R$ is the instantaneous recycled fraction and $p$ is the yield, both of which are supplied by the IMF subsystem. The rate of energy input from the stellar population is computed assuming that the canonical amount of energy from a single stellar population (as defined by the `feedbackEnergyInputAtInfinityCanonical`) is input instantaneously.

13.40.2. Noninstantaneous

Selected with `stellarPopulationPropertiesMethod=noninstantaneous` this method assumes fully non-instantaneous recycling and metal enrichment. Recycling and metal production rates from simple stellar populations are computed, for any given IMF, from stellar evolution models. The rates of change are then:

$$\dot{M}_* = \phi - \int_0^t \phi(t')\dot{R}(t - t'; Z_{\text{fuel}}[t'])\,dt', \quad (13.193)$$

$$\dot{M}_{\text{fuel}} = -\phi + \int_0^t \phi(t')\dot{R}(t - t'; Z_{\text{fuel}}[t])\,dt', \quad (13.194)$$

$$\dot{M}_{*,Z} = Z_{\text{fuel}}\phi - \int_0^t \phi(t')Z_{\text{fuel}}(t')\dot{R}(t - t'; Z_{\text{fuel}}[t'])\,dt', \quad (13.195)$$

$$\dot{M}_{\text{fuel},Z} = -Z_{\text{fuel}}\phi + \int_0^t \phi(t')\{Z_{\text{fuel}}(t')\dot{R}(t - t'; Z_{\text{fuel}}[t']) + \dot{p}(t - t'; Z_{\text{fuel}}[t'])\}\,dt', \quad (13.196)$$

where $\dot{R}(t; Z)$ and $\dot{p}(t; Z)$ are the recycling and metal yield rates respectively from a stellar population of age $t$ and metallicity $Z$. The energy input rate is computed self-consistently from the star formation history.

13.41. Stellar Population Spectra

Stellar population spectra are used to construct integrated spectra of galaxies. The method used to compute such spectra is specified by the `stellarPopulationSpectraMethod` parameter.

Selected with `stellarPopulationSpectraMethod=Conroy-White-Gunn2009` this method uses v2.2 of the FSPS code of Conroy et al. [2009] to compute stellar spectra. If necessary, the FSPS code will be downloaded, patched and compiled and run to generate spectra. These tabulations are then stored to file for later retrieval. The file name used is `data/SSP_Spectra_Conroy-et-al_v2.2_imf<imfDescriptor>.hdf5` where `<imfDescriptor>` is the IMF descriptor defined by the selected IMF (see §17.4.3).
13.41.2. File

Selected with `stellarPopulationSpectraMethod=file` this method reads stellar population spectra from an HDF5 file, with format described in §17.4.1.

13.42. Stellar Population Spectra Postprocessing

Stellar population spectra are postprocessed (to handle, for example, absorption by the IGM).

Different chains of postprocessing methods can be applied to different filters. The `[luminosityPostprocessSet]` parameter specifies, for each filter, which chain of postprocessing filters to use. (If this parameter is not present then "default" is assumed for all filters.) The filters used in each chain are specified by the input parameter `[stellarPopulationSpectraPostprocess<setName>Method]` where `<setName>` is the name specified in `[luminosityPostprocessSet]`.

13.42.1. Inoue, Shimizu & Iwata (2014) IGM Attenuation

Selected with `stellarPopulationSpectraPostprocess<setName>Method=inoue2014` this method postprocesses spectra through absorption by the IGM using the results of Inoue et al. [2014].

Selected with `stellarPopulationSpectraPostprocess<setName>Method=meiksin2006` this method postprocesses spectra through absorption by the IGM using the results of Meiksin [2006].

13.42.3. Madau (1995) IGM Attenuation

Selected with `stellarPopulationSpectraPostprocess<setName>Method=madau1995` this method postprocesses spectra through absorption by the IGM using the results of Madau [1995].

13.42.4. Lyman-continuum Suppression

Selected with `stellarPopulationSpectraPostprocess<setName>Method=lycSuppress` this method suppresses all emission in the Lyman continuum.

13.42.5. Recent Star Formation

Selected with `stellarPopulationSpectraPostprocess<setName>Method=recent` this method suppresses all emission from populations older than `[recentPopulationsTimeLimit]`.

13.42.6. Identity

Selected with `stellarPopulationSpectraPostprocess<setName>Method=identity` this method leaves the spectrum unchanged.

13.43. Stellar Astrophysics

Various properties related to stellar astrophysics are required by GALACTICUS. The following documents their implementation.
### 13.43. Basics

This subset of properties include recycled mass, metal yield and lifetime. The method used to compute such properties is specified by the `stellarAstrophysicsMethod` parameter.

**File**

Selected with `stellarAstrophysicsMethod=file` this method uses reads properties of individual stars of different initial mass and metallicity from an XML file and interpolates in them. The stars can be irregularly spaced in the plane of initial mass and metallicity. The XML file should have the following structure:

```xml
<stars>
  <star>
    <initialMass>0.6</initialMass>
    <lifetime>28.19</lifetime>
    <metallicity>0.0000</metallicity>
    <ejectedMass>7.65</ejectedMass>
    <metalYieldMass>0.44435954</metalYieldMass>
    <elementYieldMassFe>2.2017e-13</elementYieldMassFe>
    <source>Table 2 of Tumlinson, Shull &amp; Venkatesan (2003, ApJ, 584, 608)</source>
  </star>
  .
  .
  .
</stars>
```

Each star element must contain the `initialMass` (given in $M_\odot$) and `metallicity` tags. Other tags are optional. `lifetime` gives the lifetime of such a star (in Gyr), `ejectedMass` gives the total mass (in $M_\odot$) ejected by such a star during its lifetime, `metalYieldMass` gives the total mass of metals yielded by the star during its lifetime while `elementYieldMassFe` gives the mass of element Fe yielded by the star during its lifetime. The `source` and `url` tags are not used, but are strongly recommended to provide a reference to the origin of the stellar data.

### 13.43.2. Stellar Winds

Energy input to the ISM from stellar winds is used in calculations of feedback efficiency. The method used to compute stellar wind properties is specified by the `stellarWindsMethod` parameter.

**Leitherer et al. (1992)**

Selected with `stellarWindsMethod=Leitherer1992` this method uses the fitting formulae of Leitherer et al. [1992] to compute stellar wind energy input from the luminosity and effective temperature of a star.
13.43.3. Stellar Tracks

The method used to compute stellar tracks is specified by the `stellarTracksMethod` parameter.

**File**

Selected with `stellarTracksMethod=file` in this method luminosities and effective temperatures of stars are computed from a tabulated set of stellar tracks. The file containing the tracks to use is specified via the `stellarTracksFile` parameter. The file specified must be an HDF5 file with the following structure:

```plaintext
stellarTracksFile
  | +-> metallicity1
  |     | +-> metallicity
  |     | +-> mass1
  |     |     | +-> mass
  |     |     | +-> age
  |     |     | +-> luminosity
  |     |     | +-> effectiveTemperature
  |     +-> massN
  +-> metallicityN
```

Each `metallicityN` group tabulates tracks for a given metallicity (the value of which is stored in the `metallicity` dataset within each group), and may contain an arbitrary number of `massN` groups. Each `massN` group should contain a track for a star of some mass (the value of which is given in the `mass` dataset). Within each track three datasets specify the `age` (in Gyr), `luminosity` (in $L_\odot$) and `effectiveTemperature` (in Kelvin) along the track.

13.43.4. Supernovae Type Ia

Properties of Type Ia supernovae, including the cumulative number occurring and metal yield, are handled by the method selected using the `supernovaeIaMethod` parameter.

**Nagashima et al. (2005) Prescription**

Selected with `supernovaeIaMethod=Nagashima` this method uses the prescriptions from Nagashima et al. [2005] to compute the numbers and yields of Type Ia supernovae.

13.43.5. Population III Supernovae

Properties of Population III specific supernovae are handled by the method selected with the `supernovaePopIIIMethod` parameter.
Heger & Woosley (2002)
Selected with supernovaePopIIIMethod=Heger-Woosley2002 this method computes the energies of pair instability supernovae from the results of Heger and Woosley [2002].

13.43.6. Stellar Feedback
Aspects of stellar feedback are computed by the method selected with the stellarFeedbackMethod parameter.

Standard
Selected with stellarFeedbackMethod=standard, the method assumes that the cumulative energy input from a stellar population is equal to the total number of (Type II and Type Ia) supernovae multiplied by supernovaEnergy (specified in ergs) plus any Population III-specific supernovae energy plus the integrated energy input from stellar winds. The minimum mass of a star required to form a Type II supernova is specified (in $M_\odot$) via the initialMassForSupernovaeTypeII parameter.

13.44. Substructure and Merging
Substructures and merging of nodes/substructures is controlled by several algorithms which are described below:

13.44.1. Merging Timescales
The method used to compute merging timescales of substructures is specified by the satelliteMergingTimescalesMethod parameter.

Lacey & Cole (1993)
Selected with satelliteMergingTimescalesMethod=laceyCole1993, this method computes merging timescales using the dynamical friction calculation of Lacey and Cole [1993]. Timescales are multiplied by the value of the mergingTimescaleMultiplier input parameter.

Lacey & Cole (1993) + Tormen
Selected with satelliteMergingTimescalesMethod=laceyCole1993Tormen, this method computes merging timescales using the dynamical friction calculation of Lacey and Cole [1993] with a parameterization of orbital parameters designed to fit the results of Tormen [1997] as described by Cole et al. [2000]. Timescales are multiplied by the value of the mergingTimescaleMultiplier input parameter. Specifically, the merging time is taken to be:

$$\tau_{\text{merge}} = \frac{f_r \Phi \tau_{\text{dynamical}}}{2B(1)} \frac{M_{\text{host}}/M_{\text{satellite}}}{\ln(M_{\text{host}}/M_{\text{satellite}})}$$

(13.198)

where $f_r =$mergingTimescaleMultiplier, $\tau_{\text{dynamical}}$ is the dynamical time of the host halo and $B(x) = \text{erf}(x) - 2x \exp(x)/\sqrt{\Pi}$. The orbital factor $\Phi = e^{0.78 (R_c/R_{\text{vir}})^2}$ is drawn at random from a log-normal distribution with median $-0.14$ and dispersion $0.26$ as found by Cole et al. [2000].
13. Physical Implementations

**Jiang (2008)**

Selected with `satelliteMergingTimescalesMethod=jiang2008`, this method computes merging timescales using the dynamical friction calibration of Jiang et al. [2008]. Jiang et al. [2008] find that their fitting formula does not perfectly capture the results of N-body simulations, instead showing a scatter in the ratio $T_{fit}/T_{sim}$ where $T_{fit}$ is the merging time from their fitting formula and $T_{sim}$ is that measured from their N-body simulation. Furthermore, they show that the distribution of $T_{fit}/T_{sim}$ is well described by a log-normal with dispersion (in log($T_{fit}/T_{sim}$)) of $\sigma = 0.4$. Random perturbations can be applied to the merger times returned by this implementation by setting $\sigma = \text{[satelliteMergingJiang2008Scatter]} > 0$ which will cause the merger time to be drawn from a log-normal distribution of width $\sigma$ with median equal to $T_{fit}$.

**Boylan-Kolchin (2008)**

Selected with `satelliteMergingTimescalesMethod=boylanKolchin2008`, this method computes merging timescales using the dynamical friction calibration of Boylan-Kolchin et al. [2008].

**Wetzel & White (2010)**

Selected with `satelliteMergingTimescalesMethod=wetzelWhite2010`, this method computes merging timescales using the dynamical friction calibration of Wetzel and White [2010].

**Villalobos et al. (2013)**

Selected with `satelliteMergingTimescalesMethod=villalobos2013`, this method computes merging timescales using the modifier of Villalobos et al. [2013] as

$$
\tau_{\text{merge}} = (1 + z)^{\alpha} \tau'_{\text{merge}},
$$

where $\alpha = \text{[satelliteMergingTimescaleVillalobos2013Exponent]}$ and $\tau'_{\text{merge}}$ is the merging timescale computed by another satellite merging timescale method as specified via `satelliteMergingTimescaleVillalobos2013BaseMethod`.

**Preset**

Selected with `satelliteMergingTimescalesMethod=preset`, this method returns a precomputed merging timescale stored by the satellite component.

**Null**

Selected with `satelliteMergingTimescalesMethod=null`, this method returns zero merging timescale.

**Infinite**

Selected with `satelliteMergingTimescalesMethod=infinite`, this method returns an infinite merging timescale (technically, it returns $10^{30}$ Gyr which should be sufficiently close to infinity for practical purposes).

13.44.2. Virial Orbits

The algorithm to be used to determine orbital parameters of substructures when they first enter the virial radius of their host is specified via the `virialOrbitsMethod` parameter.
Benson (2005)

Selected with $\text{virialOrbitsMethod} = \text{Benson2005}$, this method selects orbital parameters randomly from the distribution given by Benson [2005].

Fixed

Selected with $\text{virialOrbitsMethod} = \text{fixed}$, this method sets all orbital parameters to fixed values, with $v_r = [\text{virialOrbitsFixedRadialVelocity}]V_{\text{virial}}$ and $v_\phi = [\text{virialOrbitsFixedTangentialVelocity}]V_{\text{virial}}$.

Wetzel (2010)

Selected with $\text{virialOrbitsMethod} = \text{Wetzel2010}$, this method selects orbital parameters randomly from the distribution given by Wetzel [2010], including the redshift and mass dependence of the distributions. Note that the parameter $R_1$ can be come negative (which is unphysical) for certain regimes of mass and redshift according to the fitting function for $R_1$ given by Wetzel [2010]. Therefore, we enforce $R_1 > 0.05$. Similarly, the parameter $C_1$ can become very large in some regimes which is probably an artifact of the fitting function used rather than physically meaningful (and which causes numerical difficulties in evaluating the distribution). We therefore prevent $C_1$ from exceeding 9.999999$^9$

13.44.3. Node Merging

The algorithm to be used to process nodes when they become substructures is specified by the $\text{nodeMergersMethod}$ parameter.

Single Level Hierarchy

Selected with $\text{nodeMergersMethod} = \text{singleLevelHierarchy}$, this method maintains a single level hierarchy of substructure, i.e. it tracks only substructures, not sub-substructures or deeper levels. When a node first becomes a satellite it is appended to the list of satellites associated with its host halo. If the node contains its own satellites they will be detached from the node and appended to the list of satellites of the new host (and assigned new merging times).

13.45. Supernovae Feedback Models

The supernovae feedback driven outflow rate is computed using the method specified by the $\text{starFormationFeedback[Disks|Spheroids]}$ parameter for disks and spheroids respectively.

13.45.1. Fixed

Selected with $\text{starFormationFeedbackDisksMethod} = \text{fixed}$, this method assumes an outflow rate of:

$$
\dot{M}_{\text{outflow}} = f_{\text{outflow}} \frac{\dot{E}}{E_{\text{canonical}}},
$$

(13.200)

where $f_{\text{outflow}} = [\text{diskOutflowFraction}]$ is the fraction of the star formation rate that goes into outflow, $\dot{E}$ is the rate of energy input from stellar populations and $E_{\text{canonical}}$ is the total energy input by a canonical stellar population normalized to $1 M_\odot$ after infinite time.

$^9$We use this value rather than 10 since the GSL $_2F_1$ hypergeometric function fails in some cases when $C_1 \geq 10$. 

303
13. Physical Implementations

### 13.45.2. Power Law

Selected with `starFormationFeedback[Disks|Spheroids]Method=powerLaw`, this method assumes an outflow rate of:

\[
\dot{M}_{\text{outflow}} = \left( \frac{\dot{V}_{\text{outflow}}}{V} \right)^{\alpha_{\text{outflow}}} \frac{\dot{E}}{E_{\text{canonical}}},
\]

where \(\dot{V}_{\text{outflow}}\)=[disk|spheroid]OutflowVelocity (in km/s) and \(\alpha_{\text{outflow}}\)=[disk|spheroid]OutflowVelocity are input parameters, \(V\) is the characteristic velocity of the component, \(\dot{E}\) is the rate of energy input from stellar populations and \(E_{\text{canonical}}\) is the total energy input by a canonical stellar population normalized to 1\(M_\odot\) after infinite time.

### 13.45.3. Creasey et al. (2012)

Selected with `starFormationFeedbackDisksMethod=Creasey2012`, this method computes the outflow rate using the model of Creasey et al. [2012]. Specifically,

\[
\dot{M}_{\text{outflow}} = \frac{\dot{E}_{\text{SN}}}{E_{\text{SN}}M_*} \int_0^\infty \beta_0 \Sigma_g^{\nu}(r)f_g(r)\dot{\Sigma}_\star(r)2\pi r dr,
\]

where \(\Sigma_g,1(r)\) is the surface density of gas in units of \(M_\odot \text{pc}^{-2}\), \(f_g(r)\) is the gas fraction, \(\dot{\Sigma}_\star(r)\) is the surface density of star formation rate, \(M_*\) is the total star formation rate in the disk, \(E_{\text{SN}}\) is the current energy input rate from supernovae, \(E_{\text{SN}}\) is the total energy input per unit mass from a stellar population after infinite time, \(\beta_0=[\text{starFormationFeedbackDisksCreasy2012Beta0}]\), \(\mu=[\text{starFormationFeedbackDisksCreasy2012Mu}]\), and \(\nu=[\text{starFormationFeedbackDisksCreasy2012Nu}]\).

### 13.46. Supernovae Expulsive Feedback Models

The expulsive supernovae feedback driven outflow rate is computed using the method specified by the `starFormationExpulsiveFeedback[Disks|Spheroids]Method` for disks and spheroids respectively.

#### 13.46.1. Null

Selected with `starFormationExpulsiveFeedback[Disks|Spheroids]Method=null`, this method assumes a zero outflow rate.

#### 13.46.2. Superwind

Selected with `starFormationExpulsiveFeedback[Disks|Spheroids]Method=superwind`, this method assumes an outflow rate of:

\[
\dot{M}_{\text{outflow}} = \beta_{\text{superwind}} \frac{\dot{E}}{E_{\text{canonical}}} \begin{cases} 
(V_{\text{superwind}}/V)^2 & \text{if } V > V_{\text{superwind}} \\
1 & \text{otherwise}
\end{cases}
\]

where \(V_{\text{superwind}}=[\text{disk|spheroid}](\text{SuperwindVelocity} \text{ (in km/s)) and } \beta_{\text{superwind}}=[\text{disk|spheroid}](\text{SuperwindMassLoading})\) are input parameters, \(V\) is the characteristic velocity of the component, \(\dot{E}\) is the rate of energy input from stellar populations and \(E_{\text{canonical}}\) is the total energy input by a canonical stellar population normalized to 1\(M_\odot\) after infinite time.
13.47. Supermassive Black Hole Binaries: Initial Separation

The method to be used for computing the initial separation of black hole binaries is specified by the blackHoleBinaryInitialRadiiMethod parameter.

13.47.1. Spheroid Radius Fraction

Selected with blackHoleBinaryInitialRadiiMethod=spheroidRadiusFraction, this method assumes that the initial separation of the binary is equal to a fixed fraction [blackHoleInitialRadiusSpheroidRadiusRatio] of the larger of the spheroid scale radii of the two merging galaxies.

Selected with blackHoleBinaryInitialRadiiMethod=Volonteri2003, this method assumes that the initial separation follows the relationship described in Volonteri et al. [2003]

\[ r_{\text{initial}} = \frac{G(M_{*1} + M_{*2})}{2\sigma_{DM}^2} \]  \hspace{1cm} (13.204)

where \( M_{*1} \) and \( M_{*2} \) are the masses of the black holes and \( \sigma_{DM} \) is the velocity dispersion of the dark matter, which we assume to equal the virial velocity of the dark matter halo.

13.47.3. Tidal Radius

Selected with blackHoleBinaryInitialRadiiMethod=tidalRadius, this method assumes an initial separation that corresponds to the distance at which the satellite galaxy is tidally stripped to its half-mass radius, thus only leaving the central massive black hole. Specifically, the initial radius is given by:

\[ \frac{M_{\text{sat}}}{2r_{\text{sat},1/2}^3} = -\frac{d}{dr} \frac{M_{\text{host}}(r_{\text{initial}})}{r_{\text{initial}}^2} \]  \hspace{1cm} (13.205)

Where \( M_{\text{sat}} \) is the mass of the satellite galaxy, \( r_{\text{sat},1/2} \) is its half mass radius, \( M_{\text{host}}(r) \) is the mass of the host galaxy within radius \( r \) and \( r_{\text{initial}} \) is the initial radius.

13.48. Supermassive Black Hole Binaries: Separation Growth Rate

The method to be used for computing the separation growth rate of black hole binaries is specified by the blackHoleBinarySeparationGrowthRateMethod parameter.

13.48.1. Null

Selected by default and with blackHoleBinarySeparationGrowthRateMethod=null, this method assumes that the initial separation of the binaries is final.

13.48.2. Standard

Selected with blackHoleBinarySeparationGrowthRateMethod=Standard, this method computes the separation growth rate of the binaries following a modified version of Volonteri et al. [2003] which include
terms for dynamical friction, hardening due to scattering of stars and gravitational wave emission.

\[ \dot{a} = \min \left( - \frac{G \rho_* a^2 H}{\sigma}, + \frac{2 \dot{v}_{DF} a}{v_c} \right) - \frac{256 G^3 M_{*,1} M_{*,2} (M_{*,1} + M_{*,2})}{5 c^5 a^3} \]  

(13.206)

where \( a \) is the black hole binary separation, \( H \) is a dimensionless hardening parameter \( H \approx 15 \) in the limit of a very hard, equal mass binary, \( \rho_* \) is the density of stars, \( \dot{v}_{DF} \) is the acceleration (negative) due to dynamical friction, \( v_c \) is the circular velocity, \( \sigma \) is the velocity dispersion of stars. Here the first factor represents hardening due to strong scattering of stars, the second results from dynamical friction with distant stars, gas and dark matter and the last results from the emission of gravitational waves Peters [1964].

The acceleration due to dynamical friction is computed using Chandrasekhar’s formula:

\[ \dot{v}_{DF} = - \frac{2 \pi G^2 M_*}{V_C^2} \sum_i \rho_i \log(1 + \Lambda_i^2) \left[ \text{erf}(X_i) - \left\{ \frac{2 X_i}{\sqrt{\pi}} \exp \left( -X_i^2 \right) \right\} \right], \]  

(13.207)

where the sum is taken over the spheroid (gaseous plus stellar mass) and dark matter halo components\(^{10}\).

Here,

\[ \Lambda_i = \frac{a \sigma^2}{G(M_{*,1} + M_{*,2})}, \]  

(13.208)

is the Coulomb logarithm and

\[ X_i = V_c / \sqrt{2} \sigma. \]  

(13.209)

In all of the above equations, the velocity dispersion \( \sigma_i \) is computed from the spherical Jeans equation assuming an isotropic velocity dispersion if \([\text{blackHoleBinariesComputeVelocityDispersion}]=\text{true}\). Otherwise, \( \sigma_i \) is set to the halo virial velocity for dark matter and to the spheroid characteristic velocity for the spheroid.

In calculating the rate of hardening due to scattering of stars, the stellar density is reduced by a factor \([\text{Volonteri et al., 2003}]\)

\[ f_\rho = \min \left\{ \left( \frac{4 a \sigma^2_{\text{spheraoid}}}{3 G(M_{*,1} + M_{*,2})} \log \left( \frac{G M_{*,2}}{4 a \sigma^2_{\text{spheraoid}} a} \right) \right)^2, 1 \right\}, \]  

(13.210)

if \([\text{stellarDensityChangeBinaryMotion}]=\text{true}\) to account for the ejection of stars from the loss cone.

### 13.49. Supermassive Black Holes Binaries: Recoil Velocity

The method to be used for computing the recoil velocity due to gravitational waves ejection during a binary merger specified by the \texttt{blackHoleBinaryRecoilVelocityMethod} parameter.

#### 13.49.1. Null

Selected by default and with \texttt{blackHoleBinaryRecoilVelocityMethod=null}, this method assumes that there is no recoil velocity.

---

\(^{10}\)The disk is ignored as the black hole is assumed to be orbiting in a circular orbit in the disk.
13.49.2. Campanelli et al. (2007)

Selected with `blackHoleBinaryRecoilVelocityMethod=Campanelli2007`, this method computes the recoil velocity during a black hole binary merger due to the emission of gravitational waves, following the formulae derived in Campanelli et al. [2007]

\[ V_{\text{recoil}} = V_m \epsilon_1 + V_\perp (\cos \xi \epsilon_1 + \sin \xi \epsilon_2) + V_\parallel \epsilon_2 \]  \hspace{1cm} (13.211)

with:

\[ V_m = A q^2 (1-q) \frac{1}{(1+q)^5} (1 + B \frac{q}{(1+q)^2}) \] \hspace{1cm} (13.212)

\[ V_\perp = H \frac{q^2}{(1+q)^5} (\alpha_{2 \parallel} - q \alpha_{1 \parallel}) \] \hspace{1cm} (13.213)

\[ V_\parallel = K \cos(\theta - \theta_0) \frac{q^2}{(1+q)^5} (\alpha_{2 \perp} - q \alpha_{1 \perp}) \] \hspace{1cm} (13.214)

where \( \theta \) is defined as the angle between the inplane component of \( \Delta \) and the infall direction at merger. \( q \) is the mass ratio of the black holes as \( q = M_{\bullet,1}/M_{\bullet,2} \) and \( \alpha_i = S_i/M_{\bullet,i} \) depends of the spin and mass of the black hole \( \xi \) measures the angle between the unequal mass and the spin contribution to the recoil velocity in the orbital plane. \( \epsilon_1, \epsilon_2 \) are orthogonal unit vectors in the orbital plane. Our method assumes the spin of the second black hole is randomly generated, while that of the first is aligned with the angular momentum of the system. The constants used are retrieved from the articles by: Koppitz et al. [2007] for \( H = (7.3 \pm 0.3) \times 10^3 \) km/s, González et al. [2007b] for \( A = 1.2 \times 10^4 \) km/s, González et al. [2007a] for \( K \cos(\delta \theta) = (6, -5.3) \times 10^4 \) km/s and \( K = (6.0 \pm 0.1) \times 10^4 \) km/s.

13.50. Supermassive Black Hole Binaries: Mergers

The method to be used for computing the effects of binary mergers of supermassive black holes is specified by the `blackHoleBinaryMergersMethod` parameter.

13.50.1. Rezzolla et al. (2008)

Selected with `blackHoleBinaryMergersMethod=Rezzolla2008`, this method uses the fitting function of Rezzolla et al. [2008] to compute the spin of the black hole resulting from a binary merger. The mass of the resulting black hole is assumed to equal the sum of the mass of the initial black holes (i.e. there is negligible energy loss through gravitational waves).

13.51. Tidal Induced Mass Loss Rates in Disks/Spheroids

The methods for computing tidal induced rates of mass loss in disks/spheroids are selected via the `tidalStrippingMassLossRate(Disks|Spheroids)Method` parameter.

13.51.1. Simple

Selected with `tidalStrippingMassLossRate(Disks|Spheroids)Method=simple` this method computes the mass loss rate to be:

\[ \dot{M} = -\alpha M/\tau_{(disk|spheroid)}, \]  \hspace{1cm} (13.215)

where

\[ \alpha = \min(F_{\text{tidal}}/F_{\text{gravity}}, R_{\text{maximum}}), \] \hspace{1cm} (13.216)
13. Physical Implementations

\[ F_{\text{tidal}} = F_{\text{tidal}}r_{1/2}, \ F_{\text{tidal}} \] is the tidal field from the host halo (see §13.35),
\[ F_{\text{gravity}} = V_{1/2}^2(r_{1/2})/r_{1/2} \quad (13.217) \]
is the gravitational restoring force in the disk/spheroid at the half-mass radius, \( r_{1/2} \), and \( R_{\text{maximum}} = [\text{tidalStrippingMassLossRate} \ (\text{Disks}|\text{Spheroids}) \ \text{Method}] \).

13.51.2. Null

Selected with \text{tidalStrippingMassLossRate(Disks|Spheroids)Method=\textbf{null}}\ this method assumes zero mass loss rate always.

13.52. Survey Geometry

The method to be used for computing the geometry of surveys for data analysis is specified by the \text{surveyGeometryMethod} parameter.

13.52.1. Li & White (2009)

Selected with \text{surveyGeometryMethod=\textbf{Li-White-2009-SDSS}}, this method describes the survey geometry of Li and White [2009].

For the angular mask, we make use of the catalog of random points within the survey footprint provided by the NYU-VAGC\textsuperscript{11} (Blanton et al. 2005; see also Adelman-McCarthy et al. 2008, Padmanabhan et al. 2008). Li and White [2009] consider only the main, contiguous region and so we keep only those points which satisfy \( \text{RA} > 100^\circ \), \( \text{RA} < 300^\circ \), and \( \text{RA} < 247^\circ \) or \( \delta < 51^\circ \). When the survey window function is needed, these points are used to determine which elements of a 3D grid fall within the window function.

To estimate the depth of the Li and White [2009] sample as a function of galaxy stellar mass we make use of semi-analytic models in the Millennium Database. Specifically, we use the semi-analytic model (SAM) of De Lucia and Blaizot (2007; specifically the millimil..DeLucia2006a and millimil..DeLucia2006a..sdss2mass tables in the Millennium Database). For each snapshot in the database, we extract the stellar masses and observed-frame SDSS r-band absolute magnitudes (including dust extinction), and determine the median absolute magnitude as a function of stellar mass. Using the limiting apparent magnitude of the Li and White [2009] sample, \( r = 17.6 \), we infer the corresponding absolute magnitude at each redshift and, using our derived absolute magnitude–stellar mass relation, infer the corresponding stellar mass.

The end result of this procedure is the limiting stellar mass as a function of redshift, accounting for k-corrections, evolution, and the effects of dust. Figure 13.1 shows the resulting relation between stellar mass and the maximum redshift at which such a galaxy would be included in the sample. Points indicate measurements from the SAM, while the line shows a polynomial fit:

\[ z(M_*) = -5.950 + 2.638m - 0.4211m^2 + 2.852 \times 10^{-2}m^3 - 6.783 \times 10^{-4}m^4, \quad (13.218) \]

where \( m = \log_{10}(M_*/M_\odot) \). We use this polynomial fit to determine the depth of the sample as a function of stellar mass. We adopt a solid angle of \( 2.1901993 \) sr [Percival et al., 2007] for the sample.

13.52.2. Martin et al. (2010)

Selected with \text{surveyGeometryMethod=\textbf{Martin-2010-ALFALFA}}, this method describes the survey geometry of Martin et al. [2010].

\textsuperscript{11}Specifically, \url{http://sdss.physics.nyu.edu/lss/dr72/random/lss_random-0.dr72.dat}.
Figure 13.1.: The maximum redshift at which a galaxy of given stellar mass can be detected in the sample of Li and White [2009]. Points show the results obtained using the De Lucia and Blaizot [2007] model from the Millennium Database, while the lines shows a polynomial fit to these results (given in eqn. 13.218).

For the angular mask we use the three disjoint regions defined by $07^h30^m < R.A. < 16^h30^m$, $+04^\circ < \text{decl.} < +16^\circ$, and $+24^\circ < \text{decl.} < +28^\circ$ and $22^h < R.A. < 03^h$, $+14^\circ < \text{decl.} < +16^\circ$, and $+24^\circ < \text{decl.} < +32^\circ$ corresponding to the sample of Martin et al. [2010]. When the survey window function is needed we generate randomly distributed points within this angular mask and out to the survey depth. These points are used to determine which elements of a 3D grid fall within the window function.

To estimate the depth of the Martin et al. [2010] sample as a function of galaxy HI mass we first infer the median line width corresponding to that mass. To do so, we have fit the median line width-mass relation from the $\alpha.40$ sample with power-law function as shown in Fig. 13.2. We find that the median line width can be approximated by

$$\log_{10}(W_{50}/\text{km s}^{-1}) = c_0 + c_1 \log_{10}(M_{\text{HI}}/M_{\odot}),$$

with $c_0 = -0.770$ and $c_1 = 0.315$. Given the line width, the corresponding integrated flux limit, $S_{\text{int}}$, for a signal-to-noise of 6.5 is inferred using equation (A1) of Haynes et al. [2011]. Finally, this integrated flux limit is converted to maximum distance at which the source could be detected using the expression given in the text of section 2.2 of Martin et al. [2010]:

$$M_{\text{HI}} = 2.356 \times 10^5 \left(\frac{D}{\text{Mpc}}\right)^2 \left(\frac{S_{\text{int}}}{\text{Jy km s}^{-1}}\right).$$
Figure 13.2.: HI line width vs. HI mass as measured from the $\alpha.40$ survey of Martin et al. [2010]. Red points with error bars show individual measurements, while the larger circles indicate the running median of these data. The green line is a power-law fit to the running median as described in eqn. (13.219).
14. Additional Output Quantities

14.1. Black Hole Accretion

Properties associated with accretion onto supermassive black holes can be output by setting blackHoleOutputAccretion=true. Currently, two additional properties are output for each node when this option is selected:

- blackHoleAccretionRate: The rate at which the supermassive black hole is accreting mass in \( M_\odot \text{ Gyr}^{-1} \);
- blackHoleJetPower: The power being emitted into jets by the black hole/accretion disk system in \( M_\odot \text{ km}^2 \text{ s}^{-2} \text{ Gyr}^{-1} \).

14.2. Cooling Data

Properties associated with cooling in hot halos can be output by setting hotHaloOutputCooling=true. Currently, two additional properties are output for each node when this option is selected:

- hotHaloCoolingRate: The rate at which gas is cooling from the halo (assuming no sources of heating) in \( M_\odot \text{ Gyr}^{-1} \);
- hotHaloCoolingRadius: The characteristic cooling radius in the halo in Mpc.

14.3. Density Contrast Data

Properties of nodes at density contrasts other than the virial density can be output by setting [outputDensityContrastData]=true. When selected, this output option requires that a list of density contrasts, \( \Delta \) (defined in units of the mean density of the Universe), be given in the [outputDensityContrastValues] input parameter. For each specified density contrast, two properties are output for each node: nodeRadius\( \Delta \) and nodeMass\( \Delta \) which give the radius enclosing a mean density contrast of \( \Delta \) and the mass enclosed within that radius. The parameter [outputDensityContrastDataDarkOnly] controls whether density contrasts are measured for total mass (false) or dark matter mass only (true). In the latter case, density contrasts are defined relative to the mean dark matter density of the Universe.

14.4. Descendent Node Index

By setting [outputDescendentIndices]=true the index of the node containing the galaxy to which each current galaxy will belong at the next output time (i.e. the forward descendent) will be written to the output file. To clarify, this will be the index of the node into which the galaxy descends, or the index of a node with which it merges prior to the next output time (and if that node merges with another, the index will be of that node and so on).

Note that, to operate correctly, information about which node a given node may merge with (and when this merger will happen) must be available. This is typically available in merger trees read from file providing [treeNodeMethodSatelliteOrbit] and [mergerTreeReadPresetMergerTimes] are both set to true. When using randomly assigned satellite orbits and merger times, information on when merging
occurs does not exist until a node becomes a satellite. Thus, if the node becomes a satellite after the current output, but before the next output, there is no way to know which node it will belong to at the next output (in such cases, the fallback assumption is no merging).

### 14.5. Half-Light Radii Data

Half-light radii and masses enclosed within them can be output by setting \([\text{outputHalfLightData}] = \text{true}\). When selected the half-light radius in each specified luminosity band is output as \([\text{halfLightRadius}\{\text{luminosityID}\}]\) (in Mpc), where \{luminosityID\} is the usual luminosity identifier suffix, and the total (dark + baryonic) mass within that radius is output as \([\text{halfLightMass}\{\text{luminosityID}\}]\) (in \(M_\odot\)).

### 14.6. Half-Mass Radii

Half-mass radii can be output by setting \([\text{outputHalfMassData}] = \text{true}\). When selected the half-mass radius is output as \([\text{halfMassRadius}]\) (in Mpc).

### 14.7. Halo Model Quantities

The following quantities related to galaxy clustering are output if \([\text{outputHaloModelData}] = \text{true}\):

- **nodeBias** The large scale, linear theory bias for each node. For satellite nodes, this corresponds to the bias of their host halo;
- **isolatedHostIndex** The index of the isolated node in which this node lives. This is identical to \(\text{nodeIndex}\) for non-satellite nodes.

In addition to these quantities output for each node, setting \([\text{outputHaloModelData}] = \text{true}\) causes the creation of a \(\text{haloModel}\) group in the \text{GALACTICUS} output file. This group contains the following:

- **wavenumber** A dataset giving the wavenumbers (in units of \(\text{Mpc}^{-1}\)) at which all output power spectra are tabulated. The minimum and maximum wavenumbers to tabulate are determined by the \([\text{haloModelWavenumberMinimum}]\) and \([\text{haloModelWavenumberMaximum}]\) parameters respectively, while the number of points to tabulate in each decade of wavenumber is determined by the \([\text{haloModelWavenumberPointsPerDecade}]\) parameter.
- **powerSpectrum** A dataset giving the linear theory power spectrum (in units of \(\text{Mpc}^3\) normalized to \(z = 0\) at each wavenumber specified in the \text{wavenumber} dataset.

\([\text{Output}\{i\}/\text{mergerTree}\{j\}/\text{fourierProfile}\{k\}]\) A dataset giving the Fourier transform of the dark matter halo density profile (dimensionless and normalized to unity at small wavenumber) for the node with index \(k\) in merger tree with index \(j\) at output number \(i\). Profiles are written only for nodes which are isolated, and are tabulated at the wavenumbers given in the \text{wavenumber} group. Note that wavenumbers are assumed to be comoving.

Finally, each numbered output group is given two additional attributes, **linearGrowthFactor** and **linearGrowthFactorLogDerivative** which give the growth factor, \(D\), and its logarithmic derivative, \(d\ln D/d\ln a\) at the output time.

The information output can be used to construct galaxy power spectra and correlation functions (see §5.2.2 for example).
14.8. Lightcone Coordinates

The position (and velocity and redshift) of a galaxy within a lightcone will automatically be output if the lightcone output filter is active (see §17.4.3). In such cases, the following properties will be output for all galaxies:

- **lightconePositionX**: Position of the galaxy (in comoving Mpc) along the radial direction of the lightcone;
- **lightconePositionY**: Position of the galaxy (in comoving Mpc) along the 1st angular direction of the lightcone;
- **lightconePositionZ**: Position of the galaxy (in comoving Mpc) along the 2nd angular direction of the lightcone;
- **lightconeVelocityX**: Velocity of the galaxy (in km/s) along the radial direction of the lightcone;
- **lightconeVelocityY**: Velocity of the galaxy (in km/s) along the 1st angular direction of the lightcone;
- **lightconeVelocityZ**: Velocity of the galaxy (in km/s) along the 2nd angular direction of the lightcone;
- **lightconeRedshift**: Redshift of the galaxy in the lightcone.

**angularWeight** The mean number density of this galaxy per unit area on the sky (in degrees^{-2}). For a “square” geometry, i.e. defined such that a point (x, y, z) is in the survey angular mask if |atan2(y, x)| < ψ/2 and |atan2(z, x)| < ψ/2 where atan2() is the quadrant-aware inverse tangent function, and ψ is the angular size of the field, we compute the solid angle of the lightcone as follows. Define a spherical coordinate system (θ, φ) with the pole (θ = 0) aligned with the x-axis. The solid angle of the field is then

\[
\Omega = 2\pi \int_0^{\psi/2} \sin \theta d\theta + 8 \int_{\psi/2}^{\tan^{-1}(\sqrt{2}\tan(\psi/2))} d\theta \sin \theta \int_{\cos^{-1}(\tan(\psi/2)/\tan \theta)}^{\pi/4} d\phi, \tag{14.1}
\]

which is

\[
\Omega = 2\pi [1 - \cos(\psi/2)] + 8 \int_{\psi/2}^{\tan^{-1}(\sqrt{2}\tan(\psi/2))} d\theta \sin \theta \left[ \frac{\pi}{4} - \cos^{-1}\left(\frac{\tan(\psi/2)}{\tan \theta}\right) \right], \tag{14.2}
\]

or

\[
\Omega = 2\pi [1 - \cos(\tan^{-1}(\sqrt{2}\tan(\psi/2)))] - 8 \int_{\psi/2}^{\tan^{-1}(\sqrt{2}\tan(\psi/2))} d\theta \sin \theta \cos^{-1}\left(\frac{\tan(\psi/2)}{\tan \theta}\right), \tag{14.3}
\]

The final integral can be evaluated (using Mathematica for example) to give

\[
\begin{align*}
\Omega &= 2\pi [3 - \cos(\tan^{-1}(\sqrt{2}\tan(\psi/2)))] - 8 \sin(x) \left( \sqrt{(a^2 + 1) \cos(2x) + a^2 - 1} \log\left((a\sqrt{2a^2 \cos^2(2x) + \cos(2x)} - 1 + 2a) - \log(\cos(2x) - 1)\right)csc^2(x) \left(-(a^2 + 1) \cos(2x) + a^2 - 1\right) - \cot(x)((a^2 + 1) \cos(2x) + a^2 - 1) \cos^{-1}(a \cot(x))) / ((a^2 + 1) \cos(2x) + a^2 - 1), \tag{14.4}
\end{align*}
\]

where \(a = \tan(\psi/2)\) and \(x = \tan^{-1}(\sqrt{2}\tan(\psi/2))\).

If active, the geometry of the lightcone must be specified in an XML file, the name of which must be specified using the [filterLightconeGeometryFileName] input parameter. The XML file should have the following structure:

\[1\] Note that this will not, in general, be precisely the same as the redshift corresponding to the output time.

</unitVector1>
14.9. Main Branch Evolution

The boxLength element should give the length of the simulation box (the box will be replicated to span the volume covered by the lightcone), while the maximumDistance element should specify the largest distance in the lightcone to be considered. The fieldOfView element must specify the geometry of the field of view. Currently, the only allowed value for the geometry of the fieldOfView element is square, in which case the length element of fieldOfView should give the length of the side of the square field of view in radians. The origin element must contain the x, y, z coordinates of the origin of the lightcone within the simulation box, while the unitVectorX elements must give unit vectors which point along the lightcone (for X = 1) and in the two directions perpendicular to the lightcone (for X = 2 and 3). The outputs element contains lists of properties corresponding to the outputs to be used for building the lightcone. The redshift subelements must list the redshifts of available outputs (in order of decreasing redshift) while the minimumDistance and maximumDistance elements must give the minimum and maximum comoving distance that should be considered to be associated with each given output redshift. The units/length element must specify the units used for lengths, with unitsInSI giving the length unit in SI units and hubbleExponent giving the exponent of h that appears in the length unit.

Finally, the optional cosmology element may give cosmological parameters relevant to this lightcone in standard GALACTICUS format.

14.9. Main Branch Evolution

The evolution of main branch galaxies can be recorded by setting \[\text{timestepRecordEvolution} = \text{true}\]. When set, the evolution of each main branch galaxy will be recorded at a set of \[\text{timestepRecordEvolutionSteps}\] timesteps spaced logarithmically in cosmic time between \[\text{timestepRecordEvolutionBegin}\] and \[\text{timestepRecordEvolutionEnd}\].

This recorded evolution will be written to the group mainProgenitorEvolution in the GALACTICUS output file. Within that group two datasets, time and expansionFactor, give the times and expansion factors at which evolution was recorded. Then for each merger tree two datasets, stellarMass\(<N>\) and totalMass\(<N>\) (where \(<N>\) is the merger tree index), give the stellar and total baryonic mass of the main branch progenitor at each timestep.
14. Additional Output Quantities

14.10. Main Branch Status

The status of each node with respect to the main branch of its merger tree can be output by setting \([\text{outputMainBranchStatus}] = \text{true}\). When set, the status will be output as \(\text{nodeIsOnMainBranch}\), with a value of 1 indicating that the node is a primary progenitor of the final halo (i.e. is on the main branch of the tree) and a value of 0 indicating that it is not.

14.11. Mass Profile Data

Masses enclosed within specific radii can be output by setting \([\text{outputMassProfileData}] = \text{true}\). When selected, this output option requires that a list of radii, \(r\) (in Mpc), be given in the \([\text{outputMassProfileRadii}]\) input parameter. For each specified radius, the total (dark + baryonic) mass will be output as \(\text{massProfile}r\).

14.12. Merger Tree Links and Node Isolation

The following properties are output to permit the merger tree structure to be recovered:

- **nodeIndex**: A unique (within a tree) integer index identifying the node;
- **childIndex**: The index of this node’s primary child node (or \(-1\) if it has no child);
- **parentIndex**: The index of this node’s parent node (or \(-1\) if it has no parent);
- **siblingIndex**: The index of this node’s sibling node (or \(-1\) if it has no sibling);
- **satelliteIndex**: The index of this node’s first satellite node (or \(-1\) if it has no satellites);
- **nodeIsIsolated**: Will be 0 for a node which is a subhalo inside some other node (i.e. a satellite galaxy) or 1 for a node that is an isolated halo (i.e. a central galaxy).

The **nodeIndex** property corresponds by default to the index of the node in the original merger tree. This means that as a galaxy evolves through the tree and, in particular, gets promoted into a new halo the index associated with a galaxy will change. This is useful to identify where the galaxy resides in the original (unevolved) tree structure, but does not allow galaxies to be traced from one output to the next using their **nodeIndex** value. By setting \([\text{nodePromotionIndexShift}] = \text{true}\) this behavior can be changed such that the value of **nodeIndex** will reflect the index of the earliest progenitor node along the main branch of the current node. As such, this index will remain the same for a given galaxy during its evolution. These two alternative algorithms for propagating node indices are illustrated in Figure 14.1.

14.13. Merger Tree Data for Rendering

Data on the structure of a merger tree and its halos useful for rendering the tree as a 3-D structure can be output using the **Merger_Trees_Render** module. Calling **Merger_Trees_Render_Dump** with a tree as the only argument will cause the tree structure will be dumped to a file named \(\text{render}_{\langle \text{treeIndex} \rangle}_ {-\langle \text{outputIndex} \rangle}.\text{hdf5}\) where \(\langle \text{treeIndex} \rangle\) is the index of the tree and \(\langle \text{outputIndex} \rangle\) is an incremental counter that tracks the number of outputs for this tree. The output is a simple HDF5 file containing the following datasets:

- **nodeIndex**: Index of the node;
- **parentIndex**: Index of the parent node;
Figure 14.1.: Illustration of options for the propagation of node indices during node promotion events. Two identical trees (top row) are evolved with $\text{[nodePromotionIndexShift]}=\text{false}$ (left column) and $\text{[nodePromotionIndexShift]}=\text{true}$ (right column). The middle and lower rows indicate the resulting node indices after two stages of tree evolution.
14. Additional Output Quantities

**childIndex** Index of the child node;

**time** Time of the node;

**expansionFactor** Corresponding expansion factor;

**radiusVirial** Virial radius of the node;

**position** \((x, y, z)\) position of the node.

### 14.14. Merger Tree Structure

The structure of each merger tree can optionally be dumped to a file suitable for post-processing with **DOT** after every step of evolution. To request this output set \([\text{mergerTreesDumpStructure}]=\text{true}\). After each evolution step the tree structure will be dumped to a file named \(\text{mergerTreeDump:}\langle\text{treeIndex}\rangle:\langle\text{outputIndex}\rangle\.gv\) where \(\langle\text{treeIndex}\rangle\) is the index of the tree and \(\langle\text{outputIndex}\rangle\) is an incremental counter that tracks the number of outputs for this tree. These files can be processed with **DOT** to produce a diagram of the tree structure. The node currently being evolved will be highlighted in green. This output option makes use of the **Merger_Trees_Dump** module to create the outputs.

### 14.15. Most Massive Progenitor

Setting \([\text{outputMostMassiveProgenitor}]=\text{true}\) causes the property \(\text{isMostMassiveProgenitor}\) to be output. This property will be 1 for the most massive progenitor node in a tree at each output time and 0 for all other nodes.

### 14.16. Rotation Curve

Setting \([\text{outputRotationCurveData}]=\text{true}\) causes the rotation curve of the node to be output at specified radii. The radii and types of rotation curve to output is specified by the \(\text{outputRotationCurveRadii}\) parameter. This parameter’s value can contain multiple entries. Each entry is of the form:

\[
\text{radiusType:componentType:massType:loading?:radius}
\]

The elements of this colon-separated specifier determine the radius at which the rotation curve is computed, which components/mass types should be counted, and whether baryonic loading of the halo should be accounted for. The elements have the following meaning:

- **radius** the numerical value of the radius at which to compute the rotation curve (with units specified by the **radiusType** element);

- **radiusType** specifies the units of the **radius** element—valid options are **diskRadius**, **diskHalfMassRadius**, **spheroidRadius**, **spheroidHalfMassRadius**, **darkMatterScaleRadius**, **virialRadius**, just **radius** (which implies radii are given in units of Mpc), **galacticMassFraction{<fraction>}**, or **galacticLightFraction{<fraction>}{<luminosity>}**, where the final two form specify a radius containing a fixed **fraction** of the galactic mass or light respectively (for the case of galactic light, **luminosity** specifies the band, e.g. **SDSS\_r:rest:z0.0000**);

- **componentType** specifies which components of the node should be counted—allowed values are **all**, **disk**, **spheroid**, **hotHalo**, **darkHalo**, and **blackHole**;
massType specifies which types of mass should be counted—allowed values are all, dark, baryonic, galactic, gaseous, stellar, and blackHole;

loading? option should be either loaded or unloaded, and specifies whether the effect of baryonic loading (i.e. adiabatic contraction) should be included in the calculation of the rotation curve.

### 14.17. Satellite Orbital Pericenter

Setting [outputSatellitePericenterData] to true will cause the pericentric values of the radius and velocity of each satellite node’s orbit to be output as satellitePericenterRadius and satellitePericenterVelocity respectively.

### 14.18. Star Formation Rates

By default the star formation rate in each galaxy is not output. However, setting [diskOutputStarFormationRate] to true will cause the current star formation rate in the disk of each galaxy to be output as diskStarFormationRate (in units of $M_\odot$/Gyr). The [spheroidOutputStarFormationRate] has the same effect for the spheroid component.

### 14.19. Velocity Dispersion

Setting [outputVelocityDispersionData]=true causes the velocity dispersion of the node to be output at specified radii, for specified components. The radii, components and type of velocity dispersion to output are specified by the outputVelocityDispersionRadii parameter. This parameter’s value can contain multiple entries. Each entry is of the form:

```
radiusType:componentType:massType:loading?:direction:radius
```

The elements of this colon-separated specifier determine the radius at which the velocity dispersion is computed, which component/mass type the velocity dispersion should be computed for, whether baryonic loading of the halo should be accounted for, and for which direction the velocity dispersion should be computed. The elements have the following meaning:

- **radius** the numerical value of the radius at which to compute the velocity dispersion (with units specified by the radiusType element);
- **radiusType** specifies the units of the radius element—valid options are diskRadius, diskHalfMassRadius, spheroidRadius, spheroidHalfMassRadius, darkMatterScaleRadius, virialRadius, just radius (which implies radii are given in units of Mpc), galacticMassFraction{<fraction>}, or galacticLightFraction{<fraction>{<luminosity>}, where the final two form specify a radius containing a fixed <fraction> of the galactic mass or light respectively (for the case of galactic light, <luminosity> specifies the band, e.g. SDSS_r:rest:z0.0000);
- **componentType** specifies which component of the node the velocity dispersion should be computed for—allowed values are all, disk, spheroid, hotHalo, darkHalo, and blackHole²;
- **massType** specifies which type of mass the velocity dispersion should be computed for—allowed values are all, dark, baryonic, galactic, gaseous, stellar, and blackHole;

²Note that attempting to compute the velocity dispersion for a black hole or disk for example won’t make any sense.
loading? option should be either loaded or unloaded, and specifies whether the effect of baryonic loading (i.e. adiabatic contraction) should be included in the calculation of the velocity dispersion.

direction should be one of radial (computes the radial component of velocity dispersion), lineOfSight{<luminosity>} (computes the line-of-sight velocity dispersion), lineOfSightInteriorAverage{<luminosity>} (computes the line-of-sight velocity dispersion averaged interior to the given radius), or lambdaR{<luminosity>} (computes the $\lambda_R$ statistic of Cappellari et al. 2007)—in the latter three cases {<luminosity>} specifies which band should be used to weight the velocity dispersion, alternatively setting {<luminosity>}=mass (or just leaving off this specifier entirely) will use mass weighting instead.

14.20. Virial Quantities

The following quantities related to the virialized region of each node are output if outputVirialData is set to true:

nodeVirialRadius The virial radius (following whatever definition of virial overdensity was selected in GALACTICUS) in units of Mpc;

nodeVirialVelocity The circular velocity at the virial radius (in km/s).
Part IV.

Development
In this Part we focus on how to modify GALACTICUS to meet your own needs. GALACTICUS is designed in a modular way to make it as simple as possible to introduce new implementations of physical processes or new galactic components without breaking the rest of the code. Nevertheless, some understanding of the structure of the code is necessary. In particular, GALACTICUS will happily compile and run calculations that make no physical sense whatsoever—it’s up to you to ensure that the changes you make are physically reasonable and consistent with the behavior of the rest of the code.
15. Developing **GALACTICUS**

The following is a quickstart guide to making changes to the GALACTICUS source code and contributing them back to the project. Note that the preferred method to do this is through **BitBucket**.

15.1. Getting Started

It’s easy to begin working with and changing the GALACTICUS source code. Assuming you have Mercurial ("hg") installed, just do:

```bash
hg clone https://abensonca@bitbucket.org/abensonca/galacticus galacticus
```

and you have a cloned copy of the GALACTICUS repository in the `galacticus` directory.

15.1.1. Using **BitBucket**

If you plan to contribute changes back to the GALACTICUS project (please do!), you should consider using **BitBucket**. After you’ve created an account for yourself at **BitBucket**, you can “fork” the GALACTICUS repository to have your own working copy. This can be done as follows:

- visit the GALACTICUS repository on **BitBucket** at [https://bitbucket.org/abensonca/galacticus/overview](https://bitbucket.org/abensonca/galacticus/overview);
- click on the “Fork” button—you’ll be presented with a form;
- fill out the form (setting a name for your fork, a short description, etc.), then click the “Fork repository” button;
- after the fork completes, you’ll be taken to the overview page for your forked repository.

You’ll now want to clone this forked repository to your local system. Click on the “Clone” button and copy the `hg clone` command presented there (you want the **SSH** version so that you can push changes back to this repository). Run this command on your local system to get a cloned copy of your new repository. You can now work with this repository, make any changes, and commit them. We’ll discuss how to send these changes back to **BitBucket**, and back to the GALACTICUS project below.

15.2. Making Simple Changes

If you want to make some relatively minor changes to the GALACTICUS code, such as fixing a typo, adding a new filter, etc. you can just make changes directly on the `default` branch (i.e. at the point of active development). To do this, make sure you’re at `default`:

```bash
hg pull
hg update default
```

Then make your changes, add new files, etc. Once you’re done, first check if there have been any changes to `default` since you pulled:

```bash
hg status
```
15. Developing **Galacticus**

hg incoming

If any new changesets are shown, use `hg pull -u` to merge these in to your working copy. Then commit your changes:

`hg commit`

Your changes are now committed to your cloned repository.

15.2.1. Contributing Your Changes Back To **Galacticus**

Once you’ve committed your changes, you can contribute them back to the **Galacticus** project.

**Via E-mail**

If you just cloned the **Galacticus** repository directly you can send a patch containing your changes by e-mail to `abensonobs.carnegiescience.edu`. First, create the patch file using:

```sh
hg export -r begin:end > changes.diff
```

where `begin` and `end` are the first and last revisions that you want to include (you can specify more complicated sets of revisions of course). Then simply attached the `changes.diff` file to an e-mail. It will be merged into the **Galacticus** project using

```sh
hg import changes.diff
```

**Using BitBucket**

If you forked the **Galacticus** repository on BitBucket, you can now push your changes back to BitBucket using

```sh
hg push
```

If you want to contribute these changes back to the **Galacticus** project the best way to do so is to create a “pull request”. Simply visit your forked repository on BitBucket and click the “Pull request” button. The form you’re presented with allows you to choose which branch in your repository you want to send changes from, and which branch in the **Galacticus** project you want them contributed to. Add a title and description of your changes (and, optionally, check the “Close branch” box if you’re done with this branch of development) then click “Create pull request”. Assuming your code looks good and works, it can then be pulled into the **Galacticus** project.

15.3. Making Bigger Changes

For bigger changes, particularly those where you’re adding a new feature, we recommend using Mercurial’s “feature branches”. These provide a permanent record of for which feature each changeset was added. Using feature branches is straightforward. Begin with `default` and create a new branch:

```sh
hg update default
hg branch myNewFeature
```

where `myNewFeature` is a name for your feature branch. Then begin working, make changes, add new files etc. You can make commits when necessary (and it’s good to make several small commits rather than one big one). You should merge `default` into your feature branch as often as possible to avoid them getting out of sync (which makes for difficulty later when you want to merge your feature branch back into `default`):
hg update myFeatureBranch
hg merge default
hg commit -m "merged default into myFeatureBranch"

Once the feature branch is stable, you can merge it back into default:

hg update default
hg merge myFeatureBranch
hg commit -m "merged myFeatureBranch"

Once you’re done developing this feature, you should close the feature branch:

hg commit --close-branch -m "finished my feature"

Note that you can always go back and work on a feature branch later, after you have closed it. Just do:

hg up myFeatureBranch
hg merge default
hg commit -m "merged default into myFeatureBranch"

then continue to work with your feature branch as normal (don’t forget to close it again when you’re finished working with it).

15.4. Releases

Each release of Galacticus exists as a separate branch within the main Galacticus repository. To work with a particular release use

hg update v0.9.2

replacing the version number with whichever version you want. To get back to the development tip use

hg update default

15.4.1. Bug Fixes In Releases

To make a bugfix in a release, simply hg update to that release, fix the bug, and commit your changes. In many cases you’ll want to fix the same bug in later releases and also in default. To do that, just hg update to each branch in turn, use hg merge fixedBranch (where “fixedBranch” is the name of the branch in which you fixed the branch, and then commit the merge. Once the bug has been fixed you can contribute the fix back to the Galacticus project using the methods described above.
16. Coding GALACTICUS

16.1. Numerical Tools

GALACTICUS provides a variety of tools to solve basic numerical problems. These can be found in files source/numerical/*. GALACTICUS makes use of the GNU Scientific Library for many of these tools, but typically provides a higher-level wrapper around those functions, providing a cleaner interface and, in some cases, additional functionality.

16.1.1. Finding Roots of Equations

Tools for solving equations of the form \( f(x) = 0 \) are provided by the rootFinder object (available via the Root_Finder module). Typical use of this object is as follows:

```fortran
! Import the module.
use Root_Finder

! Create a rootFinder object -- make it OpenMP threadprivate so it can be used ! simultaneously by all threads.
type(rootFinder), save :: finder
$omp threadprivate(finder)

! Check if our root finder has been initialized.
if (.not. finder%isInitialized()) then
  ! Specify the function that evaluates f(x).
call finder%rootFunction (myRootFunction)
  ! Specify the type of root-finding algorithm -- this is optional (Brent's ! method will be used by default).
call finder%type (FGSL_Root_fSolver_Brent)
  ! Specify the tolerances to use in finding the root. Both arguments are ! optional -- values of 1.0d-10 will be used for both absolute and relative ! tolerance by default.
call finder%tolerance (toleranceAbsolute, toleranceRelative)
  ! Specify how the initially provided range can be expanded to bracket the ! root. This is optional -- if not provided no range expansion will be attempted.
call finder%rangeExpand &
    & ( &
      & rangeExpandDownward = 0.5d0, &
      & rangeExpandUpward = 2.0d0, &
      & rangeExpandType = rangeExpandMultiplicative, &
      & rangeDownwardLimit = 1.0d-3, &
      & rangeUpwardLimit = 1.0d+3, &
      & rangeExpandDownwardSignExpect = rangeExpandSignExpectPositive, &
      & rangeExpandUpwardSignExpect = rangeExpandSignExpectNegative
    )
end if
```

329
end if
x=finder%find (rootGuess = 1.0d0)
.
.
double precision function myRootFunction(x)
    implicit none
    double precision, intent(in) :: x
    ...
    return
end function myRootFunction

The above example begins by importing the Root_Finder module and then creating a rootFinder object called finder. This is made OpenMP threadprivate so that it may be used simultaneously by all threads. The first step is to initialize finder—the isInitialized method tells us if this has already happened. The most important step is to specify the function that will evaluate f(x). This is done via the rootFunction method—once done, the rootFinder object is marked as initialized (and the isInitialized method will return true). All other initialization steps are optional. In this example, we use the type method to specify that the Brent algorithm should be used for root finding. Any valid GSL-supported root finding algorithm can be used. We then use the tolerance method to specify both the absolute and relative tolerances in the x variable that must be attained to declare the root to be found. Both arguments are optional—default values of 10^{-10} will be used if either tolerance is not specified.

The final step of initialization is to call the rangeExpand method. This specifies how the initial guessed value or range for x should be expanded to bracket the root. If you plan to always specify an initial range, and know that it will always bracket the root, you do not need to specify how the range should be expanded. In this case we’ve specified that range expansion is multiplicative—that is, the lower and upper values of x defining the range will be multiplied by fixed factors until the root is bracketed—via the rangeExpandType=rangeExpandMultiplicative option. Alternatively, additive expansion is possible using rangeExpandType=rangeExpandAdditive. The factors by which to multiply the lower and upper bounds of the range (or the factor to add in the case of additive expansion) are specified by the rangeExpandDownward and rangeExpandUpward options. It is possible to specify absolute lower/upper limits to the range via the rangeDownwardLimit and rangeUpwardLimit options. The range will not be expanded beyond these limits—if the root cannot be bracketed without exceeding these limits an error condition will occur. Finally, it is possible to indicate the expected sign of f(x) at the lower and/or upper limits via the rangeExpandDownwardSignExpect and rangeExpandUpwardSignExpect options. Valid settings are rangeExpandSignExpectNegative, rangeExpandSignExpectPositive, and rangeExpandSignExpectNone (the default—implying that there is no expectation for the sign). If the sign of f(x) is specified, then range expansion will stop once the expected sign is found. This can often improve efficiency, by allowing the range expander to expand the range in only one direction, resulting in a narrower range in which to search for the root.

Finally, we use the find method to return the value of the root. The first argument to find is the name of the function that evaluates f(x). Additionally, we must supply either rootGuess (a scalar value guess to use as the initial value for both the lower and upper values of the range—note that range expansion must be allowed in this case), or rootRange (a two-element array to use as the initial lower and upper values of the range bracketing the root).

The function evaluating f(x) must have a form compatible with that shown for myRootFunction in the above example.
16.2. Computation Dependencies and Data Files

In many situations, some module in Galacticus might want to perform a calculation and then store the results to a file so that they can be reused later. A good example is the CAMB transfer function method (see §13.4.5), which computes a transfer function using CAMB and stores this function in a file so that it can be re-read next time, avoiding the need to recompute the transfer function. A problem arises in such cases as the calculation may depend on the values of parameters (in our example, the transfer function will depend on cosmological parameters for example). We would like to record which parameter values this calculation refers to, perhaps encoding these into the file name, so that we can reuse these data in a future run only if the parameter values are unchanged. Given the modular nature of Galacticus it is impossible to know in advance which parameters will be relevant (e.g. does the cosmological parameter implementation have a parameter that describes a time varying equation of state for dark energy?).

To address this problem, Galacticus provides a mechanism to generate a unique label for a given module. This label encodes the names of modules on which the module depends, and the names and values of any parameters used by those modules. Functions to construct these labels can be generated automatically, and intelligently determine which specific implementation of any method is active in a given run.

To create a unique labelling function, use the `uniqueLabel` directive. For example, in the CAMB transfer function method the following code is used:

```xml
<uniqueLabel>
  <function>Transfer_Function_CAMB_Label</function>
  <ignore>transferFunctionFile</ignore>
  <ignoreRegex>^imf.*</ignoreRegex>
  <hashFile>myExtraFile.txt</hashFile>
</uniqueLabel>
```

This XML block specifies that the labelling function should be called `Transfer_Function_CAMB_Label`. This function will be generated automatically during Galacticus build and will be available from the `Input_Parameters` module. The `ignore` element specifies that the function should not encode the value of the `transferFunctionFile` parameter in the label (in this case, the CAMB method sets the file name directly). Similarly, the `ignoreRegex` element specifies that the function should not encode the value of any parameter which matches the regular expression provided (in this case, any parameter that begins with “imf”). Any number of `ignore` and `ignoreRegex` elements may be present. Finally, a `hashFile` element specifies the name of a file on which this calculation depends, but which will not be detected automatically (see below). An MD5 digest of the file will be included in the label if the `includeSourceDigest` argument is set to true.

The function returns a `type(varying_string)` object with the encoded label. For the CAMB method this might be:

```fortran
write (0,*) char(Transfer_Function_CAMB_Label())
::cosmology.parameters.simple#Omega_b[0.0455]#Omega_Matter[0.2725]#Omega_DE[0.7275]#T_CMB[2.72548]#H_0[70.2]
```

Note that the relevant cosmological parameters have been encoded into the label. If called with `includeVersion=.true.`, then the Galacticus version string is appended to the label:

```fortran
write (0,*) char(Transfer_Function_CAMB_Label(includeVersion=.true.))
::cosmology.parameters.simple#Omega_b[0.0455]#Omega_Matter[0.2725]#Omega_DE[0.7275]#T_CMB[2.72548]#H_0[70.2]_v0.9.3.r2022
```
This can be useful to ensure that a file was generated by the exact same version of GALACTICUS. It is also possible, by setting the optional includeBuild argument to .true., to append full build information (library versions, environment variables) to the label.

By setting the optional includeSourceDigest argument to .true., an MD5 digest of each source file on which the function depends will be incorporated into the label. In addition to source files, any data file referenced by those source files will be included in the digest calculation. Data files are taken to be any file referenced in the data/ directory and having suffix .xml or .hdf5.

Since the returned label can be long and cumbersome, if called with asHash=.true. the labelling function will return an MD5 hash of the label

\[\text{write (0,*) char(Transfer\_Function\_CAMB\_Label(includeVersion=.true.,asHash=.true.))}\]

\[\text{tudE3GawpjAXBzprr5azU0}\]

This hash can be used as part of the name of the file to which data is written.

Finally, each function can return a list of parameter names and values (as an inputParameterList object) which are included in the unique label. These parameters can then be easily written to a generated file using the outputToXML method of the inputParameterList object.

### 16.3. Optimization

In designing GALACTICUS, we opted for simplicity and clarity over speed. However, there are numerous parts of the code where optimization has been performed without a significant loss of clarity. In this section we discuss some of the techniques used.

#### 16.3.1. Unique IDs and Stored Properties

Frequently, a given property of a node may be required in many different aspects of the calculation. For example, the dark matter halo virial radius is used extensively in several distinct calculations within GALACTICUS. Frequently such calculations are performed for the same node, with the same properties several times. Obviously this is inefficient. It can be advantageous in such cases to store the result of a calculation and, if the function is called again with the same unchanged node to simply return the stored value. GALACTICUS facilitates this by two features.

The first feature is the “unique ID”—an integer number assigned to each node in GALACTICUS and which uniquely identifies a node (i.e. no two nodes processed in a GALACTICUS run will have the same unique ID). This number, which can be retrieved using the uniqueID property of a tree node, can be recorded each time a function is called. If called again for a node with the same unique ID as the previous call, the function can simply return the same answer as on the previous call.

The second feature accounts for the fact that the properties of a node will change, so even if a function is called on a node with the same unique ID it may occasionally need to recompute its result. GALACTICUS provides a calculation reset task (see §17.4.3). All such tasks are performed just prior to the computation of derivatives for a node being evolved. A function can register a calculation reset task and use it to flag that it must update its calculations even if called again with the same node.

### 16.4. Mixed Language Coding

It is possible to incorporate C or C++ code into GALACTICUS. The implementation of C++-integration into GALACTICUS is currently only partially complete— if there is a specific function or feature that you are interested in, please contact the authors. For example, GALACTICUS’s ODE solver will fix the properties of a node and then request that derivatives of all properties be computed. Some functions will then be called multiple times for the same node with unchanged properties.
would like to be C++-interoperable contact us. For an example of the various C++ interoperability see the `star_formation.timescales.disks.Baugh2005.cpp` file.

### 16.4.1. Component Property Methods

C++-wrappers are currently automatically built for the “get” method for all real scalar properties defined for GALACTICUS components. To use these wrappers include the following lines:

```cpp
//: ./work/build/objects.nodes.bindings.C.o
#include <objects.nodes.bindings.C.h>
```

The first line adds an explicit dependency on the bindings file, while the second includes it. A component of a given class can be retrieved from a supplied node pointer using:

```cpp
nodeComponent<Class> this<Class>Component (thisNode);
```

Then, real scalar get methods are available using:

```cpp
value=this<Class>Component.<property>();
```

### 16.4.2. Using Functions in C++

Where functions have been made available in C++ the approach is to make an identical interface as in Fortran, as far as is possible. So, for example, getting the expansion factor for some cosmological time would work as follows in the two languages:

**Fortran**

```fortran
use Cosmology_Functions
expansionFactor=Expansion_Factor(cosmologicalTime)
```

**C++**

```cpp
//: ./work/build/cosmology.functions.o
#include <cosmology.functions.h>
expansionFactor=Expansion_Factor(cosmologicalTime)
```

Currently, the only function with C++-wrappers are `Expansion_Factor` and the double precision and integer scalar versions of `Get_Input_Parameter`. Further wrappers will be added as needed or requested.

### 16.4.3. Adding New Implementations in C++

Adding a new implementation of a method is done in a very similar way as in Fortran. For example, the Baugh2005 disk star formation timescale method initializes as follows:

```cpp
// <starFormationTimescaleDisksMethod>
// <unitName>Star_Formation_Timescale_Disk_Baugh2005.Initialize</unitName>
// </starFormationTimescaleDisksMethod>
typedef double (func)(void *thisNode);
void Star_Formation_Timescale_Disk_Baugh2005_Initialize(char *starFormationTimescaleDisksMethod,func **Star_Formation_Timescale_Disk_Get)
{
    char ourName[] = "Baugh2005";
    if (strcmp(starFormationTimescaleDisksMethod,ourName) == 0) {
        *Star_Formation_Timescale_Disk_Get=&Star_Formation_Timescale_Disk_Baugh2005;
    }
}
```
The usual embedded XML directives specifies that this function should be called to initialize the method. The function is passed both the name of the method that has been selected and a function pointer. If the method is matched, the function simply sets the function pointer to point to the specific function implementing the timescale calculation.

16.5. Objects

16.5.1. Enumerations

Enumerations are used to communicate options to many functions in GALACTICUS. All available enumerations, along with their members, are described below.

tfamilly adjustElements

Description: Used to specify how elements should be adjusted when the metallicity of an abundances object is changed.
Provided by: tfamily module tfamily Abundances_Structure
Members: tfamily adjustElementsNone
         tfamily adjustElementsReset
         tfamily adjustElementsUpdate

tfamilly componentType

Description: Used to specify the component(s) to be queried in galactic structure functions.
Provided by: tfamily module tfamily Galactic_Structure_Options
Members: tfamily componentTypeUnknown
         tfamily componentTypeAll
         tfamily componentTypeDisk
         tfamily componentTypeSpheroid
         tfamily componentTypeHotHalo
         tfamily componentTypeDarkHalo
         tfamily componentTypeBlackHole

tfamilly coordinateSystem

Description: Used to specify the coordinate system of the input coordinates in galactic structure functions.
Provided by: tfamily module tfamily Galactic_Structure_Options
Members: tfamily coordinateSystemSpherical
         tfamily coordinateSystemCylindrical
         tfamily coordinateSystemCartesian

tfamilly dataType

Description: Used to specify the type of data being stored in a mergerTreeData structure metadata entry.
Provided by: tfamily module tfamily Merger_Tree_Data_Structure
Members: tfamily dataTypeInteger
         tfamily dataTypeDouble
         tfamily dataTypeText
tfamily extrapolationType
Description: Used to specify the type of extrapolation to use when interpolating in tables.
Provided by: tfamily module tfamily Tables
Members: tfamily extrapolationTypeExtrapolate
tfamily extrapolationTypeFix
tfamily extrapolationTypeAbort

tfamily massDistributionSymmetry
Description: Used to specify the symmetry of massDistribution objects.
Provided by: tfamily module tfamily Mass_Distributions
Members: tfamily massDistributionSymmetryNone
tfamily massDistributionSymmetryCylindrical
tfamily massDistributionSymmetrySpherical

tfamily massType
Description: Used to specify the mass type(s) to be queried in galactic structure functions.
Provided by: tfamily module tfamily Galactic_Structure_Options
Members: tfamily massTypeUnknown
tfamily massTypeAll
tfamily massTypeDark
tfamily massTypeBaryonic
tfamily massTypeGalactic
tfamily massTypeGaseous
tfamily massTypeStellar
tfamily massTypeBlackHole

tfamily metaDataType
Description: Used to specify the type of metadata being stored in a mergerTreeData structure.
Provided by: tfamily module tfamily Merger_Treestructure
Members: tfamily metaDataGeneric
tfamily metaDataCosmology
tfamily metaDataSimulation
tfamily metaDataGroupFinder
tfamily metaDataTreeBuilder
tfamily metaDataProvenance

tfamily metallicityScale
Description: Used to specify the metallicity scale when working with abundances objects.
Provided by: tfamily module tfamily Abundances_Structure
Members: tfamily linearByMass
tfamily linearByNumber
tfamily logarithmicByMassSolar
tfamily logarithmicByNumberSolar
tfamily linearByMassSolar
tfamily linearByNumberSolar
tfamily propertyType

Description: Used to specify properties in a mergerTreeData structure.
Provided by: tfamily module tfamily Merger_Tree_Data_Structure
Members: tfamily propertyTypeTreeNodeIndex
tfamily propertyTypeDescendantIndex
tfamily propertyTypeHostIndex
tfamily propertyTypeRedshift
tfamily propertyTypeScaleFactor
tfamily propertyTypeNodeMass
tfamily propertyTypeParticleCount
tfamily propertyTypePositionX
tfamily propertyTypePositionY
tfamily propertyTypePositionZ
tfamily propertyTypeVelocityX
tfamily propertyTypeVelocityY
tfamily propertyTypeVelocityZ
tfamily propertyTypeSpinX
tfamily propertyTypeSpinY
tfamily propertyTypeSpinZ
tfamily propertyTypeSpin
tfamily propertyTypeAngularMomentumX
tfamily propertyTypeAngularMomentumY
tfamily propertyTypeAngularMomentumZ
tfamily propertyTypeAngularMomentum
tfamily propertyTypeSpecificAngularMomentumX
tfamily propertyTypeSpecificAngularMomentumY
tfamily propertyTypeSpecificAngularMomentumZ
tfamily propertyTypeSpecificAngularMomentum
tfamily propertyTypeHalfMassRadius
tfamily propertyTypeScaleRadius
tfamily propertyTypeParticleIndex
tfamily propertyTypeMostBoundParticleIndex
tfamily propertyTypeSnapshot
tfamily propertyTypeTreeWeight
tfamily propertyTypeVelocityMaximum
tfamily propertyTypeVelocityDispersion

tfamily rangeExpand

Description: Used to specify the way in which the bracketing range should be expanded when searching for roots using a rootFinder object.
Provided by: tfamily module tfamily Root_Finder
Members: tfamily rangeExpandNull
tfamily rangeExpandAdditive
tfamily rangeExpandMultiplicative
16.5. Objects

tfamily rangeExpandSignExpect

Description: Used to specify the expected sign of the root function when searching for roots using a rootFinder object.

Provided by: tfamily module tfamily Root_Finder

Members: tfamily rangeExpandSignExpectNegative
          tfamily rangeExpandSignExpectNone
          tfamily rangeExpandSignExpectPositive

tfamily units

Description: Used to specify the type of units being stored in a mergerTreeData structure.

Provided by: tfamily module tfamily Merger_Tree_Data_Structure

Members: tfamily unitsStandard
          tfamily unitsTime
          tfamily unitsLittleH
          tfamily unitsMass
          tfamily unitsLength
          tfamily unitsTime
          tfamily unitsVelocity

tfamily weightBy

Description: Used to specify by which quantity to weight the results in galactic structure functions.

Provided by: tfamily module tfamily Galactic_Structure_Options

Members: tfamily weightByMass
          tfamily weightByLuminosity

16.5.2. Object Methods

The type of each method, and the type and names of its arguments are specified for each method of each object. Types are shown in red, enclosed by angle brackets, with a “*” indicating a pointer. A <void> type indicates a subroutine. Blue arrows after each argument show the argument intent: ← implies intent(in), → implies intent(out), and ↔ implies intent(inout).

tfamily abundances

add(<type(abundances)> abundances2 →) Add two abundances.

builder(<*type(node)> abundancesDefinition→) Build an abundances object from a provided XML description.

deserialize(<double(:)> historyArray→) Deserialize an abundances object from an array.

destroy() Destroy an abundances object.

divide(<double> divisor→) Divide an abundance by a scalar.

dump() Dump an abundances object.

dumpRaw(<integer> fileHandle→) Dump an abundances object to binary.
tfamily double heliumMassFraction() Returns the helium fraction by mass.

tfamily double heliumNumberFraction() Returns the helium fraction by number.

tfamily double hydrogenMassFraction() Returns the hydrogen fraction by mass.

tfamily double hydrogenNumberFraction() Returns the hydrogen fraction by number.

tfamily void increment(<type(abundances)> addAbundances→) Increment an abundances object.

tfamily logical isZero() Return true if an abundances object is zero.

tfamily void massToMassFraction(<double> mass→) Converts abundance masses to mass fractions by dividing by the given mass while ensuring that fractions are in the range 0–1.

tfamily double metallicity(<metallicityScale> [metallicityType]→) Returns the metallicity.

tfamily void metallicitySet(<double> metallicity→, <metallicityScale> [metallicityType]→, <adjustElements> [adjustElements]→, <integer> [abundanceIndex]→) Sets the metallicity to metallicity.

tfamily textcolor{red}{\textless type(abundances)\textgreater} multiply(<double> multiplier→) Multiply an abundance by a scalar.

tfamily void output(<integer> integerProperty↔, <integer> integerBufferCount↔, <integer(;;)> integerBuffer↔, <integer>doubleProperty↔, <integer> doubleBufferCount→, <double(;;)> doubleBuffer↔, <double> time→, <integer> instance→) Store an abundances object in the output buffers.

tfamily void outputCount(<integer>integerPropertyCount↔, <integer> doublePropertyCount↔, <double> time→, <integer> instance→) Specify the count of an abundances object for output.

tfamily void outputNames(<integer>integerProperty↔, <char[*](:)>integerPropertyNames↔, <char[*](:)> integerPropertyComments↔, <double(:)>integerPropertyUnitsSI↔, <integer> doubleProperty↔, <char[*](:)> doublePropertyNames↔, <char[*](:)> doublePropertyComments↔, <double(:)> doublePropertyUnitsSI↔, <double> time→, <integer> instance→) Specify the names of abundance object properties for output.

tfamily void readRaw(<integer> fileHandle→) Read an abundances object from binary.

tfamily void reset() Reset an abundances object.

tfamily void serialize(<double(;;)> historyArray←) Serialize an abundances object to an array.

tfamily int serializeCount() Return a count of the number of properties in a serialized abundances object.

tfamily void setToUnity() Set an abundances object to unity.

tfamily textcolor{red}{\textless type(abundances)\textgreater} subtract(<type(abundances)> abundances2→) Subtract one abundance from another.

tfamily accretionDiskSpectraClass

tfamily logical isFinalizable() Return true if this object can be finalized.

tfamily double precision spectrum(<double precision> wavelength→) Returns the spectrum (in units of \(L_{\odot} \text{Hz}^{-1}\)) of the accretion disk at the given wavelength (in units of Å) for node.
tfamily accretionDiskSpectraFile

tfamily logical isFinalizable() Return true if this object can be finalized.

void loadFile(<character(len=*>) fileName) Load a file of AGN spectra.

double precision spectrum(<double precision> wavelength) Returns the spectrum (in units of $L_\odot$ Hz$^{-1}$) of the accretion disk at the given wavelength (in units of Å) for node.

---

tfamily accretionDiskSpectraHopkins2007

tfamily logical isFinalizable() Return true if this object can be finalized.

void loadFile(<character(len=*>) fileName) Load a file of AGN spectra.

double precision spectrum(<double precision> wavelength) Returns the spectrum (in units of $L_\odot$ Hz$^{-1}$) of the accretion disk at the given wavelength (in units of Å) for node.

---

tfamily accretionHaloClass

tfamily double precision accretedMass(<integer> accretionMode) Returns the mass (in units of $M_\odot$) of accreted from the IGM onto node in the given accretionMode. Used to initialize nodes.

tfamily type(chemicalAbundances) accretedMassChemicals(<integer> accretionMode) Returns the mass of chemicals (in units of $M_\odot$) of accreted from the IGM onto node in the given accretionMode. Used to initialize nodes.

tfamily type(abundances) accretedMassMetals(<integer> accretionMode) Returns the mass of metals (in units of $M_\odot$) of accreted from the IGM onto node in the given accretionMode. Used to initialize nodes.

tfamily double precision accretionRate(<integer> accretionMode) Returns the rate (in units of $M_\odot$ Gyr$^{-1}$) of accretion of mass from the IGM onto node in the given accretionMode.

tfamily type(chemicalAbundances) accretionRateChemicals(<integer> accretionMode) Returns the rate (in units of $M_\odot$ Gyr$^{-1}$) of accretion of chemicals from the IGM onto node in the given accretionMode.

tfamily type(abundances) accretionRateMetals(<integer> accretionMode) Returns the rate (in units of $M_\odot$ Gyr$^{-1}$) of accretion of metals from the IGM onto node in the given accretionMode.

tfamily double precision failedAccretedMass(<integer> accretionMode) Returns the mass (in units of $M_\odot$) of that failed to accrete from the IGM onto node in the given accretionMode. Used to initialize nodes.

tfamily double precision failedAccretionRate(<integer> accretionMode) Returns the rate (in units of $M_\odot$ Gyr$^{-1}$) of failed accretion of mass from the IGM onto node in the given accretionMode.

logical isFinalizable() Return true if this object can be finalized.
tfamily accretionHaloColdMode

tfamily double precision accretedMass(<integer> accretionMode→) Returns the mass (in units of $M_\odot$) of accreted from the IGM onto node in the given accretionMode. Used to initialize nodes.

tfamily type(chemicalAbundances) accretedMassChemicals(<integer> accretionMode→) Returns the mass of chemicals (in units of $M_\odot$) of accreted from the IGM onto node in the given accretionMode. Used to initialize nodes.

tfamily type(abundances) accretedMassMetals(<integer> accretionMode→) Returns the mass of metals (in units of $M_\odot$) of accreted from the IGM onto node in the given accretionMode. Used to initialize nodes.

tfamily double precision accretionRate(<integer> accretionMode→) Returns the rate (in units of $M_\odot$ Gyr$^{-1}$) of accretion of mass from the IGM onto node in the given accretionMode.

tfamily type(chemicalAbundances) accretionRateChemicals(<integer> accretionMode→) Returns the rate (in units of $M_\odot$ Gyr$^{-1}$) of accretion of chemicals from the IGM onto node in the given accretionMode.

tfamily type(abundances) accretionRateMetals(<integer> accretionMode→) Returns the rate (in units of $M_\odot$ Gyr$^{-1}$) of accretion of metals from the IGM onto node in the given accretionMode.

tfamily double precision accretionRateTotal(<type(treeNode>) *node juvenescence) Returns the total accretion rate from the IGM onto a halo (including dark matter).

tfamily \textcolor{red}{\textless\textgreater} chemicalMasses(<type(treeNode>) *node juvenescence), <double> massAccreted →, <integer> accretionMode→) Returns the total accretion rate from the IGM onto a halo (including dark matter).

tfamily double zero coldModeFraction(<type(treeNode)> *node juvenescence, <integer> accretionMode→) Returns the total accretion rate from the IGM onto a halo (including dark matter).

tfamily double precision failedAccretedMass(<integer> accretionMode→) Returns the mass (in units of $M_\odot$) of that failed to accrete from the IGM onto node in the given accretionMode. Used to initialize nodes.

tfamily double precision failedAccretionRate(<integer> accretionMode→) Returns the rate (in units of $M_\odot$ Gyr$^{-1}$) of failed accretion of mass from the IGM onto node in the given accretionMode.

tfamily double precision failedFraction(<type(treeNode)> *node juvenescence) Returns the fraction of potential accretion onto a halo from the IGM which fails.

tfamily logical isFinalizable() Return true if this object can be finalized.

tfamily double precision massTotal(<type(treeNode)> *node juvenescence) Returns the total node mass.

tfamily double precision velocityScale(<type(treeNode)> *node juvenescence) Returns the velocity scale to use for node.
tfamily accretionHaloNaozBarkana2007

tfamily double precision accretedMass(<integer> accretionMode→) Returns the mass (in units of $M_\odot$) of accreted from the IGM onto node in the given accretionMode. Used to initialize nodes.

tfamily type(chemicalAbundances) accretedMassChemicals(<integer> accretionMode→) Returns the mass of chemicals (in units of $M_\odot$) of accreted from the IGM onto node in the given accretionMode. Used to initialize nodes.

tfamily type(abundances) accretedMassMetals(<integer> accretionMode→) Returns the mass of metals (in units of $M_\odot$) of accreted from the IGM onto node in the given accretionMode. Used to initialize nodes.

 tfamily double precision accretionRate(<integer> accretionMode→) Returns the rate (in units of $M_\odot$ Gyr$^{-1}$) of accretion of mass from the IGM onto node in the given accretionMode.

tfamily type(chemicalAbundances) accretionRateChemicals(<integer> accretionMode→) Returns the rate (in units of $M_\odot$ Gyr$^{-1}$) of accretion of chemicals from the IGM onto node in the given accretionMode.

tfamily type(abundances) accretionRateMetals(<integer> accretionMode→) Returns the rate (in units of $M_\odot$ Gyr$^{-1}$) of accretion of metals from the IGM onto node in the given accretionMode.

 tfamily double precision accretionRateTotal(<type(treeNode)> *node→) Returns the total accretion rate from the IGM onto a halo (including dark matter).

tfamily double precision failedAccretedMass(<integer> accretionMode→) Returns the mass (in units of $M_\odot$) of that failed to accrete from the IGM onto node in the given accretionMode. Used to initialize nodes.

tfamily double precision failedAccretionRate(<integer> accretionMode→) Returns the rate (in units of $M_\odot$ Gyr$^{-1}$) of failed accretion of mass from the IGM onto node in the given accretionMode.

tfamily double precision failedFraction(<type(treeNode)> *node→) Returns the fraction of potential accretion onto a halo from the IGM which fails.

 tfamily logical isFinalizable() Return true if this object can be finalized..

tfamily double precision massTotal(<type(treeNode)> *node→) Returns the total node mass.

tfamily double precision velocityScale(<type(treeNode)> *node→) Returns the velocity scale to use for node.

tfamily accretionHaloNull

 tfamily double precision accretedMass(<integer> accretionMode→) Returns the mass (in units of $M_\odot$) of accreted from the IGM onto node in the given accretionMode. Used to initialize nodes.

tfamily type(chemicalAbundances) accretedMassChemicals(<integer> accretionMode→) Returns the mass of chemicals (in units of $M_\odot$) of accreted from the IGM onto node in the given accretionMode. Used to initialize nodes.

tfamily type(abundances) accretedMassMetals(<integer> accretionMode→) Returns the mass of metals (in units of $M_\odot$) of accreted from the IGM onto node in the given accretionMode. Used to initialize nodes.
16. Coding GALACTICUS

tfamily double precision accretionRate(<integer> accretionMode→) Returns the rate (in units of $M_\odot$ Gyr$^{-1}$) of accretion of mass from the IGM onto node in the given accretionMode.

tfamily type(chemicalAbundances) accretionRateChemicals(<integer> accretionMode→) Returns the rate (in units of $M_\odot$ Gyr$^{-1}$) of accretion of chemicals from the IGM onto node in the given accretionMode.

tfamily type(abundances) accretionRateMetals(<integer> accretionMode→) Returns the rate (in units of $M_\odot$ Gyr$^{-1}$) of accretion of metals from the IGM onto node in the given accretionMode.

tfamily double precision failedAccretedMass(<integer> accretionMode→) Returns the mass (in units of $M_\odot$) of that failed to accrete from the IGM onto node in the given accretionMode. Used to initialize nodes.

tfamily double precision failedAccretionRate(<integer> accretionMode→) Returns the rate (in units of $M_\odot$ Gyr$^{-1}$) of failed accretion of mass from the IGM onto node in the given accretionMode.

tfamily logical isFinalizable() Return true if this object can be finalized.

tfamily accretionHaloSimple

tfamily double precision accretedMass(<integer> accretionMode→) Returns the mass (in units of $M_\odot$) of accreted from the IGM onto node in the given accretionMode. Used to initialize nodes.

tfamily type(chemicalAbundances) accretedMassChemicals(<integer> accretionMode→) Returns the mass of chemicals (in units of $M_\odot$) of accreted from the IGM onto node in the given accretionMode. Used to initialize nodes.

tfamily type(abundances) accretedMassMetals(<integer> accretionMode→) Returns the mass of metals (in units of $M_\odot$) of accreted from the IGM onto node in the given accretionMode. Used to initialize nodes.

tfamily double precision accretionRate(<integer> accretionMode→) Returns the rate (in units of $M_\odot$ Gyr$^{-1}$) of accretion of mass from the IGM onto node in the given accretionMode.

tfamily type(chemicalAbundances) accretionRateChemicals(<integer> accretionMode→) Returns the rate (in units of $M_\odot$ Gyr$^{-1}$) of accretion of chemicals from the IGM onto node in the given accretionMode.

tfamily type(abundances) accretionRateMetals(<integer> accretionMode→) Returns the rate (in units of $M_\odot$ Gyr$^{-1}$) of accretion of metals from the IGM onto node in the given accretionMode.

tfamily double precision accretionRateTotal(<type(treeNode>) *node→) Returns the total accretion rate from the IGM onto a halo (including dark matter).

tfamily double precision failedAccretedMass(<integer> accretionMode→) Returns the mass (in units of $M_\odot$) of that failed to accrete from the IGM onto node in the given accretionMode. Used to initialize nodes.

tfamily double precision failedAccretionRate(<integer> accretionMode→) Returns the rate (in units of $M_\odot$ Gyr$^{-1}$) of failed accretion of mass from the IGM onto node in the given accretionMode.

tfamily double precision failedFraction(<type(treeNode>) *node→) Returns the fraction of potential accretion onto a halo from the IGM which fails.
16.5. Objects

tfamily logical isFinalizable() Return true if this object can be finalized.

tfamily double precision massTotal(<type(treeNode)> *node) Returns the total node mass.

tfamily double precision velocityScale(<type(treeNode)> *node) Returns the velocity scale to use for node.

tfamily chemicalAbundances

tfamily \ doublezero abundance(<integer> moleculeIndex) Returns the abundance of a chemical given its index.

tfamily \ void abundanceSet(<integer> moleculeIndex, <double> abundance) Sets the abundance of a chemical given its index.

tfamily \ textcolor{red}{\textless type(chemicalAbundances)\textgreater} add(<type(chemicalAbundances)> abundances2) Add two chemical abundances.

tfamily \ void builder(<*type(node)> chemicalAbundancesDefinition) Build a chemical abundances object from an XML definition.

tfamily \ void deserialize(<double(:)> chemicalAbundancesArray) Deserialize a chemical abundances object from an array.

tfamily \ void destroy() Destroys a chemical abundances object.

tfamily \ textcolor{red}{\textless type(chemicalAbundances)\textgreater} divide(<double> divisor) Divide a chemical abundance by a scalar.

tfamily \ void dump() Dump a chemical abundances object.

tfamily \ void dumpRaw(<integer> fileHandle) Dump a chemical abundances object in binary.

tfamily \ void enforcePositive() Enforces all chemical values to be positive.

tfamily \ void increment(<type(chemicalAbundances)> addAbundances) Increment a chemical abundances object.

tfamily \ logicalzero isZero() Return true if a chemicals object is zero.

tfamily \ void massToNumber(<type(chemicalAbundances)> chemicalsByNumber) Converts from abundances by mass to abundances by number.

tfamily \ textcolor{red}{\textless type(chemicalAbundances)\textgreater} multiply(<double> multiplier) Multiply a chemical abundance by a scalar.

tfamily \ void numberToMass(<type(chemicalAbundances)> chemicalsByMass) Converts from abundances by number to abundances by mass.

tfamily \ void readRaw(<integer> fileHandle) Read a chemical abundances object in binary.

tfamily \ void reset() Resets abundances to zero.

tfamily \ void serialize(<double(:)> chemicalAbundancesArray) Serialize a chemical abundances object to an array.
16. Coding GALACTICUS

```c
\textfamily intzero serializeCount() \text{return a count of the number of properties in a serialized chemical abundances object.}
\textfamily void setToUnity() \text{Set abundances to unity.}
\textfamily \textcolor{red}{\textless\textbf{type(chemicalAbundances)}\textgreater} subtract(<\textbf{type(chemicalAbundances)}> abundances2\rightarrow) \text{return one chemical abundance from another.}

\textfamily chemicalStructure
\textfamily intzero charge() \text{return the charge of a chemical.}
\textfamily void export(<\text{character(len=*)}> coutputFile\rightarrow) \text{Write a chemical structure to a CML file.}
\textfamily doublezero mass() \text{return the mass of a chemical in atomic mass units.}
\textfamily void retrieve(<\text{character(len=*)}> chemicalName\rightarrow) \text{Get a chemical from the database.}

\textfamily coordinate
\textfamily void fromCartesian(<\textbf{double(3)}> x\rightarrow) \text{Set the coordinates from a Cartesian system specified as a 3-element array.}
\textfamily \textcolor{red}{\textless\textbf{double(3)}\textgreater} toCartesian() \text{return the coordinates in a Cartesian system as a 3-element array.}

\textfamily coordinateCartesian
\textfamily void fromCartesian(<\textbf{double(3)}> x\rightarrow) \text{Set the coordinates from a Cartesian system specified as a 3-element array.}
\textfamily \textcolor{red}{\textless\textbf{double(3)}\textgreater} toCartesian() \text{return the coordinates in a Cartesian system as a 3-element array.}
\textfamily doublezero x() \text{return the x-coordinate.}
\textfamily void xSet(<\textbf{double}> x\rightarrow) \text{set the x-coordinate.}
\textfamily doublezero y() \text{return the y-coordinate.}
\textfamily void ySet(<\textbf{double}> y\rightarrow) \text{set the y-coordinate.}
\textfamily doublezero z() \text{return the z-coordinate.}
\textfamily void zSet(<\textbf{double}> z\rightarrow) \text{set the z-coordinate.}

\textfamily coordinateCylindrical
\textfamily void fromCartesian(<\textbf{double(3)}> x\rightarrow) \text{Set the coordinates from a Cartesian system specified as a 3-element array.}
\textfamily doublezero phi() \text{return the φ-coordinate.}
\textfamily void phiSet(<\textbf{double}> phi\rightarrow) \text{set the φ-coordinate.}
\textfamily doublezero r() \text{return the r-coordinate.}
```
16.5. Objects

tfamily \void rSet(<double> r \rightarrow) set the r-coordinate.

tfamily \textcolor{red}{\textless double(3)\textgreater} toCartesian() Return the coordinates in a Cartesian system as a 3-element array.

tfamily \doublezero z() Get the z-coordinate.

tfamily \void zSet(<double> z \rightarrow) set the z-coordinate.

tfamily coordinateSpherical

tfamily \void fromCartesian(<double(3)> x \rightarrow) Set the coordinates from a Cartesian system specified as a 3-element array.

tfamily \doublezero phi() Get the φ-coordinate.

tfamily \void phiSet(<double> phi \rightarrow) set the φ-coordinate.

tfamily \doublezero r() Get the r-coordinate.

tfamily \void rSet(<double> r \rightarrow) set the r-coordinate.

tfamily \doublezero theta() Get the θ-coordinate.

tfamily \void thetaSet(<double> theta \rightarrow) set the θ-coordinate.

tfamily \textcolor{red}{\textless double(3)\textgreater} toCartesian() Return the coordinates in a Cartesian system as a 3-element array.

tfamily cosmologyFunctionsClass

tfamily double precision comovingVolumeElementRedshift(<double precision> time \rightarrow) Returns the differential comoving volume element \( dV/dz = r_c^2(t)cH^{-1}(t) \) (where \( r_c \) is the comoving distance to time \( t \) and \( H(t) \) is the Hubble parameter at that time) for unit solid angle at the specified time.

tfamily double precision comovingVolumeElementTime(<double precision> time \rightarrow) Returns the differential comoving volume element \( dV/dt = r_c^2(t)ca(t) \) (where \( r_c \) is the comoving distance to time \( t \) and \( a(t) \) is the expansion at that time) for unit solid angle at the specified time.

tfamily double precision cosmicTime(<double precision> expansionFactor \rightarrow, <logical> collapsingPhase \rightarrow) Return the cosmological age at the given expansion factor.

tfamily logical cosmicTimeIsValid(<double precision> time \rightarrow) Returns true if the given cosmic time is valid one for this cosmology.

tfamily void densityScalingEarlyTime(<double precision> dominateFactor \rightarrow, <double precision> densityPower ←, <double precision> expansionFactorDominant ←, <double precision> OmegaDominant ←) Compute the scaling of density with expansion factor at early times in the universe.

tfamily double precision distanceAngular(<double precision> time \rightarrow) Return the angular diameter distance to the given cosmic time.

tfamily double precision distanceComoving(<double precision> time \rightarrow) Return the comoving distance to the given cosmic time.
tfamily double precision distanceComovingConvert(<integer> output→,<double precision> distance-Modulus→,<double precision> redshift→) Convert between different measures of comoving distance.

tfamily double precision distanceLuminosity(<double precision> time→) Return the luminosity distance to the given cosmic time.

tfamily double precision dominationEpochMatter(<double precision> dominateFactor→) Compute the epoch at which matter dominates over other forms of energy by a given factor.

tfamily double precision epochTime(<double precision> time→,<double precision> expansionFactor→,<logical> collapsingPhase→) Convenience function that returns the time corresponding to an epoch specified by time or expansion factor.

tfamily double precision equalityEpochMatterCurvature(<integer> requestType→) Return the epoch of matter-curvature magnitude equality (either expansion factor or cosmic time).

tfamily double precision equalityEpochMatterDarkEnergy(<integer> requestType→) Return the epoch of matter-dark energy magnitude equality (either expansion factor or cosmic time).

tfamily double precision equationOfStateDarkEnergy(<double precision> time→,<double precision> expansionFactor→) Returns the cosmological expansion rate, $\dot{a}/a$ at expansion factor expansionFactor.

tfamily double precision exponentDarkEnergy(<double precision> time→,<double precision> expansionFactor→) HASH(0x198caa8)

tfamily double precision hubbleParameterEpochal(<double precision> time→,<double precision> expansionFactor→,<logical> collapsingPhase→) Returns the Hubble parameter at the requested cosmological time, time, or expansion factor, expansionFactor.

tfamily double precision hubbleParameterRateOfChange(<double precision> time→,<double precision> expansionFactor→,<logical> collapsingPhase→) Returns the rate of change of the Hubble parameter at the requested cosmological time, time, or expansion factor, expansionFactor.

tfamily logical isFinalizable() Return true if this object can be finalized.

tfamily double precision omegaDarkEnergyEpochal(<double precision> time→,<double precision> expansionFactor→,<logical> collapsingPhase→) Return the dark energy density parameter at expansion factor expansionFactor.

tfamily double precision omegaMatterEpochal(<double precision> time→,<double precision> expansionFactor→,<logical> collapsingPhase→) Return the matter density parameter at expansion factor expansionFactor.
16.5. Objects

**Object Methods**

- `tfamily double precision omegaMatterRateOfChange(<double precision> time→, <double precision> expansionFactor→, <logical> collapsingPhase→)` Return the rate of change of the matter density parameter at expansion factor `expansionFactor`.

- `tfamily double precision redshiftFromExpansionFactor(<double precision> expansionFactor→)` Returns redshift for a given expansion factor.

- `tfamily void stateRestore(<integer> stateFile→)` Restore the state of the object to file.

- `tfamily void stateStore(<integer> stateFile→)` Store the state of the object to file.

- `tfamily double precision temperatureCMBEpochal(<double precision> time→, <double precision> expansionFactor→, <logical> collapsingPhase→)` Return the temperature of the cosmic microwave background at `expansionFactor`.

- `tfamily double precision timeAtDistanceComoving(<double precision> comovingDistance→)` Return the cosmic time corresponding to the given `comovingDistance`.

- `tfamily double precision comovingVolumeElementRedshift(<double precision> time→)` Returns the differential comoving volume element $\frac{dV}{dz} = r_c^2(t)cH(t)^{-1}$ (where $r_c$ is the comoving distance to time $t$ and $H(t)$ is the Hubble parameter at that time) for unit solid angle at the specified `time`.

- `tfamily double precision comovingVolumeElementTime(<double precision> time→)` Returns the differential comoving volume element $\frac{dV}{dt} = r_c^2(t)ca(t)$ (where $r_c$ is the comoving distance to time $t$ and $a(t)$ is the expansion at that time) for unit solid angle at the specified `time`.

- `tfamily double precision cosmicTime(<double precision> expansionFactor→, <logical> collapsingPhase→)` Return the cosmological age at the given expansion factor.

- `tfamily logical cosmicTimeIsValid(<double precision> time→)` Returns true if the given cosmic time is valid one for this cosmology.

- `tfamily void densityScalingEarlyTime(<double precision> dominateFactor→, <double precision> densityPower←, <double precision> expansionFactorDominant←, <double precision> OmegaDominant←)` Compute the scaling of density with expansion factor at early times in the universe.

- `tfamily double precision distanceAngular(<double precision> time→)` Return the angular diameter distance to the given cosmic `time`.

- `tfamily double precision distanceComoving(<double precision> time→)` Return the comoving distance to the given cosmic `time`.

- `tfamily double precision distanceComovingConvert(<integer> output→, <double precision> distanceModulus→, <double precision> redshift→)` Convert between different measures of comoving distance.

- `tfamily double precision distanceLuminosity(<double precision> time→)` Return the luminosity distance to the given cosmic `time`.

- `tfamily void distanceTabulate(<double> time→)` Tabulate comoving distance as a function of cosmic `time`.

- `tfamily double precision dominationEpochMatter(<double precision> dominateFactor→)` Compute the epoch at which matter dominates over other forms of energy by a given factor.
16. Coding GALACTICUS

tfamily double precision epochTime(\texttt{<double precision> time\rightarrow}, \texttt{<double precision> expansionFactor\rightarrow}, \texttt{<logical> collapsingPhase\rightarrow}) Convenience function that returns the time corresponding to an epoch specified by time or expansion factor.

tfamily double precision equalityEpochMatterCurvature(\texttt{<integer> requestType\rightarrow}) Return the epoch of matter-curvature magnitude equality (either expansion factor or cosmic time).

tfamily double precision equalityEpochMatterDarkEnergy(\texttt{<integer> requestType\rightarrow}) Return the epoch of matter-dark energy magnitude equality (either expansion factor or cosmic time).

tfamily double precision equationOfStateDarkEnergy(\texttt{<double precision> time\rightarrow}, \texttt{<double precision> expansionFactor\rightarrow}) Returns the dark energy density parameter at expansion factor.

tfamily double precision expansionFactor(\texttt{<double precision> time\rightarrow}) Returns the expansion factor at cosmological time \texttt{time}.

tfamily double precision expansionFactorFromRedshift(\texttt{<double precision> redshift\rightarrow}) Returns expansion factor given a redshift.

tfamily logical expansionFactorIsValid(\texttt{<double precision> expansionFactor\rightarrow}) Returns true if the given expansion factor is valid one for this cosmology.

tfamily void expansionFactorTabulate(\texttt{<double> time\rightarrow}) Tabulate expansion factor as a function of cosmic time.

tfamily double precision expansionRate(\texttt{<double precision> expansionFactor\rightarrow}) Returns the cosmological expansion rate, $\dot{a}/a$ at expansion factor \texttt{expansionFactor}.

tfamily double precision hubbleParameterEpochal(\texttt{<double precision> time\rightarrow}, \texttt{<double precision> expansionFactor\rightarrow}, \texttt{<logical> collapsingPhase\rightarrow}) Returns the Hubble parameter at the requested cosmological time, \texttt{time}, or expansion factor, \texttt{expansionFactor}.

tfamily double precision hubbleParameterRateOfChange(\texttt{<double precision> time\rightarrow}, \texttt{<double precision> expansionFactor\rightarrow}, \texttt{<logical> collapsingPhase\rightarrow}) Returns the rate of change of the Hubble parameter at the requested cosmological time, \texttt{time}, or expansion factor, \texttt{expansionFactor}.

tfamily logical isFinalizable() Return true if this object can be finalized.

tfamily double precision omegaDarkEnergyEpochal(\texttt{<double precision> time\rightarrow}, \texttt{<double precision> expansionFactor\rightarrow}, \texttt{<logical> collapsingPhase\rightarrow}) Return the dark energy density parameter at expansion factor \texttt{expansionFactor}.

tfamily double precision omegaMatterEpochal(\texttt{<double precision> time\rightarrow}, \texttt{<double precision> expansionFactor\rightarrow}, \texttt{<logical> collapsingPhase\rightarrow}) Return the matter density parameter at expansion factor \texttt{expansionFactor}.

tfamily double precision omegaMatterRateOfChange(\texttt{<double precision> time\rightarrow}, \texttt{<double precision> expansionFactor\rightarrow}, \texttt{<logical> collapsingPhase\rightarrow}) Return the rate of change of the matter density parameter at expansion factor \texttt{expansionFactor}.
tfamily double precision redshiftFromExpansionFactor(<double precision> expansionFactor→) Returns redshift for a given expansion factor.

tfamily void stateRestore(<integer> stateFile→) Restore the state of the object to file.

tfamily void stateStore(<integer> stateFile→) Store the state of the object to file.

tfamily void targetSelf() Set a module-scope pointer to self.

tfamily double precision temperatureCMBEpochal(<double precision> time→,<double precision> expansionFactor→,<logical> collapsingPhase→) Return the temperature of the cosmic microwave background at expansionFactor.

tfamily double precision timeAtDistanceComoving(<double precision> comovingDistance→) Return the cosmic time corresponding to the given comovingDistance.

tfamily cosmologyFunctionsMatterLambda

tfamily double precision comovingVolumeElementRedshift(<double precision> time→) Returns the differential comoving volume element \(dV/dz = r_c^2(t)H^{-1}(t)\) (where \(r_c\) is the comoving distance to time \(t\) and \(H(t)\) is the Hubble parameter at that time) for unit solid angle at the specified time.

tfamily double precision comovingVolumeElementTime(<double precision> time→) Returns the differential comoving volume element \(dV/dt = r_c^2(t)ca(t)\) (where \(r_c\) is the comoving distance to time \(t\) and \(a(t)\) is the expansion at that time) for unit solid angle at the specified time.

tfamily double precision cosmicTime(<double precision> expansionFactor→,<logical> collapsingPhase→) Return the cosmological age at the given expansion factor.

tfamily logical cosmicTimeIsValid(<double precision> time→) Returns true if the given cosmic time is valid one for this cosmology.

tfamily void densityScalingEarlyTime(<double precision> dominateFactor→,<double precision> densityPower←,<double precision> expansionFactorDominant←,<double precision> OmegaDominant←) Compute the scaling of density with expansion factor at early times in the universe.

tfamily double precision distanceAngular(<double precision> time→) Return the angular diameter distance to the given cosmic time.

tfamily double precision distanceComoving(<double precision> time→) Return the comoving distance to the given cosmic time.

tfamily double precision distanceComovingConvert(<integer> output→,<double precision> distanceModulus→,<double precision> redshift→) Convert between different measures of comoving distance.

tfamily double precision distanceLuminosity(<double precision> time→) Return the luminosity distance to the given cosmic time.

tfamily void distanceTabulate(<double> time→) Tabulate comoving distance as a function of cosmic time.

tfamily double precision dominationEpochMatter(<double precision> dominateFactor→) Compute the epoch at which matter dominates over other forms of energy by a given factor.
16. Coding Galacticus

tfamily double precision epochTime(<double precision> time→, <double precision> expansionFactor→, <logical> collapsingPhase→) Convenience function that returns the time corresponding to an epoch specified by time or expansion factor.

tfamily double precision equalityEpochMatterDarkEnergy(<integer> requestType→) Return the epoch of matter-dark energy magnitude equality (either expansion factor or cosmic time).

tfamily double precision equationOfStateDarkEnergy(<double precision> time→, <double precision> expansionFactor→) HASH(0x1989a30)

tfamily double precision expansionFactor(<double precision> time→) Returns the expansion factor at cosmological time time.

tfamily double precision expansionFactorFromRedshift(<double precision> redshift→) Returns expansion factor given a redshift.

tfamily logical expansionFactorIsValid(<double precision> expansionFactor→) Returns true if the given expansion factor is valid one for this cosmology.

tfamily void expansionFactorTabulate(<double> time→) Tabulate expansion factor as a function of cosmic time.

tfamily double precision expansionRate(<double precision> expansionFactor→) Returns the cosmological expansion rate, \( \dot{a}/a \) at expansion factor expansionFactor.

tfamily double precision exponentDarkEnergy(<double precision> time→, <double precision> expansionFactor→) HASH(0x198caa8)

tfamily double precision hubbleParameterEpochal(<double precision> time→, <double precision> expansionFactor→, <logical> collapsingPhase→) Returns the Hubble parameter at the requested cosmological time, time, or expansion factor, expansionFactor.

tfamily double precision hubbleParameterRateOfChange(<double precision> time→, <double precision> expansionFactor→, <logical> collapsingPhase→) Returns the rate of change of the Hubble parameter at the requested cosmological time, time, or expansion factor, expansionFactor.

tfamily logical isFinalizable() Return true if this object can be finalized.

tfamily double precision omegaDarkEnergyEpochal(<double precision> time→, <double precision> expansionFactor→, <logical> collapsingPhase→) Return the dark energy density parameter at expansion factor expansionFactor.

tfamily double precision omegaMatterEpochal(<double precision> time→, <double precision> expansionFactor→, <logical> collapsingPhase→) Return the matter density parameter at expansion factor expansionFactor.

tfamily double precision omegaMatterRateOfChange(<double precision> time→, <double precision> expansionFactor→, <logical> collapsingPhase→) Return the rate of change of the matter density parameter at expansion factor expansionFactor.

tfamily double precision redshiftFromExpansionFactor(<double precision> expansionFactor→) Returns redshift for a given expansion factor.
tfamily void stateRestore(<integer> stateFile→) Restore the state of the object to file.

tfamily void stateStore(<integer> stateFile→) Store the state of the object to file.

tfamily double precision temperatureCMBEpochal(<double precision> time→,<double precision> expansionFactor→,<logical> collapsingPhase→) Return the temperature of the cosmic microwave background at \texttt{expansionFactor}.

tfamily double precision timeAtDistanceComoving(<double precision> comovingDistance→) Return the cosmic time corresponding to the given \texttt{comovingDistance}.

tfamily cosmologyParametersClass
tfamily double precision densityCritical() Return the critical density at the present day in units of \(M_\odot/\text{Mpc}^3\).

tfamily double precision HubbleConstant(<integer> units→) Return the Hubble constant at the present day. The optional \texttt{units} argument specifies if the return value should be in units of \(\text{km}/\text{s}/\text{Mpc}\) (\texttt{unitsStandard}), \(\text{Gyr}^{-1}\) (\texttt{unitsTime}), or 100 \(\text{km}/\text{s}/\text{Mpc}\) (\texttt{unitsLittleH}).

tfamily logical isFinalizable() Return true if this object can be finalized.

tfamily double precision OmegaBaryon() Return the cosmological baryon density in units of the critical density at the present day.

tfamily double precision OmegaCurvature() Return the cosmological curvature density in units of the critical density at the present day.

tfamily double precision OmegaDarkEnergy() Return the cosmological dark energy density in units of the critical density at the present day.

tfamily double precision OmegaMatter() Return the cosmological matter density in units of the critical density at the present day.

tfamily double precision OmegaRadiation() Return the cosmological radiation density in units of the critical density at the present day.

tfamily double precision temperatureCMB() Return the temperature of the cosmic microwave background radiation (in units of Kelvin) at the present day.

tfamily cosmologyParametersSimple
tfamily double precision densityCritical() Return the critical density at the present day in units of \(M_\odot/\text{Mpc}^3\).

tfamily double precision HubbleConstant(<integer> units→) Return the Hubble constant at the present day. The optional \texttt{units} argument specifies if the return value should be in units of \(\text{km}/\text{s}/\text{Mpc}\) (\texttt{unitsStandard}), \(\text{Gyr}^{-1}\) (\texttt{unitsTime}), or 100 \(\text{km}/\text{s}/\text{Mpc}\) (\texttt{unitsLittleH}).

tfamily logical isFinalizable() Return true if this object can be finalized.

tfamily double precision OmegaBaryon() Return the cosmological baryon density in units of the critical density at the present day.

tfamily double precision OmegaCurvature() Return the cosmological curvature density in units of the critical density at the present day.

351
16. Coding GALACTICUS

tfamily double precision OmegaDarkEnergy() Return the cosmological dark energy density in units of the critical density at the present day.

tfamily double precision OmegaMatter() Return the cosmological matter density in units of the critical density at the present day.

tfamily double precision OmegaRadiation() Return the cosmological radiation density in units of the critical density at the present day.

tfamily double precision temperatureCMB() Return the temperature of the cosmic microwave background radiation (in units of Kelvin) at the present day.

tfamily darkMatterHaloScaleClass
tfamily void calculationReset() Reset the calculation state of the object.

tfamily double precision dynamicalTimescale() The characteristic dynamical timescale of a dark matter halo.

tfamily logical isFinalizable() Return true if this object can be finalized.

tfamily double precision meanDensity() The mean density of a dark matter halo.

tfamily double precision meanDensityGrowthRate() The growth rate of the mean density of a dark matter halo.

tfamily void stateRestore(<integer> stateFile →) Restore the state of the object to file.

tfamily void stateStore(<integer> stateFile →) Store the state of the object to file.

tfamily double precision virialRadius() The virial radius of a dark matter halo.

tfamily double precision virialRadiusGrowthRate() The growth rate of the virial radius of a dark matter halo.

tfamily double precision virialTemperature() The virial temperature of a dark matter halo.

tfamily double precision virialVelocity() The virial velocity of a dark matter halo.

tfamily double precision virialVelocityGrowthRate() The growth rate of the virial velocity of a dark matter halo.

tfamily darkMatterHaloScaleVirialDensityContrastDefinition
tfamily void calculationReset() Reset the calculation state of the object.

tfamily double precision dynamicalTimescale() The characteristic dynamical timescale of a dark matter halo.

tfamily logical isFinalizable() Return true if this object can be finalized.

tfamily double precision meanDensity() The mean density of a dark matter halo.

tfamily double precision meanDensityGrowthRate() The growth rate of the mean density of a dark matter halo.

tfamily void stateRestore(<integer> stateFile →) Restore the state of the object to file.
16.5. Objects

tfamily void stateStore(<integer> stateFile→) Store the state of the object to file.

tfamily double precision virialRadius() The virial radius of a dark matter halo.

tfamily double precision virialRadiusGrowthRate() The growth rate of the virial radius of a dark matter halo.

tfamily double precision virialTemperature() The virial temperature of a dark matter halo.

tfamily double precision virialVelocity() The virial velocity of a dark matter halo.

tfamily double precision virialVelocityGrowthRate() The growth rate of the virial velocity of a dark matter halo.

tfamily darkMatterProfileClass

tfamily void calculationReset() Reset the calculation state of the object.

tfamily double precision circularVelocity(<double precision> radius→) Returns the circular velocity (in km/s) in the dark matter profile of node at the given radius (given in units of Mpc).

tfamily double precision circularVelocityMaximum() Returns the maximum circular velocity (in km/s) in the dark matter profile of node.

tfamily double precision density(<double precision> radius→) Returns the density (in \(M_\odot\ Mpc^{-3}\)) in the dark matter profile of node at the given radius (given in units of Mpc).

tfamily double precision enclosedMass(<double precision> radius→) Returns the enclosed mass (in \(M_\odot\)) in the dark matter profile of node at the given radius (given in units of Mpc) for the given node.

tfamily double precision energy() Returns the total energy for the given node in units of \(M_\odot\ km^2 s^{-1}\).

tfamily double precision energyGrowthRate() Returns the rate of change of the total energy of node in units of \(M_\odot\ km^2 s^{-1}\ Gyr^{-1}\).

tfamily double precision freefallRadius(<double precision> time→) Returns the freefall radius (in Mpc) corresponding to the given time (in Gyr) in node.

tfamily double precision freeFallRadiusIncreaseRate(<double precision> time→) Returns the rate of increase of the freefall radius (in Mpc/Gyr) corresponding to the given time (in Gyr) in node.

tfamily logical isFinalizable() Return true if this object can be finalized.

tfamily double precision kSpace(<double precision> wavenumber→) Returns the normalized Fourier space density profile of the dark matter profile of node at the given wavenumber (given in units of Mpc^{-1}).

tfamily double precision potential(<double precision> radius→,<integer> status←) Returns the gravitational potential (in \((km/s)^2\)) in the dark matter profile of node at the given radius (given in units of Mpc).

tfamily double precision radiusFromSpecificAngularMomentum(<double precision> specificAngularMomentum→) Returns the radius (in Mpc) in the dark matter profile of node at which the specific angular momentum of a circular orbit equals specificAngularMomentum (specified in units of km s^{-1} Mpc).
Galacticus

tfamily double precision rotationNormalization() Returns the relation between specific angular momentum and rotation velocity (assuming a rotation velocity that is constant in radius) for the given node. Specifically, the normalization, \( A \), returned is such that \( V_{rot} = A J / M \)

tfamily void stateRestore(<integer> stateFile→) Restore the state of the object to file.

tfamily void stateStore(<integer> stateFile→) Store the state of the object to file.

tfamily darkMatterProfileConcentrationClass
tfamily double precision concentration() Returns the concentration parameter for the given node.

tfamily class(darkMatterProfileClass) darkMatterProfileDefinition() Returns a darkMatterProfile object describing the dark matter density profile used to define this concentration.

tfamily class(virialDensityContrastClass) densityContrastDefinition() Returns a virialDensityContrast object describing the virial density contrast used to define this concentration.

tfamily logical isFinalizable() Return true if this object can be finalized.

tfamily darkMatterProfileConcentrationDiemerKravtsov2014
tfamily double precision concentration() Returns the concentration parameter for the given node.

tfamily class(darkMatterProfileClass) darkMatterProfileDefinition() Returns a darkMatterProfile object describing the dark matter density profile used to define this concentration.

tfamily class(virialDensityContrastClass) densityContrastDefinition() Returns a virialDensityContrast object describing the virial density contrast used to define this concentration.

tfamily logical isFinalizable() Return true if this object can be finalized.

tfamily darkMatterProfileConcentrationDuttonMaccio2014
tfamily double precision concentration() Returns the concentration parameter for the given node.

tfamily class(darkMatterProfileClass) darkMatterProfileDefinition() Returns a darkMatterProfile object describing the dark matter density profile used to define this concentration.

tfamily class(virialDensityContrastClass) densityContrastDefinition() Returns a virialDensityContrast object describing the virial density contrast used to define this concentration.

tfamily logical isFinalizable() Return true if this object can be finalized.

tfamily darkMatterProfileConcentrationGao2008
tfamily double precision concentration() Returns the concentration parameter for the given node.

tfamily class(darkMatterProfileClass) darkMatterProfileDefinition() Returns a darkMatterProfile object describing the dark matter density profile used to define this concentration.

tfamily class(virialDensityContrastClass) densityContrastDefinition() Returns a virialDensityContrast object describing the virial density contrast used to define this concentration.

tfamily logical isFinalizable() Return true if this object can be finalized.
16.5. Objects

tfamily darkMatterProfileConcentrationMunozCuartas2011
tfamily double precision concentration() Returns the concentration parameter for the given node.
tfamily class(darkMatterProfileClass) darkMatterProfileDefinition() Returns a darkMatterProfile object describing the dark matter density profile used to define this concentration.
tfamily class(virialDensityContrastClass) densityContrastDefinition() Returns a virialDensityContrast object describing the virial density contrast used to define this concentration.
tfamily logical isFinalizable() Return true if this object can be finalized.

tfamily darkMatterProfileConcentrationNFW1996
tfamily double precision concentration() Returns the concentration parameter for the given node.
tfamily class(darkMatterProfileClass) darkMatterProfileDefinition() Returns a darkMatterProfile object describing the dark matter density profile used to define this concentration.
tfamily class(virialDensityContrastClass) densityContrastDefinition() Returns a virialDensityContrast object describing the virial density contrast used to define this concentration.
tfamily logical isFinalizable() Return true if this object can be finalized.

tfamily darkMatterProfileConcentrationPrada2011
tfamily double precision concentration() Returns the concentration parameter for the given node.
tfamily class(darkMatterProfileClass) darkMatterProfileDefinition() Returns a darkMatterProfile object describing the dark matter density profile used to define this concentration.
tfamily class(virialDensityContrastClass) densityContrastDefinition() Returns a virialDensityContrast object describing the virial density contrast used to define this concentration.
tfamily logical isFinalizable() Return true if this object can be finalized.

tfamily darkMatterProfileConcentrationWDM
tfamily double precision concentration() Returns the concentration parameter for the given node.
tfamily class(darkMatterProfileClass) darkMatterProfileDefinition() Returns a darkMatterProfile object describing the dark matter density profile used to define this concentration.
tfamily class(virialDensityContrastClass) densityContrastDefinition() Returns a virialDensityContrast object describing the virial density contrast used to define this concentration.
tfamily logical isFinalizable() Return true if this object can be finalized.

tfamily darkMatterProfileConcentrationZhao2009
tfamily double precision concentration() Returns the concentration parameter for the given node.
tfamily class(darkMatterProfileClass) darkMatterProfileDefinition() Returns a darkMatterProfile object describing the dark matter density profile used to define this concentration.
tfamily class(virialDensityContrastClass) densityContrastDefinition() Returns a virialDensityContrast object describing the virial density contrast used to define this concentration.
tfamily logical isFinalizable() Return true if this object can be finalized.
16. Coding GALACTICUS

tfamily darkMatterProfileEinasto
tfamily void calculationReset() Reset the calculation state of the object.
tfamily double precision circularVelocity(<double precision> radius→) Returns the circular velocity (in km/s) in the dark matter profile of node at the given radius (given in units of Mpc).
tfamily double precision circularVelocityMaximum() Returns the maximum circular velocity (in km/s) in the dark matter profile of node.
tfamily double precision density(<double precision> radius→) Returns the density (in $M_\odot$ Mpc$^{-3}$) in the dark matter profile of node at the given radius (given in units of Mpc).
tfamily doublezero densityScaleFree(<double> radius→, <double> concentration→, <double> alpha→) Returns the density (in units such that the virial mass and scale length are unity) in an Einasto dark matter profile with given concentration and alpha at the given radius (given in units of the scale radius).
tfamily double precision enclosedMass(<double precision> radius→) Returns the enclosed mass (in $M_\odot$) in the dark matter profile of node at the given radius (given in units of Mpc) for the given node.
tfamily doublezero enclosedMassScaleFree(<double> radius→, <double> concentration→, <double> alpha→) Returns the enclosed mass (in units of the virial mass) in an Einasto dark matter profile with given concentration at the given radius (given in units of the scale radius).
tfamily double precision energy() Return the total energy for the given node in units of $M_\odot$ km$^2$ s$^{-1}$.
tfamily double precision energyGrowthRate() Returns the rate of chance of the total energy of node in units of $M_\odot$ km$^2$ s$^{-1}$ Gyr$^{-1}$.
tfamily void energyTableMake(<double> concentrationRequired→, <double> alphaRequired→) Create a tabulation of the energy of Einasto profiles as a function of their concentration of $\alpha$ parameter.
tfamily void fourierProfileTableMake(<double> wavenumberRequired→, <double> concentrationRequired→, <double> alphaRequired→) Create a tabulation of the Fourier transform of Einasto profiles as a function of their $\alpha$ parameter and dimensionless wavenumber.
tfamily double precision freefallRadius(<double precision> time→) Returns the freefall radius (in Mpc) corresponding to the given time (in Gyr) in node.
tfamily double precision freeFallRadiusIncreaseRate(<double precision> time→) Returns the rate of increase of the freefall radius (in Mpc/Gyr) corresponding to the given time (in Gyr) in node.
tfamily void freefallTabulate(<double> freefallTimeScaleFree→, <double> alphaRequired→) Tabulates the freefall time vs. freefall radius for Einasto halos.
tfamily doublezero freefallTimeScaleFree(<double> radius→, <double> alpha→) Compute the freefall time in a scale-free Einasto halo.
tfamily logical isFinalizable() Return true if this object can be finalized.
tfamily double precision kSpace(<double precision> wavenumber→) Returns the normalized Fourier space density profile of the dark matter profile of node at the given wavenumber (given in units of Mpc$^{-1}$).
16.5. Objects

tfamily double precision potential(<double precision> radius→, <integer> status←) Returns the gravitational potential (in \((\text{km/s})^2\)) in the dark matter profile of node at the given radius (given in units of Mpc).

tfamily \doublezero potentialScaleFree(<double> radius→, <double> concentration→, <double> alpha→) Returns the gravitational potential (in units where the virial mass and scale radius are unity) in an Einasto dark matter profile with given concentration and alpha at the given radius (given in units of the scale radius).

tfamily double precision radiusFromSpecificAngularMomentum(<double precision> specificAngularMomentum→) Returns the radius (in Mpc) in the dark matter profile of node at which the specific angular momentum of a circular orbit equals specificAngularMomentum (specified in units of km s\(^{-1}\) Mpc.

tfamily \doublezero radiusFromSpecificAngularMomentumScaleFree(<double> alpha→, <double> specificAngularMomentumScaleFree→) Compute the radius at which a circular orbit has the given specificAngularMomentumScaleFree in a scale free Einasto profile.

tfamily \void radiusFromSpecificAngularMomentumTableMake(<double> alphaRequired→, <double> specificAngularMomentumRequired→) Create a tabulation of the relation between specific angular momentum and radius in an Einasto profile.

tfamily double precision rotationNormalization() Returns the relation between specific angular momentum and rotation velocity (assuming a rotation velocity that is constant in radius) for the given node. Specifically, the normalization, \(A\), returned is such that \(V_{rot} = AJ/M\)

tfamily void stateRestore(<integer> stateFile→) Restore the state of the object to file.

tfamily void stateStore(<integer> stateFile→) Store the state of the object to file.

tfamily darkMatterProfileIsothermal

tfamily void calculationReset() Reset the calculation state of the object.

tfamily double precision circularVelocity(<double precision> radius→) Returns the circular velocity (in km/s) in the dark matter profile of node at the given radius (given in units of Mpc).

tfamily double precision circularVelocityMaximum() Returns the maximum circular velocity (in km/s) in the dark matter profile of node.

tfamily double precision density(<double precision> radius→) Returns the density (in \(\text{M}_\odot \text{Mpc}^{-3}\)) in the dark matter profile of node at the given radius (given in units of Mpc).

tfamily double precision enclosedMass(<double precision> radius→) Returns the enclosed mass (in \(\text{M}_\odot\)) in the dark matter profile of node at the given radius (given in units of Mpc). for the given node.

tfamily double precision energy() Return the total energy for the given node in units of \(\text{M}_\odot \text{km}^2 \text{s}^{-1}\).

tfamily double precision energyGrowthRate() Returns the rate of chance of the total energy of node in units of \(\text{M}_\odot \text{km}^2 \text{s}^{-1} \text{Gyr}^{-1}\).

tfamily double precision freefallRadius(<double precision> time→) Returns the freefall radius (in Mpc) corresponding to the given time (in Gyr) in node.

tfamily double precision freeFallRadiusIncreaseRate(<double precision> time→) Returns the rate of increase of the freefall radius (in Mpc/Gyr) corresponding to the given time (in Gyr) in node.
16. **Coding GALACTICUS**

tfamily logical isFinalizable() Return true if this object can be finalized.

tfamily double precision kSpace(<double precision> wavenumber→) Returns the normalized Fourier space density profile of the dark matter profile of node at the given waveNumber (given in units of Mpc⁻¹).

tfamily double precision potential(<double precision> radius→,<integer> status←) Returns the gravitational potential (in (km/s)²) in the dark matter profile of node at the given radius (given in units of Mpc).

tfamily double precision radiusFromSpecificAngularMomentum(<double precision> specificAngularMomentum→) Returns the radius (in Mpc) in the dark matter profile of node at which the specific angular momentum of a circular orbit equals specificAngularMomentum (specified in units of km s⁻¹ Mpc).

tfamily double precision rotationNormalization() Returns the relation between specific angular momentum and rotation velocity (assuming a rotation velocity that is constant in radius) for the given node. Specifically, the normalization, A, returned is such that \( V_{\text{rot}} = AJ/M \)

tfamily void stateRestore(<integer> stateFile→) Restore the state of the object to file.

tfamily void stateStore(<integer> stateFile→) Store the state of the object to file.

tfamily darkMatterProfileNFW
tfamily \( \text{doublezero angularMomentumScaleFree(<double> concentration→}) \) Returns the total angular momentum in an NFW dark matter profile with given concentration.

tfamily void calculationReset() Reset the calculation state of the object.

tfamily double precision circularVelocity(<double precision> radius→) Returns the circular velocity (in km/s) in the dark matter profile of node at the given radius (given in units of Mpc).

tfamily double precision circularVelocityMaximum() Returns the maximum circular velocity (in km/s) in the dark matter profile of node.

tfamily double precision density(<double precision> radius→) Returns the density (in \( M_\odot \) Mpc⁻³) in the dark matter profile of node at the given radius (given in units of Mpc).

tfamily \( \text{doublezero densityScaleFree(<double> radius→, <double> concentration→, <double> alpha→}) \) Returns the density (in units such that the virial mass and scale length are unity) in an NFW dark matter profile with given concentration and alpha at the given radius (given in units of the scale radius).

tfamily double precision enclosedMass(<double precision> radius→) Returns the enclosed mass (in \( M_\odot \)) in the dark matter profile of node at the given radius (given in units of Mpc), for the given node.

tfamily \( \text{doublezero enclosedMassScaleFree(<double> radius→, <double> concentration→, <double> alpha→}) \) Returns the enclosed mass (in units of the virial mass) in an NFW dark matter profile with given concentration at the given radius (given in units of the scale radius).

tfamily double precision energy() Return the total energy for the given node in units of \( M_\odot \) km² s⁻¹.

tfamily double precision energyGrowthRate() Returns the rate of change of the total energy of node in units of \( M_\odot \) km² s⁻¹ Gyr⁻¹.
tfamily double precision freefallRadius(<double precision> time) Returns the freefall radius (in Mpc) corresponding to the given time (in Gyr) in node.

tfamily double precision freeFallRadiusIncreaseRate(<double precision> time) Returns the rate of increase of the freefall radius (in Mpc/Gyr) corresponding to the given time (in Gyr) in node.

tfamily void freefallTabulate(<double> freefallTimeScaleFree, <double> alphaRequired) Tabulates the freefall time vs. freefall radius for NFW halos.

tfamily doublezero freefallTimeScaleFree(<double> radius, <double> alpha) Compute the freefall time in a scale-free NFW halo.

tfamily void inverseAngularMomentum(<double> specificAngularMomentum) Tabulates the specific angular momentum vs. radius in an NFW profile for rapid inversion.

tfamily logical isFinalizable() Return true if this object can be finalized.

tfamily double precision kSpace(<double precision> wavenumber) Returns the normalized Fourier space density profile of the dark matter profile of node at the given wavenumber (given in units of Mpc\(^{-1}\)).

tfamily double precision potential(<double precision> radius, <integer> status) Returns the gravitational potential (in \((\text{km/s})^2\)) in the dark matter profile of node at the given radius (given in units of Mpc).

tfamily doublezero profileEnergy(<double> concentration) Computes the total energy of an NFW profile halo of given concentration.

tfamily double precision radiusFromSpecificAngularMomentum(<double precision> specificAngularMomentum) Returns the radius (in Mpc) in the dark matter profile of node at which the specific angular momentum of a circular orbit equals specificAngularMomentum (specified in units of \(\text{km s}^{-1}\) Mpc).

tfamily void stateRestore(<integer> stateFile) Restore the state of the object to file.

tfamily void stateStore(<integer> stateFile) Store the state of the object to file.

tfamily void tabulate(<double> concentration) Tabulate properties of the NFW halo profile which must be computed numerically.

tfamily hashPerfect

tfamily void create(<integer(kind=kind_int8)(:)> keys, <integer(kind=kind_int8)(:)> [values], <logical>[keepInverseTable]) Create a perfect hash.

tfamily void destroy() Destroy a perfect hash.
16. Coding GALACTICUS

tfamily \textcolor{red}{\textless integer(kind=kind_int8)\textgreater} index(<integer(kind=kind_int8)> key→) Return the index corresponding to a key in a perfect hash.

tfamily \textcolor{red}{\textless integer(kind=kind_int8)\textgreater} isPresent(<integer(kind=kind_int8)> key→) Test if a key is present in a perfect hash.

tfamily \textcolor{red}{\textless integer(kind=kind_int8)\textgreater} size() Return the size of a perfect hash.

tfamily \textcolor{red}{\textless integer(kind=kind_int8)\textgreater} value(<integer(kind=kind_int8)> key→) Return the value corresponding to a key in a perfect hash.

tfamily hdf5Object

tfamily \textcolor{red}{\textless character(len=\*)\textgreater} destroy() Destroy an HDF5 object.

tfamily \textcolor{red}{\textless character(len=\*)\textgreater} hasAttribute(<character(len=\*)> [attributeName]→) Check if an object has a named attribute.

tfamily \textcolor{red}{\textless character(len=\*)\textgreater} hasDataset(<character(len=\*)> [datasetName]→) Check if an object has a named dataset.

tfamily \textcolor{red}{\textless character(len=\*)\textgreater} hasGroup(<character(len=\*)> [groupName]→) Check if an object has a named group.

tfamily \textcolor{red}{\textless character(len=\*)\textgreater} isOpen() Return true if an object is open.

tfamily \textcolor{red}{\textless character(len=\*)\textgreater} isReference() Return true if a dataset is a reference.
16.5. Objects

```
tfamily\textcolor{red}{\textless type(hdf5Object)}\textgreater\{\textless character(len=\*)\}\textgreater\textbackslash pathTo()\ Returns the path to a given object.
```

```
tfamily\intzero rank()\ Return the rank of a dataset.
```

```
tfamily\void readAttribute\{\textless character(len=\*)\}\textgreater\textbackslash attributeName\rightarrow,\\textless(character|integer(kind=\textlsq int8)|double|character(len=\*)|type(varying_string))\[[:\]\textlsq 0\to 1\]\textgreater\textbackslash attributeValue\leftarrow,\\textless logical\textgreater\allowPseudoScalar\rightarrow\ Read an attribute from an HDF5 object.
```

```
tfamily\void readAttributeStatic\{\textless character(len=\*)\}\textgreater\textbackslash attributeName\rightarrow,\\textless(character|integer(kind=\textlsq int8)|double|character(len=\*)|type(varying_string))\[[:\]\textlsq 0\to 1\]\textgreater\textbackslash attributeValue\leftarrow,\\textless logical\textgreater\allowPseudoScalar\rightarrow\ Read an attribute from an HDF5 object into a static array.
```

```
tfamily\void readDataset\{\textless character(len=\*)\}\textgreater\textbackslash datasetName\rightarrow,\\textless(character|integer(kind=\textlsq int8)|double|character(len=\*)|type(varying_string))\[[:\]\textlsq 0\to 1\]\textgreater\textbackslash datasetValue\leftarrow,\\textless integer(kind=HSIZE_T)\[1\]\textlsq readBegin\rightarrow,\\textless integer(kind=HSIZE_T)\[1\]\textlsq readCount\rightarrow\ Read a dataset from an HDF5 group into an allocatable array.
```

```
tfamily\void readDatasetStatic\{\textless character(len=\*)\}\textgreater\textbackslash datasetName\rightarrow,\\textless(character|integer(kind=\textlsq int8)|double|character(len=\*)|type(varying_string))\[[:\]\textlsq 0\to 1\]\textgreater\textbackslash datasetValue\leftarrow,\\textless integer(kind=HSIZE_T)\[1\]\textlsq readBegin\rightarrow,\\textless integer(kind=HSIZE_T)\[1\]\textlsq readCount\rightarrow\ Read a dataset from an HDF5 group into a static array.
```

```
tfamily\\textcolor{red}{\textless integer(kind=HSIZE_T)}\textgreater\size\{\textless integer\}\textgreater\textbackslash dim\rightarrow\ Return the size of a dataset.
```

```
tfamily\\textcolor{red}{\textless integer(kind=HSIZE_T)}\textgreater\size\{\textless integer\}\textgreater\textbackslash dim\rightarrow\ Return the size of a dataset.
```

```
tfamily\\textcolor{red}{\textless integer(kind=HSIZE_T)}\textgreater\size\{\textless integer\}\textgreater\textbackslash dim\rightarrow\ Return the size of a dataset.
```

```
tfamily\\textcolor{red}{\textless integer(kind=HSIZE_T)}\textgreater\size\{\textless integer\}\textgreater\textbackslash dim\rightarrow\ Return the size of a dataset.
```

```
tfamily\\textcolor{red}{\textless integer(kind=HSIZE_T)}\textgreater\size\{\textless integer\}\textgreater\textbackslash dim\rightarrow\ Return the size of a dataset.
```

```
tfamily\\textcolor{red}{\textless integer(kind=HSIZE_T)}\textgreater\size\{\textless integer\}\textgreater\textbackslash dim\rightarrow\ Return the size of a dataset.
```

```
tfamily\\textcolor{red}{\textless integer(kind=HSIZE_T)}\textgreater\size\{\textless integer\}\textgreater\textbackslash dim\rightarrow\ Return the size of a dataset.
```

```
tfamily\\textcolor{red}{\textless integer(kind=HSIZE_T)}\textgreater\size\{\textless integer\}\textgreater\textbackslash dim\rightarrow\ Return the size of a dataset.
```

```
tfamily\\textcolor{red}{\textless integer(kind=HSIZE_T)}\textgreater\size\{\textless integer\}\textgreater\textbackslash dim\rightarrow\ Return the size of a dataset.
```

```
tfamily\\textcolor{red}{\textless integer(kind=HSIZE_T)}\textgreater\size\{\textless integer\}\textgreater\textbackslash dim\rightarrow\ Return the size of a dataset.
```

```
tfamily\\textcolor{red}{\textless integer(kind=HSIZE_T)}\textgreater\size\{\textless integer\}\textgreater\textbackslash dim\rightarrow\ Return the size of a dataset.
```

```
tfamily\\textcolor{red}{\textless integer(kind=HSIZE_T)}\textgreater\size\{\textless integer\}\textgreater\textbackslash dim\rightarrow\ Return the size of a dataset.
```

```
tfamily\\textcolor{red}{\textless integer(kind=HSIZE_T)}\textgreater\size\{\textless integer\}\textgreater\textbackslash dim\rightarrow\ Return the size of a dataset.
```

```
tfamily\\textcolor{red}{\textless integer(kind=HSIZE_T)}\textgreater\size\{\textless integer\}\textgreater\textbackslash dim\rightarrow\ Return the size of a dataset.
```

```
tfamily\\textcolor{red}{\textless integer(kind=HSIZE_T)}\textgreater\size\{\textless integer\}\textgreater\textbackslash dim\rightarrow\ Return the size of a dataset.
```

```
tfamily\\textcolor{red}{\textless integer(kind=HSIZE_T)}\textgreater\size\{\textless integer\}\textgreater\textbackslash dim\rightarrow\ Return the size of a dataset.
```

```
tfamily\\textcolor{red}{\textless integer(kind=HSIZE_T)}\textgreater\size\{\textless integer\}\textgreater\textbackslash dim\rightarrow\ Return the size of a dataset.
```

```
tfamily\\textcolor{red}{\textless integer(kind=HSIZE_T)}\textgreater\size\{\textless integer\}\textgreater\textbackslash dim\rightarrow\ Return the size of a dataset.
```

```
tfamily\\textcolor{red}{\textless integer(kind=HSIZE_T)}\textgreater\size\{\textless integer\}\textgreater\textbackslash dim\rightarrow\ Return the size of a dataset.
```

```
tfamily\\textcolor{red}{\textless integer(kind=HSIZE_T)}\textgreater\size\{\textless integer\}\textgreater\textbackslash dim\rightarrow\ Return the size of a dataset.
```

```
tfamily\\textcolor{red}{\textless integer(kind=HSIZE_T)}\textgreater\size\{\textless integer\}\textgreater\textbackslash dim\rightarrow\ Return the size of a dataset.
```

```
tfamily\\textcolor{red}{\textless integer(kind=HSIZE_T)}\textgreater\size\{\textless integer\}\textgreater\textbackslash dim\rightarrow\ Return the size of a dataset.
```

```
tfamily\\textcolor{red}{\textless integer(kind=HSIZE_T)}\textgreater\size\{\textless integer\}\textgreater\textbackslash dim\rightarrow\ Return the size of a dataset.
```

```
tfamily\\textcolor{red}{\textless integer(kind=HSIZE_T)}\textgreater\size\{\textless integer\}\textgreater\textbackslash dim\rightarrow\ Return the size of a dataset.
```

```
tfamily\\textcolor{red}{\textless integer(kind=HSIZE_T)}\textgreater\size\{\textless integer\}\textgreater\textbackslash dim\rightarrow\ Return the size of a dataset.
```

```
tfamily\\textcolor{red}{\textless integer(kind=HSIZE_T)}\textgreater\size\{\textless integer\}\textgreater\textbackslash dim\rightarrow\ Return the size of a dataset.
```

```
tfamily\\textcolor{red}{\textless integer(kind=HSIZE_T)}\textgreater\size\{\textless integer\}\textgreater\textbackslash dim\rightarrow\ Return the size of a dataset.
```

```
tfamily\\textcolor{red}{\textless integer(kind=HSIZE_T)}\textgreater\size\{\textless integer\}\textgreater\textbackslash dim\rightarrow\ Return the size of a dataset.
```

```
2For double datasets, up to 5-dimensional datasets are supported.
```
tfamily history

tfamily \textcolor{red}{\textless type(history)\textgreater} add(<type(history)> + <type(history)>)
Addition operator.

tfamily \textcolor{red}{\textless type(node)\textgreater} historyDefinition \rightarrow Build a history object from an XML definition.

tfamily \textcolor{red}{\textlesstype(history)\textgreater} divide(<type(history)>/<type(history)>)
Division operator.

tfamily \textcolor{red}{\textlesstype(history)\textgreater} multiply(<type(history)>*<type(history)>)
Multiplication operator.

tfamily \textcolor{red}{\textlesstype(history)\textgreater} subtract(<type(history)>-<type(history)>)
Subtraction operator.

tfamily \textcolor{red}{\textlesstype(history)\textgreater} divide(<type(history)>/<type(history)>)
Division operator.

tfamily \textcolor{red}{\textlesstype(history)\textgreater} multiply(<type(history)>*<type(history)>)
Multiplication operator.

tfamily \textcolor{red}{\textlesstype(history)\textgreater} subtract(<type(history)>-<type(history)>)
Subtraction operator.
tfamily hotHaloMassDistributionBetaProfile

tfamily double precision density(<double precision> radius→) Return the density of the hot halo at the given radius.

tfamily double precision densityLogSlope(<double precision> radius→) Return the logarithmic slope of the density of the hot halo at the given radius.

tfamily double precision enclosedMass(<double precision> radius→) Return the mass enclosed in the hot halo at the given radius.

tfamily void initialize(<type(treeNode)> node→) Initialize the \( \beta \)-profile density hot halo mass distribution for the given node.

tfamily logical isFinalizable() Return true if this object can be finalized.

tfamily double precision radialMoment(<double precision> moment→,<double precision> radius→) Return the density of the hot halo at the given radius.

tfamily double precision rotationNormalization() Returns the relation between specific angular momentum and rotation velocity (assuming a rotation velocity that is constant in radius) for node. Specifically, the normalization, \( A \), returned is such that \( V_{\text{rot}} = AJ/M \).

---

363
tfamily hotHaloMassDistributionCoreRadiusGrowing
   tfamily logical isFinalizable() Return true if this object can be finalized.
   tfamily double precision radius() Return the core radius of the hot halo mass distribution.
   tfamily void stateRestore(<integer> stateFile→) Restore the state of the object to file.
   tfamily void stateStore(<integer> stateFile→) Store the state of the object to file.

tfamily hotHaloMassDistributionCoreRadiusVirialFraction
   tfamily logical isFinalizable() Return true if this object can be finalized.
   tfamily double precision radius() Return the core radius of the hot halo mass distribution.
   tfamily void stateRestore(<integer> stateFile→) Restore the state of the object to file.
   tfamily void stateStore(<integer> stateFile→) Store the state of the object to file.

tfamily hotHaloMassDistributionNull
   tfamily double precision density(<double precision> radius→) Return the density of the hot halo at the given radius.
   tfamily double precision densityLogSlope(<double precision> radius→) Return the logarithmic slope of the density of the hot halo at the given radius.
   tfamily double precision enclosedMass(<double precision> radius→) Return the mass enclosed in the hot halo at the given radius.
   tfamily logical isFinalizable() Return true if this object can be finalized.
   tfamily double precision radialMoment(<double precision> moment→,<double precision> radius→) Return the density of the hot halo at the given radius.
   tfamily double precision rotationNormalization() Returns the relation between specific angular momentum and rotation velocity (assuming a rotation velocity that is constant in radius) for node. Specifically, the normalization, $A$, returned is such that $V_{rot} = AJ/M$.

tfamily hotHaloMassDistributionRicotti2000
   tfamily double precision density(<double precision> radius→) Return the density of the hot halo at the given radius.
   tfamily double precision densityLogSlope(<double precision> radius→) Return the logarithmic slope of the density of the hot halo at the given radius.
   tfamily double precision enclosedMass(<double precision> radius→) Return the mass enclosed in the hot halo at the given radius.
   tfamily void initialize(<*type(treeNode)> node→) Initialize the $\beta$-profile density hot halo mass distribution for the given node.
   tfamily logical isFinalizable() Return true if this object can be finalized.
16.5. Objects

tfamily double precision radialMoment(<double precision> moment→,<double precision> radius→)
Return the density of the hot halo at the given radius.

tfamily double precision rotationNormalization() Returns the relation between specific angular momentum and rotation velocity (assuming a rotation velocity that is constant in radius) for node. Specifically, the normalization, \( A \), returned is such that \( V_{rot} = AJ/M \).

tfamily importerUnits

tfamily \textcolor{red}{\textless type(importerUnits)\textgreater} exponentiate(<integer> exponent→)
Raise to the given integer power.

tfamily \textcolor{red}{\textless type(importerUnits)\textgreater} multiply(<type(importerUnits)> units2→)
Multiply by another importerUnits object.

tfamily inputParameterList

tfamily \void add(<character(len=*>) name→, <character(len=*>) value→) Add a parameter and value to the list.

tfamily \void outputToXML() Write a list fo input parameters to an XML document.

tfamily integerScalarHash

tfamily \void delete(<(character(len=*)|varying_string)> key→, <integer> value→) Delete a key from the hash.

tfamily void destroy() Destroy the hash.

tfamily \logicalzero exists(<(character(len=*)|varying_string|<integer>)> key→) Return true if the specified key exists in the hash.

tfamily \void initialize() Initialize the hash.

tfamily \textcolor{red}{\textless type(varying_string)\[:\]} key(<integer> indexValue→) Return the key of the indexValue\(^{th}\) entry in the hash.

tfamily \void keys(<type(varying_string)[:]> keys↔) Return an array of all keys in the hash.

tfamily \void set(<(character(len=*)|varying_string)> key→, <integer> value→) Set the value of a key in the hash.

tfamily \intzero size() Return the number of keys in the hash.

tfamily \intzero value(<(character(len=*)|varying_string|<integer>)> key→, <integer> value→) Return the value for the given key.

tfamily \void values(<integer[:]> values↔) Return an array of all values in the hash.
tfamily intergalacticMediumStateClass

   tfamily double precision doublyIonizedHeliumFraction(<double precision> time→) Return the doubly-ionized fraction of helium in the IGM at the given time.

   tfamily double precision electronFraction(<double precision> time→) Return the electron fraction (relative to hydrogen) in the IGM at the given time.

   tfamily double precision electronScatteringOpticalDepth(<double precision> time→,<logical> assume-FullyIonized→) Return the electron scattering optical depth from the present day back to the given time in the IGM.

   tfamily double precision electronScatteringTime(<double precision> opticalDepth→,<logical> assume-FullyIonized→) Return the cosmological time at which the given electron scattering opticalDepth is reached (integrating from the present day) in the IGM.

   tfamily logical isFinalizable() Return true if this object can be finalized.

   tfamily double precision neutralHeliumFraction(<double precision> time→) Return the neutral fraction of helium in the IGM at the given time.

   tfamily double precision neutralHydrogenFraction(<double precision> time→) Return the neutral fraction of hydrogen in the IGM at the given time.

   tfamily double precision singlyIonizedHeliumFraction(<double precision> time→) Return the singly-ionized fraction of helium in the IGM at the given time.

   tfamily double precision singlyIonizedHydrogenFraction(<double precision> time→) Return the singly-ionized fraction of hydrogen in the IGM at the given time.

   tfamily double precision temperature(<double precision> time→) Return the temperature (in Kelvin) of the IGM at the given time.

tfamily intergalacticMediumStateFile

   tfamily double precision doublyIonizedHeliumFraction(<double precision> time→) Return the doubly-ionized fraction of helium in the IGM at the given time.

   tfamily double precision electronFraction(<double precision> time→) Return the electron fraction (relative to hydrogen) in the IGM at the given time.

   tfamily double precision electronScatteringOpticalDepth(<double precision> time→,<logical> assume-FullyIonized→) Return the electron scattering optical depth from the present day back to the given time in the IGM.

   tfamily double precision electronScatteringTime(<double precision> opticalDepth→,<logical> assume-FullyIonized→) Return the cosmological time at which the given electron scattering opticalDepth is reached (integrating from the present day) in the IGM.

   tfamily logical isFinalizable() Return true if this object can be finalized.

   tfamily double precision neutralHeliumFraction(<double precision> time→) Return the neutral fraction of helium in the IGM at the given time.

   tfamily double precision neutralHydrogenFraction(<double precision> time→) Return the neutral fraction of hydrogen in the IGM at the given time.
16.5. Objects

tfamily double precision singlyIonizedHeliumFraction(<double precision> time→) Return the singly-ionized fraction of helium in the IGM at the given time.

tfamily double precision singlyIonizedHydrogenFraction(<double precision> time→) Return the singly-ionized fraction of hydrogen in the IGM at the given time.

tfamily double precision temperature(<double precision> time→) Return the temperature (in Kelvin) of the IGM at the given time.

tfamily intergalacticMediumStateInternal
tfamily \void densityH1Set(<double(:)> densityHydrogen1→) Set the density of neutral hydrogen time series.

tfamily \void densityH2Set(<double(:)> densityHydrogen2→) Set the density of ionized hydrogen time series.

tfamily \void densityHe1Set(<double(:)> densityHelium1→) Set the density of neutral helium time series.

tfamily \void densityHe2Set(<double(:)> densityHelium2→) Set the density of singly-ionized helium time series.

tfamily \void densityHe3Set(<double(:)> densityHelium3→) Set the density of doubly-ionized helium time series.

tfamily double precision doublyIonizedHeliumFraction(<double precision> time→) Return the doubly-ionized fraction of helium in the IGM at the given time.

tfamily double precision electronFraction(<double precision> time→) Return the electron fraction (relative to hydrogen) in the IGM at the given time.

tfamily double precision electronScatteringOpticalDepth(<double precision> time→,<logical> assumeFullyIonized→) Return the electron scattering optical depth from the present day back to the given time in the IGM.

tfamily double precision electronScatteringTime(<double precision> opticalDepth→,<logical> assumeFullyIonized→) Return the cosmological time at which the given electron scattering opticalDepth is reached (integrating from the present day) in the IGM.

tfamily \double zero filteringMAss(<double> time→) Return the filtering mass at the given time.

tfamily logical isFinalizable() Return true if this object can be finalized.

tfamily \void massFilteringSet(<double(:)> massFiltering→) Set the filtering mass time series.

tfamily double precision neutralHeliumFraction(<double precision> time→) Return the neutral fraction of helium in the IGM at the given time.

tfamily double precision neutralHydrogenFraction(<double precision> time→) Return the neutral fraction of hydrogen in the IGM at the given time.

tfamily double precision singlyIonizedHeliumFraction(<double precision> time→) Return the singly-ionized fraction of helium in the IGM at the given time.
16. Coding GALACTICUS

tfamily double precision singlyIonizedHydrogenFraction(<double precision> time→) Return the singly-ionized fraction of hydrogen in the IGM at the given time.

tfamily double precision temperature(<double precision> time→) Return the temperature (in Kelvin) of the IGM at the given time.

tfamily void temperatureSet(<double: > temperature→) Set the temperature time series.

tfamily void timeSet(<double: > times→) Set the times to use for all time series.

tfamily intergalacticMediumStateRecFast

tfamily double precision doublyIonizedHeliumFraction(<double precision> time→) Return the doubly-ionized fraction of helium in the IGM at the given time.

tfamily double precision electronFraction(<double precision> time→) Return the electron fraction (relative to hydrogen) in the IGM at the given time.

tfamily double precision electronScatteringOpticalDepth(<double precision> time→, <logical> assumeFullyIonized→) Return the electron scattering optical depth from the present day back to the given time in the IGM.

tfamily double precision electronScatteringTime(<double precision> opticalDepth→, <logical> assumeFullyIonized→) Return the cosmological time at which the given electron scattering opticalDepth is reached (integrating from the present day) in the IGM.

ntfamily logical isFinalizable() Return true if this object can be finalized.

tfamily double precision neutralHeliumFraction(<double precision> time→) Return the neutral fraction of helium in the IGM at the given time.

tfamily double precision neutralHydrogenFraction(<double precision> time→) Return the neutral fraction of hydrogen in the IGM at the given time.

tfamily double precision singlyIonizedHeliumFraction(<double precision> time→) Return the singly-ionized fraction of helium in the IGM at the given time.

tfamily double precision singlyIonizedHydrogenFraction(<double precision> time→) Return the singly-ionized fraction of hydrogen in the IGM at the given time.

tfamily double precision temperature(<double precision> time→) Return the temperature (in Kelvin) of the IGM at the given time.

tfamily intergalacticMediumStateSimple

tfamily double precision doublyIonizedHeliumFraction(<double precision> time→) Return the doubly-ionized fraction of helium in the IGM at the given time.

tfamily double precision electronFraction(<double precision> time→) Return the electron fraction (relative to hydrogen) in the IGM at the given time.

tfamily double precision electronScatteringOpticalDepth(<double precision> time→, <logical> assumeFullyIonized→) Return the electron scattering optical depth from the present day back to the given time in the IGM.
tfamily double precision electronScatteringTime(<double precision> opticalDepth→,<logical> assumeFullyIonized→) Return the cosmological time at which the given electron scattering opticalDepth is reached (integrating from the present day) in the IGM.

tfamily logical isFinalizable() Return true if this object can be finalized.

tfamily double precision neutralHeliumFraction(<double precision> time→) Return the neutral fraction of helium in the IGM at the given time.

tfamily double precision neutralHydrogenFraction(<double precision> time→) Return the neutral fraction of hydrogen in the IGM at the given time.

tfamily double precision singlyIonizedHeliumFraction(<double precision> time→) Return the singly-ionized fraction of helium in the IGM at the given time.

tfamily double precision singlyIonizedHydrogenFraction(<double precision> time→) Return the singly-ionized fraction of hydrogen in the IGM at the given time.

tfamily double precision temperature(<double precision> time→) Return the temperature (in Kelvin) of the IGM at the given time.

tfamily keplerOrbit

tfamily doublezero angularMomentum() Returns the angular momentum of an orbit.

tfamily void angularMomentumSet(<double> angularMomentum→) Sets the angular momentum of an orbit.

tfamily void assertIsDefined() Asserts that an orbit is fully defined.

tfamily void builder(<*type(node)> keplerOrbitDefinition→) Build a Kepler orbit from an XML definition.

tfamily void destroy() Destroys an orbit.

tfamily void dump() Dump an orbit.

tfamily void dumpRaw(<integer> fileHandle→) Dump an orbit in binary.

tfamily doublezero eccentricity() Returns the eccentricity of an orbit.

tfamily void eccentricitySet(<double> eccentricity→) Sets the eccentricity of an orbit.

tfamily doublezero energy() Returns the energy of an orbit.

tfamily void energySet(<double> energy→) Sets the energy of an orbit.

tfamily doublezero hostMass() Returns the host mass of an orbit.

tfamily logical zero isBound() Returns true if the orbit is bound.

tfamily logical zero isDefined() Returns true if an orbit is fully defined.

tfamily void massesSet(<double> satelliteMass→, <double> hostMass→) Sets the masses of satellite and host objects.
tfamily \ void output(<integer> integerProperty\leftrightarrow, <integer> integerBufferCount\leftrightarrow, <integer(:,:)> integerBuffer\leftrightarrow, <integer> doubleProperty\leftrightarrow, <integer> doubleBufferCount\leftrightarrow, <double(:,:)>
doubleBuffer\leftrightarrow, <double> time→, <integer> instance→) Store a keplerOrbit object in the output buffers.

tfamily \ void outputCount(<integer> integerPropertyCount\leftrightarrow, <integer> doublePropertyCount\leftrightarrow, <double>
time→, <integer> instance→) Specify the count of a keplerOrbit object for output.

tfamily \ void outputNames(<integer> integerProperty\leftrightarrow, <char[*](::)> integerPropertyNames\leftrightarrow, <char[*](::)> integerPropertyComments\leftrightarrow, <double(:,:)> integerPropertyUnitsSI\leftrightarrow, <integer> doubleProperty\leftrightarrow, <char[*](::)> doublePropertyNames\leftrightarrow, <char[*](::)> doublePropertyComments\leftrightarrow, <double(:,:)>
doublePropertyUnitsSI\leftrightarrow, <double> time→, <integer> instance→) Specify the names of a keplerOrbit object properties for output.

tfamily \ void propagate(<double> velocityRadial→) Propagates an orbit to a new position.

tamily \ doublezero radius() Returns the radius of an orbit.

tfamily \ doublezero radiusApocenter() Returns the apocenter radius of an orbit.

tamily \ void radiusApocenterSet(<double> radius→) Sets the apocenter radius of an orbit.

tfamily \ doublezero radiusPericenter() Returns the pericenter radius of an orbit.

tamily \ void radiusPericenterSet(<double> radius→) Sets the pericenter radius of an orbit.

tamily \ void radiusSet(<double> radius→) Sets the radius of an orbit.

tamily \ void readRaw(<integer> fileHandle→) Read an orbit in binary.

tamily \ void reset() Resets an orbit to a null state.

tamily \ doublezero semiMajorAxis() Returns the semi-major axis of an orbit.

tamily \ void semiMajorAxisSet(<double> semiMajorAxis→) Sets the semi-major axis of an orbit.

tamily \ doublezero specificReducedMass() Returns the specific reduced mass (i.e. the reduced mass per unit satellite mass, \( \mu_s = \frac{M_{\text{host}}}{(M_{\text{satellite}} + M_{\text{host}})} \)) of the orbit.

tamily \ doublezero velocityRadial() Returns the radial velocity of an orbit.

tamily \ void velocityRadialSet(<double> newRadius→) Sets the radial velocity of an orbit.

tamily \ doublezero velocityScale() Returns the velocity scale of an orbit.

tamily \ doublezero velocityTangential() Returns the tangential velocity of an orbit.

tamily \ void velocityTangentialSet(<double> velocityTangential→) Sets the tangential velocity of an orbit.
16.5. Objects

tfamily longIntegerHistory

tfamily \void builder(<*type(node)> historyDefinition→) Build a history object from an XML definition.

tfamily \void clone(<type(history)> historyToClone→) Clone a history object.

tfamily \void create(<integer> historyCount→, <integer> timesCount→, <double> [timeBegin]→, <double> [timeEnd]→, <integer> [rangeType]→) Creates a history object with a specified range of times.

tfamily \void destroy(<type(history)> historyToClone→) Destroys a history object.

tfamily \void dump() Dump a history object.

tfamily \void dumpRaw(<integer> fileHandle→) Dump a history object in binary.

tfamily \logicalzero exists() Returns true if the given history has been created.

tfamily \void readRaw(<integer> fileHandle→) Read a history object in binary.

tfamily \void reset() Resets all entries in a history to zero.

tfamily \void trim(<double> currentTime→, <integer> [minimumPointsToRemove]→) Removes any times in a history which have become outdated.

tfamily massDistribution

tfamily \doublezero density(<class(coordinate)> coordinates→) Returns the density of the mass distribution at the supplied coordinates.

tfamily \doublezero densityGradientRadial(<class(coordinate)> coordinates→, <logical> [logarithmic]→) Returns the gradient with respect to radius of the density of the mass distribution at the supplied coordinates. If the optional logarithmic argument is set to true, return the logarithmic gradient.

tfamily \doublezero densityRadialMoment(<double> moment→, <double> radiusMinimum→, <double> radiusMaximum→, <logical> [isInfinite]←) Returns the $n^{th}$ moment of the integral of the density over radius, $\int_{0}^{\infty} \rho(x)|x|^n dx$.

tfamily \logicalzero isDimensionless() Returns true if this is a dimensionless mass distribution, false otherwise.

tfamily \doublezero massEnclosedBySphere(<double> radius→) Returns the mass enclosed by a sphere of given radius centered on the origin.

tfamily \doublezero potential(<class(coordinate)> coordinates→) Returns the gravitational potential at the specified coordinates.

tfamily \enumMassDistributionSymmetry symmetry() Returns a label specifying the symmetry of the mass distribution (see §17.5.4).
tfamily massDistributionBetaProfile

  tfamily \doublezero density(<class(coordinate)> coordinates→) Returns the density of the mass distribution at the supplied coordinates.

  tfamily \doublezero densityGradientRadial(<class(coordinate)> coordinates→, <logical> [logarithmic]→) Returns the gradient with respect to radius of the density of the mass distribution at the supplied coordinates. If the optional logarithmic argument is set to true, return the logarithmic gradient.

  tfamily \doublezero densityRadialMoment(<double> moment→, <double> radiusMinimum→, <double> radiusMaximum→, <logical> [isInfinite]←) Returns the $n^{th}$ moment of the integral of the density over radius, $\int_{0}^{\infty} \rho(x)|x|^n dx$.

  tfamily \doublezero halfMassRadius() Returns the radius enclosing half of the mass of the mass distribution.

  tfamily \void initialize(<double> beta→, <double> coreRadius→, <double> densityNormalization→, <double> mass→, <double> outerRadius→, <logical> isDimensionless→) Initialize the mass distribution.

  tfamily \logical zero isDimensionless() Returns true is this a dimensionless mass distribution, false otherwise.

  tfamily \doublezero massEnclosedBySphere(<double> radius→) Returns the mass enclosed by a sphere of given radius centered on the origin.

  tfamily \doublezero potential(<class(coordinate)> coordinates→) Returns the gravitational potential at the specified coordinates.

  tfamily \enumMassDistributionSymmetry symmetry() Returns a label specifying the symmetry of the mass distribution (see §17.5.4).

tfamily massDistributionCylindrical

  tfamily \doublezero density(<class(coordinate)> coordinates→) Returns the density of the mass distribution at the supplied coordinates.

  tfamily \doublezero densityGradientRadial(<class(coordinate)> coordinates→, <logical> [logarithmic]→) Returns the gradient with respect to radius of the density of the mass distribution at the supplied coordinates. If the optional logarithmic argument is set to true, return the logarithmic gradient.

  tfamily \doublezero densityRadialMoment(<double> moment→, <double> radiusMinimum→, <double> radiusMaximum→, <logical> [isInfinite]←) Returns the $n^{th}$ moment of the integral of the density over radius, $\int_{0}^{\infty} \rho(x)|x|^n dx$.

  tfamily \logical zero isDimensionless() Returns true is this a dimensionless mass distribution, false otherwise.

  tfamily \doublezero massEnclosedBySphere(<double> radius→) Returns the mass enclosed by a sphere of given radius centered on the origin.

  tfamily \doublezero potential(<class(coordinate)> coordinates→) Returns the gravitational potential at the specified coordinates.

  tfamily \enumMassDistributionSymmetry symmetry() Returns a label specifying the symmetry of the mass distribution (see §17.5.4).
tfamily massDistributionHernquist

tfamily \(\text{\texttt{density}}(<\texttt{coordinate}> \text{coordinates}\rightarrow)\) Returns the density of the mass distribution at the supplied coordinates.

tfamily \(\text{\texttt{densityGradientRadial}}(<\texttt{coordinate}> \text{coordinates}\rightarrow, \text{\texttt{logical}}[[\texttt{logarithmic}]\rightarrow)\)

Returns the gradient with respect to radius of the density of the mass distribution at the supplied coordinates. If the optional \texttt{logarithmic} argument is set to true, return the logarithmic gradient.

tfamily \(\text{\texttt{densityRadialMoment}}(<\texttt{double}> \text{moment}\rightarrow, <\texttt{double}> \text{radiusMinimum}\rightarrow, <\texttt{double}> \text{radiusMaximum}\rightarrow, \text{\texttt{logical}}[[\texttt{isInfinite}][\rightarrow)\)

Returns the \(n^{th}\) moment of the integral of the density over radius, \(\int_{\text{radiusMinimum}}^{\text{radiusMaximum}} \rho(x)|x^n|\text{dx}\).

tfamily \(\text{\texttt{halfMassRadius}}()\) Returns the radius enclosing half of the mass of the mass distribution.

tfamily \(\text{\texttt{initialize}}(<\texttt{double}> \text{scaleLength}\rightarrow, <\texttt{double}> \text{densityNormalization}\rightarrow, <\texttt{double}> \text{mass}\rightarrow, \text{\texttt{logical}}[[\texttt{isDimensionless}]\rightarrow)\) Initialize the mass distribution.

tfamily \(\text{\texttt{isDimensionless}}()\) Returns \texttt{true} is this is a dimensionless mass distribution, \texttt{false} otherwise.

tfamily \(\text{\texttt{massEnclosedBySphere}}(<\texttt{double}> \text{radius}\rightarrow)\) Returns the mass enclosed by a sphere of given radius centered on the origin.

tfamily \(\text{\texttt{potential}}(<\texttt{coordinate}> \text{coordinates}\rightarrow)\) Returns the gravitational potential at the specified coordinates.

tfamily \(\text{\texttt{symmetry}}()\) Returns a label specifying the symmetry of the mass distribution (see §17.5.4).

tfamily massDistributionNFW

tfamily \(\text{\texttt{density}}(<\texttt{coordinate}> \text{coordinates}\rightarrow)\) Returns the density of the mass distribution at the supplied coordinates.

tfamily \(\text{\texttt{densityGradientRadial}}(<\texttt{coordinate}> \text{coordinates}\rightarrow, \text{\texttt{logical}}[[\texttt{logarithmic}]\rightarrow)\)

Returns the gradient with respect to radius of the density of the mass distribution at the supplied coordinates. If the optional \texttt{logarithmic} argument is set to true, return the logarithmic gradient.

tfamily \(\text{\texttt{densityRadialMoment}}(<\texttt{double}> \text{moment}\rightarrow, <\texttt{double}> \text{radiusMinimum}\rightarrow, <\texttt{double}> \text{radiusMaximum}\rightarrow, \text{\texttt{logical}}[[\texttt{isInfinite}][\rightarrow)\)

Returns the \(n^{th}\) moment of the integral of the density over radius, \(\int_{\text{radiusMinimum}}^{\text{radiusMaximum}} \rho(x)|x^n|\text{dx}\).

tfamily \(\text{\texttt{halfMassRadius}}()\) Returns the radius enclosing half of the mass of the mass distribution.

tfamily \(\text{\texttt{initialize}}(<\texttt{double}> \text{scaleLength}\rightarrow, <\texttt{double}> \text{concentration}\rightarrow, <\texttt{double}> \text{densityNormalization}\rightarrow, <\texttt{double}> \text{mass}\rightarrow, <\texttt{double}> \text{virialRadius}\rightarrow, \text{\texttt{logical}}[[\texttt{isDimensionless}]\rightarrow)\) Initialize the mass distribution.

tfamily \(\text{\texttt{isDimensionless}}()\) Returns \texttt{true} is this is a dimensionless mass distribution, \texttt{false} otherwise.

tfamily \(\text{\texttt{massEnclosedBySphere}}(<\texttt{double}> \text{radius}\rightarrow)\) Returns the mass enclosed by a sphere of given radius centered on the origin.
16. Coding GALACTICUS

tfamily \doublezero potential(<\text{class(coordinate)}> coordinates→) Returns the gravitational potential at the specified coordinates.

tfamily \enumMassDistributionSymmetry symmetry() Returns a label specifying the symmetry of the mass distribution (see §17.5.4).

tfamily massDistributionSersic
tfamily \doublezero density(<\text{class(coordinate)}> coordinates→) Returns the density of the mass distribution at the supplied coordinates.

tfamily \doublezero densityGradientRadial(<\text{class(coordinate)}> coordinates→, <\text{logical}> [logarithmic]→) Returns the gradient with respect to radius of the density of the mass distribution at the supplied coordinates. If the optional logarithmic argument is set to true, return the logarithmic gradient.

tfamily \doublezero densityRadialMoment(<\text{double}>
moment→, <\text{double}>
radiusMinimum→, <\text{double}>
radiusMaximum→, <\text{logical}> [isInfinite]←) Returns the $n^{th}$ moment of the integral of the density over radius, $\int_{0}^{\infty} \rho(x)|x|^{n} dx$.

tfamily \doublezero halfMassRadius() Returns the radius enclosing half of the mass of the mass distribution.

tfamily \doublezero halfMassRadiusProjected() Return the half mass radius of the profile in projection.

tfamily \void initialize(<\text{double}>
index→, <\text{double}>
halfMassRadius→, <\text{double}>
densityNormalization→,
<\text{double}>
mass→, <\text{logical}> isDimensionless→) Initialize the mass distribution.

tfamily \logical zero isDimensionless() Returns true is this is a dimensionless mass distribution, false otherwise.

tfamily \doublezero massEnclosedBySphere(<\text{double}>
radius→) Returns the mass enclosed by a sphere of given radius centered on the origin.

tfamily \doublezero potential(<\text{class(coordinate)}> coordinates→) Returns the gravitational potential at the specified coordinates.

tfamily \enumMassDistributionSymmetry symmetry() Returns a label specifying the symmetry of the mass distribution (see §17.5.4).

tfamily massDistributionSpherical
tfamily \doublezero density(<\text{class(coordinate)}> coordinates→) Returns the density of the mass distribution at the supplied coordinates.

tfamily \doublezero densityGradientRadial(<\text{class(coordinate)}> coordinates→, <\text{logical}> [logarithmic]→) Returns the gradient with respect to radius of the density of the mass distribution at the supplied coordinates. If the optional logarithmic argument is set to true, return the logarithmic gradient.

tfamily \doublezero densityRadialMoment(<\text{double}>
moment→, <\text{double}>
radiusMinimum→, <\text{double}>
radiusMaximum→, <\text{logical}> [isInfinite]←) Returns the $n^{th}$ moment of the integral of the density over radius, $\int_{0}^{\infty} \rho(x)|x|^{n} dx$.

tfamily \doublezero halfMassRadius() Returns the radius enclosing half of the mass of the mass distribution.
16.5. Objects

tfamily `logical zero isDimensionless()` Returns `true` if this is a dimensionless mass distribution, `false` otherwise.

tfamily `double zero massEnclosedBySphere(<double> radius →)` Returns the mass enclosed by a sphere of given `radius` centered on the origin.

tfamily `double zero potential(<class(coordinate)> coordinates →)` Returns the gravitational potential at the specified `coordinates`.

tfamily `enumMassDistributionSymmetry symmetry()` Returns a label specifying the symmetry of the mass distribution (see §17.5.4).

tfamily mergerTree
tfamily `textcolor{red}{\textless *type(treeEvent)\textgreater} createEvent()` Create a `treeEvent` object in this tree.

tfamily `void destroy()` Destroys the merger tree, including all nodes and their components.

tfamily `void destroyBranch(<*type(treeNode)> thisNode ↔)` Destroys a branch of a merger tree starting from the supplied node. All nodes and their components are destroyed.

tfamily `double zero earliestTime()` Return the earliest time in a merger tree.

tfamily `double zero earliestTimeEvolving()` Return the earliest time in an evolving merger tree.

tfamily `\textcolor{red}{\textless *type(treeNode)\textgreater} getNode(<integer(kind_int8)> nodeIndex →)` Returns a pointer to the node with given index in the merger tree, or a null pointer if no such node exists.

tfamily `double zero latestTime()` Return the latest time in a merger tree.

tfamily `void removeEvent(<type(treeEvent)> event →)` Remove a `treeEvent` from this tree.

ntfamily mergerTreeData
tfamily `void addMetadata(<metaDataType> metadataType →, <character(len=*)> label →, (<>double,,<integer>,character(len=*)) value →)` Add a metadatum to the tree data structure.

tfamily `void export(<character(len=*)> outputFileName →, <character(len=*)> outputFormat →, <integer> hdfChunkSize →, <integer> hdfCompressionLevel →, <logical> [append] →)` Export the tree data to an output file.

tfamily `void makeReferences(<logical> makeReferences →)` Specify whether or not merger tree dataset references should be made.

tfamily `void nodeCountSet(<integer> nodeCount →)` Set the total number of nodes in the data structure.

tfamily `void particleCountSet(<integer> particleCount →)` Set the total number of particles in the data structure.

tfamily `void readASCII(inputFile →, [lineNumberStart] →, [lineNumberStop] →, [separator] →)` Read node data from an ASCII file into the data structure.
tfamily \void readParticlesASCII(<character(len=*>) inputFile→, <integer> [lineNumberStart]→, <integer> [lineNumberStop]→, <character(len=*)> [separator]→) Read particle data from an ASCII file into the data structure.

tfamily \void reset() Reset the data structure.

tfamily \void setDummyHostId(<integer> dummyHostId→) Set host ID for self-hosting halos if host ID is not node ID.

tfamily \void setIncludesHubbleFlow(<logical> includesHubbleFlow→) Specify if velocities include the Hubble flow.

tfamily \void setIncludesSubhaloMasses(<logical> includesSubhaloMasses→) Set whether halo masses include the masses of the subhalos.

tfamily \void setParticleMass(<double> particleMass→) Set the mass of an N-body particle in the simulation from which the trees were derived.

tfamily \void setParticlePropertyColumn(<propertyType> propertyType→, <integer> columnNumber→) Set the column in an ASCII data file corresponding to a given particle property.

tfamily \void setPositionsArePeriodic(<logical> isPeriodic→) Set if positions are periodic.

tfamily \void setProperty(<propertyType> propertyType→, <integer(kind=kind_int8)(:)|<double(:)> property→) Set a node property in the data structure.

tfamily \void setPropertyColumn(<propertyType> propertyType→, columnNumber→) Set the column in an ASCII data file corresponding to a given node property.

tfamily \void setSelfContained(<logical> areSelfContained→) Specify if trees are self-contained (i.e. contain no cross-links to other trees).

tfamily \void setUnits(<metaDataType> unitType→, <double> unitsInSI→, <integer> [hubbleExponent]→, <integer> [scaleFactorExponent]→, <character(len=*)> [name]→) Set the units used.

tfamily \void close() Closes the file.

tfamily double precision cubeLength(<double precision> time→,<integer> status←) Returns the length of the simulation cube.

tfamily void import(<integer> i→,<logical> requireScaleRadii→,<logical> requireAngularMomenta→,<logical> requireAngularMomenta3D→,<logical> requireSpin→,<logical> requireSpin3D→,<logical> requirePositions→,<logical> requireParticleCounts→,<logical> requireVelocityMaxima→,<logical> requireVelocityDispersions→) Imports the i

376
tfamily logical isFinalizable() Return true if this object can be finalized.

tfamily logical massesIncludeSubhalos() Returns a Boolean specifying whether halo masses include the contribution from their subhalos.

tfamily integer(kind=c_size_t) nodeCount(<integer> i→) Returns the number of nodes in the \(i^{th}\) tree.

tfamily void open() Opens the file.

tfamily logical particleCountAvailable() Return true if particle counts are available.

tfamily integer positionsArePeriodic() Returns a Boolean integer specifying whether positions are periodic.

tfamily logical positionsAvailable(<logical> positions→,<logical> velocities→) Return true if positions and/or velocities are available.

tfamily logical scaleRadiiAvailable() Return true if scale radii are available.

tfamily logical spin3DAvailable() Return true if spin (vectors) are available.

tfamily logical spinAvailable() Return true if spin (magnitudes) are available.

tfamily void subhaloTrace(<double precision> time←,<double precision> position←,<double precision> velocity←) Supplies epochs, positions, and velocities for traced subhalos.

tfamily integer(kind=c_size_t) subhaloTraceCount() Returns the length of a node’s subhalo trace.

tfamily integer(kind=c_size_t) treeCount() Returns a count of the number of trees available.

tfamily integer(kind=kind_int8) treeIndex(<integer> i→) Returns the index of the \(i^{th}\) tree.

tfamily integer treesAreSelfContained() Returns a Boolean integer specifying whether trees are self-contained.

tfamily integer treesHaveSubhalos() Returns a Boolean integer specifying whether or not the trees have subhalos.

tfamily double precision treeWeight(<integer> i→) Returns the weight to assign to the \(i^{th}\) tree.

tfamily integer velocitiesIncludeHubbleFlow() Returns a Boolean integer specifying whether velocities include the Hubble flow.

tfamily logical velocityDispersionAvailable() Return true if halo velocity dispersions are available.

tfamily logical velocityMaximumAvailable() Return true if rotation curve velocity maxima are available.

tfamily mergerTreeImporterGalacticus

tfamily logical angularMomenta3DAvailable() Return true if angular momenta (vectors) are available.

tfamily logical angularMomentaAvailable() Return true if angular momenta (magnitudes) are available.

tfamily logical angularMomentaIncludeSubhalos() Returns a Boolean specifying whether halo angular momenta (or spins) include the contribution from their subhalos.

tfamily void close() Closes the file.
tfamily double precision cubeLength(<double precision> time→,<integer> status←) Returns the length of the simulation cube.

tfamily void import(<integer> i→,<logical> requireScaleRadii→,<logical> requireAngularMomenta→,<logical> requireAngularMomenta3D→,<logical> requireSpin→,<logical> requireSpin3D→,<logical> requirePositions→,<logical> requireParticleCounts→,<logical> requireVelocityMaxima→,<logical> requireVelocityDispersions→) Imports the $i^{th}$ tree.

tfamily logical isFinalizable() Return true if this object can be finalized.

tfamily logical massesIncludeSubhalos() Returns a Boolean specifying whether halo masses include the contribution from their subhalos.

tfamily integer(kind=c_size_t) nodeCount(<integer> i→) Returns the number of nodes in the $i^{th}$ tree.

tfamily void open() Opens the file.

tfamily logical particleCountAvailable() Return true if particle counts are available.

tfamily integer positionsArePeriodic() Returns a Boolean integer specifying whether positions are periodic.

tfamily logical positionsAvailable(<logical> positions→,<logical> velocities→) Return true if positions and/or velocities are available.

tfamily logical scaleRadiiAvailable() Return true if scale radii are available.

tfamily logical spin3DAvailable() Return true if spin (vectors) are available.

tfamily logical spinAvailable() Return true if spin (magnitudes) are available.

tfamily void subhaloTrace(<double precision> time←,<double precision> position←,<double precision> velocity←) Supplies epochs, positions, and velocities for traced subhalos.

tfamily integer(kind=c_size_t) subhaloTraceCount() Returns the length of a node’s subhalo trace.

tfamily integer(kind=c_size_t) treeCount() Returns a count of the number of trees available.

tfamily integer(kind=kind_int8) treeIndex(<integer> i→) Returns the index of the $i^{th}$ tree.

tfamily logical treesAreSelfContained() Returns a Boolean integer specifying whether trees are self-contained.

tfamily integer treesHaveSubhalos() Returns a Boolean integer specifying whether or not the trees have subhalos.

tfamily double precision treeWeight(<integer> i→) Returns the weight to assign to the $i^{th}$ tree.

tfamily integer velocitiesIncludeHubbleFlow() Returns a Boolean integer specifying whether velocities include the Hubble flow.

tfamily logical velocityDispersionAvailable() Return true if halo velocity dispersions are available.

tfamily logical velocityMaximumAvailable() Return true if rotation curve velocity maxima are available.
16.5. Objects

tfamily mergerTreeImporterSussing

tfamily logical angularMomenta3DAvailable() Return true if angular momenta (vectors) are available.

tfamily logical angularMomentaAvailable() Return true if angular momenta (magnitudes) are available.

tfamily logical angularMomentaIncludeSubhalos() Returns a Boolean specifying whether halo angular momenta (or spins) include the contribution from their subhalos.

tfamily void close() Closes the file.

tfamily double precision cubeLength(<double precision> time→,<integer> status←) Returns the length of the simulation cube.

tfamily void import(<integer>i→,<logical> requireScaleRadii→,<logical> requireAngularMomenta→,<logical> requireAngularMomenta3D→,<logical> requireSpin→,<logical> requireSpin3D→,<logical> requirePositions→,<logical> requireParticleCounts→,<logical> requireVelocityMaxima→,<logical> requireVelocityDispersions→) Imports the $i^{th}$ tree.

tfamily logical zero inSubvolume(<double> x→, <double> y→, <double> z→, <logical> [buffered]→) Return true if the given $x,y,z$ position lies within the current subvolume (plus the buffer region if buffered is true.

tfamily logical zero inSubvolume1D(<double> x→, <integer> iSubvolume→, <logical> [buffered]→) Return true if the given $x$ position lies within the $iSubvolume$ subvolume (plus the buffer region if buffered is true.

tfamily logical isFinalizable() Return true if this object can be finalized.

tfamily logical massesIncludeSubhalos() Returns a Boolean specifying whether halo masses include the contribution from their subhalos.

tfamily integer(kind=c_size_t) nodeCount(<integer>i→) Returns the number of nodes in the $i^{th}$ tree.

tfamily void open() Opens the file.

tfamily logical particleCountAvailable() Return true if particle counts are available.

tfamily integer positionsArePeriodic() Returns a Boolean integer specifying whether positions are periodic.

tfamily logical positionsAvailable(<logical> positions→,<logical> velocities→) Return true if positions and/or velocities are available.

tfamily logical scaleRadiiAvailable() Return true if scale radii are available.

tfamily logical spin3DAvailable() Return true if spin (vectors) are available.

tfamily logical spinAvailable() Return true if spin (magnitudes) are available.

tfamily void subhaloTrace(<double precision> time←,<double precision> position←,<double precision> velocity←) Supplies epochs, positions, and velocities for traced subhalos.

tfamily integer(kind=c_size_t) subhaloTraceCount() Returns the length of a node’s subhalo trace.

tfamily integer(kind=kind_int8) treeCount() Returns a count of the number of trees available.

tfamily integer(kind=kind_int8) treeIndex(<integer>i→) Returns the index of the $i^{th}$ tree.
tfamily integer treesAreSelfContained() Returns a Boolean integer specifying whether trees are self-contained.

tfamily integer treesHaveSubhalos() Returns a Boolean integer specifying whether or not the trees have subhalos.

tfamily double precision treeWeight(<integer> i →) Returns the weight to assign to the $i^{th}$ tree.

tfamily \logicalzero valueIsBad(<double> x →) Return true if the given x value is bad.

tfamily integer velocitiesIncludeHubbleFlow() Returns a Boolean integer specifying whether velocities include the Hubble flow.

tfamily logical velocityDispersionAvailable() Return true if halo velocity dispersions are available.

tfamily logical velocityMaximumAvailable() Return true if rotation curve velocity maxima are available.

tfamily nodeComponent
tfamily \doublezero density(<double(3)> positionSpherical→, <componentType> [componentType]→,
<massType> [massType]→, <weightBy> [weightBy]→, <integer> [weightIndex]→, <logical> [haloLoaded]→) Compute the density.

tfamily \void deserializeRates(<double(:)> array←) Deserialize the evolvable rates from an array.

tfamily \void deserializeScales(<double(:)> array←) Deserialize the evolvable scales from an array.

tfamily \void deserializeValues(<double(:)> array←) Deserialize the evolvable quantities from an array.

tfamily \void destroy() Destroy the object.

tfamily \void dump() Generate an ASCII dump of all properties.

tfamily \void dumpRaw(<integer> fileHandle→) Generate a binary dump of all properties.

tfamily \void dumpXML() Generate an XML dump of all properties.

tfamily \doublezero enclosedMass(<double> radius→, <componentType> [componentType]→,
<massType> [massType]→, <weightBy> [weightBy]→, <integer> [weightIndex]→, <logical> [haloLoaded]→) Compute the mass enclosed within a radius.

tfamily \textcolor{red}{\textless *type(treeNode)\textgreater} host() Return a pointer to the host treeNode object.

tfamily \void hotHaloCoolingAbundancesRate(<type(abundances)> value) Cumulate to the rate of the hotHaloCoolingAbundances property of the hotHalo component.

tfamily \void hotHaloCoolingAngularMomentumRate(<double> value) Cumulate to the rate of the hotHaloCoolingAngularMomentum property of the hotHalo component.

tfamily \void hotHaloCoolingMassRate(<double> value) Cumulate to the rate of the hotHaloCoolingMass property of the hotHalo component.

tfamily \void nameFromIndex(<integer> count→, <varying_string>name←) Return the name of a property given is index.

tfamily \void odeStepRatesInitialize() Initialize rates for evolvable properties.
16.5. Objects

tfamily \void odeStepScalesInitialize() Initialize scales for evolvable properties.

tfamily \void output(<integer> integerProperty ↔, <integer> integerBufferCount ↔, <integer(:,:)> integerBuffer ↔, <integer>doubleProperty ↔, <integer> doubleBufferCount ↔, <double(:,:)> doubleBuffer ↔, <double> time →, <integer> instance →) Generate values of outputtable properties.

tfamily \void outputCount(<integer>integerPropertyCount ↔, <integer>doublePropertyCount ↔, <double> time →, <integer> instance →) Compute a count of outputtable properties.

tfamily \void outputNames(<integer>integerProperty ↔, <char[*](:)>integerPropertyNames ↔, <char[*](:)>integerPropertyComments ↔, <double(:)>integerPropertyUnitsSI ↔, <integer>doubleProperty ↔, <char[*](:)>doublePropertyNames ↔, <char[*](:)>doublePropertyComments ↔, <double(:)>doublePropertyUnitsSI ↔, <double> time →, <integer>instance →) Generate names of outputtable properties.

tfamily \double zero potential(<double> radius →, <componentType> [componentType] →, <massType> [massType] →, <logical> [haloLoaded] →) Compute the gravitational potential.

tfamily \double zero rotationCurve(<double> radius →, <componentType> [componentType] →, <massType> [massType] →, <logical> [haloLoaded] →) Compute the rotation curve.

tfamily \double zero rotationCurveGradient(<double> radius →, <componentType> [componentType] →, <massType> [massType] →, <logical> [haloLoaded] →) Compute the rotation curve gradient.

tfamily \int zero serializeCount() Return a count of the number of evolvable quantities to be evolved.

tfamily \void serializeRates(<double(:)> array →) Serialize the evolvable rates to an array.

tfamily \void serializeScales(<double(:)> array →) Serialize the evolvable scales to an array.

tfamily \void serializeValues(<double(:)> array →) Serialize the evolvable quantities to an array.

tfamily \double zero surfaceDensity(<double(3)> positionCylindrical →, <componentType> [componentType] →, <massType> [massType] →, <weightBy> [weightBy] →, <integer> [weightIndex] →, <logical> [haloLoaded] →) Compute the surface density.

tfamily \textcolor{red}{\textless type(varying\textunderscore string)\textgreater} type() Return the type of this object.

tfamily nodeComponentAgeStatistics

tfamily \void builder(<*type(node)>componentDefinition →) Build a nodeComponent from a supplied XML definition.

tfamily \double zero density(<double(3)> positionSpherical →, <componentType> [componentType] →, <massType> [massType] →, <weightBy> [weightBy] →, <integer> [weightIndex] →, <logical> [haloLoaded] →) Compute the density.

tfamily \void deserializeRates(<double(:)> array ←) Deserialize the evolvable rates from an array.

tfamily \void deserializeScales(<double(:)> array ←) Deserialize the evolvable scales from an array.

tfamily \void deserializeValues(<double(:)> array ←) Deserialize the evolvable quantities from an array.

tfamily \void destroy() Destroy the object.
16. Coding GALACTICUS

tfamily \textcolor{red}{\textless double \textgreater} \text{diskIntegratedSFR()} Get the diskIntegratedSFR property of the ageStatistics component.

tfamily \textcolor{red}{\textless double \textgreater} \text{diskTimeWeightedIntegratedSFR()} Get the diskTimeWeightedIntegratedSFR property of the ageStatistics component.

tfamily \textcolor{red}{\textless double \textgreater} \text{diskTimeWeightedIntegratedSFRAttributeMatch(<logical>[requireGettable] \rightarrow, <logical>[requireSettable] \rightarrow, <logical>[requireEvolvable] \rightarrow)} Return a list of implementations that provide the given list of attributes for the diskTimeWeightedIntegratedSFR property of the ageStatistics component

tfamily \intzero \text{diskIntegratedSFRCount()} Compute the count of evolvable quantities in the diskIntegratedSFR property of the AgeStatisticsStandard component.

tfamily \textcolor{red}{\textless double \textgreater} \text{diskIntegratedSFRIsGettable()} Get the diskIntegratedSFR property of the ageStatistics component.

tfamily \logicalzero \text{diskIntegratedSFRIsSettable()} Specify whether the diskIntegratedSFR property of the ageStatistics component is settable.

tfamily \void \text{diskIntegratedSFRRate(<double> value)} Cumulate to the rate of the diskIntegratedSFR property of the AgeStatisticsStandard component.

tfamily \void \text{diskIntegratedSFRScale(<double> value)} Set the scale of the diskIntegratedSFR property of the AgeStatisticsStandard component.

tfamily \void \text{diskIntegratedSFRSet(<double> value)} Set the diskIntegratedSFR property of the ageStatistics component.

tfamily \void \text{dump()} Generate an ASCII dump of all properties.

tfamily \void \text{dumpRaw(<integer> fileHandle \rightarrow)} Generate a binary dump of all properties.
tfamily \void dumpXML() Generate an XML dump of all properties.

tfamily \doublezero enclosedMass(<double> radius\to, <componentType>[componentType]→, <massType>[massType]→, <weightBy>[weightBy]→, <integer>[weightIndex]→, <logical>[haloLoaded]→) Compute the mass enclosed within a radius.

tfamily \textcolor{red}{\textless *type(treeNode)\textgreater} host() Return a pointer to the host treeNode object.

tfamily \void hotHaloCoolingAbundancesRate(<type(abundances)> value) Cumulate to the rate of the hotHaloCoolingAbundances property of the hotHalo component.

tfamily \void hotHaloCoolingAngularMomentumRate(<double> value) Cumulate to the rate of the hotHaloCoolingAngularMomentum property of the hotHalo component.

tfamily \void hotHaloCoolingMassRate(<double> value) Cumulate to the rate of the hotHaloCoolingMass property of the hotHalo component.

tfamily \void initialize() Initialize the object.

tfamily \void nameFromIndex(<integer> count→, <varying_string>name←) Return the name of a property given is index.

tfamily \logicalzero nullIsActive() Return whether the null implementation of the ageStatistics component class is active.

tfamily \void odeStepRatesInitialize() Initialize rates for evolvable properties.

tfamily \void odeStepScalesInitialize() Initialize scales for evolvable properties.

tfamily \void output(<integer> integerProperty↔, <integer> integerBufferCount↔, <integer(:,:)> integerBuffer↔, <integer>doubleProperty↔, <integer> doubleBufferCount↔, <double(:,:)> doubleBuffer↔, <double> time→, <integer> instance→) Generate values of outputtable properties.

tfamily \void outputCount(<integer> integerPropertyCount↔, <integer> doublePropertyCount↔, <double> time→, <integer> instance→) Compute a count of outputtable properties.

tfamily \void outputNames(<integer> integerProperty↔, <char[*](:)> integerPropertyNames↔, <char[*](:)> integerPropertyComments↔, <double(*)> integerPropertyUnitsSI↔, <integer> doubleProperty↔, <char[*](:)> doublePropertyNames↔, <char[*](:)> doublePropertyComments↔, <double(*)> doublePropertyUnitsSI↔, <double> time→, <integer> instance→) Generate names of outputtable properties.

tfamily \doublezero potential(<double> radius→, <componentType>[componentType]→, <massType>[massType]→, <logical>[haloLoaded]→) Compute the gravitational potential.

tfamily \doublezero rotationCurve(<double> radius→, <componentType>[componentType]→, <massType>[massType]→, <logical>[haloLoaded]→) Compute the rotation curve.

tfamily \doublezero rotationCurveGradient(<double> radius→, <componentType>[componentType]→, <massType>[massType]→, <logical>[haloLoaded]→) Compute the rotation curve gradient.

tfamily \intzero serializeCount() Return a count of the number of evolvable quantities to be evolved.

tfamily \void serializeRates(<double(:,:)> array→) Serialize the evolvable rates to an array.
### 16. Coding GALACTICUS

- `serializeScales(<double(:) array→)`: Serialize the evolvable scales to an array.
- `serializeValues(<double(:) array→)`: Serialize the evolvable quantities to an array.
- `spheroidIntegratedSFR()`: Get the `spheroidIntegratedSFR` property of the `ageStatistics` component.
- `spheroidIntegratedSFRAttributeMatch(<logical>[requireGettable→, <logical>[requireSettable→, <logical>[requireEvolvable→])`: Return a list of implementations that provide the given list of attributes for the `spheroidIntegratedSFR` property of the `ageStatistics` component.
- `spheroidIntegratedSFRCount()`: Compute the count of evolvable quantities in the `spheroidIntegratedSFR` property of the `ageStatisticsStandard` component.
- `spheroidIntegratedSFRIsGettable()`: Get the `spheroidIntegratedSFR` property of the `ageStatistics` component.
- `spheroidIntegratedSFRIsSettable()`: Specify whether the `spheroidIntegratedSFR` property of the `ageStatistics` component is settable.
- `spheroidIntegratedSFRRate(<double> value)`: Cumulate to the rate of the `spheroidIntegratedSFR` property of the `AgeStatisticsStandard` component.
- `spheroidIntegratedSFRScale(<double> value)`: Set the scale of the `spheroidIntegratedSFR` property of the `AgeStatisticsStandard` component.
- `spheroidIntegratedSFRSet(<double> value)`: Set the `spheroidIntegratedSFR` property of the `ageStatistics` component.
- `spheroidTimeWeightedIntegratedSFR()`: Get the `spheroidTimeWeightedIntegratedSFR` property of the `ageStatistics` component.
- `spheroidTimeWeightedIntegratedSFRAttributeMatch(<logical>[requireGettable→, <logical>[requireSettable→, <logical>[requireEvolvable→])`: Return a list of implementations that provide the given list of attributes for the `spheroidTimeWeightedIntegratedSFR` property of the `ageStatistics` component.
- `spheroidTimeWeightedIntegratedSFRCount()`: Compute the count of evolvable quantities in the `spheroidTimeWeightedIntegratedSFR` property of the `AgeStatisticsStandard` component.
- `spheroidTimeWeightedIntegratedSFRIsGettable()`: Get the `spheroidTimeWeightedIntegratedSFR` property of the `ageStatistics` component.
- `spheroidTimeWeightedIntegratedSFRIsSettable()`: Specify whether the `spheroidTimeWeightedIntegratedSFR` property of the `ageStatistics` component is settable.
- `spheroidTimeWeightedIntegratedSFRRate(<double> value)`: Cumulate to the rate of the `spheroidTimeWeightedIntegratedSFR` property of the `AgeStatisticsStandard` component.
- `spheroidTimeWeightedIntegratedSFRScale(<double> value)`: Set the scale of the `spheroidTimeWeightedIntegratedSFR` property of the `AgeStatisticsStandard` component.
- `spheroidTimeWeightedIntegratedSFRSet(<double> value)`: Set the `spheroidTimeWeightedIntegratedSFR` property of the `ageStatistics` component.
Objects

- **logical zero** `stdActive()` Return whether the standard implementation of the `ageStatistics` component class is active.

- **double zero** `surfDensity(<double(3) positionCylindrical→, <componentType> [componentType]→, <massType> [massType]→, <weightBy> [weightBy]→, <integer> [weightIndex]→, <logical> [haloLoaded]→)` Compute the surface density.

- **text color red** `type()` Return the type of this object.

- `nodeComponentAgeStatisticsNull`
  - **void builder(<*type(node)> componentDefinition→)` Build a `nodeComponent` from a supplied XML definition.

- **double zero** `density(<double(3) positionSpherical→, <componentType> [componentType]→, <massType> [massType]→, <weightBy> [weightBy]→, <integer> [weightIndex]→, <logical> [haloLoaded]→)` Compute the density.

- **void deserializeRates(<double(:) array←)` Deserialize the evolvable rates from an array.

- **void deserializeScales(<double(:) array←)` Deserialize the evolvable scales from an array.

- **void deserializeValues(<double(:) array←)` Deserialize the evolvable quantities from an array.

- **void destroy()` Destroy the object.

- **text color red** `diskIntegratedSFR()` Get the `diskIntegratedSFR` property of the `ageStatistics` component.

- **text color red** `diskIntegratedSFRAttributeMatch(<logical> [requireGettable]→, <logical> [requireSettable]→, <logical> [requireEvolvable]→)` Return a list of implementations that provide the given list off attributes for the `diskIntegratedSFR` property of the `ageStatistics` component.

- **int zero** `diskIntegratedSFRCount()` Compute the count of evolvable quantities in the `diskIntegratedSFR` property of the `AgeStatisticsStandard` component.

- **text color red** `diskIntegratedSFRIsGettable()` Get the `diskIntegratedSFR` property of the `ageStatistics` component.

- **logical zero** `diskIntegratedSFRIsSettable()` Specify whether the `diskIntegratedSFR` property of the `ageStatistics` component is settable.

- **void diskIntegratedSFRRate(<double> value)` Cumulate to the rate of the `diskIntegratedSFR` property of the `AgeStatisticsStandard` component.

- **void diskIntegratedSFRScale(<double> value)` Set the scale of the `diskIntegratedSFR` property of the `AgeStatisticsStandard` component.

- **void diskIntegratedSFRSet(<double> value)` Set the `diskIntegratedSFR` property of the `ageStatistics` component.

- **text color red** `diskTimeWeightedIntegratedSFR()` Get the `diskTimeWeightedIntegratedSFR` property of the `ageStatistics` component.
16. Coding GALACTICUS

tfamily \textcolor{red}{\textless type(varying\_string):}\textgreater diskTimeWeightedIntegratedSFRAttributeMatch(<logical>[requireGettable]\rightarrow, <logical>[requireSettable]\rightarrow, <logical>[requireEvolvable]\rightarrow)

Return a list of implementations that provide the given list of attributes for the diskTimeWeightedIntegratedSFR property of the ageStatistics component.

tfamily \intzero diskTimeWeightedIntegratedSFRCount() Compute the count of evolvable quantities in the diskTimeWeightedIntegratedSFR property of the AgeStatisticsStandard component.

tfamily \textcolor{red}{\textless double\textgreater} diskTimeWeightedIntegratedSFRIsGettable() Get the diskTimeWeightedIntegratedSFR property of the ageStatistics component.

tfamily \logicalzero diskTimeWeightedIntegratedSFRIsSettable() Specify whether the diskTimeWeightedIntegratedSFR property of the ageStatistics component is settable.

tfamily \void diskTimeWeightedIntegratedSFRRate(<double> value) Cumulate to the rate of the diskTimeWeightedIntegratedSFR property of the AgeStatisticsStandard component.

tfamily \void diskTimeWeightedIntegratedSFRScale(<double> value) Set the scale of the diskTimeWeightedIntegratedSFR property of the AgeStatisticsStandard component.

tfamily \void diskTimeWeightedIntegratedSFRRate(<double> value) Set the diskTimeWeightedIntegratedSFR property of the ageStatistics component.

tfamily \void dump() Generate an ASCII dump of all properties.

tfamily \void dumpRaw(<integer> fileHandle\rightarrow) Generate a binary dump of all properties.

tfamily \void dumpXML() Generate an XML dump of all properties.

tfamily \doublezero enclosedMass(<double> radius\rightarrow, <componentType>[componentType]\rightarrow, <massType>[massType]\rightarrow, <weightBy>[weightBy]\rightarrow, <integer>[weightIndex]\rightarrow, <logical>[haloLoaded]\rightarrow)

Compute the mass enclosed within a radius.

tfamily \textcolor{red}{\textless *type(treeNode)\textgreater} host() Return a pointer to the host treeNode object.

tfamily \void hotHaloCoolingAbundancesRate(<type(abundances)> value) Cumulate to the rate of the hotHaloCoolingAbundances property of the hotHalo component.

tfamily \void hotHaloCoolingAngularMomentumRate(<double> value) Cumulate to the rate of the hotHaloCoolingAngularMomentum property of the hotHalo component.

tfamily \void hotHaloCoolingMassRate(<double> value) Cumulate to the rate of the hotHaloCoolingMass property of the hotHalo component.

tfamily \void initialize() Initialize the object.

tfamily \void nameFromIndex(<integer> count\rightarrow, <varying_string>name\leftarrow) Return the name of a property given is index.

tfamily \logicalzero nullIsActive() Return whether the null implementation of the ageStatistics component class is active.

tfamily \void odeStepRatesInitialize() Initialize rates for evolvable properties.

tfamily \void odeStepScalesInitialize() Initialize scales for evolvable properties.

tfamily \void spheroidTimeWeightedIntegratedSFRScale(<double> value) Set the scale of the \texttt{spheroidTimeWeightedIntegratedSFR} property of the \texttt{AgeStatisticsStandard} component.

tfamily \void spheroidTimeWeightedIntegratedSFRSet(<double> value) Set the \texttt{spheroidTimeWeightedIntegratedSFR} property of the \texttt{ageStatistics} component.

tfamily \logicalzero standardIsActive() Return whether the standard implementation of the \texttt{ageStatistics} component class is active.

tfamily \doublezero surfaceDensity(<double(3)> positionCylindrical \rightarrow, <componentType> \rightarrow, <massType> \rightarrow, <weightBy> \rightarrow, <integer> \rightarrow, <logical> \rightarrow) Compute the surface density.

tfamily \textcolor{red}{\textless\textgreater} type() Return the type of this object.

tfamily nodeComponentAgeStatisticsStandard

tfamily \void builder(<\texttt{type(node)}\textgreater componentDefinition \rightarrow) Build a \texttt{nodeComponent} from a supplied XML definition.

tfamily \doublezero density(<double(3)> positionSpherical \rightarrow, <componentType> \rightarrow, <massType> \rightarrow, <weightBy> \rightarrow, <integer> \rightarrow, <logical> \rightarrow) Compute the density.

tfamily \void deserializeRates(<double(:)> array \leftarrow) Deserialize the evolvable rates from an array.

tfamily \void deserializeScales(<double(:)> array \leftarrow) Deserialize the evolvable scales from an array.

tfamily \void deserializeValues(<double(:)> array \leftarrow) Deserialize the evolvable quantities from an array.

tfamily \void destroy() Destroy the object.
16.5. Objects

tfamily \textcolor{red}{\textless double \textgreater} diskIntegratedSFR() Get the diskIntegratedSFR property of the ageStatistics component.

tfamily \textcolor{red}{\textless type(varying\_string):(\textgreater)} diskIntegratedSFRAttributeMatch(<logical>[requireGettable]→, <logical>[requireSettable]→, <logical>[requireEvolvable]→) Return a list of implementations that provide the given list of attributes for the diskIntegratedSFR property of the ageStatistics component.

tfamily \intzerodiskIntegratedSFRCount() Compute the count of evolvable quantities in the diskIntegratedSFR property of the AgeStatisticsStandard component.

tfamily \textcolor{red}{\textless double \textgreater} diskIntegratedSFRIsGettable() Get the diskIntegratedSFR property of the ageStatistics component.

tfamily \logicalzerodiskIntegratedSFRIsSettable() Specify whether the diskIntegratedSFR property of the ageStatistics component is settable.

tfamily \void diskIntegratedSFRRate(<double> value) Cumulate to the rate of the diskIntegratedSFR property of the AgeStatisticsStandard component.

tfamily \void diskIntegratedSFRScale(<double> value) Set the scale of the diskIntegratedSFR property of the AgeStatisticsStandard component.

tfamily \void diskIntegratedSFRRSet(<double> value) Set the diskIntegratedSFR property of the ageStatistics component.

tfamily \void dump() Generate an ASCII dump of all properties.

tfamily \void dumpRaw(<integer> fileHandle→) Generate a binary dump of all properties.
tfamily \void dumpXML() Generate an XML dump of all properties.

tfamily \doublezero enclosedMass(\double radius\rightarrow, \componentType[componentType]\rightarrow, \massType[massType]\rightarrow, \weightBy[weightBy]\rightarrow, \integer[weightIndex]\rightarrow, \logical[haloLoaded]\rightarrow) Compute the mass enclosed within a radius.

tfamily \textcolor{red}{\textless *type(treeNode)\textgreater} host() Return a pointer to the host TreeNode object.

tfamily \void hotHaloCoolingAbundancesRate(\type(abundances) value) Cumulate to the rate of the hotHaloCoolingAbundances property of the hotHalo component.

tfamily \void hotHaloCoolingAngularMomentumRate(\double value) Cumulate to the rate of the hotHaloCoolingAngularMomentum property of the hotHalo component.

tfamily \void hotHaloCoolingMassRate(\double value) Cumulate to the rate of the hotHaloCoolingMass property of the hotHalo component.

tfamily \void initialize() Initialize the object.

tfamily \void nameFromIndex(\integer count\rightarrow, \varying_string name\leftarrow) Return the name of a property given is index.

tfamily \logical zero nullIsActive() Return whether the null implementation of the ageStatistics component class is active.

tfamily \void odeStepRatesInitialize() Initialize rates for evolvable properties.

tfamily \void odeStepScalesInitialize() Initialize scales for evolvable properties.

tfamily \void output(\integer integerProperty\leftrightarrow, \integer integerBufferCount\leftrightarrow, \integer[\ldots]\leftrightarrow integerBuffer\leftrightarrow, \integer doubleProperty\leftrightarrow, \integer doubleBufferCount\leftrightarrow, \double[\ldots]\leftrightarrow doubleBuffer\leftrightarrow, \double time\rightarrow, \integer instance\rightarrow) Generate values of outputtable properties.

tfamily \void outputCount(\integer integerPropertyCount\leftrightarrow, \integer doublePropertyCount\leftrightarrow, \double time\rightarrow, \integer instance\rightarrow) Compute a count of outputtable properties.

tfamily \void outputNames(\integer integerProperty\leftrightarrow, \char[\ldots] integerPropertyNames\leftrightarrow, \char[\ldots] integerPropertyComments\leftrightarrow, \double integerPropertyUnitsSI\leftrightarrow, \integer doubleProperty\leftrightarrow, \char[\ldots] doublePropertyNames\leftrightarrow, \char[\ldots] doublePropertyComments\leftrightarrow, \double[\ldots] doublePropertyUnitsSI\leftrightarrow, \double time\rightarrow, \integer instance\rightarrow) Generate names of outputtable properties.

tfamily \double zero potential(\double radius\rightarrow, \componentType[componentType]\rightarrow, \massType[massType]\rightarrow, \logical[haloLoaded]\rightarrow) Compute the gravitational potential.

tfamily \void readRaw(\integer fileHandle\rightarrow) Read a binary dump of the nodeComponent from the given fileHandle.

tfamily \doublezero rotationCurve(\double radius\rightarrow, \componentType[componentType]\rightarrow, \massType[massType]\rightarrow, \logical[haloLoaded]\rightarrow) Compute the rotation curve.

tfamily \doublezero rotationCurveGradient(\double radius\rightarrow, \componentType[componentType]\rightarrow, \massType[massType]\rightarrow, \logical[haloLoaded]\rightarrow) Compute the rotation curve gradient.

tfamily \int zero serializeCount() Return a count of the number of evolvable quantities to be evolved.
16.5. Objects

tfamily \void serializeRates(<double()> array) Serialize the evolvable rates to an array.
tfamily \void serializeScales(<double()> array) Serialize the evolvable scales to an array.
tfamily \void serializeValues(<double()> array) Serialize the evolvable quantities to an array.
tfamily {\textcolor{red}{\textless double\textgreater}spheroidIntegratedSFR()} Get the spheroidIntegratedSFR property of the ageStatistics component.
tfamily {\textcolor{red}{\textless double\textgreater}spheroidIntegratedSFRAttributeMatch(<logical>[requireGettable] →, <logical>[requireSettable] →, <logical>[requireEvolvable] →)} Return a list of implementations that provide the given list of attributes for the spheroidIntegratedSFR property of the ageStatistics component.
tfamily \intzero spheroidIntegratedSFRCount() Compute the count of evolvable quantities in the spheroidIntegratedSFR property of the AgeStatisticsStandard component.
tfamily {\textcolor{red}{\textless double\textgreater}spheroidIntegratedSFRIsGettable()} Get the spheroidIntegratedSFR property of the ageStatistics component.
tfamily \logicalzerospheroidIntegratedSFRIsSettable() Specify whether the spheroidIntegratedSFR property of the ageStatistics component is settable.
tfamily \void spheroidIntegratedSFRRate(<double> value) Cumulate to the rate of the spheroidIntegratedSFR property of the AgeStatisticsStandard component.
tfamily \void spheroidIntegratedSFRScale(<double> value) Set the scale of the spheroidIntegratedSFR property of the AgeStatisticsStandard component.
tfamily \void spheroidIntegratedSFRSet(<double> value) Set the spheroidIntegratedSFR property of the ageStatistics component.
tfamily {\textcolor{red}{\textless double\textgreater}spheroidTimeWeightedIntegratedSFR()} Get the spheroidTimeWeightedIntegratedSFR property of the ageStatistics component.
tfamily {\textcolor{red}{\textless type(varying\_string)\textgreater}spheroidTimeWeightedIntegratedSFRAttributeMatch(<logical>[requireGettable] →, <logical>[requireSettable] →, <logical>[requireEvolvable] →)} Return a list of implementations that provide the given list of attributes for the spheroidTimeWeightedIntegratedSFR property of the ageStatistics component.
tfamily \intzero spheroidTimeWeightedIntegratedSFRCount() Compute the count of evolvable quantities in the spheroidTimeWeightedIntegratedSFR property of the AgeStatisticsStandard component.
tfamily {\textcolor{red}{\textless double\textgreater}spheroidTimeWeightedIntegratedSFRIsGettable()} Get the spheroidTimeWeightedIntegratedSFR property of the ageStatistics component.
tfamily \logicalzerospheroidTimeWeightedIntegratedSFRIsSettable() Specify whether the spheroidTimeWeightedIntegratedSFR property of the ageStatistics component is settable.
tfamily \void spheroidTimeWeightedIntegratedSFRRate(<double> value) Cumulate to the rate of the spheroidTimeWeightedIntegratedSFR property of the AgeStatisticsStandard component.
tfamily \void spheroidTimeWeightedIntegratedSFRScale(<double> value) Set the scale of the spheroidTimeWeightedIntegratedSFR property of the AgeStatisticsStandard component.
tfamily \ void spheroidTimeWeightedIntegratedSFRSet(\texttt{<double> value}) Set the spheroidTimeWeightedIntegratedSFR property of the \texttt{ageStatistics} component.

tfamily \ logicalzero standardIsActive() Return whether the standard implementation of the ageStatistics component class is active.

tfamily \ doublezero surfaceDensity(\texttt{<double(3)> positionCylindrical\rightarrow, <componentType>} \ [componentType]\rightarrow, \texttt{<massType>} \ [massType]\rightarrow, \texttt{<weightBy>} \ [weightBy]\rightarrow, \texttt{<integer>} \ [weightIndex]\rightarrow, \texttt{<logical>} \ [haloLoaded]\rightarrow) Compute the surface density.

tfamily \ textcolor{red}\textless type(varying\_\_string)\textgreater\ type() Return the type of this object.

tfamily nodeComponentBasic

tfamily \ textcolor{red}\textless double\textgreater\ accretionRate() Get the accretionRate property of the basic component.

tfamily \ textcolor{red}\textless type(varying\_\_string)\textgreater;\texttt{<logical>}\texttt{requireGettable}\rightarrow, \texttt{<logical>}\texttt{requireSettable}\rightarrow, \texttt{<logical>}\texttt{requireEvolvable}\rightarrow) Return a list of implementations that provide the given list off attributes for the accretionRate property of the basic component

tfamily \ textcolor{red}\textless double\textgreater\ accretionRateIsGettable() Get the accretionRate property of the basic component.

tfamily \ logicalzero accretionRateIsSettable() Specify whether the accretionRate property of the basic component is settable.

tfamily \ void accretionRateSet(\texttt{<double> value}) Set the accretionRate property of the basic component.

tfamily \ void builder(\texttt{<\text{\texttt{type(node)}}>componentDefinition\rightarrow}) Build a nodeComponent from a supplied XML definition.

tfamily \ doublezero density(\texttt{<double(3)> positionSpherical\rightarrow, <componentType>} \ [componentType]\rightarrow, \texttt{<massType>} \ [massType]\rightarrow, \texttt{<weightBy>} \ [weightBy]\rightarrow, \texttt{<integer>} \ [weightIndex]\rightarrow, \texttt{<logical>} \ [haloLoaded]\rightarrow) Compute the density.

tfamily \ void deserializeRates(\texttt{<double(:)> array\leftarrow}) Deserialize the evolvable rates from an array.

tfamily \ void deserializeScales(\texttt{<double(:)> array\leftarrow}) Deserialize the evolvable scales from an array.

tfamily \ void deserializeValues(\texttt{<double(:)> array\leftarrow}) Deserialize the evolvable quantities from an array.

tfamily \ void destroy() Destroy the object.

tfamily \ void dump() Generate an ASCII dump of all properties.

tfamily \ void dumpRaw(\texttt{<integer> fileHandle\rightarrow}) Generate a binary dump of all properties.

tfamily \ void dumpXML() Generate an XML dump of all properties.

tfamily \ doublezero enclosedMass(\texttt{<double> radius\rightarrow, <componentType>} \ [componentType]\rightarrow, \texttt{<massType>} \ [massType]\rightarrow, \texttt{<weightBy>} \ [weightBy]\rightarrow, \texttt{<integer>} \ [weightIndex]\rightarrow, \texttt{<logical>} \ [haloLoaded]\rightarrow) Compute the mass enclosed within a radius.
tfamily \textcolor{red}{	extless *type(treeNode)\textgreater} host() Return a pointer to the host
treeNode object.

tfamily \void hotHaloCoolingAbundancesRate(<type(abundances)> value) Cumulate to the rate of the
tHotHaloCoolingAbundances property of the hotHalo component.

tfamily \void hotHaloCoolingAngularMomentumRate(<double> value) Cumulate to the rate of the
tHotHaloCoolingAngularMomentum property of the hotHalo component.

tfamily \void hotHaloCoolingMassRate(<double> value) Cumulate to the rate of the hotHaloCoolingMass property of the hotHalo component.

tfamily \void initialize() Initialize the object.

tfamily \textcolor{red}{\textless double\textgreater} mass() Get the mass property of the basic component.

tfamily \void massAttributeMatch(<logical>[requireGettable]→, <logical>[requireSettable]→, <logical>[requireEvolvable]→) Return a list of implementations that provide the given list off attributes for the mass property of the basic component

tfamily \intzero massCount() Compute the count of evolvable quantities in the mass property of the BasicStandard component.

tfamily \textcolor{red}{\textless double\textgreater} massIsGettable() Get the mass property of the basic component.

tfamily \logicalzero massIsSettable() Specify whether the mass property of the basic component is settable.

tfamily \textcolor{red}{\textless double\textgreater} massMaximum() Get the massMaximum property of the basic component.

tfamily \void massMaximumSet(<double> value) Set the massMaximum property of the basic component.

tfamily \logicalzero massMaximumIsSettable() Specify whether the massMaximum property of the basic component is settable.

tfamily \void massMaximumSet(<double> value) Set the massMaximum property of the basic component.

tfamily \void massRate(<double> value) Cumulate to the rate of the mass property of the BasicStandard component.

tfamily \void massScale(<double> value) Set the scale of the mass property of the BasicStandard component.

tfamily \void massSet(<double> value) Set the mass property of the basic component.

tfamily \void nameFromIndex(<integer> count→, <varying_string>name←) Return the name of a property given is index.
tfamily \logicalzero nonEvolvingIsActive() Return whether the nonEvolving implementation of the basic component class is active.

tfamily \logicalzero nullIsActive() Return whether the null implementation of the basic component class is active.

tfamily \void odeStepRatesInitialize() Initialize rates for evolvable properties.

tfamily \void odeStepScalesInitialize() Initialize scales for evolvable properties.

tfamily \void output(<integer> integerProperty, <integer> integerBufferCount, <integer(:,:)> integerBuffer, <integer> doubleProperty, <integer> doubleBufferCount, <double(:,:)> doubleBuffer, <double> time, <integer> instance) Generate values of outputtable properties.

tfamily \void outputCount(<integer> integerPropertyCount, <integer> doublePropertyCount, <double> time, <integer> instance) Compute a count of outputtable properties.

tfamily \void outputNames(<integer> integerProperty, <char[*](:)> integerPropertyNames, <char[*](:)> integerPropertyComments, <double(:)> integerPropertyUnitsSI, <integer> doubleProperty, <char[*](:)> doublePropertyNames, <char[*](:)> doublePropertyComments, <double(:)> doublePropertyUnitsSI, <double> time, <integer> instance) Generate names of outputtable properties.

tfamily \doublezero potential(<double> radius, <componentType> [componentType]→, <massType> [massType]→, <logical> [haloLoaded]→) Compute the gravitational potential.

tfamily \doublezero rotationCurve(<double> radius, <componentType> [componentType]→, <massType> [massType]→, <logical> [haloLoaded]→) Compute the rotation curve.

tfamily \doublezero rotationCurveGradient(<double> radius, <componentType> [componentType]→, <massType> [massType]→, <logical> [haloLoaded]→) Compute the rotation curve gradient.

tfamily \intzero serializeCount() Return a count of the number of evolvable quantities to be evolved.

tfamily \void serializeRates(<double(:)> array) Serialize the evolvable rates to an array.

tfamily \void serializeScales(<double(:)> array) Serialize the evolvable scales to an array.

tfamily \void serializeValues(<double(:)> array) Serialize the evolvable quantities to an array.

16. Coding GALACTICUS

tfamily \logicalzero standardIsActive() Return whether the standard implementation of the basic component class is active.

tfamily \logicalzero standardTrackingIsActive() Return whether the standardTracking implementation of the basic component class is active.

tfamily \doublezero surfaceDensity(<double(3)> positionCylindrical, <componentType> [componentType]→, <massType> [massType]→, <weightBy> [weightBy]→, <integer> [weightIndex]→, <logical> [haloLoaded]→) Compute the surface density.

tfamily \textcolor{red}{\textless double\textgreater} time() Get the time property of the basic component.

394
tfamily \textcolor{red}{\textless double\textgreater} \texttt{timeCount()} Compute the count of evolvable quantities in the \texttt{time} property of the \texttt{BasicNonEvolving} component.

tfamily \textcolor{red}{\textless double\textgreater} \texttt{timeIsGettable()} Get the \texttt{time} property of the \texttt{basic} component.

tfamily \textcolor{red}{\textless double\textgreater} \texttt{timeIsSettable()} Specify whether the \texttt{time} property of the \texttt{basic} component is settable.

tfamily \textcolor{red}{\textless double\textgreater} \texttt{timeLastIsolated()} Get the \texttt{timeLastIsolated} property of the \texttt{basic} component.

tfamily \textcolor{red}{\textlesstype(varying\_string)(:)} \texttt{timeLastIsolatedAttributeMatch(\textless logical\textgreater [requireGettable] \rightarrow, \textless logical\textgreater [requireSettable] \rightarrow, \textless logical\textgreater [requireEvolvable] \rightarrow)} Return a list of implementations that provide the given list of attributes for the \texttt{timeLastIsolated} property of the \texttt{basic} component.

tfamily \textcolor{red}{\textless double\textgreater} \texttt{timeLastIsolatedIsGettable()} Get the \texttt{timeLastIsolated} property of the \texttt{basic} component.

tfamily \textcolor{red}{\textless double\textgreater} \texttt{timeLastIsolatedIsSettable()} Specify whether the \texttt{timeLastIsolated} property of the \texttt{basic} component is settable.

tfamily \texttt{timeLastIsolatedSet(\textless double\textgreater \texttt{value})} Set the \texttt{timeLastIsolated} property of the \texttt{basic} component.

tfamily \texttt{timeRate(\textless double\textgreater \texttt{value})} Cumulate to the rate of the \texttt{time} property of the \texttt{BasicNonEvolving} component.

tfamily \texttt{timeScale(\textless double\textgreater \texttt{value})} Set the scale of the \texttt{time} property of the \texttt{BasicNonEvolving} component.

tfamily \texttt{timeSet(\textless double\textgreater \texttt{value})} Set the \texttt{time} property of the \texttt{basic} component.

tfamily \textcolor{red}{\textless type(varying\_string)\textgreater} \texttt{type()} Return the type of this object.

tfamily nodeComponentBasicNonEvolving

tfamily \textcolor{red}{\textless double\textgreater} \texttt{accretionRate()} Get the \texttt{accretionRate} property of the \texttt{basic} component.

tfamily \textcolor{red}{\textlesstype(varying\_string)(:)} \texttt{accretionRateAttributeMatch(\textless logical\textgreater [requireGettable] \rightarrow, \textless logical\textgreater [requireSettable] \rightarrow, \textless logical\textgreater [requireEvolvable] \rightarrow)} Return a list of implementations that provide the given list of attributes for the \texttt{accretionRate} property of the \texttt{basic} component.

tfamily \textcolor{red}{\textless double\textgreater} \texttt{accretionRateIsGettable()} Get the \texttt{accretionRate} property of the \texttt{basic} component.

tfamily \textcolor{red}{\textless double\textgreater} \texttt{accretionRateIsSettable()} Specify whether the \texttt{accretionRate} property of the \texttt{basic} component is settable.

tfamily \texttt{accretionRateSet(\textless double\textgreater \texttt{value})} Set the \texttt{accretionRate} property of the \texttt{basic} component.

tfamily \texttt{builder(\textless type(node)\textgreater componentDefinition \rightarrow)} Build a \texttt{nodeComponent} from a supplied XML definition.
tfamily \doublezero density(<double(3)> positionSpherical→, <componentType> [componentType]→, <massType> [massType]→, <weightBy> [weightBy]→, <integer> [weightIndex]→, <logical> [haloLoaded]→) Compute the density.

tfamily \void deserializeRates(<double(:)> array←) Deserialize the evolvable rates from an array.

tfamily \void deserializeScales(<double(:)> array←) Deserialize the evolvable scales from an array.

tfamily \void deserializeValues(<double(:)> array←) Deserialize the evolvable quantities from an array.

tfamily \void destroy() Destroy the object.

tfamily \void dump() Generate an ASCII dump of all properties.

tfamily \void dumpRaw(<integer> fileHandle→) Generate a binary dump of all properties.

tfamily \void dumpXML() Generate an XML dump of all properties.

tfamily \doublezero enclosedMass(<double> radius→, <componentType> [componentType]→, <massType> [massType]→, <weightBy> [weightBy]→, <integer> [weightIndex]→, <logical> [haloLoaded]→) Compute the mass enclosed within a radius.

tfamily \textcolor{red}{\textless *type(treeNode)\textgreater} host() Return a pointer to the host treeNode object.

tfamily \void hotHaloCoolingAbundancesRate(<type(abundances)> value) Cumulate to the rate of the hotHaloCoolingAbundances property of the hotHalo component.

tfamily \void hotHaloCoolingAngularMomentumRate(<double> value) Cumulate to the rate of the hotHaloCoolingAngularMomentum property of the hotHalo component.

tfamily \void hotHaloCoolingMassRate(<double> value) Cumulate to the rate of the hotHaloCoolingMass property of the hotHalo component.

tfamily \void initialize() Initialize the object.

tfamily \textcolor{red}{\textless double\textgreater} mass() Get the mass property of the basic component.

tfamily \textcolor{red}{\textless double\textgreater} massIsGettable() Get the mass property of the basic component.

tfamily \logicalzero massIsSettable() Specify whether the mass property of the basic component is settable.

tfamily \textcolor{red}{\textless double\textgreater} massCount() Compute the count of evolvable quantities in the mass property of the BasicStandard component.

tfamily \textcolor{red}{\textless double\textgreater} massMaximum() Get the massMaximum property of the basic component.
16.5. Objects

tfamily\[textcolor{red}\{\textless varying\_\ string\(\textgreater\}\}\textgreater massMaximumAttributeMatch(\textless logical\[requireGettable\]→, \textless logical\[requireSettable\]→, \textless logical\[requireEvolvable\]→) Return a list of implementations that provide the given list of attributes for the massMaximum property of the basic component.

tfamily\[textcolor{red}\{\textless double\textgreater\} massMaximumIsGettable() Get the massMaximum property of the basic component.

tfamily logicalzero massMaximumIsSettable() Specify whether the massMaximum property of the basic component is settable.

tfamily void massMaximumSet(\textless double\(\textgreater\) value) Set the massMaximum property of the basic component.

tfamily void massRate(\textless double\(\textgreater\) value) Cumulate to the rate of the mass property of the BasicStandard component.

tfamily void massScale(\textless double\(\textgreater\) value) Set the scale of the mass property of the BasicStandard component.

tfamily void massSet(\textless double\(\textgreater\) value) Set the mass property of the basic component.

tfamily void nameFromIndex(\textless integer\(\textgreater\) count→, \textless varying\_string\(\textgreater\) name←) Return the name of a property given its index.

tfamily logicalzero nonEvolvingIsActive() Return whether the nonEvolving implementation of the basic component class is active.

tfamily logicalzero nullIsActive() Return whether the null implementation of the basic component class is active.

tfamily void odeStepRatesInitialize() Initialize rates for evolvable properties.

tfamily void odeStepScalesInitialize() Initialize scales for evolvable properties.

tfamily void output(\textless integer\(\textgreater\) integerProperty↔, \textless integer\(\textgreater\) integerBufferCount↔, \textless integer(\(\textgreater\)) integerBuffer↔, \textless integer\(\textgreater\) doubleProperty↔, \textless integer\(\textgreater\) doubleBufferCount↔, \textless double(\(\textgreater\)) doubleBuffer↔, \textless double\(\textgreater\) time→, \textless integer\(\textgreater\) instance→) Generate values of outputtable properties.

tfamily void outputCount(\textless integer\(\textgreater\) integerPropertyCount↔, \textless integer\(\textgreater\) doublePropertyCount↔, \textless double\(\textgreater\) time→, \textless integer\(\textgreater\) instance→) Compute a count of outputtable properties.

tfamily void outputNames(\textless integer\(\textgreater\) integerProperty↔, \textless char\[\ast\](\(\textgreater\)) integerPropertyNameNames↔, \textless char\[\ast\](\(\textgreater\)) integerPropertyComments↔, \textless double\(\textgreater\) integerPropertyUnitsSI↔, \textless integer\(\textgreater\) doubleProperty↔, \textless char\[\ast\](\(\textgreater\)) doublePropertyNameNames↔, \textless char\[\ast\](\(\textgreater\)) doublePropertyComments↔, \textless double\(\textgreater\) doublePropertyUnitsSI↔, \textless double\(\textgreater\) time→, \textless integer\(\textgreater\) instance→) Generate names of outputtable properties.

tfamily doublezero potential(\textless double\(\textgreater\) radius→, \textless componentType\(\textgreater\) [componentType]→, \textless massType\(\textgreater\) [massType]→, \textless logical\[haloLoaded\]→) Compute the gravitational potential.

tfamily void readRaw(\textless integer\(\textgreater\) fileHandle→) Read a binary dump of the nodeComponent from the given fileHandle.

tfamily doublezero rotationCurve(\textless double\(\textgreater\) radius→, \textless componentType\(\textgreater\) [componentType]→, \textless massType\(\textgreater\) [massType]→, \textless logical\[haloLoaded\]→) Compute the rotation curve.
16. Coding GALACTICUS

tfamily double zero rotationCurveGradient(<double> radius\rightarrow, <componentType> [componentType]\rightarrow, <massType> [massType]\rightarrow, <logical> [haloLoaded]\rightarrow) Compute the rotation curve gradient.

tfamily\int zero serializeCount() Return a count of the number of evolvable quantities to be evolved.

tfamily\void serializeRates(<double(:)> array\rightarrow) Serialize the evolvable rates to an array.

tfamily\void serializeScales(<double(:)> array\rightarrow) Serialize the evolvable scales to an array.

tfamily\void serializeValues(<double(:)> array\rightarrow) Serialize the evolvable quantities to an array.

tfamily\logical zero standardIsActive() Return whether the standard implementation of the basic component class is active.

tfamily\logical zero standardTrackingIsActive() Return whether the standardTracking implementation of the basic component class is active.

tfamily double zero surfaceDensity(<double(3)> positionCylindrical\rightarrow, <componentType> [componentType]\rightarrow, <massType> [massType]\rightarrow, <weightBy> [weightBy]\rightarrow, <integer> [weightIndex]\rightarrow, <logical> [haloLoaded]\rightarrow) Compute the surface density.

tfamily \textcolor{red}{\textless double\textgreater} time() Get the time property of the basic component.

tfamily \textcolor{red}{\textless double\textgreater} timeAttributeMatch(<logical>[requireGettable]\rightarrow, <logical>[requireSettable]\rightarrow, <logical>[requireEvolvable]\rightarrow) Return a list of implementations that provide the given list off attributes for the time property of the basic component

tfamily\int zero timeCount() Compute the count of evolvable quantities in the time property of the BasicNonEvolving component.

tfamily \textcolor{red}{\textless double\textgreater} timeIsGettable() Get the time property of the basic component.

tfamily\logical zero timeIsSettable() Specify whether the time property of the basic component is settable.

tfamily \textcolor{red}{\textless double\textgreater} timeLastIsolated() Get the timeLastIsolated property of the basic component.

tfamily \textcolor{red}{\textless double\textgreater} timeLastIsolatedAttributeMatch(<logical>[requireGettable]\rightarrow, <logical>[requireSettable]\rightarrow, <logical>[requireEvolvable]\rightarrow) Return a list of implementations that provide the given list off attributes for the timeLastIsolated property of the basic component

tfamily \textcolor{red}{\textless double\textgreater} timeLastIsolatedIsGettable() Get the timeLastIsolated property of the basic component.

tfamily\logical zero timeLastIsolatedIsSettable() Specify whether the timeLastIsolated property of the basic component is settable.

tfamily\void timeLastIsolatedSet(<double> value) Set the timeLastIsolated property of the basic component.

tfamily\void timeRate(<double> value) Cumulate to the rate of the time property of the BasicNonEvolving component.
tfamily \void timeScale(<double> value) Set the scale of the time property of the BasicNonEvolving component.

tfamily \void timeSet(<double> value) Set the time property of the basic component.

tfamily \textcolor{red}{\textless type(varying\_string)\textgreater} type() Return the type of this object.

tfamily nodeComponentBasicNull

tfamily \textcolor{red}{\textless double\textgreater} accretionRate() Get the accretionRate property of the basic component.

tfamily \textcolor{red}{\textless double\textgreater} accretionRateAttributeMatch(<logical>[requireGettable]→, <logical>[requireSettable]→, <logical>[requireEvolvable]→) Return a list of implementations that provide the given list off attributes for the accretionRate property of the basic component.

tfamily \textcolor{red}{\textless double\textgreater} accretionRateIsGettable() Get the accretionRate property of the basic component.

tfamily \logicalzero accretionRateIsSettable() Specify whether the accretionRate property of the basic component is settable.

tfamily \void accretionRateSet(<double> value) Set the accretionRate property of the basic component.

tfamily \void builder(<*type(node)>componentDefinition) Build a nodeComponent from a supplied XML definition.

tfamily \doublezero density(<double(3)> positionSpherical→, <componentType>[componentType]→, <massType>[massType]→, <weightBy>[weightBy]→, <integer>[weightIndex]→, <logical>[haloLoaded]→) Compute the density.

tfamily \void deserializeRates(<double(:)> array←) Deserialize the evolvable rates from an array.

tfamily \void deserializeScales(<double(:)> array←) Deserialize the evolvable scales from an array.

tfamily \void deserializeValues(<double(:)> array←) Deserialize the evolvable quantities from an array.

tfamily \void destroy() Destroy the object.

tfamily \void dump() Generate an ASCII dump of all properties.

tfamily \void dumpRaw(<integer> fileHandle→) Generate a binary dump of all properties.

tfamily \void dumpXML() Generate an XML dump of all properties.

tfamily \doublezero enclosedMass(<double> radius→, <componentType>[componentType]→, <massType>[massType]→, <weightBy>[weightBy]→, <integer>[weightIndex]→, <logical>[haloLoaded]→) Compute the mass enclosed within a radius.

tfamily \textcolor{red}{\textless *type(treeNode)\textgreater} host() Return a pointer to the host treeNode object.

tfamily \void hotHaloCoolingAbundancesRate(<type(abundances)> value) Cumulate to the rate of the hotHaloCoolingAbundances property of the hotHalo component.
tfamily \textcolor{red}{\textless double\textgreater} mass() Get the mass property of the basic component.

tfamily \textcolor{red}{\textless double\textgreater} massAttributeMatch(<logical>[requireGettable]→, <logical>[requireSettable]→, <logical>[requireEvolvable]→) Return a list of implementations that provide the given list off attributes for the mass property of the basic component.

tfamily \textcolor{red}{\textless double\textgreater} massIsGettable() Get the mass property of the basic component.

tfamily \textcolor{red}{\textless double\textgreater} massIsSettable() Specify whether the mass property of the basic component is settable.

tfamily \textcolor{red}{\textless double\textgreater} massMaximum() Get the massMaximum property of the basic component.

16. Coding Galacticus

tfamily \void timeScale(<double> value) Set the scale of the time property of the BasicNonEvolving component.

tfamily \void timeSet(<double> value) Set the time property of the basic component.

tfamily \textcolor{red}{\textless type(varying\_string)\textgreater} type() Return the type of this object.

ntfamily nodeComponentBasicStandardTracking

tfamily \textcolor{red}{\textless double\textgreater} accretionRate() Get the accretionRate property of the basic component.

tfamily \textcolor{red}{\textless double\textgreater} accretionRateAttributeMatch(<logical>[requireGettable]$→$, <logical>[requireSettable]$→$, <logical>[requireEvolvable]$→$) Return a list of implementations that provide the given list off attributes for the accretionRate property of the basic component.

tfamily \textcolor{red}{\textless double\textgreater} accretionRateIsGettable() Get the accretionRate property of the basic component.

tfamily \textcolor{red}{\textless double\textgreater} accretionRateIsSettable() Specify whether the accretionRate property of the basic component is settable.

tfamily \void accretionRateSet(<double> value) Set the accretionRate property of the basic component.

tfamily \void builder(<*type(node)>componentDefinition$→$) Build a nodeComponent from a supplied XML definition.

tfamily \double zero density(<double(3)> positionSpherical$→$, <componentType>[componentType]$→$, <massType>[massType]$→$, <weightBy>[weightBy]$→$, <integer>[weightIndex]$→$, <logical>[haloLoaded]$→$) Compute the density.

tfamily \void deserializeRates(<double(:)> array$←$) Deserialize the evolvable rates from an array.

tfamily \void deserializeScales(<double(:)> array$←$) Deserialize the evolvable scales from an array.

tfamily \void deserializeValues(<double(:)> array$←$) Deserialize the evolvable quantities from an array.

tfamily \void destroy() Destroy the object.

tfamily \void dump() Generate an ASCII dump of all properties.

tfamily \void dumpRaw(<integer> fileHandle$→$) Generate a binary dump of all properties.

tfamily \void dumpXML() Generate an XML dump of all properties.

tfamily \double zero enclosedMass(<double>radius$→$, <componentType>[componentType]$→$, <massType>[massType]$→$, <weightBy>[weightBy]$→$, <integer>[weightIndex]$→$, <logical>[haloLoaded]$→$) Compute the mass enclosed within a radius.

tfamily \textcolor{red}{\textless *type(treeNode)\textgreater} host() Return a pointer to the host treeNode object.

tfamily \void hotHaloCoolingAbundancesRate(<type(abundances)> value) Cumulate to the rate of the hotHaloCoolingAbundances property of the hotHalo component.
16.5. Objects

tfamily \void hotHaloCoolingAngularMomentumRate(<double> value) Cumulate to the rate of the hotHaloCoolingAngularMomentum property of the hotHalo component.

tfamily \void hotHaloCoolingMassRate(<double> value) Cumulate to the rate of the hotHaloCoolingMass property of the hotHalo component.

tfamily \void initialize() Initialize the object.

tfamily \textcolor{red}{\textless double\textgreater} mass() Get the mass property of the basic component.

tfamily \textcolor{red}{\textlesstype(varying\_string)(:)} massAttributeMatch(<logical>[requireGettable]→, <logical>[requireSettable]→, <logical>[requireEvolvable]→) Return a list of implementations that provide the given list of attributes for the mass property of the basic component.

tfamily \int massCount() Compute the count of evolvable quantities in the mass property of the BasicStandard component.

tfamily \textcolor{red}{\textless double\textgreater} massIsGettable() Get the mass property of the basic component.

tfamily \logical massIsSettable() Specify whether the mass property of the basic component is settable.

tfamily \textcolor{red}{\textless double\textgreater} massMaximum() Get the massMaximum property of the basic component.

tfamily \textcolor{red}{\textlesstype(varying\_string)(:)} massMaximumAttributeMatch(<logical>[requireGettable]→, <logical>[requireSettable]→, <logical>[requireEvolvable]→) Return a list of implementations that provide the given list of attributes for the massMaximum property of the basic component.

tfamily \textcolor{red}{\textless double\textgreater} massMaximumIsGettable() Get the massMaximum property of the basic component.

tfamily \logical massMaximumIsSettable() Specify whether the massMaximum property of the basic component is settable.

tfamily \void massMaximumSet(<double> value) Set the massMaximum property of the basic component.

tfamily \void massRate(<double> value) Cumulate to the rate of the mass property of the BasicStandard component.

tfamily \void massScale(<double> value) Set the scale of the mass property of the BasicStandard component.

tfamily \void massSet(<double> value) Set the mass property of the basic component.

tfamily \void nameFromIndex(<integer> count→, <varying\_string> name←) Return the name of a property given is index.

tfamily \logical nonEvolvingIsActive() Return whether the nonEvolving implementation of the basic component class is active.

tfamily \logical nullIsActive() Return whether the null implementation of the basic component class is active.
tfamily \void odeStepRatesInitialize() Initialize rates for evolvable properties.

tfamily \void odeStepScalesInitialize() Initialize scales for evolvable properties.

tfamily \void output(<integer> integerProperty, <integer> integerBufferCount, <integer> integerBuffer, <integer> doubleProperty, <integer> doubleBufferCount, <double> time, <integer> instance) Generate values of outputtable properties.

tfamily \void outputCount(<integer> integerPropertyCount, <integer> doublePropertyCount, <double> time, <integer> instance) Compute a count of outputtable properties.

tfamily \void outputNames(<integer> integerProperty, <char(*)[:] integerPropertyNames, <char(*)[:] integerPropertyComments, <double(*)[:] integerPropertyUnitsSI, <integer> doubleProperty, <char(*)[:] doublePropertyNames, <char(*)[:] doublePropertyComments, <double(*)[:] doublePropertyUnitsSI, <double> time, <integer> instance) Generate names of outputtable properties.

tfamily \doublezeropotential(<double> radius, <componentType> [componentType], <massType> [massType], <logical> [haloLoaded]) Compute the gravitational potential.

tfamily \void readRaw(<integer> fileHandle) Read a binary dump of the nodeComponent from the given fileHandle.

tfamily \doublezerorotationCurve(<double> radius, <componentType> [componentType], <massType> [massType], <logical> [haloLoaded]) Compute the rotation curve.

tfamily \doublezerorotationCurveGradient(<double> radius, <componentType> [componentType], <massType> [massType], <logical> [haloLoaded]) Compute the rotation curve gradient.

tfamily \intzero serializeCount() Return a count of the number of evolvable quantities to be evolved.

tfamily \void serializeRates(<double> array) Serialize the evolvable rates to an array.

tfamily \void serializeScales(<double> array) Serialize the evolvable scales to an array.

tfamily \void serializeValues(<double> array) Serialize the evolvable quantities to an array.

tfamily \logicalzero standardIsActive() Return whether the standard implementation of the basic component class is active.

tfamily \logicalzero standardTrackingIsActive() Return whether the standardTracking implementation of the basic component class is active.

tfamily \doublezerosurfaceDensity(<double(3)> positionCylindrical, <componentType> [componentType], <massType> [massType], <weightBy> [weightBy], <integer> [weightIndex], <logical> [haloLoaded]) Compute the surface density.

tfamily \textcolor{red}{\textless double\textgreater} time() Get the time property of the basic component.

tfamily \textcolor{red}{\textless double\textgreater} timeAttributeMatch(<logical> [requireGettable], <logical> [requireSettable], <logical> [requireEvolvable]) Return a list of implementations that provide the given list off attributes for the time property of the basic component.

tfamily \intzero timeCount() Compute the count of evolvable quantities in the time property of the BasicNonEvolving component.
16.5. Objects

tfamily \textcolor{red}{\textless double\textgreater} timeIsGettable() Get the time property of the basic component.

tfamily \logicalzero timeIsSettable() Specify whether the time property of the basic component is settable.

tfamily \textcolor{red}{\textless double\textgreater} timeLastIsolated() Get the timeLastIsolated property of the basic component.

tfamily \textcolor{red}{\textless type(varying\_string)(:)}\textgreater timeLastIsolatedAttributeMatch(<logical>[requireGettable] → , <logical>[requireSettable] → , <logical>[requireEvolvable] → ) Return a list of implementations that provide the given list of attributes for the timeLastIsolated property of the basic component.

tfamily \textcolor{red}{\textless double\textgreater} timeLastIsolatedIsGettable() Get the timeLastIsolated property of the basic component.

tfamily \logicalzero timeLastIsolatedIsSettable() Specify whether the timeLastIsolated property of the basic component is settable.

tfamily \void timeLastIsolatedSet(<double> value) Set the timeLastIsolated property of the basic component.

tfamily \void timeRate(<double> value) Cumulate to the rate of the time property of the BasicNonEvolving component.

tfamily \void timeScale(<double> value) Set the scale of the time property of the BasicNonEvolving component.

tfamily \void timeSet(<double> value) Set the time property of the basic component.

tfamily \textcolor{red}{\textless type(varying\_string)\textgreater} type() Return the type of this object.

{\family nodeComponentBlackHole

tfamily \textcolor{red}{\textless double\textgreater} accretionRate() Get the accretionRate property of the blackHole component.

tfamily \textcolor{red}{\textless type(varying\_string)::\textgreater} accretionRateAttributeMatch(<logical>[requireGettable] → , <logical>[requireSettable] → , <logical>[requireEvolvable] → ) Return a list of implementations that provide the given list of attributes for the accretionRate property of the blackHole component.

tfamily \textcolor{red}{\textless double\textgreater} accretionRateIsGettable() Get the accretionRate property of the blackHole component.

tfamily \logicalzero accretionRateIsSettable() Specify whether the accretionRate property of the blackHole component is settable.

tfamily \void builder(<\&type(node)>componentDefinition → ) Build a nodeComponent from a supplied XML definition.

tfamily \doublezero density(<double(3)> positionSpherical → , <componentType> [componentType] → , <massType> [massType] → , <weightBy> [weightBy] → , <integer> [weightIndex] → , <logical> [haloLoaded] → ) Compute the density.

tfamily \void deserializeRates(<double(:)> array ← ) Deserialize the evolvable rates from an array.
tfamily \void deserializeScales(<double(:)> array←) Deserialize the evolvable scales from an array.

tfamily \void deserializeValues(<double(:)> array←) Deserialize the evolvable quantities from an array.

tfamily \void destroy() Destroy the object.

tfamily \void dump() Generate an ASCII dump of all properties.

tfamily \void dumpRaw(<integer> fileHandle→) Generate a binary dump of all properties.

tfamily \void dumpXML() Generate an XML dump of all properties.

tfamily \double zero enclosedMass(<double> radius→, <componentType> [componentType]→, <massType> [massType]→, <weightBy> [weightBy]→, <integer> [weightIndex]→, <logical> [haloLoaded]→) Compute the mass enclosed within a radius.

tfamily \textcolor{red}{\textless *type(treeNode)\textgreater} host() Return a pointer to the host treeNode object.

tfamily \void hotHaloCoolingAbundancesRate(<type(abundances)> value) Cumulate to the rate of the hotHaloCoolingAbundances property of the hotHalo component.

tfamily \void hotHaloCoolingAngularMomentumRate(<double> value) Cumulate to the rate of the hotHaloCoolingAngularMomentum property of the hotHalo component.

tfamily \void hotHaloCoolingMassRate(<double> value) Cumulate to the rate of the hotHaloCoolingMass property of the hotHalo component.

tfamily \void initialize() Initialize the object.

tfamily \textcolor{red}{\textless double\textgreater} mass() Get the mass property of the blackHole component.

tfamily \textcolor{red}{\textless type(varying\_string):\textgreater} massAttributeMatch(<logical>[requireGettable]→, <logical>[requireSettable]→, <logical>[requireEvolvable]→) Return a list of implementations that provide the given list off attributes for the mass property of the blackHole component.

tfamily \int zero massCount() Compute the count of evolvable quantities in the mass property of the BlackHoleSimple component.

tfamily \textcolor{red}{\textless double\textgreater} massIsGettable() Get the mass property of the blackHole component.

tfamily \logical zero massIsSettable() Specify whether the mass property of the blackHole component is settable.

tfamily \void massRate(<double> value) Cumulate to the rate of the mass property of the BlackHoleSimple component.

tfamily \void massScale(<double> value) Set the scale of the mass property of the BlackHoleSimple component.

tfamily \textcolor{red}{\textless double\textgreater} massSeed() Get the massSeed property of the blackHole component.
16.5. Objects

tfamily \ void massRate(<double> value) Cumulate to the rate of the mass property of the BlackHoleSimple component.

tfamily \ void massScale(<double> value) Set the scale of the mass property of the BlackHoleSimple component.

tfamily \ textcolor{red}\textless double\textgreater massSeed() Get the massSeed property of the blackHole component.

tfamily \ textcolor{red}\textless double\textgreater massSeedAttributeMatch(<logical>[requireGettable]→, <logical>[requireSettable]→, <logical>[requireEvolvable]→) Return a list of implementations that provide the given list off attributes for the massSeed property of the blackHole component

tfamily \ textcolor{red}\textless double\textgreater massSeedIsGettable() Get the massSeed property of the blackHole component.

tfamily \ logical zero massSeedIsSettable() Specify whether the massSeed property of the blackHole component is settable.

tfamily \ void massSet(<double> value) Set the mass property of the blackHole component.

tfamily \ void nameFromIndex(<integer> count→, <varying_string>name←) Return the name of a property given is index.

tfamily \ logical zero nullIsActive() Return whether the null implementation of the blackHole component class is active.

tfamily \ void odeStepRatesInitialize() Initialize rates for evolvable properties.

tfamily \ void odeStepScalesInitialize() Initialize scales for evolvable properties.

tfamily \ void output(<integer> integerProperty↔, <integer> integerBufferCount↔, <integer(:,:)>integerBuffer↔, <integer>doubleProperty↔, <integer>doubleBufferCount↔, <double(:,:)>doubleBuffer↔, <double> time→, <integer>instance→) Generate values of outputtable properties.

tfamily \ void outputCount(<integer>integerPropertyCount↔, <integer>doublePropertyCount↔, <double> time→, <integer>instance→) Compute a count of outputtable properties.

tfamily \ void outputNames(<integer>integerProperty↔, <char\[*\](:)>integerPropertyNames↔, <char\[*\](:)>integerPropertyComments↔, <double(:)>integerPropertyUnitsSI↔, <integer>doubleProperty↔, <char\[*\](:)>doublePropertyNames↔, <char\[*\](:)>doublePropertyComments↔, <double(:)>doublePropertyUnitsSI↔, <double> time→, <integer>instance→) Generate names of outputtable properties.

tfamily \ double zero potential(<double> radius→, <componentType>[componentType]→, <massType>[massType]→, <logical>[haloLoaded]→) Compute the gravitational potential.

tfamily \ textcolor{red}\textless double\textgreater radialPosition() Get the radialPosition property of the blackHole component.

tfamily \ textcolor{red}\textless double\textgreater radialPositionAttributeMatch(<logical>[requireGettable]→, <logical>[requireSettable]→, <logical>[requireEvolvable]→) Return a list of implementations that provide the given list off attributes for the radialPosition property of the blackHole component

tfamily \ int zero radialPositionCount() Compute the count of evolvable quantities in the radialPosition property of the BlackHoleStandard component.
tfamily \textcolor{red}{\textless double\textgreater} radialPositionIsGettable() Get the radialPosition property of the blackHole component.

tfamily \textcolor{red}{\textless double\textgreater} radialPositionIsSettable() Specify whether the radialPosition property of the blackHole component is settable.

tfamily \textcolor{red}{\textless double\textgreater} radialPositionRate(<double> value) Cumulate to the rate of the radialPosition property of the BlackHoleStandard component.

tfamily \textcolor{red}{\textless double\textgreater} radialPositionScale(<double> value) Set the scale of the radialPosition property of the BlackHoleStandard component.

tfamily \textcolor{red}{\textless double\textgreater} radialPositionSet(<double> value) Set the radialPosition property of the blackHole component.

tfamily \textcolor{red}{\textless double\textgreater} radiativeEfficiency() Get the radiativeEfficiency property of the blackHole component.

tfamily \textcolor{red}{\textless type(varying\_string)(:)}\textgreater radiativeEfficiencyAttributeMatch(<logical> [requireGettable] →, <logical> [requireSettable] →, <logical> [requireEvolvable] →) Return a list of implementations that provide the given list off attributes for the radiativeEfficiency property of the blackHole component.

tfamily \textcolor{red}{\textless double\textgreater} radiativeEfficiencyIsGettable() Get the radiativeEfficiency property of the blackHole component.

tfamily \textcolor{red}{\textless double\textgreater} radiativeEfficiencyIsSettable() Specify whether the radiativeEfficiency property of the blackHole component is settable.

tfamily \textcolor{red}{\textless double\textgreater} spin() Get the spin property of the blackHole component.

tfamily \textcolor{red}{\textless type(varying\_string)(:)}\textgreater spinAttributeMatch(<logical> [requireGettable] →, <logical> [requireSettable] →, <logical> [requireEvolvable] →) Return a list of implementations that provide the given list off attributes for the spin property of the blackHole component.
16.5. Objects

tfamily \intzero spinCount() Compute the count of evolvable quantities in the spin property of the BlackHoleStandard component.

tfamily \textcolor{red}{\textless\textgreater\textcolor{red}{\textless\textgreater}\textcolor{red}{\textless\textgreater}} spinIsGettable() Get the spin property of the blackHole component.

tfamily \logicalzero spinIsSettable() Specify whether the spin property of the blackHole component is settable.

tfamily \void spinRate(<double> value) Cumulate to the rate of the spin property of the BlackHoleStandard component.

tfamily \void spinScale(<double> value) Set the scale of the spin property of the BlackHoleStandard component.

tfamily \textcolor{red}{\textless\textgreater\textcolor{red}{\textless\textgreater}} spinSeed() Get the spinSeed property of the blackHole component.

tfamily \textcolor{red}{\textless\textgreater\textcolor{red}{\textless\textgreater}} spinSeedAttributeMatch(<logical>[requireGettable] →, <logical>[requireSettable] →, <logical>[requireEvolvable] →) Return a list of implementations that provide the given list off attributes for the spinSeed property of the blackHole component.

tfamily \void spinSeedIsGettable() Get the spinSeed property of the blackHole component.

tfamily \logicalzero spinSeedIsSettable() Specify whether the spinSeed property of the blackHole component is settable.

tfamily \void spinSet(<double> value) Set the spin property of the blackHole component.

tfamily \logicalzero standardIsActive() Return whether the standard implementation of the blackHole component class is active.

tfamily \doublezero surfaceDensity(<double(3)> positionCylindrical →, <componentType> [componentType] →, <massType> [massType] →, <weightBy> [weightBy] →, <integer> [weightIndex] →, <logical> [haloLoaded] →) Compute the surface density.

tfamily \textcolor{red}{\textless\textgreater\textcolor{red}{\textless\textgreater}} tripleInteractionTime() Get the tripleInteractionTime property of the blackHole component.

tfamily \textcolor{red}{\textless\textgreater\textcolor{red}{\textless\textgreater}} tripleInteractionTimeAttributeMatch(<logical>[requireGettable] →, <logical>[requireSettable] →, <logical>[requireEvolvable] →) Return a list of implementations that provide the given list off attributes for the tripleInteractionTime property of the blackHole component.

tfamily \textcolor{red}{\textless\textgreater\textcolor{red}{\textless\textgreater}} tripleInteractionTimeIsGettable() Get the tripleInteractionTime property of the blackHole component.

tfamily \logicalzero tripleInteractionTimeIsSettable() Specify whether the tripleInteractionTime property of the blackHole component is settable.

tfamily \void tripleInteractionTimeSet(<double> value) Set the tripleInteractionTime property of the blackHole component.

tfamily \textcolor{red}{\textless\textgreater\textcolor{red}{\textless\textgreater}} type() Return the type of this object.
16. Coding GALACTICUS

tfamily nodeComponentBlackHoleSimple
tfamily \textcolor{red}{\textless \textgreater \textgreater} accretionRate() Get the \texttt{accretionRate} property of the \texttt{blackHole} component.

tfamily \textcolor{red}{\textless \textgreater \textgreater} accretionRateAttributeMatch(\texttt{<logical>[requireGettable]→, <logical>[requireSettable]→, <logical>[requireEvolvable]→}) Return a list of implementations that provide the given list off attributes for the \texttt{accretionRate} property of the \texttt{blackHole} component.

tfamily \textcolor{red}{\textless \textgreater \textgreater} accretionRateIsGettable() Get the \texttt{accretionRate} property of the \texttt{blackHole} component.

tfamily \textcolor{red}{\textless \textgreater \textgreater} accretionRateIsSettable() Specify whether the \texttt{accretionRate} property of the \texttt{blackHole} component is settable.

tfamily \texttt{builder(\texttt{<type(node)>componentDefinition→}) Build a nodeComponent from a supplied XML definition.

tfamily \texttt{density(\texttt{<double(3)> positionSpherical→, <componentType>[componentType]→, <massType>[massType]→, <weightBy>[weightBy]→, <integer>[weightIndex]→, <logical>[haloLoaded]→}) Compute the density.

tfamily \texttt{deserializeRates(\texttt{<double(:)> array←}) Deserialize the evolvable rates from an array.

tfamily \texttt{deserializeScales(\texttt{<double(:)> array←}) Deserialize the evolvable scales from an array.

tfamily \texttt{deserializeValues(\texttt{<double(:)> array←}) Deserialize the evolvable quantities from an array.

tfamily \texttt{destroy()} Destroy the object.

tfamily \texttt{dump()} Generate an ASCII dump of all properties.

tfamily \texttt{dumpRaw(\texttt{<integer> fileHandle→}) Generate a binary dump of all properties.

tfamily \texttt{dumpXML()} Generate an XML dump of all properties.

tfamily \texttt{enclosedMass(\texttt{<double>radius→, <componentType>[componentType]→, <massType>[massType]→, <weightBy>[weightBy]→, <integer>[weightIndex]→, <logical>[haloLoaded]→}) Compute the mass enclosed within a radius.

tfamily \textcolor{red}{\textless \textgreater \textgreater} host() Return a pointer to the host treeNode object.

tfamily \texttt{hotHaloCoolingAbundancesRate(\texttt{<type(abundances)> value}) Cumulate to the rate of the \texttt{hotHaloCoolingAbundances} property of the \texttt{hotHalo} component.

tfamily \texttt{hotHaloCoolingAngularMomentumRate(\texttt{<double> value}) Cumulate to the rate of the \texttt{hotHaloCoolingAngularMomentum} property of the \texttt{hotHalo} component.

tfamily \texttt{hotHaloCoolingMassRate(\texttt{<double> value}) Cumulate to the rate of the \texttt{hotHaloCoolingMass} property of the \texttt{hotHalo} component.

tfamily \texttt{initialize()} Initialize the object.

tfamily \textcolor{red}{\textless \textgreater \textgreater} mass() Get the \texttt{mass} property of the \texttt{blackHole} component.
tfamily \textcolor{red}{\textless\textgreater} massAttributeMatch(<logical>[requireGettable]→, <logical>[requireSettable]→, <logical>[requireEvolvable]→) Return a list of implementations that provide the given list of attributes for the mass property of the blackHole component.

tfamily \intzero massCount() Compute the count of evolvable quantities in the mass property of the BlackHoleSimple component.

tfamily \textcolor{red}{\textless\textgreater} massIsGettable() Get the mass property of the blackHole component.

tfamily \logicalzero massIsSettable() Specify whether the mass property of the blackHole component is settable.

tfamily \void massRate(<double> value) Cumulate to the rate of the mass property of the BlackHoleSimple component.

tfamily \void massScale(<double> value) Set the scale of the mass property of the BlackHoleSimple component.

tfamily \textcolor{red}{\textless\textgreater} massSeed() Get the massSeed property of the blackHole component.

tfamily \textcolor{red}{\textless\textgreater} massSeedAttributeMatch(<logical>[requireGettable]→, <logical>[requireSettable]→, <logical>[requireEvolvable]→) Return a list of implementations that provide the given list of attributes for the massSeed property of the blackHole component.

tfamily \textcolor{red}{\textless\textgreater} massSeedIsGettable() Get the massSeed property of the blackHole component.

tfamily \logicalzero massSeedIsSettable() Specify whether the massSeed property of the blackHole component is settable.

tfamily \void massSet(<double> value) Set the mass property of the blackHole component.

tfamily \void nameFromIndex(<integer> count→, <varying_string>name←) Return the name of a property given an index.

tfamily \logicalzero nullIsActive() Return whether the null implementation of the blackHole component class is active.

tfamily \void odeStepRatesInitialize() Initialize rates for evolvable properties.

tfamily \void odeStepScalesInitialize() Initialize scales for evolvable properties.

tfamily \void output(<integer> integerProperty↔, <integer> integerBufferCount↔, <integer(;)>) integerBuffer↔, <integer> doubleProperty↔, <integer> doubleBufferCount↔, <double(;)>) doubleBuffer↔, <double> time→, <integer> instance→) Generate values of outputtable properties.

tfamily \void outputCount(<integer> integerPropertyCount↔, <integer> doublePropertyCount↔, <double> time→, <integer> instance→) Compute a count of outputtable properties.

tfamily \void outputNames(<integer> integerProperty↔, <char(*)>] integerPropertyNames↔, <char(*)]) integerPropertyComments↔, <double(;)>) integerPropertyUnitsSI↔, <integer> doubleProperty↔, <char(*)>] doublePropertyNames↔, <char(*)]) doublePropertyComments↔, <double(;)>) doublePropertyUnitsSI↔, <double> time→, <integer> instance→) Generate names of outputtable properties.
tfamily double zero potential(<double> radius \rightarrow, <componentType> |componentType| \rightarrow, <massType> |massType| \rightarrow, <logical> |haloLoaded| \rightarrow) Compute the gravitational potential.

tfamily \textcolor{red}{\textless double\textgreater} radialPosition() Get the radialPosition property of the BlackHole component.

tfamily \textcolor{red}{\textless double\textgreater} radialPositionAttributeMatch(<logical>|requireGettable| \rightarrow, <logical>|requireSettable| \rightarrow, <logical>|requireEvolvable| \rightarrow) Return a list of implementations that provide the given list of attributes for the radialPosition property of the BlackHole component.

tfamily \intzero radialPositionCount() Compute the count of evolvable quantities in the radialPosition property of the BlackHoleStandard component.

tfamily \textcolor{red}{\textless double\textgreater} radialPositionIsGettable() Get the radialPosition property of the BlackHole component.

tfamily logical zero radialPositionIsSettable() Specify whether the radialPosition property of the BlackHole component is settable.

tfamily \void radialPositionRate(<double> value) Cumulate to the rate of the radialPosition property of the BlackHoleStandard component.

tfamily \void radialPositionScale(<double> value) Set the scale of the radialPosition property of the BlackHole component.

tfamily \void radialPositionSet(<double> value) Set the radialPosition property of the BlackHole component.

tfamily \textcolor{red}{\textless double\textgreater} radiativeEfficiency() Get the radiativeEfficiency property of the BlackHole component.

tfamily \textcolor{red}{\textless type(varying\_string)(;)\textgreater} radiativeEfficiencyAttributeMatch(<logical>|requireGettable| \rightarrow, <logical>|requireSettable| \rightarrow, <logical>|requireEvolvable| \rightarrow) Return a list of implementations that provide the given list of attributes for the radiativeEfficiency property of the BlackHole component.

tfamily \textcolor{red}{\textless double\textgreater} radiativeEfficiencyIsGettable() Get the radiativeEfficiency property of the BlackHole component.

tfamily logical zero radiativeEfficiencyIsSettable() Specify whether the radiativeEfficiency property of the BlackHole component is settable.

tfamily \void readRaw(<integer> fileHandle \rightarrow) Read a binary dump of the nodeComponent from the given fileHandle.

tfamily double zero rotationCurve(<double> radius \rightarrow, <componentType> |componentType| \rightarrow, <massType> |massType| \rightarrow, <logical> |haloLoaded| \rightarrow) Compute the rotation curve.

tfamily \void rotationCurveGradient(<double> radius \rightarrow, <componentType> |componentType| \rightarrow, <massType> |massType| \rightarrow, <logical> |haloLoaded| \rightarrow) Compute the rotation curve gradient.

tfamily \intzero serializeCount() Return a count of the number of evolvable quantities to be evolved.

tfamily \void serializeRates(<double(:)> array \rightarrow) Serialize the evolvable rates to an array.

tfamily \void serializeScales(<double(:)> array \rightarrow) Serialize the evolvable scales to an array.
tfamily \void serializeValues(<double(:)> array \rightarrow) Serialize the evolvable quantities to an array.

tfamily \logicalzero simpleIsActive() Return whether the simple implementation of the blackHole component class is active.

tfamily \textcolor{red}{\textless double\textgreater} spin() Get the spin property of the blackHole component.

tfamily \textcolor{red}{\textlesstype(varying\_string)(:\textgreater)} spinAttributeMatch(<logical> [requireGettable] \rightarrow, <logical> [requireSettable] \rightarrow, <logical> [requireEvolvable] \rightarrow) Return a list of implementations that provide the given list of attributes for the spin property of the blackHole component.

tfamily \intzero spinCount() Compute the count of evolvable quantities in the spin property of the BlackHoleStandard component.

tfamily \textcolor{red}{\textless double\textgreater} spinIsGettable() Get the spin property of the blackHole component.

tfamily \logicalzero spinIsSettable() Specify whether the spin property of the blackHole component is settable.

tfamily \void spinRate(<double> value) Cumulate to the rate of the spin property of the BlackHoleStandard component.

tfamily \void spinScale(<double> value) Set the scale of the spin property of the BlackHoleStandard component.

tfamily \textcolor{red}{\textless double\textgreater} spinSeed() Get the spinSeed property of the blackHole component.

tfamily \textcolor{red}{\textlesstype(varying\_string)(:\textgreater)} spinSeedAttributeMatch(<logical> [requireGettable] \rightarrow, <logical> [requireSettable] \rightarrow, <logical> [requireEvolvable] \rightarrow) Return a list of implementations that provide the given list of attributes for the spinSeed property of the blackHole component.

tfamily \void spinSet(<double> value) Set the spin property of the blackHole component.

tfamily \logicalzero standardIsActive() Return whether the standard implementation of the blackHole component class is active.

tfamily \doublezero surfaceDensity(<double(3)> positionCylindrical \rightarrow, <componentType> [componentType] \rightarrow, <massType> [massType] \rightarrow, <weightBy> [weightBy] \rightarrow, <integer> [weightIndex] \rightarrow, <logical> [haloLoaded] \rightarrow) Compute the surface density.

tfamily \textcolor{red}{\textless double\textgreater} tripleInteractionTime() Get the tripleInteractionTime property of the blackHole component.

tfamily \textcolor{red}{\textlesstype(varying\_string)(:\textgreater)} tripleInteractionTimeAttributeMatch(<logical> [requireGettable] \rightarrow, <logical> [requireSettable] \rightarrow, <logical> [requireEvolvable] \rightarrow) Return a list of implementations that provide the given list of attributes for the tripleInteractionTime property of the blackHole component.
16. Coding GALACTICUS

tfamily \textcolor{red}{\textless double\textgreater} tripleInteractionTimeIsGettable() Get the \texttt{tripleInteractionTime} property of the \texttt{blackHole} component.

tfamily \textcolor{red}{\textless logical\textgreater} tripleInteractionTimeIsSettable() Specify whether the \texttt{tripleInteractionTime} property of the \texttt{blackHole} component is settable.

tfamily \textcolor{red}{\textless void\textgreater} tripleInteractionTimeSet(<double> value) Set the \texttt{tripleInteractionTime} property of the \texttt{blackHole} component.

tfamily \textcolor{red}{\textless type(varying_string)\textgreater} type() Return the type of this object.

\begin{verbatim}
nodeComponentBlackHoleStandard

\textcolor{red}{\textless double\textgreater} accretionRate() Get the \texttt{accretionRate} property of the \texttt{blackHole} component.

\textcolor{red}{\textless type(varying_string)\textgreater} accretionRateAttributeMatch(<logical>[requireGettable] →, <logical>[requireSettable] →, <logical>[requireEvolvable] →) Return a list of implementations that provide the given list off attributes for the \texttt{accretionRate} property of the \texttt{blackHole} component.

\textcolor{red}{\textless void\textgreater} accretionRateFunction(<function()> deferredFunction) Set the function to be used for the \texttt{get} method of the \texttt{accretionRate} property of the \texttt{BlackHoleStandard} component.

\textcolor{red}{\textless logical\textgreater} accretionRateIsAttached() Return whether the \texttt{get} method of the \texttt{accretionRate} property of the \texttt{BlackHoleStandard} component has been attached to a function.

\textcolor{red}{\textless double\textgreater} accretionRateIsGettable() Get the \texttt{accretionRate} property of the \texttt{blackHole} component.

\textcolor{red}{\textless logical\textgreater} accretionRateIsSettable() Specify whether the \texttt{accretionRate} property of the \texttt{blackHole} component is settable.

\textcolor{red}{\textless void\textgreater} builder(<type(node)>componentDefinition →) Build a \texttt{nodeComponent} from a supplied XML definition.

\textcolor{red}{\textless double\textgreater} density(<double(3)> positionSpherical →, <componentType>[componentType] →, <massType>[massType] →, <weightBy>[weightBy] →, <integer>[weightIndex] →, <logical>[haloLoaded] →) Compute the density.

\textcolor{red}{\textless void\textgreater} deserializeRates(<double(:)> array ←) Deserialize the evolvable rates from an array.

\textcolor{red}{\textless void\textgreater} deserializeScales(<double(:)> array ←) Deserialize the evolvable scales from an array.

\textcolor{red}{\textless void\textgreater} deserializeValues(<double(:)> array ←) Deserialize the evolvable quantities from an array.

\textcolor{red}{\textless void\textgreater} destroy() Destroy the object.

\textcolor{red}{\textless void\textgreater} dump() Generate an ASCII dump of all properties.

\textcolor{red}{\textless void\textgreater} dumpRaw(<integer> fileHandle →) Generate a binary dump of all properties.

\textcolor{red}{\textless void\textgreater} dumpXML() Generate an XML dump of all properties.

\textcolor{red}{\textless double\textgreater} enclosedMass(<double> radius →, <componentType>[componentType] →, <massType>[massType] →, <weightBy>[weightBy] →, <integer>[weightIndex] →, <logical>[haloLoaded] →) Compute the mass enclosed within a radius.
\end{verbatim}
16.5. Objects

```
tfamily \textcolor{red}\{\textless *type(treeNode)\} \textgreater\} host() Return a pointer to the host
treeNode object.

tfamily \void hotHaloCoolingAbundancesRate(<type(abundances)> value) Cumulate to the rate of the
hotHaloCoolingAbundances property of the hotHalo component.

tfamily \void hotHaloCoolingAngularMomentumRate(<double> value) Cumulate to the rate of the
hotHaloCoolingAngularMomentum property of the hotHalo component.

tfamily \void hotHaloCoolingMassRate(<double> value) Cumulate to the rate of the hotHaloCoolingMass
property of the hotHalo component.

tfamily \void initialize() Initialize the object.

tfamily \textcolor{red}{\textbf{double}} surfaceDensity(<\textbf{double}(3)> positionCylindrical\textrightarrow{}, <\textit{componentType}> \textrightarrow{}, <\textit{massType}> \textrightarrow{}, <\textit{weightBy}> \textrightarrow{}, <\textbf{integer}> \textrightarrow{}, <\textbf{logical}> \textrightarrow{}, <\textbf{logical}> \textrightarrow{}) Compute the surface density.

tfamily \textcolor{red}{\textbf{void}} nodeComponentDarkMatterProfile

tfamily \textbf{void} builder(<\textbf{type(node)}\textrightarrow\textit{componentDefinition}) Build a \textit{nodeComponent} from a supplied XML definition.

tfamily \textbf{double} density(<\textbf{double}(3)> positionSpherical\textrightarrow{}, <\textit{componentType}> \textrightarrow{}, <\textit{massType}> \textrightarrow{}, <\textit{weightBy}> \textrightarrow{}, <\textbf{integer}> \textrightarrow{}, <\textbf{logical}> \textrightarrow{}, <\textbf{logical}> \textrightarrow{}) Compute the density.

tfamily \textbf{void} deserializeRates(<\textbf{double}(:)> array\textleft\textrightarrow) Deserialize the evolvable rates from an array.

tfamily \textbf{void} deserializeScales(<\textbf{double}(:)> array\textleft\textrightarrow) Deserialize the evolvable scales from an array.

tfamily \textbf{void} deserializeValues(<\textbf{double}(:)> array\textleft\textrightarrow) Deserialize the evolvable quantities from an array.

tfamily \textbf{void} destroy() Destroy the object.

tfamily \textbf{void} dump() Generate an ASCII dump of all properties.

tfamily \textbf{void} dumpRaw(<\textbf{integer}> fileHandle\textrightarrow) Generate a binary dump of all properties.
16.5. Objects

tfamily \void dumpXML() Generate an XML dump of all properties.

tfamily \doublezero enclosedMass(\double radius\rightarrow, \componentType\componentType\rightarrow, \massType\massType\rightarrow, \weightBy\weightBy\rightarrow, \integer\integer\rightarrow, \logical\logical\rightarrow) Compute the mass enclosed within a radius.

tfamily \textcolor{red}{\textless \type(treeNode)\textgreater} host() Return a pointer to the host \treeNode object.

tfamily \void hotHaloCoolingAbundancesRate(\type(abundances) value) Cumulate to the rate of the hotHaloCoolingAbundances property of the hotHalo component.

tfamily \void hotHaloCoolingAngularMomentumRate(\double value) Cumulate to the rate of the hotHaloCoolingAngularMomentum property of the hotHalo component.

tfamily \void hotHaloCoolingMassRate(\double value) Cumulate to the rate of the hotHaloCoolingMass property of the hotHalo component.

tfamily \void initialize() Initialize the object.

tfamily \void nameFromIndex(\integer count\rightarrow, \varying_string name\leftarrow) Return the name of a property given is index.

tfamily \logicalzero nullIsActive() Return whether the null implementation of the darkMatterProfile component class is active.

tfamily \void odeStepRatesInitialize() Initialize rates for evolvable properties.

tfamily \void odeStepScalesInitialize() Initialize scales for evolvable properties.

tfamily \void output(\integer integerProperty\leftrightarrow, \integer integerBufferCount\leftrightarrow, \integer(\ldots) integerBuffer\leftrightarrow, \integer doubleProperty\leftrightarrow, \integer doubleBufferCount\leftrightarrow, \double(\ldots) doubleBuffer\leftrightarrow, \double(\ldots) time\rightarrow, \integer instance\rightarrow) Generate values of outputtable properties.

tfamily \void outputCount(\integer integerPropertyCount\leftrightarrow, \integer doublePropertyCount\leftrightarrow, \double(\ldots) time\rightarrow, \integer instance\rightarrow) Compute a count of outputtable properties.

tfamily \void outputNames(\integer integerProperty\leftrightarrow, \char[^*][();] integerPropertyNames\leftrightarrow, \char[^*][();] integerPropertyComments\leftrightarrow, \double(\ldots) integerPropertyUnitsSI\leftrightarrow, \integer doubleProperty\leftrightarrow, \char[^*][();] doublePropertyNames\leftrightarrow, \char[^*][();] doublePropertyComments\leftrightarrow, \double(\ldots) doublePropertyUnitsSI\leftrightarrow, \double(\ldots) time\rightarrow, \integer instance\rightarrow) Generate names of outputtable properties.

tfamily \doublezero potential(\double radius\rightarrow, \componentType\componentType\rightarrow, \massType\massType\rightarrow, \logical\logical\rightarrow) Compute the gravitational potential.

tfamily \doublezero rotationCurve(\double radius\rightarrow, \componentType\componentType\rightarrow, \massType\massType\rightarrow, \logical\logical\rightarrow) Compute the rotation curve.

tfamily \doublezero rotationCurveGradient(\double radius\rightarrow, \componentType\componentType\rightarrow, \massType\massType\rightarrow, \logical\logical\rightarrow) Compute the rotation curve gradient.

tfamily \textcolor{red}{\textless \double\textgreater} scale() Get the scale property of the darkMatterProfile component.
tfamily \textcolor{red}{\textless type(varying\_string)(::)}\textgreater \textcolor{red}{\textless \textgreater} scaleAttributeMatch(\textcolor{red}{\textless logical\textgreater}\textcolor{red}{\textless requireGettable\textgreater}\textcolor{red}{\textless requireSettable\textgreater}\textcolor{red}{\textless requireEvolvable\textgreater}) Return a list of implementations that provide the given list of attributes for the scale property of the darkMatterProfile component.

tfamily \intzero scaleCount() Compute the count of evolvable quantities in the scale property of the DarkMatterProfileScale component.

tfamily \textcolor{red}{\textless text double\textgreater} scaleGrowthRate() Get the scaleGrowthRate property of the darkMatterProfile component.

tfamily \textcolor{red}{\textless type(varying\_string)(::)}\textgreater scaleGrowthRateAttributeMatch(\textcolor{red}{\textless logical\textgreater}\textcolor{red}{\textless requireGettable\textgreater}\textcolor{red}{\textless requireSettable\textgreater}\textcolor{red}{\textless requireEvolvable\textgreater}) Return a list of implementations that provide the given list of attributes for the scaleGrowthRate property of the darkMatterProfile component.

tfamily \textcolor{red}{\textless double\textgreater} scaleGrowthRateIsGettable() Get the scaleGrowthRate property of the darkMatterProfile component.

tfamily \logicalzero scaleGrowthRateIsSettable() Specify whether the scaleGrowthRate property of the darkMatterProfile component is settable.

tfamily \void scaleGrowthRateSet(\textcolor{red}{\textless double\textgreater} value) Set the scaleGrowthRate property of the darkMatterProfile component.

tfamily \logicalzero scaleIsActive() Return whether the scale implementation of the darkMatterProfile component class is active.

tfamily \textcolor{red}{\textless double\textgreater} scaleIsGettable() Get the scale property of the darkMatterProfile component.

tfamily \logicalzero scaleIsSettable() Specify whether the scale property of the darkMatterProfile component is settable.

tfamily \logicalzero scalePresetIsActive() Return whether the scalePreset implementation of the darkMatterProfile component class is active.

tfamily \void scaleRate(\textcolor{red}{\textless double\textgreater} value) Cumulate to the rate of the scale property of the DarkMatterProfileScale component.

tfamily \void scaleScale(\textcolor{red}{\textless double\textgreater} value) Set the scale of the scale property of the DarkMatterProfileScale component.

tfamily \void scaleSet(\textcolor{red}{\textless double\textgreater} value) Set the scale property of the darkMatterProfile component.

tfamily \logicalzero scaleShapeIsActive() Return whether the scaleShape implementation of the darkMatterProfile component class is active.

tfamily \intzero serializeCount() Return a count of the number of evolvable quantities to be evolved.

tfamily \void serializeRates(\textcolor{red}{\textless double(:)}\textgreater\textcolor{red}{\textless array\textgreater}) Serialize the evolvable rates to an array.

tfamily \void serializeScales(\textcolor{red}{\textless double(:)}\textgreater\textcolor{red}{\textless array\textgreater}) Serialize the evolvable scales to an array.

tfamily \void serializeValues(\textcolor{red}{\textless double(:)}\textgreater\textcolor{red}{\textless array\textgreater}) Serialize the evolvable quantities to an array.

tfamily \textcolor{red}{\textless double\textgreater} shape() Get the shape property of the darkMatterProfile component.
16.5. Objects

tfamily \textcolor{red}{\textless type(varying\_string):(\textgreater\textgreater} shapeAttributeMatch(\textless logical:\textgreater[requireGettable]→, \textless logical:\textgreater[requireSettable]→, \textless logical:\textgreater[requireEvolvable]→) Return a list of implementations that provide the given list off attributes for the shape property of the darkMatterProfile component

tfamily \textcolor{red}{\textless double\textgreater} shapeCount() Compute the count of evolvable quantities in the shape property of the DarkMatterProfileScaleShape component.

tfamily \textcolor{red}{\textless double\textgreater} shapeGrowthRate() Get the shapeGrowthRate property of the darkMatterProfile component.

tfamily \textcolor{red}{\textless type(varying\_string):(\textgreater\textgreater} shapeGrowthRateAttributeMatch(\textless logical:\textgreater[requireGettable]→, \textless logical:\textgreater[requireSettable]→, \textless logical:\textgreater[requireEvolvable]→) Return a list of implementations that provide the given list off attributes for the shapeGrowthRate property of the darkMatterProfile component

tfamily \textcolor{red}{\textless double\textgreater} shapeGrowthRateIsGettable() Get the shapeGrowthRate property of the darkMatterProfile component.

tfamily \logicalzero shapeGrowthRateIsSettable() Specify whether the shapeGrowthRate property of the darkMatterProfile component is settable.

tfamily \void shapeGrowthRateSet(<double> value) Set the shapeGrowthRate property of the darkMatterProfile component.

tfamily \textcolor{red}{\textless double\textgreater} shapeIsGettable() Get the shape property of the darkMatterProfile component.

tfamily \logicalzero shapeIsSettable() Specify whether the shape property of the darkMatterProfile component is settable.

tfamily \void shapeRate(<double> value) Cumulateto the rate of the shape property of the DarkMatterProfileScaleShape component.

tfamily \void shapeScale(<double> value) Set the scale of the shape property of the DarkMatterProfileScaleShape component.

tfamily \void shapeSet(<double> value) Set the shape property of the darkMatterProfile component.

tfamily \doublezero surfaceDensity(<double(3)> positionCylindrical→, \textless componentType\textgreater[componentType]→, \textless massType\textgreater[massType]→, \textless weightBy\textgreater[weightBy]→, \textless integer\textgreater[weightIndex]→, \textless logical\textgreater[haloLoaded]→) Compute the surface density.

tfamily \textcolor{red}{\textless type(varying\_string):(\textgreater\textgreater} type() Return the type of this object.

tfamily nodeComponentDarkMatterProfileNull

tfamily \void builder(<\*type(node)>componentDefinition→) Build a nodeComponent from a supplied XML definition.

tfamily \doublezero density(<double(3)> positionSpherical→, \textless componentType\textgreater[componentType]→, \textless massType\textgreater[massType]→, \textless weightBy\textgreater[weightBy]→, \textless integer\textgreater[weightIndex]→, \textless logical\textgreater[haloLoaded]→) Compute the density.

tfamily \void deserializeRates(<double(:)> array←) Deserialize the evolvable rates from an array.

429
tfamily \void deserializeScales(<double(:)> array←) Deserialize the evolvable scales from an array.

tfamily \void deserializeValues(<double(:)> array←) Deserialize the evolvable quantities from an array.

tfamily \void destroy() Destroy the object.

tfamily \void dump() Generate an ASCII dump of all properties.

tfamily \void dumpRaw(<integer> fileHandle→) Generate a binary dump of all properties.

tfamily \void dumpXML() Generate an XML dump of all properties.

tfamily \double zero enclosedMass(<double> radius→, <componentType>[componentType]→, <massType>[massType]→, <weightBy>[weightBy]→, <integer>[weightIndex]→, <logical>[haloLoaded]→)
Compute the mass enclosed within a radius.

tfamily \textcolor{red}{\textless *type(treeNode)\textgreater} host() Return a pointer to the host treeNode object.

tfamily \void hotHaloCoolingAbundancesRate(<type(abundances)> value) Cumulate to the rate of the hotHaloCoolingAbundances property of the hotHalo component.

tfamily \void hotHaloCoolingAngularMomentumRate(<double> value) Cumulate to the rate of the hotHaloCoolingAngularMomentum property of the hotHalo component.

tfamily \void hotHaloCoolingMassRate(<double> value) Cumulate to the rate of the hotHaloCoolingMass property of the hotHalo component.

tfamily \void initialize() Initialize the object.

tfamily \void nameFromIndex(<integer> count→, <varying_string>name←) Return the name of a property given is index.

tfamily \logical zero nullIsActive() Return whether the null implementation of the darkMatterProfile component class is active.

tfamily \void odeStepRatesInitialize() Initialize rates for evolvable properties.

tfamily \void odeStepScalesInitialize() Initialize scales for evolvable properties.

tfamily \void output(<integer> integerProperty↔, <integer> integerBufferCount↔, <integer(:,:)> integerBuffer↔, <integer>doubleProperty↔, <integer> doubleBufferCount↔, <double(:,:)> doubleBuffer↔, <double> time→, <integer> instance→) Generate values of outputtable properties.

tfamily \void outputCount(<integer>integerPropertyCount↔, <integer>doublePropertyCount↔, <double> time→, <integer> instance→) Compute a count of outputtable properties.

tfamily \void outputNames(<integer>integerProperty↔, <char[*](::)> integerPropertyNames↔, <char[*]::)> integerPropertyComments↔, <double::> integerPropertyUnitsSI↔, <integer>doubleProperty↔, <char[*]::)> doublePropertyNames↔, <char[*]::)> doublePropertyComments↔, <double::> doublePropertyUnitsSI↔, <double> time→, <integer> instance→) Generate names of outputtable properties.

tfamily \double zero potential(<double> radius→, <componentType>[componentType]→, <massType>[massType]→, <logical>[haloLoaded]→) Compute the gravitational potential.
16.5. Objects

tfamily \textcolor{red}{\textless double\textgreater} scale() Get the scale property of the darkMatterProfile component.

tfamily \textcolor{red}{\textless type(varying\_string)(:)}\textgreater scaleGrowthRate() Get the scaleGrowthRate property of the darkMatterProfile component.

tfamily \textcolor{red}{\textless double\textgreater} scaleGrowthRateIsGettable() Get the scaleGrowthRate property of the darkMatterProfile component.

tfamily \textcolor{red}{\textless type(varying\_string)(:)}\textgreater scaleGrowthRateIsSettable() Specify whether the scaleGrowthRate property of the darkMatterProfile component is settable.

tfamily \void scaleGrowthRateSet(<double> value) Set the scaleGrowthRate property of the darkMatterProfile component.

tfamily \logicalzero scaleIsActive() Return whether the scale implementation of the darkMatterProfile component class is active.

tfamily \textcolor{red}{\textless double\textgreater} scaleIsGettable() Get the scale property of the darkMatterProfile component.

tfamily \logicalzero scaleIsSettable() Specify whether the scale property of the darkMatterProfile component is settable.

tfamily \logicalzero scalePresetIsActive() Return whether the scalePreset implementation of the darkMatterProfile component class is active.

tfamily \void scaleRate(<double> value) Cumulate to the rate of the scale property of the darkMatterProfileScale component.

tfamily \void scaleScale(<double> value) Set the scale of the scale property of the darkMatterProfileScale component.

tfamily \void scaleSet(<double> value) Set the scale property of the darkMatterProfile component.
tfamily \logicalzero scaleShapeIsActive() Return whether the scaleShape implementation of the dark-MatterProfile component class is active.

tfamily \intzero serializeCount() Return a count of the number of evolvable quantities to be evolved.

tfamily \void serializeRates(<double(:)> array) Serialize the evolvable rates to an array.

tfamily \void serializeScales(<double(:)> array) Serialize the evolvable scales to an array.

tfamily \void serializeValues(<double(:)> array) Serialize the evolvable quantities to an array.

tfamily \textcolor{red}\textless\textgreater shape() Get the shape property of the darkMatterProfile component.

tfamily \textcolor{red}\textless type(varying\_string)(:)\textgreater shapeAttributeMatch(<logical>[requireGettable]→ <logical>[requireSettable]→, <logical>[requireEvolvable]→) Return a list of implementations that provide the given list off attributes for the shape property of the darkMatterProfile component

tfamily \intzero shapeCount() Compute the count of evolvable quantities in the shape property of the DarkMatterProfileScaleShape component.

tfamily \textcolor{red}\textless double\textgreater shapeGrowthRate() Get the shapeGrowthRate property of the darkMatterProfile component.

tfamily \textcolor{red}\textless type(varying\_string)(:)\textgreater shapeGrowthRateAttributeMatch(<logical>[requireGettable]→ <logical>[requireSettable]→, <logical>[requireEvolvable]→) Return a list of implementations that provide the given list off attributes for the shapeGrowthRate property of the darkMatterProfile component

tfamily \textcolor{red}\textless double\textgreater shapeGrowthRateIsGettable() Get the shapeGrowthRate property of the darkMatterProfile component.

tfamily \logicalzero shapeGrowthRateIsSettable() Specify whether the shapeGrowthRate property of the darkMatterProfile component is settable.

tfamily \void shapeGrowthRateSet(<double> value) Set the shapeGrowthRate property of the darkMatterProfile component.

tfamily \textcolor{red}\textless double\textgreater shapeIsGettable() Get the shape property of the darkMatterProfile component.

tfamily \logicalzero shapeIsSettable() Specify whether the shape property of the darkMatterProfile component is settable.

tfamily \void shapeRate(<double> value) Cumulate to the rate of the shape property of the DarkMatterProfileScaleShape component.

tfamily \void shapeScale(<double> value) Set the scale of the shape property of the DarkMatterProfileScaleShape component.

tfamily \void shapeSet(<double> value) Set the shape property of the darkMatterProfile component.

tfamily \doublezero surfaceDensity(<double(3)> positionCylindrical→, <componentType> [componentType]→, <massType> [massType]→, <weightBy> [weightBy]→, <integer> [weightIndex]→, <logical> [haloLoaded]→) Compute the surface density.

tfamily \textcolor{red}\textless type(varying\_string)\textgreater type() Return the type of this object.
16.5. Objects

```cpp
// tfamily nodeComponentDarkMatterProfileScale

// tfamily \void builder(<\texttt{*type(node)}\texttt{>componentDefinition→}) Build a nodeComponent from a supplied XML definition.

// tfamily \void outputCount(<\texttt{integer}→integerPropertyCount←, <\texttt{integer}→doublePropertyCount←, <\texttt{double}→time→, <\texttt{integer}→instance←) Compute a count of outputtable properties.
```
16. Coding Galacticus

tfamily \( \text{\textcolor{red}{\textgreater double\textless}} \text{scale()} \) Get the \text{scale} property of the \text{darkMatterProfile} component.

tfamily \( \text{\textcolor{red}{\textless type(varying\_\textgreater\_string)(:)}\textgreater\textcolor{red}{\textless double\textgreater}} \text{scaleGrowthRate()} \) Get the \text{scaleGrowthRate} property of the \text{darkMatterProfile} component.

tfamily \( \text{\textcolor{red}{\textless double\textgreater}} \text{scaleGrowthRateIsGettable()} \) Get the \text{scaleGrowthRate} property of the \text{darkMatterProfile} component.

tfamily \( \text{\textcolor{red}{\textless double\textgreater}} \text{scaleGrowthRateIsSettable()} \) Specify whether the \text{scaleGrowthRate} property of the \text{darkMatterProfile} component is settable.

tfamily \( \text{\textcolor{red}{\textless double\textgreater}} \text{scaleIsActive()} \) Return whether the scale implementation of the \text{darkMatterProfile} component class is active.

tfamily \( \text{\textcolor{red}{\textless double\textgreater}} \text{scaleIsAttached()} \) Return whether the get method of the scale property of the \text{DarkMatterProfileScale} component has been attached to a function.

tfamily \( \text{\textcolor{red}{\textless double\textgreater}} \text{scaleIsGettable()} \) Get the \text{scale} property of the \text{darkMatterProfile} component.
16.5. Objects

tfamily \logicalzero scalesIsSettable() Specify whether the scale property of the darkMatterProfile component is settable.

tfamily \logicalzero scalePresetIsActive() Return whether the scalePreset implementation of the darkMatterProfile component class is active.

tfamily \void scaleRate(<double> value) Cumulate to the rate of the scale property of the DarkMatterProfileScale component.

tfamily \void scaleScale(<double> value) Set the scale of the scale property of the DarkMatterProfileScale component.

tfamily \void scaleSet(<double> value) Set the scale property of the darkMatterProfile component.

tfamily \logicalzero scaleShapeIsActive() Return whether the scaleShape implementation of the darkMatterProfile component class is active.

tfamily \textcolor{red}{\lessdouble\textgreater} scaleValue() Get the scale property of the darkMatterProfile component.

tfamily \intzero serializeCount() Return a count of the number of evolvable quantities to be evolved.

tfamily \void serializeRates(<double(:)> array) Serialize the evolvable rates to an array.

tfamily \void serializeScales(<double(:)> array) Serialize the evolvable scales to an array.

tfamily \void serializeValues(<double(:)> array) Serialize the evolvable quantities to an array.

tfamily \textcolor{red}{\lessdouble\textgreater} shape() Get the shape property of the darkMatterProfile component.

tfamily \textcolor{red}{\less type(varying_string)(:)} shapeAttributeMatch(<logical>[requireGettable]→, <logical>[requireSettable]→, <logical>[requireEvolvable]→) Return a list of implementations that provide the given list off attributes for the shape property of the darkMatterProfile component.

tfamily \intzero shapeCount() Compute the count of evolvable quantities in the shape property of the DarkMatterProfileScaleShape component.

tfamily \textcolor{red}{\less double\textgreater} shapeGrowthRate() Get the shapeGrowthRate property of the darkMatterProfile component.

tfamily \textcolor{red}{\less type(varying_string)(:)} shapeGrowthRateAttributeMatch(<logical>[requireGettable]→, <logical>[requireSettable]→, <logical>[requireEvolvable]→) Return a list of implementations that provide the given list off attributes for the shapeGrowthRate property of the darkMatterProfile component.

tfamily \textcolor{red}{\less double\textgreater} shapeGrowthRateIsGettable() Get the shapeGrowthRate property of the darkMatterProfile component.

tfamily \logicalzero shapeGrowthRateIsSettable() Specify whether the shapeGrowthRate property of the darkMatterProfile component is settable.

tfamily \void shapeGrowthRateSet(<double> value) Set the shapeGrowthRate property of the darkMatterProfile component.

tfamily \textcolor{red}{\less double\textgreater} shapeIsGettable() Get the shape property of the darkMatterProfile component.
tfamily \logicalzero shapeIsSettable() Specify whether the shape property of the darkMatterProfile component is settable.

tfamily \void shapeRate(<double> value) Cumulate to the rate of the shape property of the DarkMatterProfileScaleShape component.

tfamily \void shapeScale(<double> value) Set the scale of the shape property of the DarkMatterProfileScaleShape component.

tfamily \void shapeSet(<double> value) Set the shape property of the darkMatterProfile component.

tfamily \doublezero surfaceDensity(<double(3)> positionCylindrical→, <componentType> [componentType]→, <massType> [massType]→, <weightBy> [weightBy]→, <integer> [weightIndex]→, <logical> [haloLoaded]→) Compute the surface density.

tfamily \textcolor{red}{\textless type(varying\_string)\textgreater} type() Return the type of this object.

tfamily nodeComponentDarkMatterProfileScalePreset

tfamily \void builder(<*type(node)>componentDefinition→) Build a nodeComponent from a supplied XML definition.

tfamily \doublezero density(<double(3)> positionSpherical→, <componentType> [componentType]→, <massType> [massType]→, <weightBy> [weightBy]→, <integer> [weightIndex]→, <logical> [haloLoaded]→) Compute the density.

tfamily \void deserializeRates(<double(:)> array←) Deserialize the evolvable rates from an array.

tfamily \void deserializeScales(<double(:)> array←) Deserialize the evolvable scales from an array.

tfamily \void deserializeValues(<double(:)> array←) Deserialize the evolvable quantities from an array.

tfamily \void destroy() Destroy the object.

tfamily \void dump() Generate an ASCII dump of all properties.

tfamily \void dumpRaw(<integer> fileHandle→) Generate a binary dump of all properties.

tfamily \void dumpXML() Generate an XML dump of all properties.

tfamily \doublezero enclosedMass(<double> radius→, <componentType> [componentType]→, <massType> [massType]→, <weightBy> [weightBy]→, <integer> [weightIndex]→, <logical> [haloLoaded]→) Compute the mass enclosed within a radius.

tfamily \textcolor{red}{\textless *type(treeNode)\textgreater} host() Return a pointer to the host treeNode object.

tfamily \void hotHaloCoolingAbundancesRate(<type(abundances)> value) Cumulate to the rate of the hotHaloCoolingAbundances property of the hotHalo component.

tfamily \void hotHaloCoolingAngularMomentumRate(<double> value) Cumulate to the rate of the hotHaloCoolingAngularMomentum property of the hotHalo component.

tfamily \void hotHaloCoolingMassRate(<double> value) Cumulate to the rate of the hotHaloCoolingMass property of the hotHalo component.
16.5. Objects

tfamily \void initialize() Initialize the object.

tfamily \void nameFromIndex(<integer> count →, <varying_string> name ←) Return the name of a property given is index.

tfamily \logicalzero nullIsActive() Return whether the null implementation of the darkMatterProfile component class is active.

tfamily \void odeStepRatesInitialize() Initialize rates for evolvable properties.

tfamily \void odeStepScalesInitialize() Initialize scales for evolvable properties.

tfamily \void output(<integer> integerProperty ↔, <integer> integerBufferCount ↔, <integer(:,:) > integerBuffer ↔, <integer> doubleProperty ↔, <integer> doubleBufferCount ↔, <double(:,:) > doubleBuffer ↔, <double> time →, <integer> instance →) Generate values of outputtable properties.

tfamily \void outputCount(<integer> integerPropertyCount ↔, <integer> doublePropertyCount ↔, <double> time →, <integer> instance →) Compute a count of outputtable properties.

tfamily \void outputNames(<integer> integerProperty ↔, <char[*](:)> integerPropertyNames ↔, <char[*](:)> integerPropertyComments ↔, <double(:)> integerPropertyUnitsSI ↔, <integer> doubleProperty ↔, <char[*](:)> doublePropertyNames ↔, <char[*](:)> doublePropertyComments ↔, <double(:)> doublePropertyUnitsSI ↔, <double> time →, <integer> instance →) Generate names of outputtable properties.

tfamily \doublezero potential(<double> radius →, <componentType> [componentType] →, <massType> [massType] →, <logical> [haloLoaded] →) Compute the gravitational potential.

tfamily \void readRaw(<integer> fileHandle →) Read a binary dump of the nodeComponent from the given fileHandle.

tfamily \doublezero rotationCurve(<double> radius →, <componentType> [componentType] →, <massType> [massType] →, <logical> [haloLoaded] →) Compute the rotation curve.

tfamily \doublezero rotationCurveGradient(<double> radius →, <componentType> [componentType] →, <massType> [massType] →, <logical> [haloLoaded] →) Compute the rotation curve gradient.

tfamily \textcolor{red}{\textless double\textgreater} scale() Get the scale property of the darkMatterProfile component.

tfamily \textcolor{red}{\textless type(varying_string)(:)\textgreater} scaleAttributeMatch(<logical>[requireGettable] →, <logical>[requireSettable] →, <logical>[requireEvolvable] →) Return a list of implementations that provide the given list off attributes for the scale property of the darkMatterProfile component

tfamily \intzero scaleCount() Compute the count of evolvable quantities in the scale property of the DarkMatterProfileScale component.

tfamily \textcolor{red}{\textless double\textgreater} scaleGrowthRate() Get the scaleGrowthRate property of the darkMatterProfile component.

tfamily \textcolor{red}{\textless type(varying_string)(:)\textgreater} scaleGrowthRateAttributeMatch(<logical>[requireGettable] →, <logical>[requireSettable] →, <logical>[requireEvolvable] →) Return a list of implementations that provide the given list off attributes for the scaleGrowthRate property of the darkMatterProfile component

437
tfamily \textcolor{red}{\textless double\textgreater} scaleGrowthRateIsGettable() Get the \texttt{scaleGrowthRate} property of the \texttt{darkMatterProfile} component.

tfamily \textcolor{red}{\textless double\textgreater} scaleGrowthRateIsSettable() Specify whether the \texttt{scaleGrowthRate} property of the \texttt{darkMatterProfile} component is settable.

tfamily \void scaleGrowthRateSet(<double> value) Set the \texttt{scaleGrowthRate} property of the \texttt{darkMatterProfile} component.

tfamily \logicalzero scaleIsActive() Return whether the scale implementation of the \texttt{darkMatterProfile} component class is active.

tfamily \textcolor{red}{\textless double\textgreater} scaleIsGettable() Get the \texttt{scale} property of the \texttt{darkMatterProfile} component.

tfamily \logicalzero scaleIsSettable() Specify whether the \texttt{scale} property of the \texttt{darkMatterProfile} component is settable.

tfamily \logicalzero scalePresetIsActive() Return whether the scalePreset implementation of the dark-MatterProfile component class is active.

tfamily \void scaleRate(<double> value) Cumulate to the rate of the \texttt{scale} property of the \texttt{DarkMatterProfileScale} component.

tfamily \void scaleScale(<double> value) Set the scale of the \texttt{scale} property of the \texttt{DarkMatterProfileScale} component.

tfamily \void scaleSet(<double> value) Set the \texttt{scale} property of the \texttt{darkMatterProfile} component.

tfamily \logicalzero scaleShapeIsActive() Return whether the scaleShape implementation of the \texttt{darkMatterProfile} component class is active.

tfamily \intzero serializeCount()Return a count of the number of evolvable quantities to be evolved.

tfamily \void serializeRates(<double(:)> array→) Serialize the evolvable rates to an array.

tfamily \void serializeScales(<double(:)> array→) Serialize the evolvable scales to an array.

tfamily \void serializeValues(<double(:)> array→) Serialize the evolvable quantities to an array.

tfamily \textcolor{red}{\textless double\textgreater} shape() Get the \texttt{shape} property of the \texttt{darkMatterProfile} component.

tfamily \textcolor{red}{\textless type(varying\_string)(:)}\textgreater shapeAttributeMatch(<logical>[requireGettable]→, <logical>[requireSettable]→, <logical>[requireEvolvable]→) Return a list of implementations that provide the given list off attributes for the \texttt{shape} property of the \texttt{darkMatterProfile} component.

tfamily \intzero shapeCount() Compute the count of evolvable quantities in the \texttt{shape} property of the \texttt{DarkMatterProfileScaleShape} component.

tfamily \textcolor{red}{\textless type(varying\_string)(:)\textgreater} shapeGrowthRate() Get the \texttt{shapeGrowthRate} property of the \texttt{darkMatterProfile} component.

tfamily \textcolor{red}{\textless type(varying\_string)(:)\textgreater} shapeGrowthRateAttributeM-

[438]atch(<logical>[requireGettable]→, <logical>[requireSettable]→, <logical>[requireEvolvable]→) Return a list of implementations that provide the given list off attributes for the \texttt{shapeGrowthRate} property of the \texttt{darkMatterProfile} component.
16.5. Objects

tfamily \textcolor{red}{\langle double\rangle} shapeGrowthRateIsGettable() Get the \texttt{shapeGrowthRate} property of the \texttt{darkMatterProfile} component.

tfamily \texttt{logical zero} shapeGrowthRateIsSettable() Specify whether the \texttt{shapeGrowthRate} property of the \texttt{darkMatterProfile} component is settable.

tfamily \texttt{void} shapeGrowthRateSet(<double> value) Set the \texttt{shapeGrowthRate} property of the \texttt{darkMatterProfile} component.

tfamily \textcolor{red}{\langle double\rangle} shapeIsGettable() Get the \texttt{shape} property of the \texttt{darkMatterProfile} component.

tfamily \texttt{logical zero} shapeIsSettable() Specify whether the \texttt{shape} property of the \texttt{darkMatterProfile} component is settable.

tfamily \texttt{void} shapeRate(<double> value) Cumulate to the rate of the \texttt{shape} property of the \texttt{DarkMatterProfileScaleShape} component.

tfamily \texttt{void} shapeScale(<double> value) Set the scale of the \texttt{shape} property of the \texttt{DarkMatterProfileScaleShape} component.

tfamily \texttt{void} shapeSet(<double> value) Set the \texttt{shape} property of the \texttt{darkMatterProfile} component.

tfamily \texttt{double zero} surfaceDensity(<double(3)> positionCylindrical\rightarrow, <componentType> \rightarrow, <massType> \rightarrow, <weightBy> \rightarrow, <integer> \rightarrow, \texttt{logical} \rightarrow) Compute the surface density.

tfamily \textcolor{red}{\langle type(varying\_string)\rangle} type() Return the type of this object.

tfamily nodeComponentDarkMatterProfileScaleShape

tfamily \texttt{void} builder(<\texttt{type(node)}\rangle componentDefinition\rightarrow) Build a \texttt{nodeComponent} from a supplied XML definition.

tfamily \texttt{double zero} density(<double(3)> positionSpherical\rightarrow, <componentType> \rightarrow, <massType> \rightarrow, <weightBy> \rightarrow, <integer> \rightarrow, \texttt{logical} \rightarrow) Compute the density.

tfamily \texttt{void} deserializeRates(<double(:)> array\leftarrow) Deserialize the evolvable rates from an array.

tfamily \texttt{void} deserializeScales(<double(:)> array\leftarrow) Deserialize the evolvable scales from an array.

tfamily \texttt{void} deserializeValues(<double(:)> array\leftarrow) Deserialize the evolvable quantities from an array.

tfamily \texttt{void} destroy() Destroy the object.

tfamily \texttt{void} dump() Generate an ASCII dump of all properties.

tfamily \texttt{void} dumpRaw(<integer> fileHandle\rightarrow) Generate a binary dump of all properties.

tfamily \texttt{void} dumpXML() Generate an XML dump of all properties.

tfamily \texttt{double zero} enclosedMass(<double> radius\rightarrow, <componentType> \rightarrow, <massType> \rightarrow, <weightBy> \rightarrow, <integer> \rightarrow, \texttt{logical} \rightarrow) Compute the mass enclosed within a radius.
tfamily `{textcolor{red}{\textless type(treeNode)\textgreater}} host() Return a pointer to the host
  treeNode object.

tfamily `{textcolor{red}{\textless type(abundances)\textgreater}} hostHaloCoolingAbundancesRate(value) Cumulate to the rate of the
galacticus\text{hotHaloCoolingAbundances} property of the hotHalo component.

tfamily `{textcolor{red}{\textless double\textgreater}} hostHaloCoolingAngularMomentumRate(value) Cumulate to the rate of the
galacticus\text{hotHaloCoolingAngularMomentum} property of the hotHalo component.

tfamily `{textcolor{red}{\textless double\textgreater}} hostHaloCoolingMassRate(value) Cumulate to the rate of the galacticus\text{hotHaloCoolingMass} property of the hotHalo component.

tfamily initialize() Initialize the object.

tfamily nameFromIndex(count →, name ←) Return the name of a property given is index.

tfamily logicalzero nullIsActive() Return whether the null implementation of the darkMatterProfile component class is active.

tfamily odeStepRatesInitialize() Initialize rates for evolvable properties.

```
tfamily odeStepScalesInitialize() Initialize scales for evolvable properties.
```

tfamily output(integer integerProperty ↔, integerBufferCount ↔, doubleBuffer ↔,
  integerProperty count →, integerBufferCount →, doubleBuffer →, double time →, instance →) Generate values of outputtable properties.

```
tfamily outputCount(integer integerPropertyCount ↔, doublePropertyCount ↔,
  double time →, instance →) Compute a count of outputtable properties.
```

```
tfamily outputNames(integerProperty ↔, integerPropertyNames ↔, integerPropertyComments ↔,
  integerPropertyUnitsSI ↔, doubleProperty ↔, doublePropertyNames ↔, doublePropertyComments ↔,
  doublePropertyUnitsSI ↔, double time →, instance →) Generate names of outputtable properties.
```

```
tfamily double potential(radius →, componentType [componentType] →, massType [massType] →, logical [haloLoaded] →) Compute the gravitational potential.
```

```
tfamily readRaw(fileHandle →) Read a binary dump of the nodeComponent from the
given fileHandle.
```

```
tfamily double rotationCurve(radius →, componentType [componentType] →, massType [massType] →, logical [haloLoaded] →) Compute the rotation curve.
```

```
tfamily double rotationCurveGradient(radius →, componentType [componentType] →, massType [massType] →, logical [haloLoaded] →) Compute the rotation curve gradient.
```

```
tfamily `{textcolor{red}{\textless double\textgreater}} scale() Get the scale property of the darkMatterProfile component.
```

```
tfamily `{textcolor{red}{\textless type(varying_string)\textgreater}} scaleAttributeMatch(requireGettable →, requireSettable →, requireEvolvable →) Return a list of implementations that
  provide the given list off attributes for the scale property of the darkMatterProfile component.
```
16.5. Objects

tfamily intzero scaleCount() Compute the count of evolvable quantities in the scale property of the
DarkMatterProfileScale component.

tfamily void scaleFunction(<function()> deferredFunction) Set the function to be used for the get
method of the scale property of the DarkMatterProfileScale component.

tfamily textcolor{red}{\textless double\textgreater} scaleGrowthRate() Get the scaleGrowthRate
property of the DarkMatterProfile component.

tfamily textcolor{red}{\textless type(varying\_string)(:)} scaleGrowthRateAttributeMatch(<logical>|requireGettable|→, <logical>|requireSettable|→, <logical>|requireEvolvable|→) Return a list of implementations that provide the given list of attributes for the scaleGrowthRate
property of the darkMatterProfile component.

tfamily textcolor{red}{\textless double\textgreater} scaleGrowthRateIsGettable() Get the scaleGrowthRateIsGettable() Get the scaleGrowthRate
property of the darkMatterProfile component.

tfamily logicalzero scaleGrowthRateIsSettable() Specify whether the scaleGrowthRate property of the
darkMatterProfile component is settable.

tfamily void scaleGrowthRateSet(<double> value) Set the scaleGrowthRate property of the darkMatterProfile
component.

tfamily logicalzero scaleIsActive() Return whether the scale implementation of the darkMatterProfile
component class is active.

tfamily logicalzero scaleIsAttached() Return whether the get method of the scale property of the
DarkMatterProfileScale component has been attached to a function.

tfamily textcolor{red}{\textless double\textgreater} scaleIsGettable() Get the scale property of the
darkMatterProfile component.

tfamily logicalzero scaleIsSettable() Specify whether the scale property of the darkMatterProfile
component is settable.

tfamily logicalzero scalePresetIsActive() Return whether the scalePreset implementation of the darkMatterProfile component class is active.

tfamily void scaleRate(<double> value) Cumulate to the rate of the scale property of the DarkMatterProfileScale
component.

tfamily void scaleScale(<double> value) Set the scale of the scale property of the DarkMatterProfileScale
component.

tfamily void scaleSet(<double> value) Set the scale property of the darkMatterProfile component.

tfamily logicalzero scaleShapeIsActive() Return whether the scaleShape implementation of the darkMatterProfile component class is active.

tfamily textcolor{red}{\textless double\textgreater} scaleValue() Get the scale property of the darkMatterProfile
component.

tfamily intzero serializeCount() Return a count of the number of evolvable quantities to be evolved.

tfamily void serializeRates(<double(:)> array→) Serialize the evolvable rates to an array.
tfamily \void serializeScales(\texttt{<double(:)> array}) Serialize the evolvable scales to an array.

tfamily \void serializeValues(\texttt{<double(:)> array}) Serialize the evolvable quantities to an array.

tfamily \textcolor{red}{\textless \texttt{double\textgreater}} \texttt{shape()} Get the \texttt{shape} property of the \texttt{darkMatterProfile} component.

tfamily \textcolor{red}{\textless \texttt{type(varying\_string):\textgreater}} \texttt{shapeAttributeMatch(\texttt{<logical>[requireGettable]→, \texttt{<logical>[requireSettable]→, \texttt{<logical>[requireEvolvable]→)}})} Return a list of implementations that provide the given list of attributes for the \texttt{shape} property of the \texttt{darkMatterProfile} component.

tfamily \intzero \texttt{shapeCount()} Compute the count of evolvable quantities in the \texttt{shape} property of the \texttt{DarkMatterProfileScaleShape} component.

tfamily \textcolor{red}{\textless \texttt{double\textgreater}} \texttt{shapeGrowthRate()} Get the \texttt{shapeGrowthRate} property of the \texttt{darkMatterProfile} component.

tfamily \textcolor{red}{\textless \texttt{type(varying\_string):\textgreater}} \texttt{shapeGrowthRateAttributeMatch(\texttt{<logical>[requireGettable]→, \texttt{<logical>[requireSettable]→, \texttt{<logical>[requireEvolvable]→)}})} Return a list of implementations that provide the given list of attributes for the \texttt{shapeGrowthRate} property of the \texttt{darkMatterProfile} component.

tfamily \textcolor{red}{\textless \texttt{double\textgreater}} \texttt{shapeGrowthRateIsGettable()} Get the \texttt{shapeGrowthRate} property of the \texttt{darkMatterProfile} component.

tfamily \logicalzero \texttt{shapeGrowthRateIsSettable()} Specify whether the \texttt{shapeGrowthRate} property of the \texttt{darkMatterProfile} component is settable.

tfamily \void \texttt{shapeGrowthRateSet(\texttt{<double> value})} Set the \texttt{shapeGrowthRate} property of the \texttt{darkMatterProfile} component.

tfamily \textcolor{red}{\textless \texttt{double\textgreater}} \texttt{shapeIsGettable()} Get the \texttt{shape} property of the \texttt{darkMatterProfile} component.

tfamily \logicalzero \texttt{shapeIsSettable()} Specify whether the \texttt{shape} property of the \texttt{darkMatterProfile} component is settable.

tfamily \void \texttt{shapeRate(\texttt{<double> value})} Cumulate to the rate of the \texttt{shape} property of the \texttt{DarkMatterProfileScaleShape} component.

tfamily \void \texttt{shapeScale(\texttt{<double> value})} Set the scale of the \texttt{shape} property of the \texttt{DarkMatterProfileScaleShape} component.

tfamily \void \texttt{shapeSet(\texttt{<double> value})} Set the \texttt{shape} property of the \texttt{darkMatterProfile} component.

tfamily \doublezero \texttt{surfaceDensity(\texttt{<double(3)> positionCylindrical→, \texttt{<componentType>[componentType]→, \texttt{<massType>[massType]→, \texttt{<weightBy>[weightBy]→, \texttt{<integer>[weightIndex]→, \texttt{<logical>[haloLoaded]→)}})}})} Compute the surface density.

tfamily \textcolor{red}{\textless \texttt{type(varying\_string):\textgreater}} \texttt{type()} Return the type of this object.
16.5. Objects

tfamily nodeComponentDisk

tfamily \textcolor{red}{\textless type(\textless double\textgreater)\textgreater} angularMomentum() Get the angularMomentum property of the disk component.

tfamily \textcolor{red}{\textless type(\textless double\textgreater)\textgreater} abundancesStellar() Get the abundancesStellar property of the disk component.

tfamily \textcolor{red}{\textless type(varying\_string)()\textgreater} abundancesStellarAttributeMatch(<logical>[requireGettable]→, <logical>[requireSettable]→, <logical>[requireEvolvable]→) Return a list of implementations that provide the given list of attributes for the abundancesStellar property of the disk component.

tfamily \intzero abundancesStellarCount() Compute the count of evolvable quantities in the abundancesStellar property of the DiskExponential component.

tfamily \textcolor{red}{\textless type(\textless double\textgreater)\textgreater} abundancesStellarIsGettable() Get the abundancesStellar property of the disk component.

tfamily \logicalzero abundancesStellarIsSettable() Specify whether the abundancesStellar property of the disk component is settable.

tfamily \void abundancesStellarRate(<type(abundances)> value) Cumulate to the rate of the abundancesStellar property of the DiskExponential component.

tfamily \void abundancesStellarScale(<type(abundances)> value) Set the scale of the abundancesStellar property of the DiskExponential component.

tfamily \void abundancesStellarSet(<type(abundances)> value) Set the abundancesStellar property of the disk component.

tfamily \textcolor{red}{\textless type(abundances)\textgreater} abundancesStellar() Get the abundancesStellar property of the disk component.

tfamily \textcolor{red}{\textless type(varying\_string)()\textgreater} abundancesStellarAttributeMatch(<logical>[requireGettable]→, <logical>[requireSettable]→, <logical>[requireEvolvable]→) Return a list of implementations that provide the given list of attributes for the abundancesStellar property of the disk component.

tfamily \intzero abundancesStellarCount() Compute the count of evolvable quantities in the abundancesStellar property of the DiskExponential component.

tfamily \textcolor{red}{\textless type(\textless double\textgreater)\textgreater} abundancesStellarIsGettable() Get the abundancesStellar property of the disk component.

tfamily \logicalzero abundancesStellarIsSettable() Specify whether the abundancesStellar property of the disk component is settable.

tfamily \void abundancesStellarRate(<type(abundances)> value) Cumulate to the rate of the abundancesStellar property of the DiskExponential component.

tfamily \void abundancesStellarScale(<type(abundances)> value) Set the scale of the abundancesStellar property of the DiskExponential component.

tfamily \void abundancesStellarSet(<type(abundances)> value) Set the abundancesStellar property of the disk component.

tfamily \textcolor{red}{\textless type(abundances)\textgreater} abundancesGas() Get the abundancesGas property of the disk component.

tfamily \textcolor{red}{\textless type(varying\_string)()\textgreater} abundancesGasAttributeMatch(<logical>[requireGettable]→, <logical>[requireSettable]→, <logical>[requireEvolvable]→) Return a list of implementations that provide the given list of attributes for the abundancesGas property of the disk component.

tfamily \intzero abundancesGasCount() Compute the count of evolvable quantities in the abundancesGas property of the DiskExponential component.

tfamily \textcolor{red}{\textless type(\textless double\textgreater)\textgreater} abundancesGasIsGettable() Get the abundancesGas property of the disk component.

tfamily \logicalzero abundancesGasIsSettable() Specify whether the abundancesGas property of the disk component is settable.

tfamily \void abundancesGasRate(<type(abundances)> value) Cumulate to the rate of the abundancesGas property of the DiskExponential component.

tfamily \void abundancesGasScale(<type(abundances)> value) Set the scale of the abundancesGas property of the DiskExponential component.

tfamily \void abundancesGasSet(<type(abundances)> value) Set the abundancesGas property of the disk component.

tfamily \textcolor{red}{\textless type(abundances)\textgreater} abundancesGas() Get the abundancesGas property of the disk component.

tfamily \textcolor{red}{\textless type(varying\_string)()\textgreater} abundancesGasAttributeMatch(<logical>[requireGettable]→, <logical>[requireSettable]→, <logical>[requireEvolvable]→) Return a list of implementations that provide the given list of attributes for the abundancesGas property of the disk component.
tfamily \textcolor{red}{\{\textless double\textgreater\}} angularMomentumAttributeMatch(<logical>[requireGettable]→, <logical>[requireSettable]→, <logical>[requireEvolvable]→) Return a list of implementations that provide the given list of attributes for the angularMomentum property of the disk component.

tfamily \intzero angularMomentumCount() Compute the count of evolvable quantities in the angularMomentum property of the DiskExponential component.

tfamily \textcolor{red}{\{\textless double\textgreater\}} angularMomentumIsGettable() Get the angularMomentum property of the disk component.

tfamily \logicalzero angularMomentumIsSettable() Specify whether the angularMomentum property of the disk component is settable.

tfamily \void angularMomentumRate(<double> value) Cumulate to the rate of the angularMomentum property of the DiskExponential component.

tfamily \void angularMomentumScale(<double> value) Set the scale of the angularMomentum property of the DiskExponential component.

tfamily \void angularMomentumSet(<double> value) Set the angularMomentum property of the disk component.

tfamily \void builder(<\*type(node)>componentDefinition→) Build a nodeComponent from a supplied XML definition.

tfamily \doublezero density(<double(3)> positionSpherical→, <componentType>[componentType]→, <massType>[massType]→, <weightBy>[weightBy]→, <integer>[weightIndex]→, <logical>[haloLoaded]→) Compute the density.

tfamily \void deserializeRates(<double(:)> array←) Deserialize the evolvable rates from an array.

tfamily \void deserializeScales(<double(:)> array←) Deserialize the evolvable scales from an array.

tfamily \void deserializeValues(<double(:)> array←) Deserialize the evolvable quantities from an array.

tfamily \void destroy() Destroy the object.

tfamily \void dump() Generate an ASCII dump of all properties.

tfamily \void dumpRaw(<\integer> fileHandle→) Generate a binary dump of all properties.

tfamily \void dumpXML() Generate an XML dump of all properties.

tfamily \doublezero enclosedMass(<double> radius→, <componentType>[componentType]→, <massType>[massType]→, <weightBy>[weightBy]→, <integer>[weightIndex]→, <logical>[haloLoaded]→) Compute the mass enclosed within a radius.

tfamily \logicalzero exponentialIsActive() Return whether the exponential implementation of the disk component class is active.

tfamily \textcolor{red}{\{\textless double\textgreater\}} halfMassRadius() Get the halfMassRadius property of the disk component.

tfamily \textcolor{red}{\{\textless double\textgreater\}} halfMassRadiusAttributeMatch(<logical>[requireGettable]→, <logical>[requireSettable]→, <logical>[requireEvolvable]→) Return a list of implementations that provide the given list of attributes for the halfMassRadius property of the disk component.
16.5. Objects

tfamily \textcolor{red}{\textless double\textgreater} halfMassRadiusIsGettable() Get the halfMassRadius property of the disk component.

tfamily \textcolor{red}{\textless logical\textgreater} halfMassRadiusIsSettable() Specify whether the halfMassRadius property of the disk component is settable.

tfamily \textcolor{red}{\textless type(treeNode)\textgreater} host() Return a pointer to the host treeNode object.

tfamily \textcolor{red}{\textless logical\textgreater} isInitialized() Get the isInitialized property of the disk component.

tfamily \textcolor{red}{\textless type(varying\_string)(:)\textgreater} isInitializedAttributeMatch(<logical>[requireGettable]→, <logical>[requireSettable]→, <logical>[requireEvolvable]→) Return a list of implementations that provide the given list of attributes for the isInitialized property of the disk component.

tfamily \textcolor{red}{\textless logical\textgreater} isInitializedIsGettable() Get the isInitialized property of the disk component.

tfamily \textcolor{red}{\textless logical\textgreater} isInitializedIsSettable() Specify whether the isInitialized property of the disk component is settable.

tfamily \textcolor{red}{\textless logical\textgreater} isInitializedSet(<logical> value) Set the isInitialized property of the disk component.

tfamily \textcolor{red}{\textless type(stellarLuminosities)\textgreater} luminositiesStellar() Get the luminositiesStellar property of the disk component.

tfamily \textcolor{red}{\textless type(varying\_string)(:)\textgreater} luminositiesStellarAttributeMatch(<logical>[requireGettable]→, <logical>[requireSettable]→, <logical>[requireEvolvable]→) Return a list of implementations that provide the given list of attributes for the luminositiesStellar property of the disk component.

tfamily \intzero luminositiesStellarCount() Compute the count of evolvable quantities in the luminositiesStellar property of the DiskExponential component.

tfamily \textcolor{red}{\textless type(stellarLuminosities)\textgreater} luminositiesStellarIsGettable() Get the luminositiesStellar property of the disk component.

tfamily \textcolor{red}{\textless logical\textgreater} luminositiesStellarIsSettable() Specify whether the luminositiesStellar property of the disk component is settable.

tfamily \textcolor{red}{\textless type(stellarLuminosities)\textgreater} luminositiesStellarRate(<type(stellarLuminosities)> value) Cumulate to the rate of the luminositiesStellar property of the DiskExponential component.
16. Coding GALACTICUS

tfamily \ void luminositiesStellarScale(<type(stellarLuminosities)> value) Set the scale of the luminositiesStellar property of the DiskExponential component.

tfamily \ void luminositiesStellarSet(<type(stellarLuminosities)> value) Set the luminositiesStellar property of the disk component.

tfamily \textcolor{red}{\textless double\textgreater} massGas() Get the massGas property of the disk component.

tfamily \textcolor{red}{\textlesstype(varying\_string)(:)} massGasAttributeMatch(<logical>[requireGettable] → , <logical>[requireSettable] → , <logical>[requireEvolvable]→) Return a list of implementations that provide the given list off attributes for the massGas property of the disk component

tfamily \intzero massGasCount() Compute the count of evolvable quantities in the massGas property of the DiskExponential component.

tfamily \textcolor{red}{\textless double\textgreater} massGasGettable() Get the massGas property of the disk component.

tfamily \logicalzero massGasIsSettable() Specify whether the massGas property of the disk component is settable.

tfamily \ void massGasRate(<double> value) Cumulate to the rate of the massGas property of the DiskExponential component.

tfamily \ void massGasScale(<double> value) Set the scale of the massGas property of the DiskExponential component.

tfamily \ void massGasSet(<double> value) Set the massGas property of the disk component.

tfamily \textcolor{red}{\textless double\textgreater} massStellar() Get the massStellar property of the disk component.

tfamily \textcolor{red}{\textlesstype(varying\_string)(:)} massStellarAttributeMatch(<logical>[requireGettable] → , <logical>[requireSettable] → , <logical>[requireEvolvable]→) Return a list of implementations that provide the given list off attributes for the massStellar property of the disk component

tfamily \intzero massStellarCount() Compute the count of evolvable quantities in the massStellar property of the DiskExponential component.

tfamily \textcolor{red}{\textless double\textgreater} massStellarGettable() Get the massStellar property of the disk component.

tfamily \logicalzero massStellarIsSettable() Specify whether the massStellar property of the disk component is settable.

tfamily \ void massStellarRate(<double> value) Cumulate to the rate of the massStellar property of the DiskExponential component.

tfamily \ void massStellarScale(<double> value) Set the scale of the massStellar property of the DiskExponential component.

tfamily \ void massStellarSet(<double> value) Set the massStellar property of the disk component.

tfamily \ void nameFromIndex(<integer> count→, <varying_string>name←) Return the name of a property given is index.
logicalzero nullIsActive() Return whether the null implementation of the disk component class is active.

tfamily \void odeStepRatesInitialize() Initialize rates for evolvable properties.

tfamily \void odeStepScalesInitialize() Initialize scales for evolvable properties.

tfamily \void output(<integer> integerProperty, <integer> integerBufferCount, <integer> integerBuffer, <integer> doubleProperty, <integer> doubleBufferCount, <double> doubleBuffer, <double> time, <integer> instance) Generate values of outputtable properties.

tfamily \void outputCount(<integer> integerPropertyCount, <integer> doublePropertyCount, <double> time, <integer> instance) Compute a count of outputtable properties.

tfamily \void outputNames(<integer> integerProperty, <char> integerPropertyNames, <char> integerPropertyComments, <double> integerPropertyUnitsSI, <integer> doubleProperty, <char> doublePropertyNames, <char> doublePropertyComments, <double> doublePropertyUnitsSI, <double> time, <integer> instance) Generate names of outputtable properties.

doublezeropotential(<double> radius, <componentType> componentType, <massType> massType, <logical> haloLoaded) Compute the gravitational potential.

textcolor{red}{\textless double\textgreater} radius() Get the radius property of the disk component.

textcolor{red}{\textless varying\_string\(\rangle\)textgreater} radiusAttributeMatch(<logical> requireGettable, <logical> requireSettable, <logical> requireEvolvable) Return a list of implementations that provide the given list off attributes for the radius property of the disk component.

textcolor{red}{\textless double\textgreater} radiusIsGettable() Get the radius property of the disk component.

logicalzero radiusIsSettable() Specify whether the radius property of the disk component is settable.

tfamily \void radiusSet(<double> value) Set the radius property of the disk component.

doublezerorotationCurve(<double> radius, <componentType> componentType, <massType> massType, <logical> haloLoaded) Compute the rotation curve.

doublezerorotationCurveGradient(<double> radius, <componentType> componentType, <massType> massType, <logical> haloLoaded) Compute the rotation curve gradient.

intzero serializeCount() Return a count of the number of evolvable quantities to be evolved.

tfamily \void serializeRates(<double> array) Serialize the evolvable rates to an array.

tfamily \void serializeScales(<double> array) Serialize the evolvable scales to an array.

tfamily \void serializeValues(<double> array) Serialize the evolvable quantities to an array.

starFormationHistory() Get the starFormationHistory property of the disk component.
16. Coding GALACTICUS

tfamily \textcolor{red}{\textless textless type(varying \_string):\textgreater} starFormationHistoryAttributeM-
atch(<logical>[requireGettable] →, <logical>[requireSettable] →, <logical>[requireEvolvable] →) Re-
turn a list of implementations that provide the given list off attributes for the starFormationHistory
property of the disk component.

tfamily \intzerostarFormationHistoryCount() Compute the count of evolvable quantities in the starFormationHistory
property of the DiskExponential component.

tfamily \textcolor{red}{\textless textless type(history):\textgreater} starFormationHistoryIsGettable() Get the starFormationHistory
property of the disk component.

tfamily \logicalzero starFormationHistoryIsSettable() Specify whether the starFormationHistory property
of the disk component is settable.

tfamily \void starFormationHistoryRate(<type(history)> value) Cumulate to the rate of the starFormationHistory
property of the DiskExponential component.

tfamily \void starFormationHistoryScale(<type(history)> value) Set the scale of the starFormationHistory
property of the DiskExponential component.

tfamily \void starFormationHistorySet(<type(history)> value) Set the starFormationHistory property
of the disk component.

tfamily \textcolor{red}{\textless double\textgreater} starFormationRate() Get the starFormationRate
property of the disk component.

tfamily \textcolor{red}{\textless textless type(varying \_string):\textgreater} starFormationRateAttributeM-
atch(<logical>[requireGettable] →, <logical>[requireSettable] →, <logical>[requireEvolvable] →) Re-
turn a list of implementations that provide the given list off attributes for the starFormationRate
property of the disk component.

tfamily \intzerostarFormationRateCount() Compute the count of evolvable quantities in the starFormationRate
property of the DiskExponential component.

tfamily \textcolor{red}{\textless textless type(history):\textgreater} starFormationRateIsGettable() Get the starFormationRate
property of the disk component.

tfamily \logicalzero starFormationRateIsSettable() Specify whether the starFormationRate property
of the disk component is settable.

tfamily \void starFormationRateRate(<type(history)> value) Cumulate to the rate of the starFormationRate
property of the DiskExponential component.

tfamily \void starFormationRateScale(<type(history)> value) Set the scale of the starFormationRate
property of the DiskExponential component.

tfamily \void starFormationRateSet(<type(history)> value) Set the starFormationRate property
of the disk component.

tfamily \textcolor{red}{\textless type(history):\textgreater} stellarPropertiesHistory() Get the stellarPropertiesHistory
property of the disk component.

tfamily \textcolor{red}{\textless textless type(varying \_string):\textgreater} stellarPropertiesHistoryAttributeM-
atch(<logical>[requireGettable] →, <logical>[requireSettable] →, <logical>[requireEvolvable] →) Re-
turn a list of implementations that provide the given list off attributes for the stellarPropertiesHistory
property of the disk component.

tfamily \intzerostellarPropertiesHistoryCount() Compute the count of evolvable quantities in the stellarPropertiesHistory
property of the DiskExponential component.

tfamily \textcolor{red}{\textless textless type(history):\textgreater} stellarPropertiesHistoryIsGettable() Get the stellarPropertiesHistory
property of the disk component.

tfamily \logicalzero stellarPropertiesHistoryIsSettable() Specify whether the stellarPropertiesHistory
property of the disk component is settable.

tfamily \void stellarPropertiesHistoryRate(<type(history)> value) Cumulate to the rate of the stellarPropertiesHistory
property of the DiskExponential component.
tfamily \void stellarPropertiesHistoryScale(<type(history)> value) Set the scale of the stellarPropertiesHistory property of the DiskExponential component.

tfamily \void stellarPropertiesHistorySet(<type(history)> value) Set the stellarPropertiesHistory property of the disk component.

tfamily \double zero surfaceDensity(<double(3)> positionCylindrical→, <componentType> [componentType]→, <massType> [massType]→, <weightBy> [weightBy]→, <integer> [weightIndex]→, <logical> [haloLoaded]→) Compute the surface density.

tfamily \textcolor{red}{\textless type(varying\_string)\textgreater} type() Return the type of this object.

ntfamily \textcolor{red}{\textless double\textgreater} velocity() Get the velocity property of the disk component.

tfamily \textcolor{red}{\textless type(varying\_string):(\:)\textgreater} velocityAttributeMatch(<logical>[requireGettable]→, <logical>[requireSettable]→, <logical>[requireEvolvable]→) Return a list of implementations that provide the given list of attributes for the velocity property of the disk component.

tfamily \textcolor{red}{\textless double\textgreater} velocityIsGettable() Get the velocity property of the disk component.

tfamily \logical zero velocityIsSettable() Specify whether the velocity property of the disk component is settable.

tfamily \void velocitySet(<double> value) Set the velocity property of the disk component.

tfamily \logical zero verySimpleIsActive() Return whether the verySimple implementation of the disk component class is active.

ntfamily nodeComponentDiskExponential

tfamily \textcolor{red}{\textless type(abundances)\textgreater} abundancesGas() Get the abundancesGas property of the disk component.

tfamily \textcolor{red}{\textless type(abundances):(\:)\textgreater} abundancesGasAttributeMatch(<logical>[requireGettable]→, <logical>[requireSettable]→, <logical>[requireEvolvable]→) Return a list of implementations that provide the given list of attributes for the abundancesGas property of the disk component.

tfamily \int zero abundancesGasCount() Compute the count of evolvable quantities in the abundancesGas property of the DiskExponential component.

tfamily \textcolor{red}{\textless type(abundances)\textgreater} abundancesGasIsGettable() Get the abundancesGas property of the disk component.

tfamily \logical zero abundancesGasIsSettable() Specify whether the abundancesGas property of the disk component is settable.

tfamily \void abundancesGasRate(<type(abundances)> value) Cumulate to the rate of the abundancesGas property of the DiskExponential component.

tfamily \void abundancesGasScale(<type(abundances)> value) Set the scale of the abundancesGas property of the DiskExponential component.
16. Coding Galacticus

tfamily \void abundancesGasSet(<\textsf{type(abundances)}>) value Set the abundancesGas property of the disk component.

tfamily \textcolor{red}{\less than \textsf{type(abundances)}} \textgreater \ abundancesStellar() Get the abundancesStellar property of the disk component.

tfamily \textcolor{red}{\textless \textsf{type(varying\string)}(::)} \textgreater \ abundancesStellarAttributeMatch(<\textsf{logical}>[\textsf{requireGettable}]\rightarrow, <\textsf{logical}>[\textsf{requireSettable}]\rightarrow, <\textsf{logical}>[\textsf{requireEvolvable}]\rightarrow) Return a list of implementations that provide the given list of attributes for the abundancesStellar property of the disk component.

tfamily \intzero abundancesStellarCount() Compute the count of evolvable quantities in the abundancesStellar property of the DiskExponential component.

tfamily \textcolor{red}{\textless \textsf{double}} \textgreater \ abundancesStellarIsGettable() Get the abundancesStellar property of the disk component.

tfamily \logicalzero abundancesStellarIsSettable() Specify whether the abundancesStellar property of the disk component is settable.

tfamily \void abundancesStellarRate(<\textsf{type(abundances)}>) value Cumulate to the rate of the abundancesStellar property of the DiskExponential component.

tfamily \void abundancesStellarScale(<\textsf{type(abundances)}>) value Set the scale of the abundancesStellar property of the DiskExponential component.

tfamily \void abundancesStellarSet(<\textsf{type(abundances)}>) value Set the abundancesStellar property of the disk component.

tfamily \textcolor{red}{\textless \textsf{double}} \textgreater \ angularMomentum() Get the angularMomentum property of the disk component.

tfamily \textcolor{red}{\textless \textsf{type(varying\string)}(::)} \textgreater \ angularMomentumAttributeMatch(<\textsf{logical}>[\textsf{requireGettable}]\rightarrow, <\textsf{logical}>[\textsf{requireSettable}]\rightarrow, <\textsf{logical}>[\textsf{requireEvolvable}]\rightarrow) Return a list of implementations that provide the given list of attributes for the angularMomentum property of the disk component.

tfamily \intzero angularMomentumCount() Compute the count of evolvable quantities in the angularMomentum property of the DiskExponential component.

tfamily \textcolor{red}{\textless \textsf{double}} \textgreater \ angularMomentumIsGettable() Get the angularMomentum property of the disk component.

tfamily \logicalzero angularMomentumIsSettable() Specify whether the angularMomentum property of the disk component is settable.

tfamily \void angularMomentumRate(<\textsf{double}>) value Cumulate to the rate of the angularMomentum property of the DiskExponential component.

tfamily \void angularMomentumScale(<\textsf{double}>) value Set the scale of the angularMomentum property of the DiskExponential component.

tfamily \void angularMomentumSet(<\textsf{double}>) value Set the angularMomentum property of the disk component.

tfamily \void attachPipes() Attach pipes to the exponential disk component.
16.5. Objects

tfamily void builder(<*type(node)>componentDefinition→) Build a nodeComponent from a supplied XML definition.

tfamily double zero density(<double(3)> positionSpherical→, <componentType> [componentType]→, <massType> [massType]→, <weightBy> [weightBy]→, <integer> [weightIndex]→, <logical> [haloLoaded]→) Compute the density.

tfamily void deserializeRates(<double(:)> array←) Deserialize the evolvable rates from an array.

tfamily void deserializeScales(<double(:)> array←) Deserialize the evolvable scales from an array.

tfamily void deserializeValues(<double(:)> array←) Deserialize the evolvable quantities from an array.

tfamily void destroy() Destroy the object.

tfamily void dump() Generate an ASCII dump of all properties.

tfamily void dumpRaw(<integer> fileHandle→) Generate a binary dump of all properties.

tfamily void dumpXML() Generate an XML dump of all properties.

tfamily double zero enclosedMass(<double> radius→, <componentType> [componentType]→, <massType> [massType]→, <weightBy> [weightBy]→, <integer> [weightIndex]→, <logical> [haloLoaded]→) Compute the mass enclosed within a radius.

tfamily logical zero exponentialIsActive() Return whether the exponential implementation of the disk component class is active.

tfamily textcolor{red}{	extless double\textgreater} halfMassRadius() Get the halfMassRadius property of the disk component.

tfamily textcolor{red}{	extless type(varying\_string)(:)}\textgreater halfMassRadiusAttributeMatch(<logical>[requireGettable]→, <logical>[requireSettable]→, <logical>[requireEvolvable]→) Return a list of implementations that provide the given list of attributes for the halfMassRadius property of the disk component.

tfamily textcolor{red}{	extless double\textgreater} halfMassRadiusIsGettable() Get the halfMassRadius property of the disk component.

tfamily logical zero halfMassRadiusIsSettable() Specify whether the halfMassRadius property of the disk component is settable.

tfamily textcolor{red}{	extless *type(treeNode)\textgreater} host() Return a pointer to the host treeNode object.

tfamily void hotHaloCoolingAbundancesRate(<type(abundances)> value) Cumulate to the rate of the hotHaloCoolingAbundances property of the hotHalo component.

tfamily void hotHaloCoolingAngularMomentumRate(<double> value) Cumulate to the rate of the hotHaloCoolingAngularMomentum property of the hotHalo component.

tfamily void hotHaloCoolingMassRate(<double> value) Cumulate to the rate of the hotHaloCoolingMass property of the hotHalo component.

tfamily void initialize() Initialize the object.

tfamily textcolor{red}{	extless logical\textgreater} isInitialized() Get the isInitialized property of the disk component.
16. Coding GALACTICUS

tfamily {textcolor{red}{\textless textless type(varying \_ string)(::):textgreater}} isInitializedAttributeMatch(<logical>|requireGettable→, <logical>|requireSettable→, <logical>|requireEvolvable→) Return a list of implementations that provide the given list of attributes for the isInitialized property of the disk component.

tfamily isInitializedIsGettable() Get the isInitialized property of the disk component.

tfamily {logicalzero} isInitializedIsSettable() Specify whether the isInitialized property of the disk component is settable.

tfamily {void} isInitializedSet(<logical> value) Set the isInitialized property of the disk component.

tfamily {textless type(stellarLuminosities):textgreater} luminositiesStellar() Get the luminositiesStellar property of the disk component.

tfamily luminositiesStellarAttributeMatch(<logical>|requireGettable→, <logical>|requireSettable→, <logical>|requireEvolvable→) Return a list of implementations that provide the given list of attributes for the luminositiesStellar property of the disk component.

tfamily {intzero} luminositiesStellarCount() Compute the count of evolvable quantities in the luminositiesStellar property of the DiskExponential component.

tfamily {textless type(stellarLuminosities):textgreater} luminositiesStellarIsGettable() Get the luminositiesStellar property of the disk component.

tfamily {logicalzero} luminositiesStellarIsSettable() Specify whether the luminositiesStellar property of the disk component is settable.

tfamily {void} luminositiesStellarRate(<type(stellarLuminosities)> value) Cumulate to the rate of the luminositiesStellar property of the DiskExponential component.

tfamily {void} luminositiesStellarScale(<type(stellarLuminosities)> value) Set the scale of the luminositiesStellar property of the DiskExponential component.

tfamily {void} luminositiesStellarSet(<type(stellarLuminosities)> value) Set the luminositiesStellar property of the disk component.

tfamily {textcolor{red}{\textless double:textgreater}} massGas() Get the massGas property of the disk component.

tfamily massGasAttributeMatch(<logical>|requireGettable→, <logical>|requireSettable→, <logical>|requireEvolvable→) Return a list of implementations that provide the given list of attributes for the massGas property of the disk component.

tfamily {intzero} massGasCount() Compute the count of evolvable quantities in the massGas property of the DiskExponential component.

tfamily {textless double:textgreater} massGasIsGettable() Get the massGas property of the disk component.

tfamily {logicalzero} massGasIsSettable() Specify whether the massGas property of the disk component is settable.

tfamily {void} massGasRate(<double> value) Cumulate to the rate of the massGas property of the DiskExponential component.
tfamily
  \textcolor{red}{\textgreater \textless \textgreater} massGasScale(<\text{double}>) Set the scale of the massGas property of the DiskExponential component.

tfamily
  \textcolor{red}{\textgreater \textless \textgreater} massGasSet(<\text{double}>) Set the massGas property of the disk component.

tfamily
  \textcolor{red}{\textless \textgreater} massStellar() Get the massStellar property of the disk component.

tfamily
  \textcolor{red}{\textless \textgreater \textless \textgreater} massStellarAttributeMatch(<\text{logical}>)\texttt{[requireGettable]} →, <\text{logical}>)\texttt{[requireSettable]} →, <\text{logical}>)\texttt{[requireEvolvable]} →) Return a list of implementations that provide the given list off attributes for the massStellar property of the disk component.

tfamily
  \textcolor{red}{\textless \textgreater \textless \textgreater} massStellarCount() Compute the count of evolvable quantities in the massStellar property of the DiskExponential component.

tfamily
  \textcolor{red}{\textless \textgreater \textless \textgreater} massStellarIsGettable() Get the massStellar property of the disk component.

tfamily
  \logical\textcolor{red}{\textless \textgreater \textless \textgreater} massStellarIsSettable() Specify whether the massStellar property of the disk component is settable.

tfamily
  \textcolor{red}{\textless \textgreater \textless \textgreater} massStellarRate(<\text{double}>) Cumulate to the rate of the massStellar property of the DiskExponential component.

tfamily
  \textcolor{red}{\textless \textgreater \textless \textgreater} massStellarScale(<\text{double}>) Set the scale of the massStellar property of the DiskExponential component.

tfamily
  \textcolor{red}{\textless \textgreater \textless \textgreater} massStellarSet(<\text{double}>) Set the massStellar property of the disk component.

tfamily
  \textcolor{red}{\textless \textgreater \textless \textgreater} nameFromIndex(<\text{integer}>)\texttt{[count]} →, <\text{varying\_string}>\texttt{name}←) Return the name of a property given is index.

tfamily
  \logical\textcolor{red}{\textless \textgreater \textless \textgreater} nullIsActive() Return whether the null implementation of the disk component class is active.

tfamily
  \textcolor{red}{\textless \textgreater \textless \textgreater} odeStepRatesInitialize() Initialize rates for evolvable properties.

tfamily
  \textcolor{red}{\textless \textgreater \textless \textgreater} odeStepScalesInitialize() Initialize scales for evolvable properties.

tfamily
  \textcolor{red}{\textless \textgreater \textless \textgreater} output(<\text{integer}>)\texttt{[integerProperty]} →, <\text{integer}>\texttt{[integerBufferCount]}→, <\text{integer}>)\texttt{[integerBuffer]} ↔, <\text{integer}>)\texttt{[doubleProperty]} →, <\text{integer}>\texttt{[doubleBufferCount]}→, <\text{double}>)\texttt{[doubleBuffer]} ↔, <\text{integer}>)\texttt{[time]} →, <\text{integer}>)\texttt{[instance]}→) Generate values of outputtable properties.

tfamily
  \textcolor{red}{\textless \textgreater \textless \textgreater} outputCount(<\text{integer}>)\texttt{[integerPropertyCount]}→, <\text{integer}>\texttt{[doublePropertyCount]}→, <\text{double}>)\texttt{[time]} →, <\text{integer}>)\texttt{[instance]}→) Compute a count of outputtable properties.

tfamily
  \textcolor{red}{\textless \textgreater \textless \textgreater} outputNames(<\text{integer}>)\texttt{[integerProperty]}→, <\text{char\[*\]}>\texttt{[integerPropertyNames]}→, <\text{char\[*\]]}>\texttt{[integerPropertyComments]}→, <\text{char\[*\]]}>\texttt{[integerPropertyUnits\_SI]}→, <\text{integer}>)\texttt{[doubleProperty]}→, <\text{char\[*\]}>\texttt{[doublePropertyNames]}→, <\text{char\[*\]]}>\texttt{[doublePropertyComments]}→, <\text{char\[*\]]}>\texttt{[doublePropertyUnits\_SI]}→, <\text{double}>)\texttt{[time]} →, <\text{integer}>)\texttt{[instance]}→) Generate names of outputtable properties.

tfamily
  \textcolor{red}{\textless \textgreater \textless \textgreater} potential(<\text{double}>)\texttt{[radius]} →, <\text{componentType}>\texttt{[componentType]} →, <\text{massType}>\texttt{[massType]} →, <\text{logical}>)\texttt{[halo\_loaded]} →) Compute the gravitational potential.
tfamily \textcolor{red}\{	extless double\textgreater\} radius() Get the \texttt{radius} property of the \texttt{disk} component.

tfamily \textcolor{red}\{\textless double\textgreater\} radiusAttributeMatch(<logical>[requireGettable]\rightarrow, <logical>[requireSettable]\rightarrow, <logical>[requireEvolvable]\rightarrow) Return a list of implementations that provide the given list of attributes for the \texttt{radius} property of the \texttt{disk} component.

tfamily \textcolor{red}\{\textless double\textgreater\} radiusIsGettable() Get the \texttt{radius} property of the \texttt{disk} component.

tfamily \textcolor{red}\{\textless double\textgreater\} radiusIsSettable() Specify whether the \texttt{radius} property of the \texttt{disk} component is settable.

tfamily \void radiusSet(<double> value) Set the \texttt{radius} property of the \texttt{disk} component.

tfamily \void readRaw(<integer> fileHandle\rightarrow) Read a binary dump of the \texttt{nodeComponent} from the given \texttt{fileHandle}.

tfamily \double zero rotationCurve(<double> radius\rightarrow, <componentType>[componentType]\rightarrow, <massType>[massType]\rightarrow, <logical>[haloLoaded]\rightarrow) Compute the rotation curve.

tfamily \double zero rotationCurveGradient(<double> radius\rightarrow, <componentType>[componentType]\rightarrow, <massType>[massType]\rightarrow, <logical>[haloLoaded]\rightarrow) Compute the rotation curve gradient.

tfamily \int zero serializeCount() Return a count of the number of evolvable quantities to be evolved.

tfamily \void serializeRates(<double(:)> array\rightarrow) Serialize the evolvable rates to an array.

tfamily \void serializeScales(<double(:)> array\rightarrow) Serialize the evolvable scales to an array.

tfamily \void serializeValues(<double(:)> array\rightarrow) Serialize the evolvable quantities to an array.

tfamily \textcolor{red}\{\textless type\textgreater\} starFormationHistory() Get the \texttt{starFormationHistory} property of the \texttt{disk} component.

tfamily \textcolor{red}\{\textless type\textgreater\} starFormationHistoryAttributeMatch(<logical>[requireGettable]\rightarrow, <logical>[requireSettable]\rightarrow, <logical>[requireEvolvable]\rightarrow) Return a list of implementations that provide the given list of attributes for the \texttt{starFormationHistory} property of the \texttt{disk} component.

tfamily \int zero starFormationHistoryCount() Compute the count of evolvable quantities in the \texttt{starFormationHistory} property of the \texttt{DiskExponential} component.

tfamily \textcolor{red}\{\textless type\textgreater\} starFormationHistoryIsGettable() Get the \texttt{starFormationHistory} property of the \texttt{disk} component.

tfamily \logical zero starFormationHistoryIsSettable() Specify whether the \texttt{starFormationHistory} property of the \texttt{disk} component is settable.

tfamily \void starFormationHistoryRate(<type\textgreater\text{history}> value) Cumulate to the rate of the \texttt{starFormationHistory} property of the \texttt{DiskExponential} component.

tfamily \void starFormationHistoryScale(<type\textgreater\text{history}> value) Set the scale of the \texttt{starFormationHistory} property of the \texttt{DiskExponential} component.

tfamily \void starFormationHistorySet(<type\textgreater\text{history}> value) Set the \texttt{starFormationHistory} property of the \texttt{disk} component.
16.5. Objects

tfamily \textcolor{red}{\textless double\textgreater} starFormationRate() Get the starFormationRate property of the disk component.

tfamily \textcolor{red}{\textless type(varying\_string):\textgreater} starFormationRateAttributeMatch(<logical>[requireGettable]\rightarrow, <logical>[requireSettable]\rightarrow, <logical>[requireEvolvable]\rightarrow) Return a list of implementations that provide the given list of attributes for the starFormationRate property of the disk component.

tfamily \void starFormationRateFunction(<function()> deferredFunction) Set the function to be used for the get method of the starFormationRate property of the DiskExponential component.

tfamily \logicalzero starFormationRateIsAttached() Return whether the get method of the starFormationRate property of the DiskExponential component has been attached to a function.

tfamily \textcolor{red}{\textless double\textgreater} starFormationRateIsGettable() Get the starFormationRate property of the disk component.

tfamily \logicalzero starFormationRateIsSettable() Specify whether the starFormationRate property of the disk component is settable.

tfamily \textcolor{red}{\textless type(history):\textgreater} stellarPropertiesHistory() Get the stellarPropertiesHistory property of the disk component.

tfamily \textcolor{red}{\textless type(varying\_string):\textgreater} stellarPropertiesHistoryAttributeMatch(<logical>[requireGettable]\rightarrow, <logical>[requireSettable]\rightarrow, <logical>[requireEvolvable]\rightarrow) Return a list of implementations that provide the given list of attributes for the stellarPropertiesHistory property of the disk component.

tfamily \intzero stellarPropertiesHistoryCount() Compute the count of evolvable quantities in the stellarPropertiesHistory property of the DiskExponential component.

tfamily \textcolor{red}{\textless type(history):\textgreater} stellarPropertiesHistoryIsGettable() Get the stellarPropertiesHistory property of the disk component.

tfamily \logicalzero stellarPropertiesHistoryIsSettable() Specify whether the stellarPropertiesHistory property of the disk component is settable.

tfamily \void stellarPropertiesHistoryRate(<type(history)> value) Cumulate to the rate of the stellarPropertiesHistory property of the DiskExponential component.

tfamily \void stellarPropertiesHistoryScale(<type(history)> value) Set the scale of the stellarPropertiesHistory property of the DiskExponential component.

tfamily \void stellarPropertiesHistorySet(<type(history)> value) Set the stellarPropertiesHistory property of the disk component.

tfamily \doublezero surfaceDensity(<double(3)> positionCylindrical\rightarrow, <componentType>[componentType]\rightarrow, <massType>[massType]\rightarrow, <weightBy>[weightBy]\rightarrow, <integer>[weightIndex]\rightarrow, <logical>[haloLoaded]\rightarrow) Compute the surface density.

tfamily \textcolor{red}{\textless type(varying\_string):\textgreater} type() Return the type of this object.

tfamily \textcolor{red}{\textless double\textgreater} velocity() Get the velocity property of the disk component.
16. Coding Galacticus

tfamily \textcolor{red}{\textless type(varying \_string)(:)\textgreater} velocityAttributeMatch(<\text{logical}>[requireGettable]→, <\text{logical}>[requireSettable]→, <\text{logical}>[requireEvolvable]→) Return a list of implementations that provide the given list off attributes for the velocity property of the disk component.

tfamily \textcolor{red}{\textless double\textgreater} velocityIsGettable() Get the velocity property of the disk component.

tfamily \textcolor{red}{\textless logical\textgreater} velocityIsSettable() Specify whether the velocity property of the disk component is settable.

tfamily \text{void} velocitySet(<double> value) Set the velocity property of the disk component.

tfamily \textcolor{red}{\textless logical\textgreater} verySimpleIsActive() Return whether the verySimple implementation of the disk component class is active.

tfamily nodeComponentDiskNull

tfamily \textcolor{red}{\textless type(\text{abundances})\textgreater} abundancesGas() Get the abundancesGas property of the disk component.

tfamily \textcolor{red}{\textless type(varying \_string)(:)\textgreater} abundancesGasAttributeMatch(<\text{logical}>[requireGettable]→, <\text{logical}>[requireSettable]→, <\text{logical}>[requireEvolvable]→) Return a list of implementations that provide the given list off attributes for the abundancesGas property of the disk component.

tfamily \text{int} zero abundancesGasCount() Compute the count of evolvable quantities in the abundancesGas property of the DiskExponential component.

tfamily \textcolor{red}{\textless type(\text{abundances})\textgreater} abundancesGasIsGettable() Get the abundancesGas property of the disk component.

tfamily \textcolor{red}{\textless logical\textgreater} abundancesGasIsSettable() Specify whether the abundancesGas property of the disk component is settable.

tfamily \text{void} abundancesGasRate(<\text{type(\text{abundances})}> value) Cumulate to the rate of the abundancesGas property of the DiskExponential component.

tfamily \text{void} abundancesGasScale(<\text{type(\text{abundances})}> value) Set the scale of the abundancesGas property of the DiskExponential component.

tfamily \text{void} abundancesGasSet(<\text{type(\text{abundances})}> value) Set the abundancesGas property of the disk component.

tfamily \textcolor{red}{\textless type(\text{abundances})\textgreater} abundancesStellar() Get the abundancesStellar property of the disk component.

tfamily \textcolor{red}{\textless type(varying \_string)(:)\textgreater} abundancesStellarAttributeMatch(<\text{logical}>[requireGettable]→, <\text{logical}>[requireSettable]→, <\text{logical}>[requireEvolvable]→) Return a list of implementations that provide the given list off attributes for the abundancesStellar property of the disk component.

tfamily \text{int} zero abundancesStellarCount() Compute the count of evolvable quantities in the abundancesStellar property of the DiskExponential component.

tfamily \textcolor{red}{\textless type(\text{abundances})\textgreater} abundancesStellarIsGettable() Get the abundancesStellar property of the disk component.
16.5. Objects

tfamily \logicalzero abundancesStellarIsSettable() Specify whether the abundancesStellar property of the disk component is settable.

tfamily \void abundancesStellarRate(<type(abundances)> value) Cumulate to the rate of the abundancesStellar property of the DiskExponential component.

tfamily \void abundancesStellarScale(<type(abundances)> value) Set the scale of the abundancesStellar property of the DiskExponential component.

tfamily \void abundancesStellarSet(<type(abundances)> value) Set the abundancesStellar property of the disk component.

tfamily \textcolor{red}{\textless double\textgreater} angularMomentum() Get the angularMomentum property of the disk component.

tfamily \textcolor{red}{\textless type(varying\_string)(:)}\textgreater angularMomentumAttributeMatch(<logical>[requireGettable→, <logical>[requireSettable→, <logical>[requireEvolvable→) Return a list of implementations that provide the given list of attributes for the angularMomentum property of the disk component.

tfamily \intzero angularMomentumCount() Compute the count of evolvable quantities in the angularMomentum property of the DiskExponential component.

tfamily \textcolor{red}{\textless double\textgreater} angularMomentumIsGettable() Get the angularMomentum property of the disk component.

tfamily \logicalzero angularMomentumIsSettable() Specify whether the angularMomentum property of the disk component is settable.

tfamily \void angularMomentumRate(<double> value) Cumulate to the rate of the angularMomentum property of the DiskExponential component.

tfamily \void angularMomentumScale(<double> value) Set the scale of the angularMomentum property of the DiskExponential component.

tfamily \void angularMomentumSet(<double> value) Set the angularMomentum property of the disk component.

tfamily \void builder(<*type(node)>componentDefinition→) Build a nodeComponent from a supplied XML definition.

tfamily \doublezero density(<double(3)> positionSpherical→, <componentType>[componentType→, <massType>[massType→, <weightBy>[weightBy→, <integer>[weightIndex→, <logical>[haloLoaded→) Compute the density.

tfamily \void deserializeRates(<double(:)> array←) Deserialize the evolvable rates from an array.

tfamily \void deserializeScales(<double(:)> array←) Deserialize the evolvable scales from an array.

tfamily \void deserializeValues(<double(:)> array←) Deserialize the evolvable quantities from an array.

tfamily \void destroy() Destroy the object.

tfamily \void dump() Generate an ASCII dump of all properties.

tfamily \void dumpRaw(<integer> fileHandle→) Generate a binary dump of all properties.
16. Coding GALACTICUS

tfamily void dumpXML() Generate an XML dump of all properties.

tfamily double zero enclosedMass(<double> radius→, <componentType> [componentType]→, <massType> [massType]→, <weightBy> [weightBy]→, <integer> [weightIndex]→, <logical> [haloLoaded]→) Compute the mass enclosed within a radius.

tfamily logical zero exponentialIsActive() Return whether the exponential implementation of the disk component class is active.

tfamily textcolor{red}{	extless double\textgreater} halfMassRadius() Get the halfMassRadius property of the disk component.

tfamily textcolor{red}{	extless logical\textgreater} halfMassRadiusIsGettable() Get the halfMassRadius property of the disk component.

tfamily logical zero halfMassRadiusIsSettable() Specify whether the halfMassRadius property of the disk component is settable.

tfamily textcolor{red}{	extless *type(treeNode)\textgreater} host() Return a pointer to the host TreeNode object.

tfamily void hotHaloCoolingAbundancesRate(<type(abundances)> value) Cumulate to the rate of the hotHaloCoolingAbundances property of the hotHalo component.

tfamily void hotHaloCoolingAngularMomentumRate(<double> value) Cumulate to the rate of the hotHaloCoolingAngularMomentum property of the hotHalo component.

tfamily void hotHaloCoolingMassRate(<double> value) Cumulate to the rate of the hotHaloCoolingMass property of the hotHalo component.

tfamily void initialize() Initialize the object.

tfamily textcolor{red}{	extless logical\textgreater} isInitialized() Get the isInitialized property of the disk component.

tfamily textcolor{red}{	extless logical\textgreater} isInitializedIsGettable() Get the isInitialized property of the disk component.

tfamily logical zero isInitializedIsSettable() Specify whether the isInitialized property of the disk component is settable.

tfamily void isInitializedSet(<logical> value) Set the isInitialized property of the disk component.

tfamily textcolor{red}{	extless type(stellarLuminosities)\textgreater} luminositiesStellar() Get the luminositiesStellar property of the disk component.
16.5. Objects

tfamily \textcolor{red}{\textless type(varying\_string)(:)}\textgreater luminositiesStellarAttributeMatch(<logical>[requireGettable] → , <logical>[requireSettable] → , <logical>[requireEvolvable]→) Return a list of implementations that provide the given list of attributes for the luminositiesStellar property of the disk component.

tfamily \textcolor{red}{\textless double\textgreater} massGas() Get the massGas property of the disk component.

tfamily \textcolor{red}{\textless double\textgreater} massStellar() Get the massStellar property of the disk component.

tfamily \textcolor{red}{\textlesstype(varying\_string)(:)}\textgreater massStellarAttributeMatch(<logical>[requireGettable] → , <logical>[requireSettable] → , <logical>[requireEvolvable]→) Return a list of implementations that provide the given list of attributes for the massStellar property of the disk component.

tfamily \intzero luminositiesStellarCount() Compute the count of evolvable quantities in the luminositiesStellar property of the DiskExponential component.

tfamily \textcolor{red}{\textless type(stellarLuminosities)\textgreater} luminositiesStellarIsGettable() Get the luminositiesStellar property of the disk component.

tfamily \textcolor{red}{\textless double\textgreater} massGasIsGettable() Get the massGas property of the disk component.

tfamily \textcolor{red}{\textlesstype(varying\_string)(:)}\textgreater massGasAttributeMatch(<logical>[requireGettable] → , <logical>[requireSettable] → , <logical>[requireEvolvable]→) Return a list of implementations that provide the given list of attributes for the massGas property of the disk component.

tfamily \intzero massGasCount() Compute the count of evolvable quantities in the massGas property of the DiskExponential component.

tfamily \textcolor{red}{\textless type(stellarLuminosities)\textgreater} luminositiesStellarIsSettable() Specify whether the luminositiesStellar property of the disk component is settable.

tfamily \textcolor{red}{\textless double\textgreater} massStellarIsGettable() Get the massStellar property of the disk component.

tfamily \textcolor{red}{\textlesstype(varying\_string)(:)}\textgreater massStellarAttributeMatch(<logical>[requireGettable] → , <logical>[requireSettable] → , <logical>[requireEvolvable]→) Return a list of implementations that provide the given list of attributes for the massStellar property of the disk component.

tfamily \intzero massStellarCount() Compute the count of evolvable quantities in the massStellar property of the DiskExponential component.

tfamily \textcolor{red}{\textlesstype(varying\_string)(:)}\textgreater massStellarAttributeMatch(<logical>[requireGettable] → , <logical>[requireSettable] → , <logical>[requireEvolvable]→) Return a list of implementations that provide the given list of attributes for the massStellar property of the disk component.

tfamily \intzero massStellarCount() Compute the count of evolvable quantities in the massStellar property of the DiskExponential component.
tfamily \textcolor{red}{\textless\textgreater} massStellarIsGettable() Get the \texttt{massStellar} property of the \texttt{disk} component.

tfamily \textcolor{red}{\textless\textgreater} massStellarIsSettable() Specify whether the \texttt{massStellar} property of the \texttt{disk} component is settable.

tfamily \textcolor{red}{\textless\textgreater} massStellarRate(<double> value) Cumulate to the rate of the \texttt{massStellar} property of the \texttt{DiskExponential} component.

tfamily \textcolor{red}{\textless\textgreater} massStellarScale(<double> value) Set the scale of the \texttt{massStellar} property of the \texttt{DiskExponential} component.

tfamily \textcolor{red}{\textless\textgreater} massStellarSet(<double> value) Set the \texttt{massStellar} property of the \texttt{disk} component.

tfamily nullIsActive() Return whether the null implementation of the disk component class is active.

tfamily odeStepRatesInitialize() Initialize rates for evolvable properties.

tfamily odeStepScalesInitialize() Initialize scales for evolvable properties.

tfamily output(<integer> integerProperty\leftrightarrow, <integer> integerBufferCount\leftrightarrow, <integer[:,:] > integerBuffer\leftrightarrow, <integer> doubleProperty\leftrightarrow, <integer> doubleBufferCount\leftrightarrow, <double[:,:] > doubleBuffer\leftrightarrow, <double> time\rightarrow, <integer> instance\rightarrow) Generate values of outputtable properties.

tfamily outputCount(<integer> integerPropertyCount\leftrightarrow, <integer> doublePropertyCount\leftrightarrow, <double> time\rightarrow, <integer> instance\rightarrow) Compute a count of outputtable properties.

tfamily outputNames(<integer> integerProperty\leftrightarrow, <char[\*](:) > integerPropertyNames\leftrightarrow, <char[\*](:) > integerPropertyComments\leftrightarrow, <double(:) > integerPropertyUnitsSI\leftrightarrow, <integer> doubleProperty\leftrightarrow, <char[\*](:) > doublePropertyNames\leftrightarrow, <char[\*](:) > doublePropertyComments\leftrightarrow, <double(:) > doublePropertyUnitsSI\leftrightarrow, <double> time\rightarrow, <integer> instance\rightarrow) Generate names of outputtable properties.

double zero potential(<double> radius\rightarrow, <componentType> [componentType]\rightarrow, <massType> [massType]\rightarrow, <logical> [haloLoaded]\rightarrow) Compute the gravitational potential.

tfamily \textcolor{red}{\textless\textgreater} radius() Get the \texttt{radius} property of the \texttt{disk} component.

tfamily \textcolor{red}{\textless\textgreater} radiusAttributeMatch(<logical>[requireGettable] \rightarrow, <logical>[requireSettable] \rightarrow, <logical>[requireEvolvable] \rightarrow) Return a list of implementations that provide the given list off attributes for the \texttt{radius} property of the \texttt{disk} component.

tfamily \textcolor{red}{\textless\textgreater} radiusIsGettable() Get the \texttt{radius} property of the \texttt{disk} component.

tfamily \textcolor{red}{\textless\textgreater} radiusIsSettable() Specify whether the \texttt{radius} property of the \texttt{disk} component is settable.

tfamily void radiusSet(<double> value) Set the \texttt{radius} property of the \texttt{disk} component.
16.5. Objects

tfamily \void readRaw(<integer> fileHandle→) Read a binary dump of the nodeComponent from the given fileHandle.

tfamily \doublezero rotationCurve(<double> radius→, <componentType> [componentType]→, <massType> [massType]→, <logical> [haloLoaded]→) Compute the rotation curve.

tfamily \doublezero rotationCurveGradient(<double> radius→, <componentType> [componentType]→, <massType> [massType]→, <logical> [haloLoaded]→) Compute the rotation curve gradient.

tfamily \intzero serializeCount() Return a count of the number of evolvable quantities to be evolved.

tfamily \void serializeRates(<double(:)> array→) Serialize the evolvable rates to an array.

tfamily \void serializeScales(<double(:)> array→) Serialize the evolvable scales to an array.

tfamily \void serializeValues(<double(:)> array→) Serialize the evolvable quantities to an array.

tfamily \textcolor{red}{\textlesstype(history)\textgreater} starFormationHistory() Get the starFormationHistory property of the disk component.

tfamily \textcolor{red}{\textlesstype(varying\_string)(:)\textgreater} starFormationHistoryAttributeMatch(<logical> [requireGettable]→, <logical> [requireSettable]→, <logical> [requireEvolvable]→) Return a list of implementations that provide the given list of attributes for the starFormationHistory property of the disk component.

tfamily \intzero starFormationHistoryCount() Compute the count of evolvable quantities in the starFormationHistory property of the DiskExponential component.

tfamily \textcolor{red}{\textless \texttype(history)\textgreater} starFormationHistoryIsGettable() Get the starFormationHistory property of the disk component.

tfamily \logicalzero starFormationHistoryIsSettable() Specify whether the starFormationHistory property of the disk component is settable.

tfamily \void starFormationHistoryRate(<type(history)> value) Cumulate to the rate of the starFormationHistory property of the DiskExponential component.

tfamily \void starFormationHistoryScale(<type(history)> value) Set the scale of the starFormationHistory property of the DiskExponential component.

tfamily \void starFormationHistorySet(<type(history)> value) Set the starFormationHistory property of the disk component.

tfamily \textcolor{red}{\textless \textdouble\textgreater} starFormationRate() Get the starFormationRate property of the disk component.

tfamily \textcolor{red}{\textlesstype(varying\_string)(:\textgreater)} starFormationRateAttributeMatch(<logical> [requireGettable]→, <logical> [requireSettable]→, <logical> [requireEvolvable]→) Return a list of implementations that provide the given list of attributes for the starFormationRate property of the disk component.

tfamily \textcolor{red}{\textless \textdouble\textgreater} starFormationRateIsGettable() Get the starFormationRate property of the disk component.

tfamily \logicalzero starFormationRateIsSettable() Specify whether the starFormationRate property of the disk component is settable.
16. Coding GALACTICUS

tfamily {textcolor{red}}\{\textless type(history)\textgreater\} stellarPropertiesHistory() Get the stellarPropertiesHistory property of the disk component.

tfamily {textcolor{red}}\{\textless varying\_string\} stellarPropertiesHistoryAttributeMatch(\textless logical\textgreater [requireGettable] →, \textless logical\textgreater [requireSettable] →, \textless logical\textgreater [requireEvolvable] →) Return a list of implementations that provide the given list of attributes for the stellarPropertiesHistory property of the disk component.

tfamily \intzero stellarPropertiesHistoryCount() Compute the count of evolvable quantities in the stellarPropertiesHistory property of the DiskExponential component.

tfamily {textcolor{red}}\{\textless type(history)\textgreater\} stellarPropertiesHistoryIsGettable() Get the stellarPropertiesHistory property of the disk component.

tfamily \logicalzero stellarPropertiesHistoryIsSettable() Specify whether the stellarPropertiesHistory property of the disk component is settable.

tfamily \void stellarPropertiesHistoryRate(\textless type(history)\textgreater value) Cumulate to the rate of the stellarPropertiesHistory property of the DiskExponential component.

tfamily \void stellarPropertiesHistoryScale(\textless type(history)\textgreater value) Set the scale of the stellarPropertiesHistory property of the DiskExponential component.

tfamily \void stellarPropertiesHistorySet(\textless type(history)\textgreater value) Set the stellarPropertiesHistory property of the disk component.

tfamily {doublezero} surfaceDensity(\textless double(3)\textgreater positionCylindrical→, \textless componentType\textgreater [componentType]→, \textless massType\textgreater [massType]→, \textless weightBy\textgreater [weightBy]→, \textless integer\textgreater [weightIndex]→, \textless logical\textgreater [haloLoaded]→) Compute the surface density.

tfamily {textcolor{red}}\{\textless varying\_string\} type() Return the type of this object.

tfamily {textcolor{red}}\{\textless double\} velocity() Get the velocity property of the disk component.

tfamily {textcolor{red}}\{\textless varying\_string\} velocityAttributeMatch(\textless logical\textgreater [requireGettable] →, \textless logical\textgreater [requireSettable] →, \textless logical\textgreater [requireEvolvable] →) Return a list of implementations that provide the given list of attributes for the velocity property of the disk component.

tfamily \logicalzero velocityIsSettable() Specify whether the velocity property of the disk component is settable.

tfamily \void velocitySet(\textless double\textgreater value) Set the velocity property of the disk component.

tfamily \logicalzero verySimpleIsActive() Return whether the verySimple implementation of the disk component class is active.
16.5. Objects

tfamily nodeComponentDiskVerySimple

tfamily \textcolor{red}{\textless type(abundances)\textgreater} abundancesGas() Get the abundancesGas property of the disk component.

tfamily \textcolor{red}{\textless type(varying\_string)()\textgreater} abundancesGasAttributeMatch (<logical>[requireGettable] →, <logical>[requireSettable] →, <logical>[requireEvolvable] →) Return a list of implementations that provide the given list off attributes for the abundancesGas property of the disk component.

tfamily \intzero abundancesGasCount() Compute the count of evolvable quantities in the abundancesGas property of the DiskExponential component.

tfamily \textcolor{red}{\textlesstype(abundances)\textgreater} abundancesGasIsGettable() Get the abundancesGas property of the disk component.

tfamily \logicalzero abundancesGasIsSettable() Specify whether the abundancesGas property of the disk component is settable.

tfamily \void abundancesGasRate(<type(abundances)> value) Cumulate to the rate of the abundancesGas property of the DiskExponential component.

tfamily \void abundancesGasScale(<type(abundances)> value) Set the scale of the abundancesGas property of the DiskExponential component.

tfamily \void abundancesGasSet(<type(abundances)> value) Set the abundancesGas property of the disk component.

tfamily \textcolor{red}{\textlesstype(abundances)\textgreater} abundancesStellar() Get the abundancesStellar property of the disk component.

tfamily \textcolor{red}{\textless type(varying\_string)()\textgreater} abundancesStellarAttributeMatch (<logical>[requireGettable] →, <logical>[requireSettable] →, <logical>[requireEvolvable] →) Return a list of implementations that provide the given list off attributes for the abundancesStellar property of the disk component.

tfamily \intzero abundancesStellarCount() Compute the count of evolvable quantities in the abundancesStellar property of the DiskExponential component.

tfamily \textcolor{red}{\textlesstype(abundances)\textgreater} abundancesStellarIsGettable() Get the abundancesStellar property of the disk component.

tfamily \logicalzero abundancesStellarIsSettable() Specify whether the abundancesStellar property of the disk component is settable.

tfamily \void abundancesStellarRate(<type(abundances)> value) Cumulate to the rate of the abundancesStellar property of the DiskExponential component.

tfamily \void abundancesStellarScale(<type(abundances)> value) Set the scale of the abundancesStellar property of the DiskExponential component.

tfamily \void abundancesStellarSet(<type(abundances)> value) Set the abundancesStellar property of the disk component.

tfamily \textcolor{red}{\textlesstype(double)\textgreater} angularMomentum() Get the angularMomentum property of the disk component.
Coding GALACTICUS

16. Coding GALACTICUS

tfamily \textcolor{red}{\textless double\textgreater} angularMomentumIsGettable() Get the angularMomentum property of the disk component.

tfamily \textcolor{red}{\textless double\textgreater} angularMomentumIsSettable() Specify whether the angularMomentum property of the disk component is settable.

tfamily \void angularMomentumRate(<double> value) Cumulate to the rate of the angularMomentum property of the DiskExponential component.

tfamily \void angularMomentumScale(<double> value) Set the scale of the angularMomentum property of the DiskExponential component.

tfamily \void angularMomentumSet(<double> value) Set the angularMomentum property of the disk component.

tfamily \void attachPipe() Attach pipes to the very simple disk component.

tfamily \void builder(<\text{node}>componentDefinition\rightarrow) Build a nodeComponent from a supplied XML definition.

tfamily \double zero density(<double (3)> positionSpherical\rightarrow, <\text{componentType}>[\text{componentType}]\rightarrow, <\text{massType}>[\text{massType}]\rightarrow, <\text{weightBy}>[\text{weightBy}]\rightarrow, <\text{integer}>[\text{weightIndex}]\rightarrow, <\text{logical}>[\text{haloLoaded}]\rightarrow) Compute the density.

tfamily \void deserializeRates(<double(:)> array\leftarrow) Deserialize the evolvable rates from an array.

tfamily \void deserializeScales(<double(:)> array\leftarrow) Deserialize the evolvable scales from an array.

tfamily \void deserializeValues(<double(:)> array\leftarrow) Deserialize the evolvable quantities from an array.

tfamily \void destroy() Destroy the object.

tfamily \void dump() Generate an ASCII dump of all properties.

tfamily \void dumpRaw(<\text{integer}> fileHandle\rightarrow) Generate a binary dump of all properties.

tfamily \void dumpXML() Generate an XML dump of all properties.

tfamily \double zero enclosedMass(<double> radius\rightarrow, <\text{componentType}>[\text{componentType}]\rightarrow, <\text{massType}>[\text{massType}]\rightarrow, <\text{weightBy}>[\text{weightBy}]\rightarrow, <\text{integer}>[\text{weightIndex}]\rightarrow, <\text{logical}>[\text{haloLoaded}]\rightarrow) Compute the mass enclosed within a radius.

tfamily \textcolor{red}{\textless logical\textgreater} exponentialIsActive() Return whether the exponential implementation of the disk component class is active.

tfamily \textcolor{red}{\textless double\textgreater} halfMassRadius() Get the halfMassRadius property of the disk component.
16.5. Objects

tfamily \textcolor{red}{\textless type(varying\_string)(:)\textgreater} halfMassRadiusAttributeMatch(<logical>[requireGettable→, <logical>[requireSettable→, <logical>[requireEvolvable→]) Return a list of implementations that provide the given list off attributes for the \texttt{halfMassRadius} property of the disk component.

tfamily \textcolor{red}{\textless double\textgreater} halfMassRadiusIsGettable() Get the \texttt{halfMassRadius} property of the disk component.

tfamily \logicalzero halfMassRadiusIsSettable() Specify whether the \texttt{halfMassRadius} property of the disk component is settable.

tfamily \textcolor{red}{\textless type(treeNode)\textgreater} host() Return a pointer to the host \texttt{treeNode} object.

tfamily \void hotHaloCoolingAbundancesRate(<type(abundances)> value) Cumulate to the rate of the \texttt{hotHaloCoolingAbundances} property of the \texttt{hotHalo} component.

tfamily \void hotHaloCoolingAngularMomentumRate(<double> value) Cumulate to the rate of the \texttt{hotHaloCoolingAngularMomentum} property of the \texttt{hotHalo} component.

tfamily \void hotHaloCoolingMassRate(<double> value) Cumulate to the rate of the \texttt{hotHaloCoolingMass} property of the \texttt{hotHalo} component.

tfamily \void initialize() Initialize the object.

tfamily \textcolor{red}{\textless logical\textgreater} isInitialized() Get the \texttt{isInitialized} property of the disk component.

tfamily \textcolor{red}{\textless type(varying\_string)(:)\textgreater} isInitializedAttributeMatch(<logical>[requireGettable→, <logical>[requireSettable→, <logical>[requireEvolvable→]) Return a list of implementations that provide the given list off attributes for the \texttt{isInitialized} property of the disk component.

tfamily \textcolor{red}{\textless logical\textgreater} isInitializedIsGettable() Get the \texttt{isInitialized} property of the disk component.

tfamily \logicalzero isInitializedIsSettable() Specify whether the \texttt{isInitialized} property of the disk component is settable.

tfamily \void isInitializedSet(<logical> value) Set the \texttt{isInitialized} property of the disk component.

tfamily \textcolor{red}{\textless type(stellarLuminosities)\textgreater} luminositiesStellar() Get the \texttt{luminositiesStellar} property of the disk component.

tfamily \textcolor{red}{\textless type(varying\_string)(:)\textgreater} luminositiesStellarAttributeMatch(<logical>[requireGettable→, <logical>[requireSettable→, <logical>[requireEvolvable→]) Return a list of implementations that provide the given list off attributes for the \texttt{luminositiesStellar} property of the disk component.

tfamily \intzero luminositiesStellarCount() Compute the count of evolvable quantities in the \texttt{luminositiesStellar} property of the \texttt{DiskExponential} component.

tfamily \textcolor{red}{\textless type(stellarLuminosities)\textgreater} luminositiesStellarIsGettable() Get the \texttt{luminositiesStellar} property of the disk component.

tfamily \logicalzero luminositiesStellarIsSettable() Specify whether the \texttt{luminositiesStellar} property of the disk component is settable.
tfamily \void luminositiesStellarRate(<type(stellarLuminosities)> value) Cumulate to the rate of the luminositiesStellar property of the DiskExponential component.

tfamily \void luminositiesStellarScale(<type(stellarLuminosities)> value) Set the scale of the luminositiesStellar property of the DiskExponential component.

tfamily \void luminositiesStellarSet(<type(stellarLuminosities)> value) Set the luminositiesStellar property of the disk component.

tfamily \textcolor{red}{\textless double\textgreater} massGas() Get the massGas property of the disk component.

tfamily \textcolor{red}{\textless double\textgreater} massStellar() Get the massStellar property of the disk component.

tfamily \logicalzero massGasIsSettable() Specify whether the massGas property of the disk component is settable.

tfamily \void massGasRate(<double> value) Cumulate to the rate of the massGas property of the DiskExponential component.

tfamily \void massGasScale(<double> value) Set the scale of the massGas property of the DiskExponential component.

tfamily \void massStellarSet(<double> value) Set the massStellar property of the disk component.
tfamily \void nameFromIndex(<integer> count→, <varying_string>name←) Return the name of a property given its index.

tfamily \logicalzero nullIsActive() Return whether the null implementation of the disk component class is active.

tfamily \void odeStepRatesInitialize() Initialize rates for evolvable properties.

tfamily \void odeStepScalesInitialize() Initialize scales for evolvable properties.

tfamily \void output(<integer> integerProperty↔, <integer> integerBufferCount↔, <integer(:,:)> integerBuffer↔, <integer>doubleProperty↔, <integer> doubleBufferCount↔, <double(:,:)> doubleBuffer↔, <double> time→, <integer> instance→) Generate values of outputtable properties.

tfamily \void outputCount(<integer> integerPropertyCount↔, <integer>doublePropertyCount↔, <double> time→, <integer> instance→) Compute a count of outputtable properties.

tfamily \void outputNames(<integer> integerProperty↔, <char[*](:)>integerPropertyNames↔, <char[*](:)>integerPropertyComments↔, <double(:)> integerPropertyUnitsSI↔, <integer>doubleProperty↔, <char[*](:)> doublePropertyNames↔, <char[*](:)>doublePropertyComments↔, <double(:)> doublePropertyUnitsSI↔, <double> time→, <integer> instance→) Generate names of outputtable properties.

tfamily \doublezeropotential(<double>radius→, <componentType>[componentType]→, <massType>[massType]→, <logical>[haloLoaded]→) Compute the gravitational potential.

tfamily \textcolor{red}{\textless double\textgreater} radius() Get the radius property of the disk component.

tfamily \textcolor{red}{\textless varying\_string\rangle(:)}\textgreater radiusAttributeMatch(<logical>[requireGettable]→, <logical>[requireSettable]→, <logical>[requireEvolvable]→) Return a list of implementations that provide the given list of attributes for the radius property of the disk component.

tfamily \textcolor{red}{\textless double\textgreater} radiusIsGettable() Get the radius property of the disk component.

tfamily \logicalzero radiusIsSettable() Specify whether the radius property of the disk component is settable.

tfamily \void radiusSet(<double> value) Set the radius property of the disk component.

tfamily \void readRaw(<integer> fileHandle→) Read a binary dump of the nodeComponent from the given fileHandle.

tfamily \doublezerotationCurve(<double>radius→, <componentType>[componentType]→, <massType>[massType]→, <logical>[haloLoaded]→) Compute the rotation curve.

tfamily \doublezerotationCurveGradient(<double>radius→, <componentType>[componentType]→, <massType>[massType]→, <logical>[haloLoaded]→) Compute the rotation curve gradient.

tfamily \intzero serializeCount() Return a count of the number of evolvable quantities to be evolved.

tfamily \void serializeRates(<double(:)> array→) Serialize the evolvable rates to an array.

tfamily \void serializeScales(<double(:)> array→) Serialize the evolvable scales to an array.
16. Coding GALACTICUS

tfamily \ void serializeValues(<double(>:: array→) Serialize the evolvable quantities to an array.

tfamily \textcolor{red}{\textless textless type(history):\textgreater starFormationHistory()} Get the \textit{starFormationHistory} property of the \textit{disk} component.

tfamily \textcolor{red}{\textless textless type(varying::_string):\textgreater starFormationHistoryAttributeMatch(<logical>[requireGettable→, <logical>[requireSettable→, <logical>[requireEvolvable→) Return a list of implementations that provide the given list of attributes for the \textit{starFormationHistory} property of the \textit{disk} component.

tfamily \intzero starFormationHistoryCount() Compute the count of evolvable quantities in the \textit{starFormationHistory} property of the \textit{DiskExponential} component.

tfamily \textcolor{red}{\textless type(history):\textgreater starFormationHistoryIsGettable()} Get the \textit{starFormationHistory} property of the \textit{disk} component.

tfamily \logicalzero starFormationHistoryIsSettable() Specify whether the \textit{starFormationHistory} property of the \textit{disk} component is settable.

tfamily \ void starFormationHistoryRate(<type(history)> value) Cumulate to the rate of the \textit{starFormationHistory} property of the \textit{DiskExponential} component.

tfamily \ void starFormationHistoryScale(<type(history)> value) Set the scale of the \textit{starFormationHistory} property of the \textit{DiskExponential} component.

tfamily \ void starFormationHistorySet(<type(history)> value) Set the \textit{starFormationHistory} property of the \textit{disk} component.

tfamily \textcolor{red}{\textless double\textgreater starFormationRate()} Get the \textit{starFormationRate} property of the \textit{disk} component.

tfamily \textcolor{red}{\textless textless type(varying::_string):\textgreater starFormationRateAttributeMatch(<logical>[requireGettable→, <logical>[requireSettable→, <logical>[requireEvolvable→) Return a list of implementations that provide the given list of attributes for the \textit{starFormationRate} property of the \textit{disk} component.

tfamily \textcolor{red}{\textless double\textgreater starFormationRateIsGettable()} Get the \textit{starFormationRate} property of the \textit{disk} component.

tfamily \logicalzero starFormationRateIsSettable() Specify whether the \textit{starFormationRate} property of the \textit{disk} component is settable.

tfamily \ textcolor{red}{\textless textless type(history):\textgreater stellarPropertiesHistory()} Get the \textit{stellarPropertiesHistory} property of the \textit{disk} component.

tfamily \textcolor{red}{\textless textless type(varying::_string):\textgreater stellarPropertiesHistoryAttributeMatch(<logical>[requireGettable→, <logical>[requireSettable→, <logical>[requireEvolvable→) Return a list of implementations that provide the given list of attributes for the \textit{stellarPropertiesHistory} property of the \textit{disk} component.

tfamily \intzero stellarPropertiesHistoryCount() Compute the count of evolvable quantities in the \textit{stellarPropertiesHistory} property of the \textit{DiskExponential} component.

tfamily \textcolor{red}{\textless textless type(history):\textgreater stellarPropertiesHistoryIsGettable()} Get the \textit{stellarPropertiesHistory} property of the \textit{disk} component.
16.5. Objects

tfamily \logicalzero stellarPropertiesHistoryIsSettable() Specify whether the stellarPropertiesHistory property of the disk component is settable.

tfamily \void stellarPropertiesHistoryRate(<type(history)> value) Cumulate to the rate of the stellarPropertiesHistory property of the DiskExponential component.

tfamily \void stellarPropertiesHistoryScale(<type(history)> value) Set the scale of the stellarPropertiesHistory property of the DiskExponential component.

tfamily \void stellarPropertiesHistorySet(<type(history)> value) Set the stellarPropertiesHistory property of the disk component.

tfamily \doublezero surfaceDensity(<double(3)> positionCylindrical→, \langle componentType \rangle \to, \langle massType \rangle \to, \langle weightBy \rangle \to, \langle integer \rangle \to, \langle logical \rangle \to) Compute the surface density.

tfamily \textcolor{red}{\langle type(varying\_string)\rangle} type() Return the type of this object.

tfamily \textcolor{red}{\langle double\rangle} velocity() Get the velocity property of the disk component.

tfamily \textcolor{red}{\langle type(varying\_string)(::)\rangle} velocityAttributeMatch(<logical>[requireGettable]→, <logical>[requireSettable]→, <logical>[requireEvolvable]→) Return a list of implementations that provide the given list off attributes for the velocity property of the disk component.

tfamily \textcolor{red}{\langle double::\rangle} velocityIsGettable() Get the velocity property of the disk component.

tfamily \logicalzero velocityIsSettable() Specify whether the velocity property of the disk component is settable.

tfamily \void velocitySet(<double> value) Set the velocity property of the disk component.

tfamily \logicalzero verySimpleIsActive() Return whether the verySimple implementation of the disk component class is active.

tfamily nodeComponentDynamicsStatistics

tfamily \textcolor{red}{\langle type\rangle} adiabaticRatio() Get the adiabaticRatio property of the dynamicsStatistics component.

tfamily \textcolor{red}{\langle type\rangle} adiabaticRatioAttributeMatch(<logical>[requireGettable]→, <logical>[requireSettable]→, <logical>[requireEvolvable]→) Return a list of implementations that provide the given list off attributes for the adiabaticRatio property of the dynamicsStatistics component.

tfamily \textcolor{red}{\langle type\rangle} adiabaticRatioIsGettable() Get the adiabaticRatio property of the dynamicsStatistics component.

tfamily \logicalzero adiabaticRatioIsSettable() Specify whether the adiabaticRatio property of the dynamicsStatistics component is settable.

tfamily \void adiabaticRatioSet(<double::>) value) Set the adiabaticRatio property of the dynamicsStatistics component.
16. Coding Galacticus

tfamily \textcolor{red}{\textless textless double(:)\textgreater} barInstabilityTimescale() Get the barInstabilityTimescale property of the dynamicsStatistics component.

tfamily \textcolor{red}{\textless textless type(varying\_string)(:)\textgreater} barInstabilityTimescaleAttributeMatch(<logical>[requireGettable] \rightarrow, <logical>[requireSettable] \rightarrow, <logical>[requireEvolvable] \rightarrow) Return a list of implementations that provide the given list of attributes for the barInstabilityTimescale property of the dynamicsStatistics component.

tfamily \textcolor{red}{\textless double(:)\textgreater} barInstabilityTimescaleIsGettable() Get the barInstabilityTimescale property of the dynamicsStatistics component.

tfamily \textcolor{red}{\textless logical\textgreater} barInstabilityTimescaleIsSettable() Specify whether the barInstabilityTimescale property of the dynamicsStatistics component is settable.

tfamily \void barInstabilityTimescaleSet(<double(:)> value) Set the barInstabilityTimescale property of the dynamicsStatistics component.

tfamily \logical zero barsIsActive() Return whether the bars implementation of the dynamicsStatistics component class is active.

tfamily \void builder(<\*type(node)>componentDefinition \rightarrow) Build a nodeComponent from a supplied XML definition.

tfamily \void deserializeRates(<double(:)> array \leftarrow) Deserialize the evolvable rates from an array.

tfamily \void deserializeScales(<double(:)> array \leftarrow) Deserialize the evolvable scales from an array.

tfamily \void deserializeValues(<double(:)> array \leftarrow) Deserialize the evolvable quantities from an array.

tfamily \void destroy() Destroy the object.

tfamily \void dump() Generate an ASCII dump of all properties.

tfamily \void dumpRaw(<integer> fileHandle \rightarrow) Generate a binary dump of all properties.

tfamily \void dumpXML() Generate an XML dump of all properties.

tfamily \void enclosedMass(<double>radius \rightarrow, <componentType>[componentType] \rightarrow, <massType>[massType] \rightarrow, <weightBy>[weightBy] \rightarrow, <integer>[weightIndex] \rightarrow, <logical>[haloLoaded] \rightarrow) Compute the mass enclosed within a radius.

tfamily \textcolor{red}{\textless *type(treeNode)\textgreater} host() Return a pointer to the host treeNode object.

tfamily \void hotHaloCoolingAbundancesRate(<type(abundances)> value) Cumulate to the rate of the hotHaloCoolingAbundances property of the hotHalo component.

tfamily \void hotHaloCoolingAngularMomentumRate(<double> value) Cumulate to the rate of the hotHaloCoolingAngularMomentum property of the hotHalo component.

tfamily \void hotHaloCoolingMassRate(<double> value) Cumulate to the rate of the hotHaloCoolingMass property of the hotHalo component.
16.5. Objects

tfamily \void initialize() Initialize the object.

tfamily \void nameFromIndex(<integer> count →, <varying_string> name ←) Return the name of a property given is index.

ntfamily \logicalzero nullIsActive() Return whether the null implementation of the dynamicsStatistics component class is active.

tfamily \void odeStepRatesInitialize() Initialize rates for evolvable properties.

tfamily \void odeStepScalesInitialize() Initialize scales for evolvable properties.

tfamily \void output(<integer> integerProperty ↔, <integer> integerBufferCount ↔, <integer(:,:)> integerBuffer ↔, <integer> doubleProperty ↔, <integer doubleBufferCount ↔, <double(:,:)> doubleBuffer ↔, <double> time →, <integer> instance →) Generate values of outputtable properties.

ntfamily \void outputCount(<integer> integerPropertyCount ↔, <integer> doublePropertyCount ↔, <double> time →, <integer> instance →) Compute a count of outputtable properties.

ntfamily \void outputNames(<integer> integerProperty ↔, <char[*](:)> integerPropertyNames ↔, <char[*](:)> integerPropertyComments ↔, <double(:)> integerPropertyUnitsSI ↔, <integer> doubleProperty ↔, <char[*](:)> doublePropertyNames ↔, <char[*](:)> doublePropertyComments ↔, <double(:)> doublePropertyUnitsSI ↔, <double> time →, <integer> instance →) Generate names of outputtable properties.

ntfamily \doublezero potential(<double> radius →, <componentType> [componentType] →, <massType> [massType] →, <logical> [haloLoaded] →) Compute the gravitational potential.

ntfamily \doublezero rotationCurve(<double> radius →, <componentType> [componentType] →, <massType> [massType] →, <logical> [haloLoaded] →) Compute the rotation curve.

ntfamily \doublezero rotationCurveGradient(<double> radius →, <componentType> [componentType] →, <massType> [massType] →, <logical> [haloLoaded] →) Compute the rotation curve gradient.

ntfamily \intzero serializeCount() Return a count of the number of evolvable quantities to be evolved.

ntfamily \void serializeRates(<double(:)> array →) Serialize the evolvable rates to an array.

ntfamily \void serializeScales(<double(:)> array →) Serialize the evolvable scales to an array.

ntfamily \void serializeValues(<double(:)> array →) Serialize the evolvable quantities to an array.

ntfamily \doublezero surfaceDensity(<double(3)> positionCylindrical →, <componentType> [componentType] →, <massType> [massType] →, <weightBy> [weightBy] →, <integer> [weightIndex] →, <logical> [haloLoaded] →) Compute the surface density.

ntfamily \textcolor{red}{{\textlessdouble(:)\textgreater}} time() Get the time property of the dynamicsStatistics component.

ntfamily \textcolor{red}{{\textlessvarying\_string(:)\textgreater}} timeAttributeMatch(<logical> [requireGettable] →, <logical> [requireSettable] →, <logical> [requireEvolvable] →) Return a list of implementations that provide the given list off attributes for the time property of the dynamicsStatistics component.

ntfamily \textcolor{red}{{\textlessdouble(:)\textgreater}} timeIsGettable() Get the time property of the dynamicsStatistics component.
tfamily \textcolor{red}{\textless type(varying\_string)\textgreater} type() Return the type of this object.

tfamily nodeComponentDynamicsStatisticsBars

tfamily \textcolor{red}{\textless double(:)\textgreater} adiabaticRatio() Get the adiabaticRatio property of the dynamicsStatistics component.

tfamily \textcolor{red}{\textless double(:)\textgreater} adiabaticRatioIsGettable() Get the adiabaticRatio property of the dynamicsStatistics component.

tfamily \logicalzero adiabaticRatioIsSettable() Specify whether the adiabaticRatio property of the dynamicsStatistics component is settable.

tfamily \void adiabaticRatioSet(<double(:)> value) Set the adiabaticRatio property of the dynamicsStatistics component.

472

472
tfamily \textbf{\textcolor{red}{\textless *type(treeNode)\textgreater} host()} Return a pointer to the host \textbf{treeNode} object.

tfamily \textbf{\textcolor{red}{\textless *type(treeNode)\textgreater} hotHaloCoolingAbundancesRate(<type(abundances)> value)} Cumulate to the rate of the \textbf{hotHaloCoolingAbundances} property of the \textbf{hotHalo} component.

tfamily \textbf{\textcolor{red}{\textless *type(treeNode)\textgreater} hotHaloCoolingAngularMomentumRate(<double> value)} Cumulate to the rate of the \textbf{hotHaloCoolingAngularMomentum} property of the \textbf{hotHalo} component.

tfamily \textbf{\textcolor{red}{\textless *type(treeNode)\textgreater} hotHaloCoolingMassRate(<double> value)} Cumulate to the rate of the \textbf{hotHaloCoolingMass} property of the \textbf{hotHalo} component.

tfamily \textbf{\textcolor{red}{\textless *type(treeNode)\textgreater} initialize()} Initialize the object.

tfamily \textbf{\textcolor{red}{\textless *type(treeNode)\textgreater} nameFromIndex(<integer> count\rightarrow, \textbf{\textcolor{red}{\textless varying_string\textgreater} name\leftarrow})} Return the name of a property given is index.

tfamily \textbf{\textcolor{red}{\textless *type(treeNode)\textgreater} nullIsActive()} Return whether the null implementation of the \textbf{dynamicsStatistics} component class is active.

tfamily \textbf{\textcolor{red}{\textless *type(treeNode)\textgreater} odeStepRatesInitialize()} Initialize rates for evolvable properties.

tfamily \textbf{\textcolor{red}{\textless *type(treeNode)\textgreater} odeStepScalesInitialize()} Initialize scales for evolvable properties.

tfamily \textbf{\textcolor{red}{\textless *type(treeNode)\textgreater} output(<integer> integerProperty\leftrightarrow, <integer> integerBufferCount\leftrightarrow, <integer(\ldots)> integerBuffer\leftrightarrow, <integer> doubleProperty\leftrightarrow, <integer> doubleBufferCount\leftrightarrow, <double(\ldots)> doubleBuffer\leftrightarrow, <double> time\rightarrow, <integer> instance\rightarrow)} Generate values of outputtable properties.

tfamily \textbf{\textcolor{red}{\textless *type(treeNode)\textgreater} outputCount(<integer> integerPropertyCount\leftrightarrow, <integer> doublePropertyCount\leftrightarrow, <double> time\rightarrow, <integer> instance\rightarrow)} Compute a count of outputtable properties.

tfamily \textbf{\textcolor{red}{\textless *type(treeNode)\textgreater} outputNames(<integer> integerProperty\leftrightarrow, <char\[*]\textgreater integerPropertyNames\leftrightarrow, <char\[*]\textgreater(integerPropertyComments\leftrightarrow, <double(\ldots)> integerPropertyUnitsSI\leftrightarrow, <integer> doubleProperty\leftrightarrow, <char\[*]\textgreater doublePropertyNames\leftrightarrow, <char\[*]\textgreater(doublePropertyComments\leftrightarrow, <double(\ldots)> doublePropertyUnitsSI\leftrightarrow, <double> time\rightarrow, <integer> instance\rightarrow)} Generate names of outputtable properties.

tfamily \textbf{\textcolor{red}{\textless *type(treeNode)\textgreater} potential(<double> radius\rightarrow, <componentType[\ldots]> componentType\rightarrow, <massType[\ldots]> massType\rightarrow, <logical> haloLoaded\rightarrow)} Compute the gravitational potential.
tfamily \textcolor{red}{\textless double(:)\textgreater} adiabaticRatio() Get the adiabaticRatio property of the dynamicsStatistics component.

tfamily \textcolor{red}{\textless double(:)\textgreater} adiabaticRatioAttributeMatch(<logical>[requireGettable]→, <logical>[requireSettable]→, <logical>[requireEvolvable]→) Return a list of implementations that provide the given list off attributes for the adiabaticRatio property of the dynamicsStatistics component

tfamily \textcolor{red}{\textless double(:)\textgreater} adiabaticRatioIsGettable() Get the adiabaticRatioIsGettable() Get the adiabaticRatio property of the dynamicsStatistics component.
16.5. Objects

tfamily logicalzero adiabaticRatioIsSettable() Specify whether the adiabaticRatio property of the dynamicsStatistics component is settable.

tfamily void adiabaticRatioSet(<double()> value) Set the adiabaticRatio property of the dynamicsStatistics component.

tfamily textcolor{red}{textless double():textgreater} barInstabilityTimescale() Get the barInstabilityTimescale property of the dynamicsStatistics component.

tfamily textcolor{red}{textless type(varying\_string):textgreater} barInstabilityTimescaleAttributeMatch(<logical>[requireGettable]→, <logical>[requireSettable]→, <logical>[requireEvolvable]→) Return a list of implementations that provide the given list off attributes for the barInstabilityTimescale property of the dynamicsStatistics component.

tfamily textcolor{red}{textless double():textgreater} barInstabilityTimescaleIsGettable() Get the barInstabilityTimescale property of the dynamicsStatistics component.

tfamily logicalzero barInstabilityTimescaleIsSettable() Specify whether the barInstabilityTimescale property of the dynamicsStatistics component is settable.

tfamily void barInstabilityTimescaleSet(<double()> value) Set the barInstabilityTimescale property of the dynamicsStatistics component.

tfamily logicalzero barsIsActive() Return whether the bars implementation of the dynamicsStatistics component class is active.

tfamily void builder(<*type(node)>componentDefinition) Build a nodeComponent from a supplied XML definition.

tfamily double zero density(<double(3)> positionSpherical→, <componentType>[componentType]→, <massType>[massType]→, <weightBy>[weightBy]→, <integer>[weightIndex]→, <logical>[haloLoaded]→) Compute the density.

tfamily void deserializeRates(<double()> array←) Deserialize the evolvable rates from an array.

tfamily void deserializeScales(<double()> array←) Deserialize the evolvable scales from an array.

tfamily void deserializeValues(<double()> array←) Deserialize the evolvable quantities from an array.

tfamily void destroy() Destroy the object.

tfamily void dump() Generate an ASCII dump of all properties.

tfamily void dumpRaw(<integer> fileHandle→) Generate a binary dump of all properties.

tfamily void dumpXML() Generate an XML dump of all properties.

tfamily double zero enclosedMass(<double>radius→, <componentType>[componentType]→, <massType>[massType]→, <weightBy>[weightBy]→, <integer>[weightIndex]→, <logical>[haloLoaded]→) Compute the mass enclosed within a radius.

tfamily textcolor{red}{textless *type(treeNode):textgreater} host() Return a pointer to the host treeNode object.

tfamily void hotHaloCoolingAbundancesRate(<type(abundances)> value) Cumulate to the rate of the hotHaloCoolingAbundances property of the hotHalo component.
16. Coding GALACTICUS

tfamily \ void hotHaloCoolingAngularMomentumRate(<double> value) Cumulate to the rate of the hotHaloCoolingAngularMomentum property of the hotHalo component.

tfamily \ void hotHaloCoolingMassRate(<double> value) Cumulate to the rate of the hotHaloCoolingMass property of the hotHalo component.

tfamily \ void initialize() Initialize the object.

tfamily \ void nameFromIndex(<integer> count →, <varying_string> name ←) Return the name of a property given is index.

tfamily \ logicalzero nullsActive() Return whether the null implementation of the dynamicsStatistics component class is active.

tfamily \ void odeStepRatesInitialize() Initialize rates for evolvable properties.

tfamily \ void odeStepScalesInitialize() Initialize scales for evolvable properties.

tfamily \ void output(<integer> integerProperty ↔, <integer> integerBufferCount ↔, <integer(:,:)> integerBuffer ↔, <integer> doubleProperty ↔, <integer> doubleBufferCount ↔, <double(:,:)> doubleBuffer ↔, <double> time →, <integer> instance →) Generate values of outputtable properties.

tfamily \ void outputCount(<integer> integerPropertyCount ↔, <integer> doublePropertyCount ↔, <double> time →, <integer> instance →) Compute a count of outputtable properties.

tfamily \ void outputNames(<integer> integerProperty ↔, <char[*](:)> integerPropertyNames ↔, <char[*](:)> integerPropertyComments ↔, <double(:)> integerPropertyUnitsSI ↔, <integer> doubleProperty ↔, <char[*](:)> doublePropertyNames ↔, <char[*](:)> doublePropertyComments ↔, <double(:)> doublePropertyUnitsSI ↔, <double> time →, <integer> instance →) Generate names of outputtable properties.

tfamily \ doublezero potential(<double> radius →, <componentType> [componentType]→, <massType> [massType]→, <logical> [haloLoaded]→) Compute the gravitational potential.

tfamily \ void readRaw(<integer> fileHandle →) Read a binary dump of the nodeComponent from the given fileHandle.

tfamily \ doublezero rotationCurve(<double> radius →, <componentType> [componentType]→, <massType> [massType]→, <logical> [haloLoaded]→) Compute the rotation curve.

tfamily \ doublezero rotationCurveGradient(<double> radius →, <componentType> [componentType]→, <massType> [massType]→, <logical> [haloLoaded]→) Compute the rotation curve gradient.

tfamily \ intzero serializeCount() Return a count of the number of evolvable quantities to be evolved.

tfamily \ void serializeRates(<double(:)> array →) Serialize the evolvable rates to an array.

tfamily \ void serializeScales(<double(:)> array →) Serialize the evolvable scales to an array.

tfamily \ void serializeValues(<double(:)> array →) Serialize the evolvable quantities to an array.

tfamily \ doublezero surfaceDensity(<double(3)> positionCylindrical →, <componentType> [componentType]→, <massType> [massType]→, <weightBy> [weightBy]→, <integer> [weightIndex]→, <logical> [haloLoaded]→) Compute the surface density.

tfamily \ textcolor{red}{\textless double(:)\textgreater} time() Get the time property of the dynamicsStatistics component.
16.5. Objects

tfamily \textcolor{red}{\textless\text{type(varying\_string):}\textgreater} \text{timeAttributeMatch}(<\text{logical}>[\text{requireGettable}]->, <\text{logical}>[\text{requireSettable}]->, <\text{logical}>[\text{requireEvolvable}]->) Return a list of implementations that provide the given list of attributes for the time property of the dynamicsStatistics component.

tfamily \textcolor{red}{\textless\text{double}:\textgreater} \text{timeIsGettable()} Get the time property of the dynamicsStatistics component.

tfamily logicalzero \text{timeIsSettable()} Specify whether the time property of the dynamicsStatistics component is settable.

tfamily void \text{timeSet(<\text{double}:> value)} Set the time property of the dynamicsStatistics component.

tfamily \textcolor{red}{\textless\text{type(varying\_string):}\textgreater} \text{type()} Return the type of this object.

tfamily nodeComponentFormationTime

tfamily void \text{builder(<\text{type(node)}>componentDefinition->)} Build a nodeComponent from a supplied XML definition.

tfamily logicalzero \text{cole2000IsActive()} Return whether the Cole2000 implementation of the formationTime component class is active.

tfamily doublezero \text{density(<\text{double(3)}> positionSpherical->, <\text{componentType}>[\text{componentType}]->, <\text{massType}>[\text{massType}]->, <\text{weightBy}>[\text{weightBy}]->, <\text{integer}>[\text{weightIndex}]->, <\text{logical}>[\text{haloLoaded}]->) Compute the density.

tfamily void \text{deserializeRates(<\text{double}:> array<-)} Deserialize the evolvable rates from an array.

tfamily void \text{deserializeScales(<\text{double}:> array<-)} Deserialize the evolvable scales from an array.

tfamily void \text{deserializeValues(<\text{double}:> array<-)} Deserialize the evolvable quantities from an array.

tfamily void \text{destroy()} Destroy the object.

tfamily void \text{dump()} Generate an ASCII dump of all properties.

tfamily void \text{dumpRaw(<\text{integer}> fileHandle->)} Generate a binary dump of all properties.

tfamily void \text{dumpXML()} Generate an XML dump of all properties.

tfamily doublezero \text{enclosedMass(<\text{double}> radius->, <\text{componentType}>[\text{componentType}]->, <\text{massType}>[\text{massType}]->, <\text{weightBy}>[\text{weightBy}]->, <\text{integer}>[\text{weightIndex}]->, <\text{logical}>[\text{haloLoaded}]->) Compute the mass enclosed within a radius.

tfamily \textcolor{red}{\textless\text{double:}\textgreater} \text{formationTime()} Get the formationTime property of the formationTime component.

tfamily \textcolor{red}{\textless\text{type(varying\_string):}\textgreater} \text{formationTimeAttributeMatch(<\text{logical}>[\text{requireGettable}]->, <\text{logical}>[\text{requireSettable}]->, <\text{logical}>[\text{requireEvolvable}]->) Return a list of implementations that provide the given list of attributes for the formationTime property of the formationTime component.

tfamily \textcolor{red}{\textless\text{double:}\textgreater} \text{formationTimeIsGettable()} Get the formationTime property of the formationTime component.
tfamily \logicalzero formationTimeIsSettable() Specify whether the formationTime property of the formationTime component is settable.

tfamily \textcolor{red}{\textless *type(treeNode)\textgreater} host() Return a pointer to the host treeNode object.

tfamily \void hotHaloCoolingAbundancesRate(<type(abundances)> value) Cumulate to the rate of the hotHaloCoolingAbundances property of the hotHalo component.

tfamily \void hotHaloCoolingAngularMomentumRate(<double> value) Cumulate to the rate of the hotHaloCoolingAngularMomentum property of the hotHalo component.

tfamily \void hotHaloCoolingMassRate(<double> value) Cumulate to the rate of the hotHaloCoolingMass property of the hotHalo component.

tfamily \void initialize() Initialize the object.

tfamily \void nameFromIndex(<integer> count →, <varying_string>name ←) Return the name of a property given is index.

tfamily \logicalzero nullIsActive() Return whether the null implementation of the formationTime component class is active.

tfamily \void odeStepRatesInitialize() Initialize rates for evolvable properties.

tfamily \void odeStepScalesInitialize() Initialize scales for evolvable properties.

tfamily \void output(<integer> integerProperty ↔, <integer> integerBufferCount ↔, <integer(:, :)> integerBuffer ↔, <integer>doubleProperty ↔, <integer> doubleBufferCount ↔, <double(:, :)> doubleBuffer ↔, <double> time →, <integer> instance →) Generate values of outputtable properties.

tfamily \void outputCount(<integer> integerPropertyCount ↔, <integer> doublePropertyCount ↔, <double> time →, <integer> instance →) Compute a count of outputtable properties.

tfamily \void outputNames(<integer> integerProperty ↔, <char[ ]*: ]> integerPropertyNames ↔, <char[*]: ]> integerPropertyComments ↔, <double(:, :)> integerPropertyUnitsSI ↔, <integer> doubleProperty ↔, <char[*]: ]> doublePropertyNames ↔, <char[*]: ]> doublePropertyComments ↔, <double(:, :)> doublePropertyUnitsSI ↔, <double> time →, <integer> instance →) Generate names of outputtable properties.

tfamily \doublezero potential(<double> radius →, <componentType> [componentType] →, <massType> [massType] →, <logical> [haloLoaded] →) Compute the gravitational potential.

tfamily \doublezero rotationCurve(<double> radius →, <componentType> [componentType] →, <massType> [massType] →, <logical> [haloLoaded] →) Compute the rotation curve.

tfamily \doublezero rotationCurveGradient(<double> radius →, <componentType> [componentType] →, <massType> [massType] →, <logical> [haloLoaded] →) Compute the rotation curve gradient.

tfamily \intzero serializeCount() Return a count of the number of evolvable quantities to be evolved.

tfamily \void serializeRates(<double(:, :)> array →) Serialize the evolvable rates to an array.

tfamily \void serializeScales(<double(:, :)> array →) Serialize the evolvable scales to an array.

tfamily \void serializeValues(<double(:, :)> array →) Serialize the evolvable quantities to an array.
16.5. Objects

tfamily \doublezero surfaceDensity(<double(3)> positionCylindrical\rightarrow, <componentType> \rightarrow, <massType> \rightarrow, <weightBy> \rightarrow, <integer> \rightarrow, <logical> \rightarrow) Compute the surface density.

tfamily \textcolor{red}\textless type(varying\_string)\textgreater type() Return the type of this object.

tfamily nodeComponentFormationTimeCole2000

tfamily \void builder(<type(node)>componentDefinition\rightarrow) Build a nodeComponent from a supplied XML definition.

tfamily \logicalzero cole2000IsActive() Return whether the Cole2000 implementation of the formation-Time component class is active.

tfamily \doublezero density(<double(3)> positionSpherical\rightarrow, <componentType> \rightarrow, <massType> \rightarrow, <weightBy> \rightarrow, <integer> \rightarrow, <logical> \rightarrow) Compute the density.

tfamily \void deserializeRates(<double(:)> array←) Deserialize the evolvable rates from an array.

tfamily \void deserializeScales(<double(:)> array←) Deserialize the evolvable scales from an array.

tfamily \void deserializeValues(<double(:)> array←) Deserialize the evolvable quantities from an array.

tfamily \void destroy() Destroy the object.

tfamily \void dump() Generate an ASCII dump of all properties.

tfamily \void dumpRaw(<integer> fileHandle\rightarrow) Generate a binary dump of all properties.

tfamily \void dumpXML() Generate an XML dump of all properties.

tfamily \doublezero enclosedMass(<double>radius→, <componentType> \rightarrow, <massType> \rightarrow, <weightBy> \rightarrow, <integer> \rightarrow, <logical> \rightarrow) Compute the mass enclosed within a radius.

tfamily \textcolor{red}\textless double\textgreater formationTime() Get the formationTime property of the formationTime component.

tfamily \textcolor{red}\textless type(treeNode)\textgreater host() Return a pointer to the host treeNode object.

tfamily \void hotHaloCoolingAbundancesRate(<type(abundances)> value) Cumulate to the rate of the hotHaloCoolingAbundances property of the hotHalo component.
16. Coding GALACTICUS

tfamily \void hotHaloCoolingAngularMomentumRate(<double> value) Cumulate to the rate of the hotHaloCoolingAngularMomentum property of the hotHalo component.

tfamily \void hotHaloCoolingMassRate(<double> value) Cumulate to the rate of the hotHaloCoolingMass property of the hotHalo component.

tfamily \void initialize() Initialize the object.

tfamily \void nameFromIndex(<integer> count →, <varying_string> name←) Return the name of a property given is index.

tfamily \logical zero nullIsActive() Return whether the null implementation of the formationTime component class is active.

tfamily \void odeStepRatesInitialize() Initialize rates for evolvable properties.

tfamily \void odeStepScalesInitialize() Initialize scales for evolvable properties.

tfamily \void output(<integer> integerProperty↔, <integer> integerBufferCount↔, <integer(:,:)> integerBuffer↔, <integer> doubleProperty↔, <integer> doubleBufferCount↔, <double(:,:)> doubleBuffer↔, <double> time→, <integer> instance→) Generate values of outputtable properties.

tfamily \void outputCount(<integer> integerPropertyCount↔, <integer> doublePropertyCount↔, <double> time→, <integer> instance→) Compute a count of outputtable properties.

tfamily \void outputNames(<integer> integerProperty↔, <char[*](:)> integerPropertyNames↔, <char[*]( :)> integerPropertyComments↔, <double(:)> integerPropertyUnitsSI↔, <integer> doubleProperty↔, <char[*]( :)> doublePropertyNames↔, <char[*]( :)> doublePropertyComments↔, <double(:)> doublePropertyUnitsSI↔, <double> time→, <integer> instance→) Generate names of outputtable properties.

tfamily \double zero potential(<double> radius→, <componentType>[componentType]→, <massType>[massType]→, <logical> [haloLoaded]→) Compute the gravitational potential.

tfamily \void readRaw(<integer> fileHandle→) Read a binary dump of the nodeComponent from the given fileHandle.

tfamily \double zero rotationCurve(<double> radius→, <componentType> [componentType]→, <massType> [massType]→, <logical> [haloLoaded]→) Compute the rotation curve.

tfamily \double zero rotationCurveGradient(<double> radius→, <componentType> [componentType]→, <massType> [massType]→, <logical> [haloLoaded]→) Compute the rotation curve gradient.

tfamily \int zero serializeCount() Return a count of the number of evolvable quantities to be evolved.

tfamily \void serializeRates(<double(:)> array→) Serialize the evolvable rates to an array.

tfamily \void serializeScales(<double(:)> array→) Serialize the evolvable scales to an array.

tfamily \void serializeValues(<double(:)> array→) Serialize the evolvable quantities to an array.

tfamily \double zero surfaceDensity(<double(3)> positionCylindrical→, <componentType> [componentType]→, <massType> [massType]→, <weightBy> [weightBy]→, <integer> [weightIndex]→, <logical> [haloLoaded]→) Compute the surface density.

tfamily \textcolor{red}\{\textless type(varying\_string)\textgreater\} type() Return the type of this object.
16.5. Objects

tfamily nodeComponentFormationTimeNull

\texttt{tfamily void builder(\texttt{<type(node)>componentDefinition}→) Build a nodeComponent from a supplied XML definition.}

tfamily nodeComponentHostHistoryNull

tfamily \ void builder(\type(node)\ componentDefinition\ →) Build a \nodeComponent\ from a supplied \XML\ definition.

tfamily \ double zero \ density(\double(3)\ position\ spherical\ →, \componentType\ \componentType\ →, \massType\ \massType\ →, \weightBy\ \weightBy\ →, \integer\ \integer\ →, \logical\ \haloLoaded\ →) Compute the density.

tfamily \ void \ deserializeRates(\double(:)\ array←) Deserialize the evolvable rates from an array.

tfamily \ void \ deserializeScales(\double(:)\ array←) Deserialize the evolvable scales from an array.

tfamily \ void \ deserializeValues(\double(:)\ array←) Deserialize the evolvable quantities from an array.

tfamily \ void \ destroy() Destroy the object.

tfamily \ void \ dump() Generate an ASCII dump of all properties.

tfamily \ void \ dumpRaw(\integer\ fileHandle→) Generate a binary dump of all properties.

tfamily \ void \ dumpXML() Generate an XML dump of all properties.

tfamily \ double zero \ enclosedMass(\double\ radius→, \componentType\ \componentType\ →, \massType\ \massType\ →, \weightBy\ \weightBy\ →, \integer\ \integer\ →, \logical\ \haloLoaded\ →) Compute the mass enclosed within a radius.

tfamily \ textual {red} \ type(treeNode)\ host() Return a pointer to the host \treeNode\ object.

tfamily \ textual {red} \ hostMassMaximum() Get the hostMassMaximum property of the hostHistory component.

tfamily \ textual {red} \ hostMassMaximum\AttributeMatch(\logical\ \requireGettable→, \logical\ \requireSettable→, \logical\ \requireEvolvable→) Return a list of implementations that provide the given list of attributes for the hostMassMaximum property of the hostHistory component.

tfamily \ textual {red} \ hostMassMaximum\IsGettable() Get the hostMassMaximum property of the hostHistory component.

tfamily \ logical zero \ hostMassMaximum\IsSettable() Specify whether the hostMassMaximum property of the hostHistory component is settable.

tfamily \ void \ hostMassMaximum\Set(\double\ value) Set the hostMassMaximum property of the hostHistory component.

tfamily \ void \ hotHaloCooling\AbundancesRate(\type(abundances)\ value) Cumulate to the rate of the hotHaloCooling\Abundances property of the hotHalo component.

tfamily \ void \ hotHaloCooling\AngularMomentumRate(\double\ value) Cumulate to the rate of the hotHaloCooling\AngularMomentum property of the hotHalo component.

tfamily \ void \ hotHaloCooling\MassRate(\double\ value) Cumulate to the rate of the hotHaloCooling\Mass property of the hotHalo component.

tfamily \ void \ initialize() Initialize the object.
tfamily \textcolor{red}{\textless type(varying\_string)\textgreater} type() Return the type of this object.
16.5. Objects

tfamily nodeComponentHostHistoryStandard

tfamily \void builder(<\texttt{type(node)}\texttt{componentDefinition}\rightarrow) Build a nodeComponent from a supplied XML definition.

tfamily \doublezero density(<\texttt{double(3)}\texttt{positionSpherical}\rightarrow, <\texttt{componentType}\texttt{componentType}\rightarrow, <\texttt{massType}\texttt{massType}\rightarrow, <\texttt{weightBy}\texttt{weightBy}\rightarrow, <\texttt{integer}\texttt{weightIndex}\rightarrow, <\texttt{logical}\texttt{haloLoaded}\rightarrow) Compute the density.

tfamily \void deserializeRates(<\texttt{double(:)}\texttt{array}\leftarrow) Deserialize the evolvable rates from an array.

tfamily \void deserializeScales(<\texttt{double(:)}\texttt{array}\leftarrow) Deserialize the evolvable scales from an array.

tfamily \void deserializeValues(<\texttt{double(:)}\texttt{array}\leftarrow) Deserialize the evolvable quantities from an array.

tfamily \void destroy() Destroy the object.

tfamily \void dump() Generate an ASCII dump of all properties.

tfamily \void dumpRaw(<\texttt{integer}\texttt{fileHandle}\rightarrow) Generate a binary dump of all properties.

tfamily \void dumpXML() Generate an XML dump of all properties.

tfamily \doublezero enclosedMass(<\texttt{double}\texttt{radius}\rightarrow, <\texttt{componentType}\texttt{componentType}\rightarrow, <\texttt{massType}\texttt{massType}\rightarrow, <\texttt{weightBy}\texttt{weightBy}\rightarrow, <\texttt{integer}\texttt{weightIndex}\rightarrow, <\texttt{logical}\texttt{haloLoaded}\rightarrow) Compute the mass enclosed within a radius.

tfamily \textcolor{red}{\textless\texttt{type(treeNode)}\textgreater} host() Return a pointer to the host treeNode object.

tfamily \textcolor{red}{\textless\texttt{double}\textgreater} hostMassMaximum() Get the hostMassMaximum property of the hostHistory component.

tfamily \textcolor{red}{\textless\texttt{type(varying\_string)}\textgreater} hostMassMaximumAttributeMatch(<\texttt{logical}\texttt{requireGettable}\rightarrow, <\texttt{logical}\texttt{requireSettable}\rightarrow, <\texttt{logical}\texttt{requireEvolvable}\rightarrow) Return a list of implementations that provide the given list off attributes for the hostMassMaximum property of the hostHistory component.

tfamily \textcolor{red}{\textless\texttt{double}\textgreater} hostMassMaximumIsGettable() Get the hostMassMaximum property of the hostHistory component.

tfamily \logicalzero hostMassMaximumIsSettable() Specify whether the hostMassMaximum property of the hostHistory component is settable.

tfamily \void hostMassMaximumSet(<\texttt{double}\texttt{value}) Set the hostMassMaximum property of the hostHistory component.

tfamily \void hotHaloCoolingAbundancesRate(<\texttt{type(abundances)}\texttt{value}) Cumulate to the rate of the hotHaloCoolingAbundances property of the hotHalo component.

tfamily \void hotHaloCoolingAngularMomentumRate(<\texttt{double}\texttt{value}) Cumulate to the rate of the hotHaloCoolingAngularMomentum property of the hotHalo component.

tfamily \void hotHaloCoolingMassRate(<\texttt{double}\texttt{value}) Cumulate to the rate of the hotHaloCoolingMass property of the hotHalo component.

tfamily \void initialize() Initialize the object.
tfamily \void nameFromIndex(<integer> count\rightarrow, <varying_string> name\leftarrow) Return the name of a property given is index.

tfamily \logicalzero nullIsActive() Return whether the null implementation of the hostHistory component class is active.

tfamily \void odeStepRatesInitialize() Initialize rates for evolvable properties.

tfamily \void odeStepScalesInitialize() Initialize scales for evolvable properties.

tfamily \void output(<integer> integerProperty↔, <integer> integerBufferCount↔, <integer(:,:)> integerBuffer↔, <integer> doubleProperty↔, <integer> doubleBufferCount↔, <double(:,:)> doubleBuffer↔, <double> time→, <integer> instance→) Generate values of outputtable properties.

tfamily \void outputCount(<integer> integerPropertyCount↔, <integer> doublePropertyCount↔, <double> time→, <integer> instance→) Compute a count of outputtable properties.

tfamily \void outputNames(<integer> integerProperty↔, <char[*](:)> integerPropertyNames↔, <char[*](:)> integerPropertyComments↔, <double(:)> integerPropertyUnitsSI↔, <integer> doubleProperty↔, <char[*](:)> doublePropertyNames↔, <char[*](:)> doublePropertyComments↔, <double(:)> doublePropertyUnitsSI↔, <double> time→, <integer> instance→) Generate names of outputtable properties.

tfamily \doublezero potential(<double> radius→, <componentType> [componentType]→, <massType> [massType]→, <logical> [haloLoaded]→) Compute the gravitational potential.

tfamily \void readRaw(<integer> fileHandle→) Read a binary dump of the nodeComponent from the given fileHandle.

tfamily \doublezero rotationCurve(<double> radius→, <componentType> [componentType]→, <massType> [massType]→, <logical> [haloLoaded]→) Compute the rotation curve.

tfamily \doublezero rotationCurveGradient(<double> radius→, <componentType> [componentType]→, <massType> [massType]→, <logical> [haloLoaded]→) Compute the rotation curve gradient.

tfamily \intzero serializeCount() Return a count of the number of evolvable quantities to be evolved.

tfamily \void serializeRates(<double(:)> array→) Serialize the evolvable rates to an array.

tfamily \void serializeScales(<double(:)> array→) Serialize the evolvable scales to an array.

tfamily \void serializeValues(<double(:)> array→) Serialize the evolvable quantities to an array.

tfamily \logicalzero standardIsActive() Return whether the standard implementation of the hostHistory component class is active.

tfamily \doublezero surfaceDensity(<double(3)> positionCylindrical→, <componentType> [componentType]→, <massType> [massType]→, <weightBy> [weightBy]→, <integer> [weightIndex]→, <logical> [haloLoaded]→) Compute the surface density.

tfamily \textcolor{red}{\textless type(varying}_{\_}\_string}\textgreater type() Return the type of this object.
16.5. Objects

```
tfamily nodeComponentHotHalo

  tfamily \textcolor{red}{\textless type(abundances)\textgreater} abundances() Get the abundances property of the hotHalo component.

  tfamily \textcolor{red}{\textless type(varying\_string)\textgreater} abundancesAttributeMatch(<logical>[requireGettable] → <logical>[requireSettable] → <logical>[requireEvolvable] → ) Return a list of implementations that provide the given list of attributes for the abundances property of the hotHalo component.

  tfamily \textcolor{red}{\textless type(abundances)\textgreater} abundancesCold() Get the abundancesCold property of the hotHalo component.

  tfamily \textcolor{red}{\textless type(varying\_string)\textgreater} abundancesColdAttributeMatch(<logical>[requireGettable] → <logical>[requireSettable] → <logical>[requireEvolvable] → ) Return a list of implementations that provide the given list of attributes for the abundancesCold property of the hotHalo component.

  tfamily \intzero abundancesColdCount() Compute the count of evolvable quantities in the abundancesCold property of the HotHaloColdMode component.

  tfamily \textcolor{red}{\textless type(abundances)\textgreater} abundancesColdIsGettable() Get the abundancesCold property of the hotHalo component.

  tfamily \logical zero abundancesColdIsSettable() Specify whether the abundancesCold property of the hotHalo component is settable.

  tfamily \void abundancesColdRate(<type(abundances)> value) Cumulate to the rate of the abundancesCold property of the HotHaloColdMode component.

  tfamily \void abundancesColdScale(<type(abundances)> value) Set the scale of the abundancesCold property of the HotHaloColdMode component.

  tfamily \void abundancesColdSet(<type(abundances)> value) Set the abundancesCold property of the hotHalo component.

  tfamily \intzero abundancesCount() Compute the count of evolvable quantities in the abundances property of the HotHaloStandard component.

  tfamily \textcolor{red}{\textless double\textgreater} angularMomentum() Get the angularMomentum property of the hotHalo component.

  tfamily \logical zero abundancesIsGettable() Specify whether the abundances property of the hotHalo component is settable.

  tfamily \void abundancesRate(<type(abundances)> value) Cumulate to the rate of the abundances property of the HotHaloStandard component.

  tfamily \void abundancesScale(<type(abundances)> value) Set the scale of the abundances property of the HotHaloStandard component.

  tfamily \void abundancesSet(<type(abundances)> value) Set the abundances property of the hotHalo component.

  tfamily \textcolor{red}{\textless double\textgreater} angularMomentum() Get the angularMomentum property of the hotHalo component.
```
tfamily \textcolor{red}{\textless double\textgreater} angularMomentumAttributeMatch(<logical>[requireGettable]→, <logical>[requireSettable]→, <logical>[requireEvolvable]→) Return a list of implementations that provide the given list of attributes for the angularMomentum property of the hotHalo component.

tfamily \textcolor{red}{\textless double\textgreater} angularMomentumCold() Get the angularMomentumCold property of the hotHalo component.

tfamily \textcolor{red}{\textless double\textgreater} angularMomentumColdAttributeMatch(<logical>[requireGettable]→, <logical>[requireSettable]→, <logical>[requireEvolvable]→) Return a list of implementations that provide the given list of attributes for the angularMomentumCold property of the hotHalo component.

tfamily \textcolor{red}{\textless double\textgreater} angularMomentumColdCount() Compute the count of evolvable quantities in the angularMomentumCold property of the HotHaloColdMode component.

tfamily \textcolor{red}{\textless double\textgreater} angularMomentumColdIsGettable() Get the angularMomentumCold property of the hotHalo component.

tfamily \textcolor{red}{\textless double\textgreater} angularMomentumColdIsSettable() Specify whether the angularMomentumCold property of the hotHalo component is settable.

tfamily \textcolor{red}{\textless double\textgreater} angularMomentumColdRate(<double> value) Cumulate to the rate of the angularMomentumCold property of the HotHaloColdMode component.

tfamily \textcolor{red}{\textless double\textgreater} angularMomentumColdScale(<double> value) Set the scale of the angularMomentumCold property of the HotHaloColdMode component.

tfamily \textcolor{red}{\textless double\textgreater} angularMomentumColdSet(<double> value) Set the angularMomentumCold property of the hotHalo component.

tfamily \textcolor{red}{\textless double\textgreater} angularMomentumCount() Compute the count of evolvable quantities in the angularMomentum property of the HotHaloStandard component.

tfamily \textcolor{red}{\textless double\textgreater} angularMomentumIsGettable() Get the angularMomentum property of the hotHalo component.

tfamily \textcolor{red}{\textless double\textgreater} angularMomentumIsSettable() Specify whether the angularMomentum property of the hotHalo component is settable.

tfamily \textcolor{red}{\textless double\textgreater} angularMomentumRate(<double> value) Cumulate to the rate of the angularMomentum property of the HotHaloStandard component.

tfamily \textcolor{red}{\textless double\textgreater} angularMomentumScale(<double> value) Set the scale of the angularMomentum property of the HotHaloStandard component.

tfamily \textcolor{red}{\textless double\textgreater} angularMomentumSet(<double> value) Set the angularMomentum property of the hotHalo component.

tfamily \textcolor{red}{\textless double\textgreater} builder(<*type(node)>componentDefinition→) Build a nodeComponent from a supplied XML definition.

tfamily \textcolor{red}{\textless double\textgreater} chemicals() Get the chemicals property of the hotHalo component.
16.5. Objects

tfamily \textcolor{red}{\textless\textless varying\_string\rangle\textless\textgreater} chemicalsAttributeMatch(\langle\text{logical}\rangle[\text{requireGettable}]
\rightarrow, \langle\text{logical}\rangle[\text{requireSettable}]
\rightarrow, \langle\text{logical}\rangle[\text{requireEvolvable}]
\rightarrow) Return a list of implementations that provide the given list of attributes for the chemicals property of the hotHalo component.

tfamily \intzero chemicalsCount() Compute the count of evolvable quantities in the chemicals property of the HotHaloStandard component.

tfamily \textcolor{red}{\textless\textless chemicalAbundances\rangle\textless\textgreater} chemicalsIsGettable() Get the chemicals property of the hotHalo component.

tfamily \logicalzero chemicalsIsSettable() Specify whether the chemicals property of the hotHalo component is settable.

tfamily \void chemicalsRate(\langle\text{type(chemicalAbundances)}\rangle\text{value}) Cumulate to the rate of the chemicals property of the HotHaloStandard component.

tfamily \void chemicalsScale(\langle\text{type(chemicalAbundances)}\rangle\text{value}) Set the scale of the chemicals property of the HotHaloStandard component.

tfamily \void chemicalsSet(\langle\text{type(chemicalAbundances)}\rangle\text{value}) Set the chemicals property of the hotHalo component.

tfamily \logicalzero coldModeIsActive() Return whether the coldMode implementation of the hotHalo component class is active.

tfamily \doublezero density(\langle\text{double(3)}\rangle\text{positionSpherical}\rightarrow, \langle\text{componentType}\rangle[\text{componentType}]\rightarrow,
\langle\text{massType}\rangle[\text{massType}]\rightarrow, \langle\text{weightBy}\rangle[\text{weightBy}]\rightarrow, \langle\text{integer}\rangle[\text{weightIndex}]\rightarrow, \langle\text{logical}\rangle[\text{haloLoaded}]\rightarrow) Compute the density.

tfamily \void deserializeRates(\langle\text{double(\_)}\rangle\text{array}←) Deserialize the evolvable rates from an array.

tfamily \void deserializeScales(\langle\text{double(\_)}\rangle\text{array}←) Deserialize the evolvable scales from an array.

tfamily \void deserializeValues(\langle\text{double(\_)}\rangle\text{array}←) Deserialize the evolvable quantities from an array.

tfamily \void destroy() Destroy the object.

tfamily \void dump() Generate an ASCII dump of all properties.

tfamily \void dumpRaw(\langle\text{integer}\rangle\text{fileHandle}→) Generate a binary dump of all properties.

tfamily \void dumpXML() Generate an XML dump of all properties.

tfamily \doublezero enclosedMass(\langle\text{double}\rangle\text{radius}→, \langle\text{componentType}\rangle[\text{componentType}]\rightarrow,
\langle\text{massType}\rangle[\text{massType}]\rightarrow, \langle\text{weightBy}\rangle[\text{weightBy}]→, \langle\text{integer}\rangle[\text{weightIndex}]→, \langle\text{logical}\rangle[\text{haloLoaded}]→) Compute the mass enclosed within a radius.

tfamily \textcolor{red}{\textless\textless double\textgreater} heatSource() Get the heatSource property of the hotHalo component.

tfamily \textcolor{red}{\textless\textless varying\_string\rangle\textless\textgreater} heatSourceAttributeMatch(\langle\text{logical}\rangle[\text{requireGettable}]
\rightarrow, \langle\text{logical}\rangle[\text{requireSettable}]
\rightarrow, \langle\text{logical}\rangle[\text{requireEvolvable}]
\rightarrow) Return a list of implementations that provide the given list of attributes for the heatSource property of the hotHalo component.

tfamily \intzero heatSourceCount() Compute the count of evolvable quantities in the heatSource property of the HotHaloStandard component.
tfamily \textcolor{red}{\textless double\textgreater} heatSourceIsGettable() Get the \texttt{heatSource} property of the \texttt{hotHalo} component.

tfamily \textcolor{red}{\textlesstype(abundances)\textgreater} hotHaloCoolingAbundancesIsGettable() Get the \texttt{hotHaloCoolingAbundances} property of the \texttt{hotHalo} component.

tfamily \logicalzero heatSourceIsSettable() Specify whether the \texttt{heatSource} property of the \texttt{hotHalo} component is settable.

tfamily \void heatSourceRate(<double> value) Cumulate to the rate of the \texttt{heatSource} property of the \texttt{HotHaloStandard} component.

tfamily \textcolor{red}{\textless *type(treeNode)\textgreater} host() Return a pointer to the host \texttt{treeNode} object.

tfamily \textcolor{red}{\textlesstype(\_string)(:)\textgreater} hotHaloCoolingAbundancesAttributeMatch(<logical>[requireGettable]→, <logical>[requireSettable]→, <logical>[requireEvolvable]→) Return a list of implementations that provide the given list of attributes for the \texttt{hotHaloCoolingAbundances} property of the \texttt{hotHalo} component.

tfamily \intzero hotHaloCoolingAbundancesCount() Compute the count of evolvable quantities in the \texttt{hotHaloCoolingAbundances} property of the \texttt{HotHaloStandard} component.

tfamily \textcolor{red}{\textless double\textgreater} hotHaloCoolingAngularMomentum() Get the \texttt{hotHaloCoolingAngularMomentum} property of the \texttt{hotHalo} component.

tfamily \textcolor{red}{\textlesstype(\_string)(:)\textgreater} hotHaloCoolingAngularMomentumAttributeMatch(<logical>[requireGettable]→, <logical>[requireSettable]→, <logical>[requireEvolvable]→) Return a list of implementations that provide the given list of attributes for the \texttt{hotHaloCoolingAngularMomentum} property of the \texttt{hotHalo} component.

tfamily \intzero hotHaloCoolingAngularMomentumCount() Compute the count of evolvable quantities in the \texttt{hotHaloCoolingAngularMomentum} property of the \texttt{HotHaloStandard} component.
tfamily \ void hotHaloCoolingAngularMomentumRate(<double> value) Cumulate to the rate of the hotHaloCoolingAngularMomentum property of the hotHalo component.

tfamily \ void hotHaloCoolingAngularMomentumRateFunction(<function()> deferredFunction) Set the function to be used for the rate method of the hotHaloCoolingAngularMomentum property of the hotHalo component.

tfamily \ logical zero hotHaloCoolingAngularMomentumRateIsAttached() Return whether the rate method of the hotHaloCoolingAngularMomentum property of the hotHalo component has been attached to a function.

tfamily \ textcolor{red}{\textless double\textgreater} hotHaloCoolingMass() Get the hotHaloCoolingMass property of the hotHalo component.

tfamily \ textcolor{red}{\textless logical\textgreater} hotHaloCoolingMassIsGettable() Get the hotHaloCoolingMass property of the hotHalo component.

tfamily \ void hotHaloCoolingMassRate(<double> value) Cumulate to the rate of the hotHaloCoolingMass property of the hotHalo component.

tfamily \ void hotHaloCoolingMassRateFunction(<function()> deferredFunction) Set the function to be used for the rate method of the hotHaloCoolingMass property of the hotHalo component.

tfamily \ logical zero hotHaloCoolingMassRateIsAttached() Return whether the rate method of the hotHaloCoolingMass property of the hotHalo component has been attached to a function.

tfamily \ void initialize() Initialize the object.

tfamily \ textcolor{red}{\textless logical\textgreater} isInitialized() Get the isInitialized property of the hotHalo component.

tfamily \ textcolor{red}{\textless logical\textgreater} isInitializedIsGettable() Get the isInitialized property of the hotHalo component.

tfamily \ void isInitializedSet(<logical> value) Set the isInitialized property of the hotHalo component.

493
16. Coding GALACTICUS

tfamily \textcolor{red}\{\textless double\textgreater\} mass() Get the mass property of the hotHalo component.

tfamily \textcolor{red}\{\textless double\textgreater\} massAttributeMatch(<logical>[requireGettable]\rightarrow, <logical>[requireSettable]\rightarrow, <logical>[requireEvolvable]\rightarrow) Return a list of implementations that provide the given list off attributes for the mass property of the hotHalo component.

tfamily \textcolor{red}\{\textless double\textgreater\} massCold() Get the massCold property of the hotHalo component.

tfamily \textcolor{red}\{\textless double\textgreater\} massColdAttributeMatch(<logical>[requireGettable]\rightarrow, <logical>[requireSettable]\rightarrow, <logical>[requireEvolvable]\rightarrow) Return a list of implementations that provide the given list off attributes for the massCold property of the hotHalo component.

tfamily \intzero massColdCount() Compute the count of evolvable quantities in the massCold property of the HotHaloColdMode component.

tfamily \textcolor{red}\{\textless double\textgreater\} massColdIsGettable() Get the massCold property of the hotHalo component.

tfamily \logicalzero massColdIsSettable() Specify whether the massCold property of the hotHalo component is settable.

tfamily \void massColdRate(<double> value) Cumulate to the rate of the massCold property of the HotHaloColdMode component.

tfamily \void massColdScale(<double> value) Set the scale of the massCold property of the HotHaloColdMode component.

tfamily \void massColdSet(<double> value) Set the massCold property of the hotHalo component.

tfamily \intzero massCount() Compute the count of evolvable quantities in the mass property of the HotHaloStandard component.

tfamily \textcolor{red}\{\textless double\textgreater\} massIsGettable() Get the mass property of the hotHalo component.

tfamily \logicalzero massIsSettable() Specify whether the mass property of the hotHalo component is settable.

tfamily \void massRate(<double> value) Cumulate to the rate of the mass property of the HotHaloStandard component.

tfamily \void massScale(<double> value) Set the scale of the mass property of the HotHaloStandard component.

tfamily \void massSet(<double> value) Set the mass property of the hotHalo component.

tfamily \textcolor{red}\{\textless double\textgreater\} massSink() Get the massSink property of the hotHalo component.

tfamily \textcolor{red}\{\textless double\textgreater\} massSinkAttributeMatch(<logical>[requireGettable]\rightarrow, <logical>[requireSettable]\rightarrow, <logical>[requireEvolvable]\rightarrow) Return a list of implementations that provide the given list off attributes for the massSink property of the hotHalo component.
tfamily \textcolor{red}{\textless double\textgreater} massSinkIsGettable() Get the massSink property of the hotHalo component.

tfamily \logicalzero massSinkIsSettable() Specify whether the massSink property of the hotHalo component is settable.

tfamily \void massSinkRate(<double> value) Cumulate to the rate of the massSink property of the HotHaloStandard component.

tfamily \void nameFromIndex(<integer> count →, <varying_string>name←) Return the name of a property given is index.

tfamily \logicalzero nullIsActive() Return whether the null implementation of the hotHalo component class is active.

tfamily \void odeStepRatesInitialize() Initialize rates for evolvable properties.

tfamily \void odeStepScalesInitialize() Initialize scales for evolvable properties.

tfamily \textcolor{red}{\textless double\textgreater} outerRadius() Get the outerRadius property of the hotHalo component.

tfamily \textcolor{red}{\textless double\textgreater} outflowedAbundances() Get the outflowedAbundances property of the hotHalo component.

tfamily \void outerRadiusScale(<double> value) Set the scale of the outerRadius property of the HotHaloStandard component.

tfamily \void outerRadiusSet(<double> value) Set the outerRadius property of the hotHalo component.

tfamily \logicalzero outflowingAngularMomentumIsSettable() Specify whether the \textcolor{red}{\textlesstype(abundances)\textgreater} outflowingAngularMomentum property of the hotHalo component is settable.

tfamily \void outflowingAngularMomentumRate(<\text{double}> value) Cumulate to the rate of the \textcolor{red}{\textlesstype(abundances)\textgreater} outflowingAngularMomentum property of the HotHaloStandard component.

tfamily \textcolor{red}{\textlesstype(abundances)\textgreater} outflowingMass() Get the \textcolor{red}{\textlesstype(abundances)\textgreater} outflowingMass property of the hotHalo component.
tfamily \textcolor{red}{\textless\textgreater}

\textlesstype(outflowingMassAttributeMatch(<\textlesstype[requireGettable]→,<\textlesstype[requireSettable]→,<\textlesstype[requireEvolvable]→))

Return a list of implementations that provide the given list of attributes for the \textlesstype(outflowingMass) property of the hotHalo component.

tfamily \intzero

\textlesstype(outflowingMassCount())

Compute the count of evolvable quantities in the \textlesstype(outflowingMass) property of the HotHaloStandard component.

tfamily \textcolor{red}{\textless\textgreater}

\textlesstype(outflowingMassIsGettable())

Get the \textlesstype(outflowingMass) property of the hotHalo component.

tfamily \logicalzero

\textlesstype(outflowingMassIsSettable())

Specify whether the \textlesstype(outflowingMass) property of the hotHalo component is settable.

tfamily \void

\textlesstype(outflowingMassRate(<\textlesstype[double] value))

Cumulate to the rate of the \textlesstype(outflowingMass) property of the HotHaloStandard component.

tfamily \logicalzero

\textlesstype(outflowTrackingIsActive())

Return whether the outflowTracking implementation of the hotHalo component class is active.

tfamily \void

\textlesstype(output(<\textlesstype[integer] integerProperty↔,<\textlesstype[integer] integerBufferCount↔,<\textlesstype[integer] integerBuffer↔,<\textlesstype[integer] doubleProperty↔,<\textlesstype[integer] doubleBufferCount↔,<\textlesstype[double] time→,<\textlesstype[integer] instance→)))

Generate values of outputtable properties.

tfamily \void

\textlesstype(outputCount(<\textlesstype[integer] integerPropertyCount↔,<\textlesstype[integer] doublePropertyCount↔,<\textlesstype[double] time→,<\textlesstype[integer] instance→))

Compute a count of outputtable properties.

tfamily \void

\textlesstype(outputNames(<\textlesstype[integer] integerProperty↔,<\textlesstype[char\[*\]() integerPropertyNames↔,<\textlesstype[char\[*\]() integerPropertyComments↔,<\textlesstype[double] integerPropertyUnitsSI↔,<\textlesstype[integer] doubleProperty↔,<\textlesstype[char\[*\]() doublePropertyNames↔,<\textlesstype[char\[*\]() doublePropertyComments↔,<\textlesstype[double] doublePropertyUnitsSI↔,<\textlesstype[double] time→,<\textlesstype[integer] instance→))

Generate names of outputtable properties.

tfamily \doublezero

\textlesstype(potential(<\textlesstype[double] radius→,<\textlesstype[componentType] componentType→,<\textlesstype[massType] massType→,<\textlesstype[logical] haloLoaded→))

Compute the gravitational potential.

tfamily \doublezero

\textlesstype(rotationCurve(<\textlesstype[double] radius→,<\textlesstype[componentType] componentType→,<\textlesstype[massType] massType→,<\textlesstype[logical] haloLoaded→))

Compute the rotation curve.

tfamily \doublezero

\textlesstype(rotationCurveGradient(<\textlesstype[double] radius→,<\textlesstype[componentType] componentType→,<\textlesstype[massType] massType→,<\textlesstype[logical] haloLoaded→))

Compute the rotation curve gradient.

tfamily \intzero

\textlesstype(serializeCount())

Return a count of the number of evolvable quantities to be evolved.

tfamily \void

\textlesstype(serializeRates(<\textlesstype[double] array→))

Serialize the evolvable rates to an array.

tfamily \void

\textlesstype(serializeScales(<\textlesstype[double] array→))

Serialize the evolvable scales to an array.

tfamily \logicalzero

\textlesstype(serializeValues(<\textlesstype[double] array→))

Serialize the evolvable quantities to an array.

tfamily \logicalzero

\textlesstype(standardIsActive())

Return whether the standard implementation of the hotHalo component class is active.

tfamily \textcolor{red}{\textlesstype(abundances)\textless\textgreater}

\textlesstype(strippedAbundances())

Get the \textlesstype(strippedAbundances) property of the hotHalo component.
16.5. Objects

tfamily \textcolor{red}{\textless type(varying\_string):\textgreater} strippedAbundancesAttributeMatch(<logical>[requireGettable]→, <logical>[requireSettable]→, <logical>[requireEvolvable]→) Return a list of implementations that provide the given list of attributes for the strippedAbundances property of the hotHalo component.

tfamily \intzero strippedAbundancesCount() Compute the count of evolvable quantities in the strippedAbundances property of the HotHaloStandard component.

tfamily \textcolor{red}{\textless type(abundances):\textgreater} strippedAbundancesIsGettable() Get the strippedAbundances property of the hotHalo component.

tfamily \logicalzero strippedAbundancesIsSettable() Specify whether the strippedAbundances property of the hotHalo component is settable.

tfamily \void strippedAbundancesRate(<type(abundances)> value) Cumulate to the rate of the strippedAbundances property of the HotHaloStandard component.

tfamily \void strippedAbundancesScale(<type(abundances)> value) Set the scale of the strippedAbundances property of the HotHaloStandard component.

tfamily \void strippedAbundancesSet(<type(abundances)> value) Set the strippedAbundances property of the hotHalo component.

tfamily \textcolor{red}{\textless double:\textgreater} strippedMass() Get the strippedMass property of the hotHalo component.

tfamily \textcolor{red}{\textless type(abundances):\textgreater} strippedMassAttributeMatch(<logical>[requireGettable]→, <logical>[requireSettable]→, <logical>[requireEvolvable]→) Return a list of implementations that provide the given list of attributes for the strippedMass property of the hotHalo component.

tfamily \intzero strippedMassCount() Compute the count of evolvable quantities in the strippedMass property of the HotHaloStandard component.

tfamily \textcolor{red}{\textless double:\textgreater} strippedMassIsGettable() Get the strippedMass property of the hotHalo component.

tfamily \logicalzero strippedMassIsSettable() Specify whether the strippedMass property of the hotHalo component is settable.

tfamily \void strippedMassRate(<double> value) Cumulate to the rate of the strippedMass property of the HotHaloStandard component.

tfamily \void strippedMassScale(<double> value) Set the scale of the strippedMass property of the HotHaloStandard component.

tfamily \void strippedMassSet(<double> value) Set the strippedMass property of the hotHalo component.

tfamily \doublezero surfaceDensity(<double(3)> positionCylindrical→, <componentType>[componentType]→, <massType>[massType]→, <weightBy>[weightBy]→, <integer>[weightIndex]→, <logical>[haloLoaded]→) Compute the surface density.

tfamily \textcolor{red}{\textless type(abundances):\textgreater} trackedOutflowAbundances() Get the trackedOutflowAbundances property of the hotHalo component.
16. Coding Galacticus

tfamily \textcolor{red}{\textless type(varying\_string):}\textgreater\ trackedOutflowAbundancesAttributeMatch(<logical>[requireGettable]→, <logical>[requireSettable]→, <logical>[requireEvolvable]→)
Return a list of implementations that provide the given list of attributes for the trackedOutflowAbundances property of the hotHalo component.

tfamily \intzero trackedOutflowAbundancesCount() Compute the count of evolvable quantities in the trackedOutflowAbundances property of the HotHaloOutflowTracking component.

tfamily \textcolor{red}{\textless type(abundances):}\textgreater\ trackedOutflowAbundancesIsGettable()
Get the trackedOutflowAbundances property of the hotHalo component.

tfamily \logicalzero trackedOutflowAbundancesIsSettable() Specify whether the trackedOutflowAbundances property of the hotHalo component is settable.

tfamily \void trackedOutflowAbundancesRate(<type(abundances)> value) Cumulate to the rate of the trackedOutflowAbundances property of the HotHaloOutflowTracking component.

tfamily \void trackedOutflowAbundancesScale(<double> value) Set the scale of the trackedOutflowAbundances property of the HotHaloOutflowTracking component.

tfamily \void trackedOutflowAbundancesSet(<double> value) Set the trackedOutflowAbundances property of the hotHalo component.

tfamily \textcolor{red}{\textless double:}\textgreater\ trackedOutflowMass() Get the trackedOutflowMass property of the hotHalo component.

tfamily \textcolor{red}{\textless double:}\textgreater\ trackedOutflowMassIsGettable()
Get the trackedOutflowMass property of the hotHalo component.

tfamily \logicalzero trackedOutflowMassIsSettable() Specify whether the trackedOutflowMass property of the hotHalo component is settable.

tfamily \void trackedOutflowMassRate(<double> value) Cumulate to the rate of the trackedOutflowMass property of the HotHaloOutflowTracking component.

tfamily \void trackedOutflowMassScale(<double> value) Set the scale of the trackedOutflowMass property of the HotHaloOutflowTracking component.

tfamily \void trackedOutflowMassSet(<double> value) Set the trackedOutflowMass property of the hotHalo component.

tfamily \textcolor{red}{\textless double:}\textgreater\ unaccretedMass() Get the unaccretedMass property of the hotHalo component.
16.5. Objects

```plaintext
tfamily \textcolor{red}{\textless type(abundances)\textgreater} abundances() Get the abundances property of the hotHalo component.

tfamily \textcolor{red}{\textless type(abundances)\textgreater} abundancesCold() Get the abundancesCold property of the hotHalo component.

tfamily \textcolor{red}{\textless type(abundances)\textgreater} abundancesColdIsGettable() Get the abundancesCold property of the hotHalo component.

tfamily \logicalzero abundancesColdIsSettable() Specify whether the abundancesCold property of the hotHalo component is settable.

tfamily \void abundancesColdRate(<type(abundances)> value) Cumulate to the rate of the abundancesCold property of the HotHaloColdMode component.

tfamily \void abundancesColdScale(<type(abundances)> value) Set the scale of the abundancesCold property of the HotHaloColdMode component.
```

501
tfamily \textcolor{red}{\textlesstype(abundances)} abundancesColdSet(<type(abundances)> value) Set the abundancesCold property of the hotHalo component.

tfamily \intzero abundancesCount() Compute the count of evolvable quantities in the abundances property of the HotHaloStandard component.

tfamily \textcolor{red}{\textlesstype(abundances)} abundancesIsGettable() Get the abundances property of the hotHalo component.

tfamily \logicalzero abundancesIsSettable() Specify whether the abundances property of the hotHalo component is settable.

tfamily \void abundancesRate(<type(abundances)> value) Cumulate to the rate of the abundances property of the HotHaloStandard component.

tfamily \void abundancesScale(<type(abundances)> value) Set the scale of the abundances property of the HotHaloStandard component.

tfamily \void abundancesSet(<type(abundances)> value) Set the abundances property of the hotHalo component.

tfamily \textcolor{red}{\textlesstype(varying\_string)(:)} angularMomentum() Get the angularMomentum property of the hotHalo component.

tfamily \textcolor{red}{\textlesstype(varying\_string)(:)} angularMomentumAttributeMatch(<logical>[requireGettable]→, <logical>[requireSettable]→, <logical>[requireEvolvable]→) Return a list of implementations that provide the given list of attributes for the angularMomentum property of the hotHalo component.

tfamily \void angularMomentumCold(<double> value) Cumulate to the rate of the angularMomentumCold property of the HotHaloColdMode component.

tfamily \void angularMomentumColdScale(<double> value) Set the scale of the angularMomentumCold property of the HotHaloColdMode component.

tfamily \void angularMomentumColdSet(<double> value) Set the angularMomentumCold property of the hotHalo component.

502
tfamily \textcolor{red}{\textless\textbf{double}\textgreater } angularMomentumIsGettable() Get the angularMomentum property of the hotHalo component.

tfamily \textcolor{red}{\textless\textbf{logical}\textgreater } angularMomentumIsSettable() Specify whether the angularMomentum property of the hotHalo component is settable.

tfamily \textcolor{red}{\textless\textbf{double}\textgreater } angularMomentumRate(<double> value) Cumulate to the rate of the angularMomentum property of the HotHaloStandard component.

tfamily \textcolor{red}{\textless\textbf{double}\textgreater } angularMomentumScale(<double> value) Set the scale of the angularMomentum property of the HotHaloStandard component.

tfamily \textcolor{red}{\textless\textbf{double}\textgreater } angularMomentumSet(<double> value) Set the angularMomentum property of the hotHalo component.

tfamily \textcolor{red}{\textless\textbf{double}\textgreater } angularMomentumCount() Compute the count of evolvable quantities in the angularMomentum property of the HotHaloStandard component.

tfamily \textcolor{red}{\textless\textbf{double}\textgreater } chemicals() Get the chemicals property of the hotHalo component.

tfamily \textcolor{red}{\textless\textbf{logical}\textgreater } chemicalsIsGettable() Get the chemicals property of the hotHalo component.

tfamily \textcolor{red}{\textless\textbf{logical}\textgreater } chemicalsIsSettable() Specify whether the chemicals property of the hotHalo component is settable.

tfamily \textcolor{red}{\textless\textbf{type(chemicalAbundances)\textgreater } chemicalsIsGettable() Get the chemicals property of the HotHaloStandard component.

tfamily \textcolor{red}{\textless\textbf{type(chemicalAbundances)\textgreater } chemicalsIsSettable() Specify whether the chemicals property of the hotHalo component is settable.

tfamily \textcolor{red}{\textless\textbf{type(chemicalAbundances)\textgreater } chemicalsRate(<type(chemicalAbundances)> value) Cumulate to the rate of the chemicals property of the HotHaloStandard component.

tfamily \textcolor{red}{\textless\textbf{type(chemicalAbundances)\textgreater } chemicalsScale(<type(chemicalAbundances)> value) Set the scale of the chemicals property of the HotHaloStandard component.

tfamily \textcolor{red}{\textless\textbf{type(chemicalAbundances)\textgreater } chemicalsSet(<type(chemicalAbundances)> value) Set the chemicals property of the hotHalo component.

tfamily \textcolor{red}{\textless\textbf{logical}\textgreater } coldModeIsActive() Return whether the coldMode implementation of the hotHalo component class is active.

tfamily \textcolor{red}{\textless\textbf{function()}\textgreater } createFunctionSet(<function()> Set the function used to create HotHaloStandard components.

tfamily \double \textcolor{red}{\textless\textbf{double}(3)\textgreater } positionSpherical→, <componentType> [componentType]→, <massType> [massType]→, <weightBy> [weightBy]→, <integer> [weightIndex]→, <logical> [haloLoaded]→ Compute the density.

tfamily \textcolor{red}{\textless\textbf{int}\textgreater } chemicalsCount() Compute the count of evolvable quantities in the chemicals property of the HotHaloStandard component.

tfamily \textcolor{red}{\textless\textbf{int}\textgreater } chemicalsIsGettable() Get the chemicals property of the hotHalo component.

tfamily \textcolor{red}{\textless\textbf{logical}\textgreater } chemicalsIsSettable() Specify whether the chemicals property of the hotHalo component is settable.

tfamily \textcolor{red}{\textless\textbf{type(chemicalAbundances)\textgreater } chemicalsRate(<type(chemicalAbundances)> value) Cumulate to the rate of the chemicals property of the HotHaloStandard component.

tfamily \textcolor{red}{\textless\textbf{type(chemicalAbundances)\textgreater } chemicalsScale(<type(chemicalAbundances)> value) Set the scale of the chemicals property of the HotHaloStandard component.

tfamily \textcolor{red}{\textless\textbf{type(chemicalAbundances)\textgreater } chemicalsSet(<type(chemicalAbundances)> value) Set the chemicals property of the hotHalo component.

tfamily \void deserializeRates(\textless\text{double}\textgreater\ array←) Deserialize the evolvable rates from an array.

tfamily \void deserializeScales(\textless\text{double}\textgreater\ array←) Deserialize the evolvable scales from an array.

tfamily \void deserializeValues(\textless\text{double}\textgreater\ array←) Deserialize the evolvable quantities from an array.

tfamily \void destroy() Destroy the object.

tfamily \void dump() Generate an ASCII dump of all properties.

tfamily \void dumpRaw(\textless\text{integer}\textgreater\ fileHandle→) Generate a binary dump of all properties.

tfamily \void dumpXML() Generate an XML dump of all properties.

tfamily \textcolor{red}{\textless\text{double}\textgreater} heatSource() Get the \textcolor{red}{heatSource} property of the \textcolor{red}{hotHalo} component.

tfamily \textcolor{red}{\textless\text{type(abundances)}\textgreater} hotHaloCoolingAbundances() Get the \textcolor{red}{hotHaloCoolingAbundances} property of the \textcolor{red}{hotHalo} component.

504
16.5. Objects

tfamily \textcolor{red}{\textless type(abundances)}, \textgreater{ hotHaloCoolingAbundancesIsGettable() Get the hotHaloCoolingAbundances property of the hotHalo component.

tfamily \logicalzero hotHaloCoolingAbundancesIsSettable() Specify whether the hotHaloCoolingAbundances property of the hotHalo component is settable.

tfamily \void hotHaloCoolingAbundancesRate(<type(abundances)> value) Cumulate to the rate of the hotHaloCoolingAbundances property of the hotHalo component.

tfamily \void hotHaloCoolingAbundancesRateFunction(<function()> deferredFunction) Set the function to be used for the rate method of the hotHaloCoolingAbundances property of the hotHalo component.

tfamily \logicalzero hotHaloCoolingAbundancesRateIsAttached() Return whether the rate method of the hotHaloCoolingAbundances property of the hotHalo component has been attached to a function.

tfamily \textcolor{red}{\textless double\textgreater} hotHaloCoolingAngularMomentum() Get the hotHaloCoolingAngularMomentum property of the hotHalo component.

tfamily \textcolor{red}{\textless type(varying \_string):\textgreater} hotHaloCoolingAngularMomentumAttributeMatch(<logical>[requireGettable]→, <logical>[requireSettable]→, <logical>[requireEvolvable]→) Return a list of implementations that provide the given list of attributes for the hotHaloCoolingAngularMomentum property of the hotHalo component.

tfamily \intzero hotHaloCoolingAngularMomentumCount() Compute the count of evolvable quantities in the hotHaloCoolingAngularMomentum property of the HotHaloStandard component.

tfamily \textcolor{red}{\textless double\textgreater} hotHaloCoolingAngularMomentumIsGettable() Get the hotHaloCoolingAngularMomentum property of the hotHalo component.

tfamily \logicalzero hotHaloCoolingAngularMomentumIsSettable() Specify whether the hotHaloCoolingAngularMomentum property of the hotHalo component is settable.

tfamily \void hotHaloCoolingAngularMomentumRate(<double> value) Cumulate to the rate of the hotHaloCoolingAngularMomentum property of the hotHalo component.

tfamily \void hotHaloCoolingAngularMomentumRateFunction(<function()> deferredFunction) Set the function to be used for the rate method of the hotHaloCoolingAngularMomentum property of the hotHalo component.

tfamily \logicalzero hotHaloCoolingAngularMomentumRateIsAttached() Return whether the rate method of the hotHaloCoolingAngularMomentum property of the hotHalo component has been attached to a function.

tfamily \textcolor{red}{\textless double\textgreater} hotHaloCoolingMass() Get the hotHaloCoolingMass property of the hotHalo component.

tfamily \textcolor{red}{\textless type(varying \_string):\textgreater} hotHaloCoolingMassAttributeMatch(<logical>[requireGettable]→, <logical>[requireSettable]→, <logical>[requireEvolvable]→) Return a list of implementations that provide the given list of attributes for the hotHaloCoolingMass property of the hotHalo component.

tfamily \intzero hotHaloCoolingMassCount() Compute the count of evolvable quantities in the hotHaloCoolingMass property of the HotHaloStandard component.
16. Coding GALACTICUS

tfamily \textcolor{red}{\textless double\textgreater} hotHaloCoolingMassIsGettable() Get the \textit{hotHaloCoolingMass} property of the \textit{hotHalo} component.

tfamily \logicalzero hotHaloCoolingMassIsSettable() Specify whether the \textit{hotHaloCoolingMass} property of the \textit{hotHalo} component is settable.

tfamily \void hotHaloCoolingMassRate(<double> value) Cumulate to the rate of the \textit{hotHaloCoolingMass} property of the \textit{hotHalo} component.

tfamily \void hotHaloCoolingMassRateFunction(<function()> deferredFunction) Set the function to be used for the \textit{rate} method of the \textit{hotHaloCoolingMass} property of the \textit{hotHalo} component.

tfamily \logicalzero hotHaloCoolingMassRateIsAttached() Return whether the rate method of the hotHaloCoolingMass property of the hotHalo component has been attached to a function.

tfamily \void initialize() Initialize the object.

tfamily \textcolor{red}{\textless logical\textgreater} isInitialized() Get the isInitialized property of the hotHalo component.

tfamily \textcolor{red}{\textless type(varying\_string)(:)}\textgreater isInitializedAttributeMatch(<logical>[requireGettable] →, <logical>[requireSettable] →, <logical>[requireEvolvable] →) Return a list of implementations that provide the given list of attributes for the isInitialized property of the hotHalo component.

tfamily \textcolor{red}{\textless logical\textgreater} isInitializedIsGettable() Get the isInitialized property of the hotHalo component.

tfamily \logicalzero isInitializedIsSettable() Specify whether the isInitialized property of the hotHalo component is settable.

tfamily \void isInitializedSet(<logical> value) Set the isInitialized property of the hotHalo component.

tfamily \textcolor{red}{\textless type(varying\_string)(:)}\textgreater massAttributeMatch(<logical>[requireGettable] →, <logical>[requireSettable] →, <logical>[requireEvolvable] →) Return a list of implementations that provide the given list of attributes for the mass property of the hotHalo component.

tfamily \textcolor{red}{\textless double\textgreater} mass() Get the mass property of the hotHalo component.

tfamily \void massSet(<logical> value) Set the mass property of the hotHalo component.

tfamily \intzero massColdCount() Compute the count of evolvable quantities in the massCold property of the HotHaloColdMode component.

tfamily \textcolor{red}{\textless double\textgreater} massColdIsGettable() Get the massCold property of the hotHalo component.

tfamily \logicalzero massColdIsSettable() Specify whether the massCold property of the hotHalo component is settable.
tfamily \void massColdRate(<double> value) Cumulate to the rate of the massCold property of the HotHaloColdMode component.

tfamily \void massColdScale(<double> value) Set the scale of the massCold property of the HotHaloColdMode component.

tfamily \void massColdSet(<double> value) Set the massCold property of the hotHalo component.

tfamily \int zero massCount() Compute the count of evolvable quantities in the mass property of the HotHaloStandard component.

tfamily \textcolor{red}{\textless double\textgreater} massIsGettable() Get the mass property of the hotHalo component.

tfamily \logical zero massIsSettable() Specify whether the mass property of the hotHalo component is settable.

tfamily \void massRate(<double> value) Cumulate to the rate of the mass property of the HotHaloStandard component.

tfamily \void massRemovalRate() Called whenever the standard hot halo component removes mass from the halo.

tfamily \void massScale(<double> value) Set the scale of the mass property of the HotHaloStandard component.

tfamily \void massSet(<double> value) Set the mass property of the hotHalo component.

tfamily \textcolor{red}{\textless double\textgreater} massSink() Get the massSink property of the hotHalo component.

tfamily \textcolor{red}{\textless type(varying\_string)(:)}\textgreater massSinkAttributeMatch(<logical>[requireGettable] →, <logical>[requireSettable] →, <logical>[requireEvolvable] →) Return a list of implementations that provide the given list off attributes for the massSink property of the hotHalo component.

tfamily \int zero massSinkCount() Compute the count of evolvable quantities in the massSink property of the HotHaloStandard component.

tfamily \textcolor{red}{\textless double\textgreater} massSinkIsGettable() Get the massSink property of the hotHalo component.

tfamily \logical zero massSinkIsSettable() Specify whether the massSink property of the hotHalo component is settable.

tfamily \void massSinkRate(<double> value) Cumulate to the rate of the massSink property of the hotHalo component.

tfamily \void massSinkRateFunction(<function()> deferredFunction) Set the function to be used for the rate method of the massSink property of the HotHaloStandard component.

tfamily \logical zero massSinkRateIsAttached() Return whether the rate method of the massSink property of the HotHaloStandard component has been attached to a function.

tfamily \void nameFromIndex(<integer> count →, <varying_string>name ←) Return the name of a property given is index.
16. Coding Galacticus

tfamily \logicalzero nullIsActive() Return whether the null implementation of the hotHalo component class is active.

tfamily \void odeStepRatesInitialize() Initialize rates for evolvable properties.

tfamily \void odeStepScalesInitialize() Initialize scales for evolvable properties.

tfamily \textcolor{red}{\textless double\textgreater} outerRadius() Get the outerRadius property of the hotHalo component.

tfamily \textcolor{red}{\textless textless type(varying\_string):(\textgreater}\textgreater} outerRadiusAttributeMatch(<logical>[requireGettable]:→,<logical>[requireSettable]→,<logical>[requireEvolvable]→) Return a list of implementations that provide the given list of attributes for the outerRadius property of the hotHalo component.

tfamily \intzero outerRadiusCount() Compute the count of evolvable quantities in the outerRadius property of the HotHaloStandard component.

tfamily \void outerRadiusFunction(<function()> deferredFunction) Set the function to be used for the get method of the outerRadius property of the HotHaloStandard component.

tfamily \textcolor{red}{\textless double\textgreater} outerRadiusGrowthRate() Get the outerRadiusGrowthRate property of the HotHaloColdMode component.

tfamily \void outerRadiusGrowthRateFunction(procedure(HotHaloColdModeouterRadiusGrowthRateInterface) deferredFunction) Set the function for the deferred outerRadiusGrowthRate property of the HotHaloColdMode component.

tfamily \logicalzero outerRadiusGrowthRateFunctionIsSet() Specify whether the deferred function for the outerRadiusGrowthRate property of the HotHaloColdMode component has been set.

tfamily \logicalzero outerRadiusIsAttached() Return whether the get method of the outerRadius property of the HotHaloStandard component has been attached to a function.

tfamily \textcolor{red}{\textless double\textgreater} outerRadiusIsGettable() Get the outerRadius property of the hotHalo component.

tfamily \logicalzero outerRadiusIsSettable() Specify whether the outerRadius property of the hotHalo component is settable.

tfamily \void outerRadiusRate(<double> value) Cumulate to the rate of the outerRadius property of the HotHaloStandard component.

tfamily \void outerRadiusScale(<double> value) Set the scale of the outerRadius property of the HotHaloStandard component.

tfamily \void outerRadiusSet(<double> value) Set the outerRadius property of the hotHalo component.

tfamily \textcolor{red}{\textless double\textgreater} outerRadiusValue() Get the outerRadius property of the hotHalo component.

tfamily \textcolor{red}{\textless abundances\textgreater} outflowedAbundances() Get the outflowedAbundances property of the hotHalo component.
16.5. Objects

tfamily {textcolor{red}\textless double\textgreater} outflowedAbundances() Get the outflowedAbundances property of the hotHalo component.

tfamily int zero outflowedAbundancesCount() Compute the count of evolvable quantities in the outflowedAbundances property of the HotHaloStandard component.

tfamily {textcolor{red}\textless double\textgreater} outflowedAbundancesIsGettable() Get the outflowedAbundances property of the hotHalo component.

tfamily int zero outflowedAbundancesIsSettable() Specify whether the outflowedAbundances property of the hotHalo component is settable.

tfamily void outflowedAbundancesRate(<type(abundances)> value) Cumulate to the rate of the outflowedAbundances property of the HotHaloStandard component.

tfamily void outflowedAbundancesScale(<type(abundances)> value) Set the scale of the outflowedAbundances property of the HotHaloStandard component.

tfamily void outflowedAbundancesSet(<type(abundances)> value) Set the outflowedAbundances property of the hotHalo component.

outflowedAbundancesAttributeMatch(<logical>[requireGettable]->, <logical>[requireSettable]->, <logical>[requireEvolvable]->) Return a list of implementations that provide the given list of attributes for the outflowedAbundances property of the hotHalo component.

tfamily {textless type(abundances):}\textgreater outflowedAbundancesIsGettable() Get the outflowedAbundances property of the hotHalo component.

outflowedAbundancesIsSettable() Specify whether the outflowedAbundances property of the hotHalo component is settable.

tfamily void outflowedAbundancesRate(<type(abundances)> value) Cumulate to the rate of the outflowedAbundances property of the HotHaloStandard component.

tfamily void outflowedAbundancesScale(<type(abundances)> value) Set the scale of the outflowedAbundances property of the HotHaloStandard component.

tfamily void outflowedAbundancesSet(<type(abundances)> value) Set the outflowedAbundances property of the hotHalo component.

outflowedAbundancesAttributeMatch(<logical>[requireGettable]->, <logical>[requireSettable]->, <logical>[requireEvolvable]->) Return a list of implementations that provide the given list of attributes for the outflowedAbundances property of the hotHalo component.

outflowedAngularMomentum() Get the outflowedAngularMomentum property of the hotHalo component.

outflowedAngularMomentumAttributeMatch(<logical>[requireGettable]->, <logical>[requireSettable]->, <logical>[requireEvolvable]->) Return a list of implementations that provide the given list of attributes for the outflowedAngularMomentum property of the hotHalo component.

outflowedAngularMomentumCount() Compute the count of evolvable quantities in the outflowedAngularMomentum property of the HotHaloStandard component.

outflowedAngularMomentumIsGettable() Get the outflowedAngularMomentum property of the hotHalo component.

outflowedAngularMomentumIsSettable() Specify whether the outflowedAngularMomentum property of the hotHalo component is settable.

outflowedAngularMomentumRate(<double> value) Cumulate to the rate of the outflowedAngularMomentum property of the HotHaloStandard component.

outflowedAngularMomentumScale(<double> value) Set the scale of the outflowedAngularMomentum property of the HotHaloStandard component.

outflowedAngularMomentumSet(<double> value) Set the outflowedAngularMomentum property of the hotHalo component.

outflowedAngularMomentumAttributeMatch(<logical>[requireGettable]->, <logical>[requireSettable]->, <logical>[requireEvolvable]->) Return a list of implementations that provide the given list of attributes for the outflowedAngularMomentum property of the hotHalo component.

outflowedMass() Get the outflowedMass property of the hotHalo component.

outflowedMassAttributeMatch(<logical>[requireGettable]->, <logical>[requireSettable]->, <logical>[requireEvolvable]->) Return a list of implementations that provide the given list of attributes for the outflowedMass property of the hotHalo component.
16. Coding GALACTICUS

tfamily \intzero outflowedMassCount() Compute the count of evolvable quantities in the `outflowedMass` property of the `HotHaloStandard` component.

tfamily \textcolor{red}\{\textless double\textgreater\ outflowedMassIsGettable() Get the `outflowedMass` property of the `hotHalo` component.

tfamily \logicalzero outflowedMassIsSettable() Specify whether the `outflowedMass` property of the `hotHalo` component is settable.

tfamily \void outflowedMassRate(<double> value) Cumulate to the rate of the `outflowedMass` property of the `HotHaloStandard` component.

tfamily \void outflowedMassScale(<double> value) Set the scale of the `outflowedMass` property of the `HotHaloStandard` component.

tfamily \void outflowedMassSet(<double> value) Set the `outflowedMass` property of the `hotHalo` component.

tfamily \textcolor{red}\{\textless double\textgreater\ outflowingAbundances() Get the `outflowingAbundances` property of the `hotHalo` component.

tfamily \textcolor{red}\{\textless double\textgreater\ outflowingAbundancesIsGettable() Get the `outflowingAbundances` property of the `hotHalo` component.

tfamily \logicalzero outflowingAbundancesIsSettable() Specify whether the `outflowingAbundances` property of the `hotHalo` component is settable.

tfamily \void outflowingAbundancesRate(<type(abundances)> value) Cumulate to the rate of the `outflowingAbundances` property of the `HotHaloStandard` component.

tfamily \void outflowingAbundancesRateFunction(<function()> deferredFunction) Set the function to be used for the rate method of the `outflowingAbundances` property of the `HotHaloStandard` component.

tfamily \logicalzero outflowingAbundancesRateIsAttached() Return whether the rate method of the `outflowingAbundances` property of the `HotHaloStandard` component has been attached to a function.

tfamily \textcolor{red}\{\textless double\textgreater\ outflowingAngularMomentum() Get the `outflowingAngularMomentum` property of the `hotHalo` component.

tfamily \textcolor{red}\{\textless double\textgreater\ outflowingAngularMomentumIsGettable() Get the `outflowingAngularMomentum` property of the `hotHalo` component.

tfamily \logicalzero outflowingAngularMomentumIsSettable() Specify whether the `outflowingAngularMomentum` property of the `hotHalo` component is settable.

tfamily \void outflowingAngularMomentumRate(<type(abundances)> value) Cumulate to the rate of the `outflowingAngularMomentum` property of the `HotHaloStandard` component.

tfamily \void outflowingAngularMomentumRateFunction(<function()> deferredFunction) Set the function to be used for the rate method of the `outflowingAngularMomentum` property of the `HotHaloStandard` component.

tfamily \intzero outflowingAngularMomentumCount() Compute the count of evolvable quantities in the `outflowingAngularMomentum` property of the `HotHaloStandard` component.
tfamily \textcolor{red}\{\textless double\textgreater\} outflowingAngularMomentumIsGettable() Get the *outflowingAngularMomentum* property of the *hotHalo* component.

tfamily \logicalzero outflowingAngularMomentumIsSettable() Specify whether the *outflowingAngularMomentum* property of the *hotHalo* component is settable.

tfamily \void outflowingAngularMomentumRate(<double> value) Cumulate to the rate of the *outflowingAngularMomentum* property of the *hotHalo* component.

tfamily \void outflowingAngularMomentumRateFunction(<function()> deferredFunction) Set the function to be used for the *rate* method of the *outflowingAngularMomentum* property of the *HotHaloStandard* component.

tfamily \logicalzero outflowingAngularMomentumRateIsAttached() Return whether the rate method of the *outflowingAngularMomentum* property of the *HotHaloStandard* component has been attached to a function.

\textcolor{red}\{\textless double\textgreater\} outflowingMass() Get the *outflowingMass* property of the *hotHalo* component.

\textcolor{red}\{\textless double\textgreater\} outflowingMassAttributeMatch(<logical>[requireGettable]→, <logical>[requireSettable]→, <logical>[requireEvolvable]→) Return a list of implementations that provide the given list off attributes for the *outflowingMass* property of the *hotHalo* component.

tfamily \int zero outflowingMassCount() Compute the count of evolvable quantities in the *outflowingMass* property of the *HotHaloStandard* component.

tfamily \textcolor{red}\{\textless double\textgreater\} outflowingMassIsGettable() Get the *outflowingMass* property of the *hotHalo* component.

tfamily \logicalzero outflowingMassIsSettable() Specify whether the *outflowingMass* property of the *hotHalo* component is settable.

tfamily \void outflowingMassRate(<double> value) Cumulate to the rate of the *outflowingMass* property of the *hotHalo* component.

tfamily \void outflowingMassRateFunction(<function()> deferredFunction) Set the function to be used for the *rate* method of the *outflowingMass* property of the *HotHaloStandard* component.

tfamily \logicalzero outflowingMassRateIsAttached() Return whether the rate method of the *outflowingMass* property of the *HotHaloStandard* component has been attached to a function.

tfamily \textcolor{red}\{\textless void\textgreater\} outflowReturn() Get the *outflowReturn* property of the *HotHaloColdMode* component.

tfamily \void outflowReturnFunction(procedure(HotHaloColdModeoutflowReturnInterface) deferredFunction) Set the function for the deferred *outflowReturn* property of the *HotHaloColdMode* component.

tfamily \logicalzero outflowReturnFunctionIsSet() Specify whether the deferred function for the *outflowReturn* property of the *HotHaloColdMode* component has been set.

\logicalzero outflowTrackingIsActive() Return whether the outflowTracking implementation of the *hotHalo* component class is active.
16. Coding GALACTICUS

tfamily \void output(\text{integer}\text{Property}+, \text{integer} BufferCount+, \text{integer}(;:\text{Property}+) integerBuffer\leftrightarrow, \text{integer} doubleProperty\leftrightarrow, \text{integer} doubleBufferCount+, \text{double}(;:\text{Property}+) doubleBuffer\leftrightarrow, \text{double} time\rightarrow, \text{integer} instance\rightarrow) Generate values of outputtable properties.

tfamily \void outputCount(\text{integer} PropertyCount+, \text{integer} doublePropertyCount+, \text{double} time\rightarrow, \text{integer} instance\rightarrow) Compute a count of outputtable properties.

tfamily \void outputNames(\text{integer} Property+, \text{char} (:|) PropertyNames+, \text{char} (:|) PropertyComments+, \text{double}(;:\text{Property}+) doublePropertyNames+, \text{double}(;:\text{Property}+) doublePropertyComments+, \text{double}(;:\text{Property}+) doublePropertyUnitsSI+, \text{integer} doubleProperty\rightarrow, \text{double} time\rightarrow, \text{integer} instance\rightarrow) Generate names of outputtable properties.

tfamily \double zero potential(\text{double} radius\rightarrow, \text{componentType} [componentType]\rightarrow, \text{massType} [massType]\rightarrow, \text{logical} [haloLoaded]\rightarrow) Compute the gravitational potential.

tfamily \void readRaw(\text{integer} fileHandle\rightarrow) Read a binary dump of the nodeComponent from the given fileHandle.

tfamily \double zero rotationCurve(\text{double} radius\rightarrow, \text{componentType} [componentType]\rightarrow, \text{massType} [massType]\rightarrow, \text{logical} [haloLoaded]\rightarrow) Compute the rotation curve.

tfamily \double zero rotationCurveGradient(\text{double} radius\rightarrow, \text{componentType} [componentType]\rightarrow, \text{massType} [massType]\rightarrow, \text{logical} [haloLoaded]\rightarrow) Compute the rotation curve gradient.

tfamily \int zero serializeCount() Return a count of the number of evolvable quantities to be evolved.

tfamily \void serializeRates(\text{double}(:) array\rightarrow) Serialize the evolvable rates to an array.

tfamily \void serializeScales(\text{double}(:) array\rightarrow) Serialize the evolvable scales to an array.

tfamily \void serializeValues(\text{double}(:) array\rightarrow) Serialize the evolvable quantities to an array.

tfamily \logical zero standardIsActive() Return whether the standard implementation of the hotHalo component class is active.

tfamily \textcolor{red}{\textless type(abundances)\textgreater} strippedAbundances() Get the strippedAbundances property of the hotHalo component.

tfamily \textcolor{red}{\textless type(varying\_string)(:)\textgreater} strippedAbundancesAttributeMatch(\text{logical} [requireGettable]\rightarrow, \text{logical} [requireSettable]\rightarrow, \text{logical} [requireEvolvable]\rightarrow) Return a list of implementations that provide the given list of attributes for the strippedAbundances property of the hotHalo component.

tfamily \int zero strippedAbundancesCount() Compute the count of evolvable quantities in the strippedAbundances property of the HotHaloStandard component.

tfamily \textcolor{red}{\textless type(abundances)\textgreater} strippedAbundancesIsGettable() Get the strippedAbundances property of the hotHalo component.

tfamily \logical zero strippedAbundancesIsSettable() Specify whether the strippedAbundances property of the hotHalo component is settable.

tfamily \void strippedAbundancesRate(\text{type(abundances)} value) Cumulate to the rate of the strippedAbundances property of the HotHaloStandard component.
16.5. Objects

tfamily\void strippedAbundancesScale(<type(abundances)> value) Set the scale of the strippedAbundances property of the HotHaloStandard component.

tfamily\void strippedAbundancesSet(<type(abundances)> value) Set the strippedAbundances property of the hotHalo component.

tfamily \textcolor{red}{{\textless double\textgreater}} strippedMass() Get the strippedMass property of the hotHalo component.

tfamily \textcolor{red}{{\textless type(varying\_string)(:)}\textgreater} strippedMassAttributeMatch(<logical>[requireGettable]→, <logical>[requireSettable]→, <logical>[requireEvolvable]→) Return a list of implementations that provide the given list off attributes for the strippedMass property of the hotHalo component

tfamily\intzero strippedMassCount() Compute the count of evolvable quantities in the strippedMass property of the HotHaloStandard component.

tfamily \textcolor{red}{{\textless type(abundances)}} trackedOutflowAbundances() Get the trackedOutflowAbundances property of the hotHalo component.

tfamily \textcolor{red}{{\textless type(varying\_string)(:)}\textgreater} trackedOutflowAbundancesAttributeMatch(<logical>[requireGettable]→, <logical>[requireSettable]→, <logical>[requireEvolvable]→) Return a list of implementations that provide the given list off attributes for the trackedOutflowAbundances property of the hotHalo component

tfamily\intzero trackedOutflowAbundancesCount() Compute the count of evolvable quantities in the trackedOutflowAbundances property of the HotHaloOutflowTracking component.

tfamily \textcolor{red}{{\textless type(abundances)}} trackedOutflowAbundancesIsGettable() Get the trackedOutflowAbundances property of the hotHalo component.

tfamily\logicalzero trackedOutflowAbundancesIsSettable() Specify whether the trackedOutflowAbundances property of the hotHalo component is settable.

tfamily\void trackedOutflowAbundancesRate(<type(abundances)> value) Cumulate to the rate of the trackedOutflowAbundances property of the HotHaloOutflowTracking component.
tfamily \ void trackedOutflowAbundancesScale(<type(abundances)> value) Set the scale of the trackedOutflowAbundances property of the HotHaloOutflowTracking component.

tfamily \ void trackedOutflowAbundancesSet(<type(abundances)> value) Set the trackedOutflowAbundances property of the hotHalo component.

 tfamily \ textcolor{red}{\textless\textgreater} trackedOutflowAbundancesSet(<type(abundances)> value) Set the trackedOutflowAbundances property of the hotHalo component.

tfamily \ textcolor{red}{\textlesstype(varying\_string)(:)} trackedOutflowMass() Get the trackedOutflowMass property of the hotHalo component.

tfamily \ textcolor{red}{\textlesstype(varying\_string)(:)} trackedOutflowMassAttributeMatch(<logical>[requireGettable]→, <logical>[requireSettable]→, <logical>[requireEvolvable]→) Return a list of implementations that provide the given list of attributes for the trackedOutflowMass property of the hotHalo component.

tfamily \ int zero trackedOutflowMassCount() Compute the count of evolvable quantities in the trackedOutflowMass property of the HotHaloOutflowTracking component.

 tfamily \ textcolor{red}{\textlesstype(varying\_string)(:)} trackedOutflowMassIsGettable() Get the trackedOutflowMass property of the hotHalo component.

 tfamily \ logical zero trackedOutflowMassIsSettable() Specify whether the trackedOutflowMass property of the hotHalo component is settable.

 tfamily \ void trackedOutflowMassRate(<double> value) Cumulate to the rate of the trackedOutflowMass property of the HotHaloOutflowTracking component.

tfamily \ void trackedOutflowMassScale(<double> value) Set the scale of the trackedOutflowMass property of the HotHaloOutflowTracking component.

 tfamily \ void trackedOutflowMassSet(<double> value) Set the trackedOutflowMass property of the hotHalo component.

 tfamily \ textcolor{red}{\textless\textgreater} trackedOutflowMassAttributeMatch(<logical>[requireGettable]→, <logical>[requireSettable]→, <logical>[requireEvolvable]→) Return a list of implementations that provide the given list of attributes for the trackedOutflowMass property of the hotHalo component.

 tfamily \ int zero trackedOutflowMassCount() Compute the count of evolvable quantities in the trackedOutflowMass property of the HotHaloOutflowTracking component.

 tfamily \ textcolor{red}{\textlesstype(varying\_string)(:)} trackedOutflowMassIsGettable() Get the trackedOutflowMass property of the hotHalo component.

 tfamily \ logical zero trackedOutflowMassIsSettable() Specify whether the trackedOutflowMass property of the hotHalo component is settable.

 tfamily \ void trackedOutflowMassRate(<double> value) Cumulate to the rate of the trackedOutflowMass property of the HotHaloOutflowTracking component.

 tfamily \ void trackedOutflowMassScale(<double> value) Set the scale of the trackedOutflowMass property of the hotHalo component.

 tfamily \ textcolor{red}{\textlesstype(varying\_string)(:)} type() Return the type of this object.

 tfamily \ textcolor{red}{\textlesstype(varying\_string)(:)} unaccretedMass() Get the unaccretedMass property of the hotHalo component.

 tfamily \ textcolor{red}{\textlesstype(varying\_string)(:)} unaccretedMassAttributeMatch(<logical>[requireGettable]→, <logical>[requireSettable]→, <logical>[requireEvolvable]→) Return a list of implementations that provide the given list of attributes for the unaccretedMass property of the hotHalo component.

 tfamily \ int zero unaccretedMassCount() Compute the count of evolvable quantities in the unaccretedMass property of the HotHaloStandard component.

 tfamily \ textcolor{red}{\textlesstype(varying\_string)(:)} unaccretedMassIsGettable() Get the unaccretedMass property of the hotHalo component.

 tfamily \ logical zero unaccretedMassIsSettable() Specify whether the unaccretedMass property of the hotHalo component is settable.

 tfamily \ void unaccretedMassRate(<double> value) Cumulate to the rate of the unaccretedMass property of the HotHaloStandard component.

 tfamily \ void unaccretedMassScale(<double> value) Set the scale of the unaccretedMass property of the HotHaloStandard component.
16.5. Objects

tfamily \ void unaccretedMassSet(<double> value) Set the unaccretedMass property of the hotHalo component.

tfamily \ logical zero verySimpleIsActive() Return whether the verySimple implementation of the hotHalo component class is active.

tfamily nodeComponentHotHaloNull

tfamily {\textcolor{red}{\textless type(abundances)\textgreater}} abundances() Get the abundances property of the hotHalo component.

tfamily {\textcolor{red}{\textless type(varying\_string)\textgreater}} abundancesAttributeMatch(<logical>[requireGettable] →, <logical>[requireSettable] →, <logical>[requireEvolvable] →) Return a list of implementations that provide the given list off attributes for the abundances property of the hotHalo component.

tfamily {\textcolor{red}{\textless type(abundances)\textgreater}} abundancesCold() Get the abundancesCold property of the hotHalo component.

tfamily {\textcolor{red}{\textless type(varying\_string)\textgreater}} abundancesColdAttributeMatch(<logical>[requireGettable] →, <logical>[requireSettable] →, <logical>[requireEvolvable] →) Return a list of implementations that provide the given list off attributes for the abundancesCold property of the hotHalo component.

tfamily \intzero abundancesColdCount() Compute the count of evolvable quantities in the abundancesCold property of the HotHaloColdMode component.

tfamily {\textcolor{red}{\textless type(abundances)\textgreater}} abundancesIsGettable() Get the abundancesCold property of the hotHalo component.

tfamily \ logical zero abundancesColdIsSettable() Specify whether the abundancesCold property of the hotHalo component is settable.

tfamily \ void abundancesColdRate(<type(abundances)> value) Cumulate to the rate of the abundancesCold property of the HotHaloColdMode component.

tfamily \ void abundancesColdScale(<type(abundances)> value) Set the scale of the abundancesCold property of the HotHaloColdMode component.

tfamily \ void abundancesColdSet(<type(abundances)> value) Set the abundancesCold property of the hotHalo component.

tfamily \intzero abundancesCount() Compute the count of evolvable quantities in the abundances property of the HotHaloStandard component.

tfamily {\textcolor{red}{\textless type(abundances)\textgreater}} abundancesIsGettable() Get the abundances property of the hotHalo component.

tfamily \ logical zero abundancesIsSettable() Specify whether the abundances property of the hotHalo component is settable.

tfamily \ void abundancesRate(<type(abundances)> value) Cumulate to the rate of the abundances property of the HotHaloStandard component.

tfamily \ void abundancesScale(<type(abundances)> value) Set the scale of the abundances property of the HotHaloStandard component.
tfamily \ void abundancesSet(<type(abundances)> value) Set the abundances property of the hotHalo component.

tfamily \ \textcolor{red}{\textless\textless\textgreater\textgreater\textless\textgreater} angularMomentum() Get the angularMomentum property of the hotHalo component.

tfamily \ \textcolor{red}{\textless\textless\textgreater\textless\textgreater} angularMomentumAttributeMatch(<logical>[requireGettable]→, <logical>[requireSettable]→, <logical>[requireEvolvable]→) Return a list of implementations that provide the given list off attributes for the angularMomentum property of the hotHalo component.

tfamily \ \textcolor{red}{\textless\textless\textgreater\textless\textgreater} angularMomentumCold() Get the angularMomentumCold property of the hotHalo component.

tfamily \ \textcolor{red}{\textless\textless\textgreater\textless\textgreater} angularMomentumColdAttributeMatch(<logical>[requireGettable]→, <logical>[requireSettable]→, <logical>[requireEvolvable]→) Return a list of implementations that provide the given list off attributes for the angularMomentumCold property of the hotHalo component.

tfamily \ \textcolor{red}{\textless\textless\textgreater\textless\textgreater} angularMomentumColdCount() Compute the count of evolvable quantities in the angularMomentumCold property of the hotHaloColdMode component.

tfamily \ \textcolor{red}{\textless\textless\textgreater\textless\textgreater} angularMomentumColdIsGettable() Get the angularMomentumCold property of the hotHalo component.

tfamily \ \textcolor{red}{\textless\textless\textgreater\textless\textgreater} angularMomentumColdIsSettable() Specify whether the angularMomentumCold property of the hotHalo component is settable.

tfamily \ void angularMomentumColdRate(<double> value) Cumulate to the rate of the angularMomentumCold property of the hotHaloColdMode component.

tfamily \ void angularMomentumColdScale(<double> value) Set the scale of the angularMomentumCold property of the hotHaloColdMode component.

tfamily \ void angularMomentumColdSet(<double> value) Set the angularMomentumCold property of the hotHalo component.

tfamily \ \intzero angularMomentumCount() Compute the count of evolvable quantities in the angularMomentum property of the hotHaloStandard component.

tfamily \ \textcolor{red}{\textless\textless\textgreater\textless\textgreater} angularMomentumIsGettable() Get the angularMomentum property of the hotHalo component.

tfamily \ \textcolor{red}{\textless\textless\textgreater\textless\textgreater} angularMomentumIsSettable() Specify whether the angularMomentum property of the hotHalo component is settable.

tfamily \ void angularMomentumRate(<double> value) Cumulate to the rate of the angularMomentum property of the hotHaloStandard component.

tfamily \ void angularMomentumScale(<double> value) Set the scale of the angularMomentum property of the hotHaloStandard component.

tfamily \ void angularMomentumSet(<double> value) Set the angularMomentum property of the hotHalo component.
16.5. Objects

tfamily \void builder(\*type(node)>componentDefinition→) Build a nodeComponent from a supplied XML definition.

tfamily \textcolor{red}{\textless type(chemicalAbundances)>\textgreater} chemicals() Get the chemicals property of the hotHalo component.

tfamily \textcolor{red}{\textless varying\_string()>\textgreater} chemicalsAttributeMatch(<logical>[requireGettable]→, <logical>[requireSettable]→, <logical>[requireEvolvable]→) Return a list of implementations that provide the given list off attributes for the chemicals property of the hotHalo component.

tfamily \intzero chemicalsCount() Compute the count of evolvable quantities in the chemicals property of the HotHaloStandard component.

tfamily \textcolor{red}{\textless type(chemicalAbundances)>\textgreater} chemicalsIsGettable() Get the chemicals property of the hotHalo component.

tfamily \logicalzero chemicalsIsSettable() Specify whether the chemicals property of the hotHalo component is settable.

tfamily \void chemicalsRate(<type(chemicalAbundances)> value) Cumulate to the rate of the chemicals property of the HotHaloStandard component.

tfamily \void chemicalsScale(<type(chemicalAbundances)> value) Set the scale of the chemicals property of the HotHaloStandard component.

tfamily \void chemicalsSet(<type(chemicalAbundances)> value) Set the chemicals property of the hotHalo component.

tfamily \logicalzero coldModeIsActive() Return whether the coldMode implementation of the hotHalo component class is active.

tfamily \doublezero density(<double(3)> positionSpherical→, <componentType>[componentType]→, <massType>[massType]→, <weightBy>[weightBy]→, <integer>[weightIndex]→, <logical>[haloLoaded]→) Compute the density.

tfamily \void deserializeRates(<double(:)> array←) Deserialize the evolvable rates from an array.

tfamily \void deserializeScales(<double(:)> array←) Deserialize the evolvable scales from an array.

tfamily \void deserializeValues(<double(:)> array←) Deserialize the evolvable quantities from an array.

tfamily \void destroy() Destroy the object.

tfamily \void dump() Generate an ASCII dump of all properties.

tfamily \void dumpRaw(<integer> fileHandle→) Generate a binary dump of all properties.

tfamily \void dumpXML() Generate an XML dump of all properties.

tfamily \doublezero enclosedMass(<double> radius→, <componentType>[componentType]→, <massType>[massType]→, <weightBy>[weightBy]→, <integer>[weightIndex]→, <logical>[haloLoaded]→) Compute the mass enclosed within a radius.

tfamily \textcolor{red}{\textless double\textgreater} heatSource() Get the heatSource property of the hotHalo component.
tfamily \textcolor{red}{\textless double\textgreater} heatSourceRate(<double> value) Cumulate to the rate of the heatSource property of the HotHaloStandard component.

tfamily \textcolor{red}{\textless double\textgreater} hotHaloCoolingAngularMomentum() Get the hotHaloCoolingAngularMomentum property of the hotHalo component.

tfamily \textcolor{red}{\textless double\textgreater} hotHaloCoolingAngularMomentumAttributeMatch(<logical>[requireGettable]->, <logical>[requireSettable]->, <logical>[requireEvolvable]->) Return a list of implementations that provide the given list of attributes for the hotHaloCoolingAngularMomentum property of the hotHalo component.

tfamily \textcolor{red}{\textless *type(treeNode)\textgreater} hotHaloCoolingAngularMomentumIsAttached() Return whether the rate method of the hotHaloCoolingAngularMomentum property of the hotHalo component has been attached to a function.

tfamily \textcolor{red}{\textless type(varying\_string)(:)} hotHaloCoolingAngularMomentumAt- ttributeMatch(<logical>[requireGettable]->, <logical>[requireSettable]->, <logical>[requireEvolvable]->) Return a list of implementations that provide the given list of attributes for the hotHaloCoolingAngularMomentum property of the hotHalo component.

tfamily \textcolor{red}{\textless type(varying\_string)(:)} hotHaloCoolingAngularMomentumAt- ttributeMatch(<logical>[requireGettable]->, <logical>[requireSettable]->, <logical>[requireEvolvable]->) Return a list of implementations that provide the given list of attributes for the hotHaloCoolingAngularMomentum property of the hotHalo component.

tfamily \textcolor{red}{\textless type(varying\_string)(:)} hotHaloCoolingAngularMomentumAt- ttributeMatch(<logical>[requireGettable]->, <logical>[requireSettable]->, <logical>[requireEvolvable]->) Return a list of implementations that provide the given list of attributes for the hotHaloCoolingAngularMomentum property of the hotHalo component.

518
16.5. Objects

tfamily $\intzero \text{hotHaloCoolingAngularMomentumCount()}$ Compute the count of evolvable quantities in the hotHaloCoolingAngularMomentum property of the HotHaloStandard component.

tfamily $\textcolor{red}{\textless \text{double}\textgreater} \text{hotHaloCoolingAngularMomentumIsGettable()}$ Get the hotHaloCoolingAngularMomentum property of the hotHalo component.

tfamily $\logicalzero \text{hotHaloCoolingAngularMomentumIsSettable()}$ Specify whether the hotHaloCoolingAngularMomentum property of the hotHalo component is settable.

tfamily $\void \text{hotHaloCoolingAngularMomentumRate(<double> value)}$ Cumulate to the rate of the hotHaloCoolingAngularMomentum property of the hotHalo component.

tfamily $\void \text{hotHaloCoolingAngularMomentumRateFunction(<function()> deferredFunction)}$ Set the function to be used for the rate method of the hotHaloCoolingAngularMomentum property of the hotHalo component.

tfamily $\logicalzero \text{hotHaloCoolingAngularMomentumRateIsAttached()}$ Return whether the rate method of the hotHaloCoolingAngularMomentum property of the hotHalo component has been attached to a function.

tfamily $\textcolor{red}{\textless \text{double}\textgreater} \text{hotHaloCoolingMass()}$ Get the hotHaloCoolingMass property of the hotHalo component.

tfamily $\textcolor{red}{\textless \text{type(varying\_string)(:)}\textgreater} \text{hotHaloCoolingMassAttributeMatch(<logical>[requireGettable]→, <logical>[requireSettable]→, <logical>[requireEvolvable]→)}$ Return a list of implementations that provide the given list of attributes for the hotHaloCoolingMass property of the hotHalo component.

tfamily $\intzero \text{hotHaloCoolingMassCount()}$ Compute the count of evolvable quantities in the hotHaloCoolingMass property of the HotHaloStandard component.

tfamily $\textcolor{red}{\textless \text{double}\textgreater} \text{hotHaloCoolingMassIsGettable()}$ Get the hotHaloCoolingMass property of the hotHalo component.

tfamily $\logicalzero \text{hotHaloCoolingMassIsSettable()}$ Specify whether the hotHaloCoolingMass property of the hotHalo component is settable.

tfamily $\void \text{hotHaloCoolingMassRate(<double> value)}$ Cumulate to the rate of the hotHaloCoolingMass property of the hotHalo component.

tfamily $\void \text{hotHaloCoolingMassRateFunction(<function()> deferredFunction)}$ Set the function to be used for the rate method of the hotHaloCoolingMass property of the hotHalo component.

tfamily $\logicalzero \text{hotHaloCoolingMassRateIsAttached()}$ Return whether the rate method of the hotHaloCoolingMass property of the hotHalo component has been attached to a function.

tfamily $\void \text{initialize()}$ Initialize the object.

tfamily $\textcolor{red}{\textless \text{logical}\textgreater} \text{isInitialized()}$ Get the isInitialized property of the hotHalo component.

tfamily $\textcolor{red}{\textless \text{type(varying\_string)(:)}\textgreater} \text{isInitializedAttributeMatch(<logical>[requireGettable]→, <logical>[requireSettable]→, <logical>[requireEvolvable]→)}$ Return a list of implementations that provide the given list of attributes for the isInitialized property of the hotHalo component.
tfamily \textcolor{red}{\textless \text{logical}\textgreater} \text{isInitializedIsGettable}() Get the \texttt{isInitialized} property of the hotHalo component.

tfamily \texttt{logicalzero} \text{isInitializedIsSettable}() Specify whether the \texttt{isInitialized} property of the hotHalo component is settable.

tfamily \texttt{void} \text{isInitializedSet}(<\text{logical}> \text{value}) Set the \texttt{isInitialized} property of the hotHalo component.

tfamily \textcolor{red}{\textless \text{double}\textgreater} \text{mass}() Get the \texttt{mass} property of the hotHalo component.

tfamily \textcolor{red}{\textless \text{double}\textgreater} \text{massCold}() Get the \texttt{massCold} property of the hotHalo component.

tfamily \text{massColdAttributeMatch}(<\text{logical}>[\text{requireGettable}] \rightarrow, <\text{logical}>[\text{requireSettable}] \rightarrow, <\text{logical}>[\text{requireEvolvable}] \rightarrow) Return a list of implementations that provide the given list off attributes for the \texttt{mass} property of the hotHalo component.

tfamily \text{massColdCount}() Compute the count of evolvable quantities in the \texttt{massCold} property of the HotHaloColdMode component.

tfamily \text{massColdGettable}() Get the \texttt{massCold} property of the hotHalo component.

tfamily \text{massColdIsSettable}() Specify whether the \texttt{massCold} property of the hotHalo component is settable.

tfamily \text{massColdRate}(<\text{double}> \text{value}) Cumulate to the rate of the \texttt{massCold} property of the HotHaloColdMode component.

tfamily \text{massColdScale}(<\text{double}> \text{value}) Set the scale of the \texttt{massCold} property of the HotHaloColdMode component.

tfamily \text{massColdSet}(<\text{double}> \text{value}) Set the \texttt{massCold} property of the hotHalo component.

tfamily \text{massCount}() Compute the count of evolvable quantities in the \texttt{mass} property of the HotHaloStandard component.

tfamily \textcolor{red}{\textless \text{double}\textgreater} \text{massGettable}() Get the \texttt{mass} property of the hotHalo component.

tfamily \text{massIsSettable}() Specify whether the \texttt{mass} property of the hotHalo component is settable.

tfamily \text{massRate}(<\text{double}> \text{value}) Cumulate to the rate of the \texttt{mass} property of the HotHaloStandard component.

tfamily \text{massScale}(<\text{double}> \text{value}) Set the scale of the \texttt{mass} property of the HotHaloStandard component.

tfamily \text{massSet}(<\text{double}> \text{value}) Set the \texttt{mass} property of the hotHalo component.
16.5. Objects

tfamily \textcolor{red}{\textless double\textgreater} massSink() Get the massSink property of the hotHalo component.

tfamily \textcolor{red}{\textless double\textgreater} massSinkAttributeMatch(<logical>[requireGettable] \rightarrow, <logical>[requireSettable] \rightarrow, <logical>[requireEvolvable] \rightarrow) Return a list of implementations that provide the given list of attributes for the massSink property of the hotHalo component.

tfamily \intzero massSinkCount() Compute the count of evolvable quantities in the massSink property of the HotHaloStandard component.

tfamily \textcolor{red}{\textless double\textgreater} massSinkIsGettable() Get the massSink property of the hotHalo component.

tfamily \logicalzero massSinkIsSettable() Specify whether the massSink property of the hotHalo component is settable.

tfamily \void massSinkRate(<double> value) Cumulate to the rate of the massSink property of the HotHaloStandard component.

tfamily \void nameFromIndex(<integer> count \rightarrow, <varying_string>name \leftarrow) Return the name of a property given is index.

tfamily \logicalzero nullIsActive() Return whether the null implementation of the hotHalo component class is active.

tfamily \void odeStepRatesInitialize() Initialize rates for evolvable properties.

tfamily \void odeStepScalesInitialize() Initialize scales for evolvable properties.

tfamily \textcolor{red}{\textless double\textgreater} outerRadius() Get the outerRadius property of the hotHalo component.

tfamily \textcolor{red}{\textless double\textgreater} outerRadiusAttributeMatch(<logical>[requireGettable] \rightarrow, <logical>[requireSettable] \rightarrow, <logical>[requireEvolvable] \rightarrow) Return a list of implementations that provide the given list of attributes for the outerRadius property of the hotHalo component.

tfamily \intzero outerRadiusCount() Compute the count of evolvable quantities in the outerRadius property of the HotHaloStandard component.

tfamily \textcolor{red}{\textless double\textgreater} outerRadiusIsGettable() Get the outerRadius property of the hotHalo component.

tfamily \logicalzero outerRadiusIsSettable() Specify whether the outerRadius property of the hotHalo component is settable.

tfamily \void outerRadiusRate(<double> value) Cumulate to the rate of the outerRadius property of the HotHaloStandard component.

tfamily \void outerRadiusScale(<double> value) Set the scale of the outerRadius property of the HotHaloStandard component.

tfamily \void outerRadiusSet(<double> value) Set the outerRadius property of the hotHalo component.

tfamily \textcolor{red}{\textlesstype(abundances)\textgreater} outflowedAbundances() Get the outflowedAbundances property of the hotHalo component.
16. Coding GALACTICUS

tfamily \textcolor{red}{\textless} double \textgreater{} outflowedAngularMomentum() Get the \textit{outflowedAngularMomentum} property of the \textit{hotHalo} component.

tfamily \textcolor{red}{\textless} double \textgreater{} outflowedAngularMomentumIsGettable() Get the \textit{outflowedAngularMomentum} property of the \textit{hotHalo} component.

tfamily \logicalzero outflowedAngularMomentumIsSettable() Specify whether the \textit{outflowedAngularMomentum} property of the \textit{hotHalo} component is settable.

tfamily \void outflowedAngularMomentumRate(<double> value) Cumulate to the rate of the \textit{outflowedAngularMomentum} property of the \textit{HotHaloStandard} component.

tfamily \void outflowedAngularMomentumScale(<double> value) Set the scale of the \textit{outflowedAngularMomentum} property of the \textit{HotHaloStandard} component.

tfamily \void outflowedAngularMomentumSet(<double> value) Set the \textit{outflowedAngularMomentum} property of the \textit{hotHalo} component.

tfamily \textcolor{red}{\textless} double \textgreater{} outflowedMass() Get the \textit{outflowedMass} property of the \textit{hotHalo} component.

tfamily \textcolor{red}{\textless} double \textgreater{} outflowedMassIsGettable() Get the \textit{outflowedMass} property of the \textit{hotHalo} component.

tfamily \logicalzero outflowedMassIsSettable() Specify whether the \textit{outflowedMass} property of the \textit{hotHalo} component is settable.

tfamily \void outflowedMassRate(<double> value) Cumulate to the rate of the \textit{outflowedMass} property of the \textit{HotHaloStandard} component.

tfamily \void outflowedMassScale(<double> value) Set the scale of the \textit{outflowedMass} property of the \textit{HotHaloStandard} component.

tfamily \void outflowedMassSet(<double> value) Set the \textit{outflowedMass} property of the \textit{hotHalo} component.

522
16.5. Objects

- `intzero outflowedMassCount()` Compute the count of evolvable quantities in the `outflowedMass` property of the `HotHaloStandard` component.

- `textcolor{red}{\textless double\textgreater} outflowedMassIsGettable()` Get the `outflowedMass` property of the `hotHalo` component.

- `logicalzero outflowedMassIsSettable()` Specify whether the `outflowedMass` property of the `hotHalo` component is settable.

- `void outflowedMassRate(<double> value)` Cumulate to the rate of the `outflowedMass` property of the `HotHaloStandard` component.

- `void outflowedMassScale(<double> value)` Set the scale of the `outflowedMass` property of the `HotHaloStandard` component.

- `void outflowedMassSet(<double> value)` Set the `outflowedMass` property of the `hotHalo` component.

- `textcolor{red}{\textless double\textgreater} outflowingAbundances()` Get the `outflowingAbundances` property of the `hotHalo` component.

- `textcolor{red}{\textlesstype(varying\_string)(:)\textgreater} outflowingAbundancesAttributeMatch(<logical>[requireGettable]→, <logical>[requireSettable]→, <logical>[requireEvolvable]→)` Return a list of implementations that provide the given list of attributes for the `outflowingAbundances` property of the `hotHalo` component.

- `intzero outflowingAbundancesCount()` Compute the count of evolvable quantities in the `outflowingAbundances` property of the `HotHaloStandard` component.

- `textcolor{red}{\textless double\textgreater} outflowingAbundancesIsGettable()` Get the `outflowingAbundances` property of the `hotHalo` component.

- `logicalzero outflowingAbundancesIsSettable()` Specify whether the `outflowingAbundances` property of the `hotHalo` component is settable.

- `void outflowingAbundancesRate(<type(abundances)> value)` Cumulate to the rate of the `outflowingAbundances` property of the `HotHaloStandard` component.

- `textcolor{red}{\textless double\textgreater} outflowingAngularMomentum()` Get the `outflowingAngularMomentum` property of the `hotHalo` component.

- `textcolor{red}{\textlesstype(varying\_string)(:)\textgreater} outflowingAngularMomentumAttributeMatch(<logical>[requireGettable]→, <logical>[requireSettable]→, <logical>[requireEvolvable]→)` Return a list of implementations that provide the given list of attributes for the `outflowingAngularMomentum` property of the `hotHalo` component.

- `intzero outflowingAngularMomentumCount()` Compute the count of evolvable quantities in the `outflowingAngularMomentum` property of the `HotHaloStandard` component.

- `textcolor{red}{\textless double\textgreater} outflowingAngularMomentumIsGettable()` Get the `outflowingAngularMomentum` property of the `hotHalo` component.

- `logicalzero outflowingAngularMomentumIsSettable()` Specify whether the `outflowingAngularMomentum` property of the `hotHalo` component is settable.
Coding GALACTICUS

16. Coding GALACTICUS

tfamily \void outflowingAngularMomentumRate(<double> value) Cumulate to the rate of the outflowingAngularMomentum property of the HotHaloStandard component.

tfamily \textcolor{red}{\textless double\textgreater} outflowingMass() Get the outflowingMass property of the hotHalo component.

tfamily \textcolor{red}{\textless double\textgreater outflowingMassAttributeMatch(<logical>[requireGettable] \rightarrow \textfamily{<logical>[requireSettable] \rightarrow, <logical>[requireEvolvable] \rightarrow}) Return a list of implementations that provide the given list off attributes for the outflowingMass property of the hotHalo component.

tfamily \intzero outflowingMassCount() Compute the count of evolvable quantities in the outflowingMass property of the HotHaloStandard component.

tfamily \textcolor{red}{\textless double\textgreater outflowingMassIsGettable() Get the outflowingMass property of the hotHalo component.

tfamily \logical zero outflowingMassIsSettable() Specify whether the outflowingMass property of the hotHalo component is settable.

tfamily \void outflowingMassRate(<double> value) Cumulate to the rate of the outflowingMass property of the HotHaloStandard component.

tfamily \logical zero outflowTrackingIsActive() Return whether the outflowTracking implementation of the hotHalo component class is active.

tfamily \void output(<integer> integerProperty ↔, <integer> integerBufferCount ↔, <integer>[;;:] integerBuffer ↔, <integer>doubleProperty ↔, <integer> doubleBufferCount ↔, <double[;;:]> doubleBuffer ↔, <double> time→, <integer> instance→) Generate values of outputtable properties.

tfamily \void outputCount(<integer> integerPropertyCount ↔, <integer> doublePropertyCount ↔, <double> time→, <integer> instance→) Compute a count of outputtable properties.

tfamily \void outputNames(<integer> integerProperty ↔, <char[*]:] integerPropertyNames ↔, <char[*]:] integerPropertyComments ↔, <double[;:]> integerPropertyUnitsSI ↔, <integer> doubleProperty ↔, <char[*]:] doublePropertyNames ↔, <char[*]:] doublePropertyComments ↔, <double[;:]> doublePropertyUnitsSI ↔, <double> time→, <integer> instance→) Generate names of outputtable properties.

tfamily \double zero potential(<double> radius→, <componentType>[componentType]→, <massType>[massType]→, <logical> [haloLoaded]→) Compute the gravitational potential.

tfamily \void readRaw(<integer> fileHandle→) Read a binary dump of the nodeComponent from the given fileHandle.

tfamily \double zero rotationCurve(<double> radius→, <componentType>[componentType]→, <massType>[massType]→, <logical> [haloLoaded]→) Compute the rotation curve.

tfamily \double zero rotationCurveGradient(<double> radius→, <componentType>[componentType]→, <massType>[massType]→, <logical> [haloLoaded]→) Compute the rotation curve gradient.

tfamily \intzero serializeCount() Return a count of the number of evolvable quantities to be evolved.

tfamily \void serializeRates(<double[;:]:] array) Serialize the evolvable rates to an array.

tfamily \void serializeScales(<double[;:]:] array) Serialize the evolvable scales to an array.
16.5. Objects

tfamily void serializeValues(<double()> array) Serialize the evolvable quantities to an array.

tfamily logical zero standardIsActive() Return whether the standard implementation of the hotHalo component class is active.

tfamily textcolor{red}{textless type(abundances)\textgreater} strippedAbundances() Get the strippedAbundances property of the hotHalo component.

tfamily textcolor{red}{textless type(varying_string)\textgreater} strippedAbundancesAttributeMatch(<logical>[requireGettable] \rightarrow, <logical>[requireSettable] \rightarrow, <logical>[requireEvolvable] \rightarrow) Return a list of implementations that provide the given list off attributes for the strippedAbundances property of the hotHalo component.

tfamily int zero strippedAbundancesCount() Compute the count of evolvable quantities in the strippedAbundances property of the HotHaloStandard component.

tfamily textcolor{red}{textless type(abundances)\textgreater} strippedAbundancesIsGettable() Get the strippedAbundances property of the hotHalo component.

tfamily logical zero strippedAbundancesIsSettable() Specify whether the strippedAbundances property of the hotHalo component is settable.

tfamily void strippedAbundancesRate(<type(abundances)> value) Cumulate to the rate of the strippedAbundances property of the HotHaloStandard component.

tfamily void strippedAbundancesScale(<type(abundances)> value) Set the scale of the strippedAbundances property of the HotHaloStandard component.

tfamily void strippedAbundancesSet(<type(abundances)> value) Set the strippedAbundances property of the hotHalo component.

tfamily textcolor{red}{textless double\textgreater} strippedMass() Get the strippedMass property of the hotHalo component.

tfamily textcolor{red}{textless type(varying_string)\textgreater} strippedMassAttributeMatch(<logical>[requireGettable] \rightarrow, <logical>[requireSettable] \rightarrow, <logical>[requireEvolvable] \rightarrow) Return a list of implementations that provide the given list off attributes for the strippedMass property of the hotHalo component.

tfamily int zero strippedMassCount() Compute the count of evolvable quantities in the strippedMass property of the HotHaloStandard component.

tfamily textcolor{red}{textless double\textgreater} strippedMassIsGettable() Get the strippedMass property of the hotHalo component.

tfamily logical zero strippedMassIsSettable() Specify whether the strippedMass property of the hotHalo component is settable.

tfamily void strippedMassRate(<double> value) Cumulate to the rate of the strippedMass property of the HotHaloStandard component.

tfamily void strippedMassScale(<double> value) Set the scale of the strippedMass property of the HotHaloStandard component.

tfamily void strippedMassSet(<double> value) Set the strippedMass property of the hotHalo component.
tfamily \textcolor{red}{\textless type(abundances)\textgreater} trackedOutflowAbundances() Get the trackedOutflowAbundances property of the hotHalo component.

tfamily \textcolor{red}{\textless type(varying\_string)(:)\textgreater} trackedOutflowAbundancesAttributeMatch(\textcolor{red}{\textless logical\[requireGettable\]}\rightarrow, \textcolor{red}{\textless logical\[requireSettable\]}\rightarrow, \textcolor{red}{\textless logical\[requireEvolvable\]}\rightarrow) Return a list of implementations that provide the given list of attributes for the trackedOutflowAbundances property of the hotHalo component.

tfamily \textcolor{red}{\textlesstype(abundances)\textgreater} trackedOutflowAbundancesIsGettable() Get the trackedOutflowAbundances property of the hotHalo component.

tfamily \textcolor{red}{\textless double\textgreater} trackedOutflowMass() Get the trackedOutflowMass property of the hotHalo component.

tfamily \textcolor{red}{\textlesstype(varying\_string)(:)\textgreater} trackedOutflowMassAttributeMatch(\textcolor{red}{\textless logical\[requireGettable\]}\rightarrow, \textcolor{red}{\textless logical\[requireSettable\]}\rightarrow, \textcolor{red}{\textless logical\[requireEvolvable\]}\rightarrow) Return a list of implementations that provide the given list of attributes for the trackedOutflowMass property of the hotHalo component.

tfamily \textcolor{red}{\textlesstype(abundances)\textgreater} trackedOutflowMassIsGettable() Get the trackedOutflowMass property of the hotHalo component.

16. Coding GALACTICUS
16.5. Objects

tfamily \textcolor{red}{\textless type(varying\_string)\textgreater} type() Return the type of this object.

tfamily \textcolor{red}{\textless double\textgreater} unaccretedMass() Get the unaccretedMass property of the hotHalo component.

tfamily \textcolor{red}{\textless type(varying\_string)(:)\textgreater} unaccretedMassAttributeMatch(<logical>[requireGettable], <logical>[requireSettable], <logical>[requireEvolvable]) Return a list of implementations that provide the given list of attributes for the unaccretedMass property of the hotHalo component.

tfamily \intzerounaccretedMassCount() Compute the count of evolvable quantities in the unaccretedMass property of the HotHaloStandard component.

tfamily \textcolor{red}{\textless double\textgreater} unaccretedMassIsGettable() Get the unaccretedMass property of the hotHalo component.

tfamily \logicalzero unaccretedMassIsSettable() Specify whether the unaccretedMass property of the hotHalo component is settable.

tfamily \void unaccretedMassRate(<double> value) Cumulate to the rate of the unaccretedMass property of the HotHaloStandard component.

tfamily \void unaccretedMassScale(<double> value) Set the scale of the unaccretedMass property of the HotHaloStandard component.

tfamily \void unaccretedMassSet(<double> value) Set the unaccretedMass property of the hotHalo component.

tfamily \logicalzero verySimpleIsActive() Return whether the verySimple implementation of the hotHalo component class is active.

tfamily nodeComponentHotHaloOutflowTracking

tfamily \textcolor{red}{\textless type(abundances)\textgreater} abundances() Get the abundances property of the hotHalo component.

tfamily \textcolor{red}{\textless type(varying\_string)(:)\textgreater} abundancesAttributeMatch(<logical>[requireGettable], <logical>[requireSettable], <logical>[requireEvolvable]) Return a list of implementations that provide the given list of attributes for the abundances property of the hotHalo component.

tfamily \textcolor{red}{\textless type(abundances)\textgreater} abundancesCold() Get the abundancesCold property of the hotHalo component.

tfamily \textcolor{red}{\textless type(varying\_string)(:)\textgreater} abundancesColdAttributeMatch(<logical>[requireGettable], <logical>[requireSettable], <logical>[requireEvolvable]) Return a list of implementations that provide the given list of attributes for the abundancesCold property of the hotHalo component.

tfamily \intzero abundancesColdCount() Compute the count of evolvable quantities in the abundancesCold property of the HotHaloColdMode component.

tfamily \textcolor{red}{\textless type(abundances)\textgreater} abundancesColdIsGettable() Get the abundancesCold property of the hotHalo component.

tfamily \logicalzero abundancesColdIsSettable() Specify whether the abundancesCold property of the hotHalo component is settable.
16. Coding GALACTICUS

tfamily \void abundancesColdRate(<type(abundances)> value) Cumulate to the rate of the abundancesCold property of the HotHaloColdMode component.

tfamily \void abundancesColdScale(<type(abundances)> value) Set the scale of the abundancesCold property of the HotHaloColdMode component.

tfamily \void abundancesColdSet(<type(abundances)> value) Set the abundancesCold property of the hotHalo component.

tfamily \intzero abundancesCount() Compute the count of evolvable quantities in the abundances property of the HotHaloStandard component.

tfamily \textcolor{red}{\textless double\textgreater} angularMomentum() Get the angularMomentum property of the hotHalo component.

tfamily \textcolor{red}{\textless double\textgreater} angularMomentumCold() Get the angularMomentumCold property of the hotHalo component.

528
16.5. Objects

tfamily\void\angularMomentumColdScale(<double> value) Set the scale of the \textit{angularMomentumCold} property of the \texttt{HotHaloColdMode} component.

tfamily\void\angularMomentumColdSet(<double> value) Set the \textit{angularMomentumCold} property of the \texttt{hotHalo} component.

tfamily\intzero\angularMomentumCount() Compute the count of evolvable quantities in the \textit{angularMomentum} property of the \texttt{HotHaloStandard} component.

tfamily\textcolor{red}{\textless double\textgreater}\angularMomentumIsGettable() Get the \textit{angularMomentum} property of the \texttt{hotHalo} component.

tfamily\logicalzero\angularMomentumIsSettable() Specify whether the \textit{angularMomentum} property of the \texttt{hotHalo} component is settable.

tfamily\void\angularMomentumRate(<double> value) Cumulate to the rate of the \textit{angularMomentum} property of the \texttt{HotHaloStandard} component.

tfamily\void\angularMomentumScale(<double> value) Set the scale of the \textit{angularMomentum} property of the \texttt{HotHaloStandard} component.

tfamily\void\angularMomentumSet(<double> value) Set the \textit{angularMomentum} property of the \texttt{hotHalo} component.

tfamily\void\builder(<\*type(node)>componentDefinition→) Build a \texttt{nodeComponent} from a supplied XML definition.

tfamily\textcolor{red}{\textless\textless type(chemicalAbundances)\textless\textgreater}\chemicals() Get the \textit{chemicals} property of the \texttt{hotHalo} component.

tfamily\textcolor{red}{\textless\textless type(varying\_string)::\textless\textgreater}\chemicalsAttributeMatch(<logical>|requireGettable|→, <logical>|requireSettable|→, <logical>|requireEvolvable|→) Return a list of implementations that provide the given list of attributes for the \textit{chemicals} property of the \texttt{hotHalo} component.

tfamily\intzero\chemicalsCount() Compute the count of evolvable quantities in the \textit{chemicals} property of the \texttt{HotHaloStandard} component.

tfamily\textcolor{red}{\textless\textless type(chemicalAbundances)\textless\textgreater}\chemicalsIsGettable() Get the \textit{chemicals} property of the \texttt{hotHalo} component.

tfamily\logicalzero\chemicalsIsSettable() Specify whether the \textit{chemicals} property of the \texttt{hotHalo} component is settable.

tfamily\void\chemicalsRate(<\texttt{chemicalAbundances}> value) Cumulate to the rate of the \textit{chemicals} property of the \texttt{HotHaloStandard} component.

tfamily\void\chemicalsScale(<\texttt{chemicalAbundances}> value) Set the scale of the \textit{chemicals} property of the \texttt{HotHaloStandard} component.

tfamily\void\chemicalsSet(<\texttt{chemicalAbundances}> value) Set the \textit{chemicals} property of the \texttt{hotHalo} component.

tfamily\logicalzero\coldModeIsActive() Return whether the \textit{coldMode} implementation of the \texttt{hotHalo} component class is active.

529
tfamily \void createFunctionSet(\langle function() \rangle) Set the function used to create \texttt{HotHaloStandard} components.

tfamily \doublezero density(\langle double(3) \rangle positionSpherical \rightarrow, \langle componentType \rangle [componentType] \rightarrow, \langle massType \rangle [massType] \rightarrow, \langle weightBy \rangle [weightBy] \rightarrow, \langle integer \rangle [weightIndex] \rightarrow, \langle logical \rangle [haloLoaded] \rightarrow) Compute the density.

tfamily \void deserializeRates(\langle double() \rangle array \leftarrow) Deserialize the evolvable rates from an array.

tfamily \void deserializeScales(\langle double() \rangle array \leftarrow) Deserialize the evolvable scales from an array.

tfamily \void deserializeValues(\langle double() \rangle array \leftarrow) Deserialize the evolvable quantities from an array.

tfamily \void destroy() Destroy the object.

tfamily \void dump() Generate an ASCII dump of all properties.

tfamily \void dumpRaw(\langle integer \rangle fileHandle \rightarrow) Generate a binary dump of all properties.

tfamily \void dumpXML() Generate an XML dump of all properties.

tfamily \doublezero enclosedMass(\langle double \rangle radius \rightarrow, \langle componentType \rangle [componentType] \rightarrow, \langle massType \rangle [massType] \rightarrow, \langle weightBy \rangle [weightBy] \rightarrow, \langle integer \rangle [weightIndex] \rightarrow, \langle logical \rangle [haloLoaded] \rightarrow) Compute the mass enclosed within a radius.

tfamily \red \textless double \langle heatSource() \rangle Get the \texttt{heatSource} property of the \texttt{hotHalo} component.

tfamily \red \textless type(varying\_string)(:): \langle heatSourceAttributeMatch(\langle logical \rangle [requireGettable] \rightarrow, \langle logical \rangle [requireSettable] \rightarrow, \langle logical \rangle [requireEvolvable] \rightarrow) \rangle \rangle Return a list of implementations that provide the given list off attributes for the \texttt{heatSource} property of the \texttt{hotHalo} component.

tfamily \intzero heatSourceCount() Compute the count of evolvable quantities in the \texttt{heatSource} property of the \texttt{HotHaloStandard} component.

tfamily \red \textless double \langle heatSourceIsGettable() \rangle Get the \texttt{heatSource} property of the \texttt{hotHalo} component.

tfamily \logicalzero heatSourceIsSettable() Specify whether the \texttt{heatSource} property of the \texttt{hotHalo} component is settable.

tfamily \void heatSourceRate(\langle double \rangle value) Cumulate to the rate of the \texttt{heatSource} property of the \texttt{hotHalo} component.

tfamily \void heatSourceRateFunction(\langle function() \rangle deferredFunction) Set the function to be used for the rate method of the \texttt{heatSource} property of the \texttt{HotHaloStandard} component.

tfamily \logicalzero heatSourceRateIsAttached() Return whether the rate method of the heatSource property of the \texttt{HotHaloStandard} component has been attached to a function.

tfamily \red \textless *type(treeNode) \langle host() \rangle Return a pointer to the host \texttt{treeNode} object.

tfamily \red \textless type(abundances) \langle hotHaloCoolingAbundances() \rangle Get the \texttt{hotHaloCoolingAbundances} property of the \texttt{hotHalo} component.
16.5. Objects

tfamily {textcolor{red}\{\textless\ type(varying\_string):\}\textgreater} hotHaloCoolingAbundancesAttrib-

tReturn a list of implementations that provide the given list of attributes for the hotHaloCoolingAbundances property of the hotHalo component.

tfamily {intzero\} hotHaloCoolingAbundancesCount() Compute the count of evolvable quantities in the hotHaloCoolingAbundances property of the HotHaloStandard component.

tfamily {textcolor{red}\{\textless\ type(abundances):\}\textgreater} hotHaloCoolingAbundancesIsGettable() Get the hotHaloCoolingAbundances property of the hotHalo component.

tfamily {logicalzero\} hotHaloCoolingAbundancesIsSettable() Specify whether the hotHaloCoolingAbundances property of the hotHalo component is settable.

tfamily {void\} hotHaloCoolingAbundancesRate(<type(abundances)> value) Cumulate to the rate of the hotHaloCoolingAbundances property of the hotHalo component.

tfamily {void\} hotHaloCoolingAbundancesRateFunction(<function()> deferredFunction) Set the function to be used for the rate method of the hotHaloCoolingAbundances property of the hotHalo component.

tfamily {logicalzero\} hotHaloCoolingAbundancesRateIsAttached() Return whether the rate method of the hotHaloCoolingAbundances property of the hotHalo component has been attached to a function.

tfamily {textcolor{red}\{\textless\ double\}\textgreater} hotHaloCoolingAngularMomentum() Get the hotHaloCoolingAngularMomentum property of the hotHalo component.

tfamily {textcolor{red}\{\textless\ type(varying\_string):\}\textgreater} hotHaloCoolingAngularMomentumAttributeMatch(<logical>[requireGettable]→, <logical>[requireSettable]→, <logical>[requireEvolvable]→) Return a list of implementations that provide the given list of attributes for the hotHaloCoolingAngularMomentum property of the hotHalo component.

tfamily {intzero\} hotHaloCoolingAngularMomentumCount() Compute the count of evolvable quantities in the hotHaloCoolingAngularMomentum property of the HotHaloStandard component.

tfamily {textcolor{red}\{\textless\ double\}\textgreater} hotHaloCoolingAngularMomentumIsGettable() Get the hotHaloCoolingAngularMomentum property of the hotHalo component.

tfamily {logicalzero\} hotHaloCoolingAngularMomentumIsSettable() Specify whether the hotHaloCoolingAngularMomentum property of the hotHalo component is settable.

tfamily {void\} hotHaloCoolingAngularMomentumRate(<double> value) Cumulate to the rate of the hotHaloCoolingAngularMomentum property of the hotHalo component.

tfamily {void\} hotHaloCoolingAngularMomentumRateFunction(<function()> deferredFunction) Set the function to be used for the rate method of the hotHaloCoolingAngularMomentum property of the hotHalo component.

tfamily {logicalzero\} hotHaloCoolingAngularMomentumRateIsAttached() Return whether the rate method of the hotHaloCoolingAngularMomentum property of the hotHalo component has been attached to a function.

tfamily {textcolor{red}\{\textless\ double\}\textgreater} hotHaloCoolingMass() Get the hotHaloCoolingMass property of the hotHalo component.
16. Coding GALACTICUS

tfamily \textcolor{red}{\textless\textgreater} hotHaloCoolingMassAttributeMatch(<logical>[requireGettable] \rightarrow, <logical>[requireSettable] \rightarrow, <logical>[requireEvolvable] \rightarrow) Return a list of implementations that provide the given list off attributes for the hotHaloCoolingMass property of the hotHalo component.

tfamily \intzero hotHaloCoolingMassCount() Compute the count of evolvable quantities in the hotHaloCoolingMass property of the HotHaloStandard component.

tfamily \textcolor{red}{\textless\textgreater} hotHaloCoolingMassIsGettable() Get the hotHaloCoolingMass property of the hotHalo component.

tfamily \logicalzero hotHaloCoolingMassIsSettable() Specify whether the hotHaloCoolingMass property of the hotHalo component is settable.

tfamily \void hotHaloCoolingMassRate(<double> value) Cumulate to the rate of the hotHaloCoolingMass property of the hotHalo component.

tfamily \void hotHaloCoolingMassRateFunction(<function()> deferredFunction) Set the function to be used for the rate method of the hotHaloCoolingMass property of the hotHalo component.

tfamily \logicalzero hotHaloCoolingMassRateIsAttached() Return whether the rate method of the hotHaloCoolingMass property of the hotHalo component has been attached to a function.

tfamily \void initialize() Initialize the object.

tfamily \textcolor{red}{\textless\textgreater} isInitialized() Get the isInitialized property of the hotHalo component.

tfamily \textcolor{red}{\textless\textgreater} isInitializedAttributeMatch(<logical>[requireGettable] \rightarrow, <logical>[requireSettable] \rightarrow, <logical>[requireEvolvable] \rightarrow) Return a list of implementations that provide the given list off attributes for the isInitialized property of the hotHalo component.

tfamily \textcolor{red}{\textless\textgreater} isInitializedIsGettable() Get the isInitialized property of the hotHalo component.

tfamily \logicalzero isInitializedIsSettable() Specify whether the isInitialized property of the hotHalo component is settable.

tfamily \void isInitializedSet(<logical> value) Set the isInitialized property of the hotHalo component.

tfamily \textcolor{red}{\textless\textgreater} mass() Get the mass property of the hotHalo component.

tfamily \textcolor{red}{\textless\textgreater} massAttributeMatch(<logical>[requireGettable] \rightarrow, <logical>[requireSettable] \rightarrow, <logical>[requireEvolvable] \rightarrow) Return a list of implementations that provide the given list off attributes for the mass property of the hotHalo component.

tfamily \textcolor{red}{\textless\textgreater} massCold() Get the massCold property of the hotHalo component.

tfamily \textcolor{red}{\textless\textgreater} massColdAttributeMatch(<logical>[requireGettable] \rightarrow, <logical>[requireSettable] \rightarrow, <logical>[requireEvolvable] \rightarrow) Return a list of implementations that provide the given list off attributes for the massCold property of the hotHalo component.
tfamily \intzero massColdCount() Compute the count of evolvable quantities in the **massCold** property of the **HotHaloColdMode** component.

tfamily \textcolor{red}{\textless double\textgreater} massColdIsGettable() Get the **massCold** property of the **hotHalo** component.

tfamily \logicalzero massColdIsSettable() Specify whether the **massCold** property of the **hotHalo** component is settable.

tfamily \void massColdRate(<double> value) Cumulate to the rate of the **massCold** property of the **HotHaloColdMode** component.

tfamily \void massColdScale(<double> value) Set the scale of the **massCold** property of the **HotHaloColdMode** component.

tfamily \void massColdSet(<double> value) Set the **massCold** property of the **hotHalo** component.

tfamily \intzero massCount() Compute the count of evolvable quantities in the **mass** property of the **HotHaloStandard** component.

tfamily \textcolor{red}{\textless double\textgreater} massIsGettable() Get the **mass** property of the **hotHalo** component.

tfamily \logicalzero massIsSettable() Specify whether the **mass** property of the **hotHalo** component is settable.

tfamily \void massRate(<double> value) Cumulate to the rate of the **mass** property of the **HotHaloStandard** component.

tfamily \void massRemovalRate() Called whenever the standard hot halo component removes mass from the halo.

tfamily \void massScale(<double> value) Set the scale of the **mass** property of the **HotHaloStandard** component.

tfamily \void massSet(<double> value) Set the **mass** property of the **hotHalo** component.

tfamily \textcolor{red}{\textless double\textgreater} massSink() Get the **massSink** property of the **hotHalo** component.

tfamily \textcolor{red}{\textless type(varying\_string)(:\textgreater)} massSinkAttributeMatch(<logical> requireGettable \rightarrow <logical> requireSettable \rightarrow <logical> requireEvolvable \rightarrow) Return a list of implementations that provide the given list off attributes for the **massSink** property of the **hotHalo** component.

tfamily \intzero massSinkCount() Compute the count of evolvable quantities in the **massSink** property of the **HotHaloStandard** component.

tfamily \textcolor{red}{\textless double\textgreater} massSinkIsGettable() Get the **massSink** property of the **hotHalo** component.

tfamily \logicalzero massSinkIsSettable() Specify whether the **massSink** property of the **hotHalo** component is settable.

tfamily \void massSinkRate(<double> value) Cumulate to the rate of the **massSink** property of the **hotHalo** component.
16. Coding GALACTICUS

tfamily \void massSinkRateFunction(<function()> deferredFunction) Set the function to be used for the rate method of the massSink property of the HotHaloStandard component.

tfamily \logicalzero massSinkRateIsAttached() Return whether the rate method of the massSink property of the HotHaloStandard component has been attached to a function.

tfamily \void nameFromIndex(<integer> count →, <varying_string>name←) Return the name of a property given is index.

tfamily \logicalzero nullIsActive() Return whether the null implementation of the hotHalo component class is active.

tfamily \void odeStepRatesInitialize() Initialize rates for evolvable properties.

tfamily \void odeStepScalesInitialize() Initialize scales for evolvable properties.

tfamily \textcolor{red}{\textless double\textgreater} outerRadius() Get the outerRadius property of the hotHalo component.

tfamily \textcolor{red}{\textless double\textgreater\textgreater} outerRadiusAttributeMatch(<logical>[requireGettable] →, <logical>[requireSettable] →, <logical>[requireEvolvable] →) Return a list of implementations that provide the given list of attributes for the outerRadius property of the hotHalo component.

tfamily \intzero outerRadiusCount() Compute the count of evolvable quantities in the outerRadius property of the HotHaloStandard component.

tfamily \void outerRadiusFunction(<function()> deferredFunction) Set the function to be used for the get method of the outerRadius property of the HotHaloStandard component.

tfamily \textcolor{red}{\textless double\textgreater\textgreater} outerRadiusGrowthRate() Get the outerRadiusGrowthRate property of the HotHaloOutflowTracking component.

tfamily \void outerRadiusGrowthRateFunction(procedure(HotHaloOutflowTrackingouterRadiusGrowthRateInterface) deferredFunction) Set the function for the deferred outerRadiusGrowthRate property of the HotHaloOutflowTracking component.

tfamily \logicalzero outerRadiusGrowthRateFunctionIsSet() Specify whether the deferred function for the outerRadiusGrowthRate property of the HotHaloOutflowTracking component has been set.

tfamily \logicalzero outerRadiusIsAttached() Return whether the get method of the outerRadius property of the HotHaloStandard component has been attached to a function.

tfamily \textcolor{red}{\textless double\textgreater\textgreater} outerRadiusIsGettable() Get the outerRadius property of the hotHalo component.

tfamily \logicalzero outerRadiusIsSettable() Specify whether the outerRadius property of the hotHalo component is settable.

tfamily \void outerRadiusRate(<double> value) Cumulate to the rate of the outerRadius property of the HotHaloStandard component.

tfamily \void outerRadiusScale(<double> value) Set the scale of the outerRadius property of the HotHaloStandard component.

tfamily \void outerRadiusSet(<double> value) Set the outerRadius property of the hotHalo component.
16.5. Objects

tfamily \textcolor{red}{\textless \textgreater} \texttt{outerRadiusValue}() Get the \texttt{outerRadius} property of the \texttt{hotHalo} component.

tfamily \texttt{outflowedAbundances()} Get the \texttt{outflowedAbundances} property of the \texttt{hotHalo} component.

tfamily \texttt{outflowedAbundancesAttributeMatch\langle \texttt{logical}[\texttt{requireGettable}] \rightarrow, \texttt{logical}[\texttt{requireSettable}] \rightarrow, \texttt{logical}[\texttt{requireEvolvable}] \rightarrow\rangle} Return a list of implementations that provide the given list of attributes for the \texttt{outflowedAbundances} property of the \texttt{hotHalo} component.

tfamily \intzero \texttt{outflowedAbundancesCount()} Compute the count of evolvable quantities in the \texttt{outflowedAbundances} property of the \texttt{HotHaloStandard} component.

tfamily \textcolor{red}{\textless \textgreater} \texttt{outflowedAbundancesIsGettable}() Get the \texttt{outflowedAbundances} property of the \texttt{hotHalo} component.

tfamily \texttt{outflowedAbundancesIsSettable()} Specify whether the \texttt{outflowedAbundances} property of the \texttt{hotHalo} component is settable.

tfamily \texttt{outflowedAbundancesRate\langle \texttt{type(abundances)} > value\rangle} Cumulate to the rate of the \texttt{outflowedAbundances} property of the \texttt{HotHaloStandard} component.

tfamily \texttt{outflowedAbundancesScale\langle \texttt{type(abundances)} > value\rangle} Set the scale of the \texttt{outflowedAbundances} property of the \texttt{HotHaloStandard} component.

tfamily \texttt{outflowedAbundancesSet\langle \texttt{type(abundances)} > value\rangle} Set the \texttt{outflowedAbundances} property of the \texttt{hotHalo} component.

tfamily \textcolor{red}{\textless \textgreater} \texttt{outflowedAngularMomentum() Get the \texttt{outflowedAngularMomentum} property of the \texttt{hotHalo} component.

tfamily \texttt{outflowedAngularMomentumAttributeMatch\langle \texttt{logical}[\texttt{requireGettable}] \rightarrow, \texttt{logical}[\texttt{requireSettable}] \rightarrow, \texttt{logical}[\texttt{requireEvolvable}] \rightarrow\rangle} Return a list of implementations that provide the given list of attributes for the \texttt{outflowedAngularMomentum} property of the \texttt{hotHalo} component.

tfamily \intzero \texttt{outflowedAngularMomentumCount()} Compute the count of evolvable quantities in the \texttt{outflowedAngularMomentum} property of the \texttt{HotHaloStandard} component.

tfamily \textcolor{red}{\textless \textgreater} \texttt{outflowedAngularMomentumIsGettable}() Get the \texttt{outflowedAngularMomentum} property of the \texttt{hotHalo} component.

tfamily \texttt{outflowedAngularMomentumIsSettable()} Specify whether the \texttt{outflowedAngularMomentum} property of the \texttt{hotHalo} component is settable.

tfamily \texttt{outflowedAngularMomentumRate\langle \texttt{double} > value\rangle} Cumulate to the rate of the \texttt{outflowedAngularMomentum} property of the \texttt{HotHaloStandard} component.

tfamily \texttt{outflowedAngularMomentumScale\langle \texttt{double} > value\rangle} Set the scale of the \texttt{outflowedAngularMomentum} property of the \texttt{HotHaloStandard} component.

tfamily \texttt{outflowedAngularMomentumSet\langle \texttt{double} > value\rangle} Set the \texttt{outflowedAngularMomentum} property of the \texttt{hotHalo} component.
16. Coding GALACTICUS

tfamily {\textcolor{red}{\textless double\textgreater}} outflowedMass() Get the outflowedMass property of the hotHalo component.

tfamily {\textcolor{red}{\textless double\textgreater}} outflowedMassAttributeMatch(<logical>[requireGettable], <logical>[requireSettable], <logical>[requireEvolvable]) Return a list of implementations that provide the given list of attributes for the outflowedMass property of the hotHalo component.

tfamily {\textcolor{red}{\textless double\textgreater}} outflowedMassCount() Compute the count of evolvable quantities in the outflowedMass property of the HotHaloStandard component.

tfamily {\textcolor{red}{\textless double\textgreater}} outflowedMassIsGettable() Get the outflowedMass property of the hotHalo component.

tfamily {\textcolor{red}{\textless double\textgreater}} outflowedMassIsSettable() Specify whether the outflowedMass property of the hotHalo component is settable.

tfamily void outflowedMassRate(<double> value) Cumulate to the rate of the outflowedMass property of the HotHaloStandard component.

tfamily void outflowedMassScale(<double> value) Set the scale of the outflowedMass property of the HotHaloStandard component.

tfamily void outflowedMassSet(<double> value) Set the outflowedMass property of the hotHalo component.

tfamily {\textcolor{red}{\textless double\textgreater}} outflowingAngularMomentum() Get the outflowingAngularMomentum property of the hotHalo component.

tfamily {\textcolor{red}{\textless double\textgreater}} outflowingAngularMomentumRate(<function()> deferredFunction) Set the function to be used for the rate method of the outflowingAngularMomentum property of the HotHaloStandard component.

tfamily {\textcolor{red}{\textless double\textgreater}} outflowingAngularMomentumRateIsAttached() Return whether the rate method of the outflowingAngularMomentum property of the HotHaloStandard component has been attached to a function.

tfamily {\textcolor{red}{\textless double\textgreater}} outflowingAngularMomentumIsGettable() Get the outflowingAngularMomentum property of the hotHalo component.
16.5. Objects

tfamily \textcolor{red}{\textless\textless\textgreater}\textless\textless\textgreater\textless\textless\textgreater} outflowingAngularMomentumAttributeMatch(<logical>[requireGettable]→, <logical>[requireSettable]→, <logical>[requireEvolvable]→)
Return a list of implementations that provide the given list of attributes for the outflowingAngularMomentum property of the hotHalo component.

tfamily \intzero outflowingAngularMomentumCount() Compute the count of evolvable quantities in the outflowingAngularMomentum property of the HotHaloStandard component.

tfamily \textcolor{red}{\textless\textless\textgreater} outflowingAngularMomentumIsGettable() Get the outflowingAngularMomentum property of the hotHalo component.

tfamily \logicalzero outflowingAngularMomentumIsSettable() Specify whether the outflowingAngularMomentum property of the hotHalo component is settable.

tfamily \void outflowingAngularMomentumRate(<double> value) Cumulate to the rate of the outflowingAngularMomentum property of the hotHalo component.

tfamily \void outflowingAngularMomentumRateFunction(<function()> deferredFunction) Set the function to be used for the rate method of the outflowingAngularMomentum property of the HotHaloStandard component.

tfamily \logicalzero outflowingAngularMomentumRateIsAttached() Return whether the rate method of the outflowingAngularMomentum property of the HotHaloStandard component has been attached to a function.

tfamily \textcolor{red}{\textless\textless\textgreater} outflowingMassAttributeMatch(<logical>[requireGettable]→, <logical>[requireSettable]→, <logical>[requireEvolvable]→)
Return a list of implementations that provide the given list of attributes for the outflowingMass property of the hotHalo component.

tfamily \intzero outflowingMassCount() Compute the count of evolvable quantities in the outflowingMass property of the HotHaloStandard component.

tfamily \textcolor{red}{\textless\textless\textgreater} outflowingMassIsGettable() Get the outflowingMass property of the hotHalo component.

tfamily \logicalzero outflowingMassIsSettable() Specify whether the outflowingMass property of the hotHalo component is settable.

tfamily \void outflowingMassRate(<double> value) Cumulate to the rate of the outflowingMass property of the hotHalo component.

tfamily \void outflowingMassRateFunction(<function()> deferredFunction) Set the function to be used for the rate method of the outflowingMass property of the HotHaloStandard component.

tfamily \logicalzero outflowingMassRateIsAttached() Return whether the rate method of the outflowingMass property of the HotHaloStandard component has been attached to a function.

tfamily \textcolor{red}{\textless\textless\textgreater} outflowReturn() Get the outflowReturn property of the HotHaloOutflowTracking component.

tfamily \void outflowReturnFunction(procedure(HotHaloOutflowTracking outflowReturnInterface) deferredFunction) Set the function for the deferred outflowReturn property of the HotHaloOutflowTracking component.
16. Coding GALACTICUS

tfamily \logicalzero outflowReturnFunctionIsSet() Specify whether the deferred function for the outflowReturn
property of the HotHaloOutflowTracking component has been set.

tfamily \logicalzero outflowTrackingIsActive() Return whether the outflowTracking implementation of
the hotHalo component class is active.

tfamily \void output(<integer> integerProperty↔, <integer> integerBufferCount↔, <integer(;;)> integerBuffer↔, <integer>doubleProperty↔, <integer> doubleBufferCount↔, <double(;;)> doubleBuffer↔, <double> time→, <integer> instance→) Generate values of outputtable properties.

tfamily \void outputCount(<integer>integerPropertyCount↔, <integer> doublePropertyCount↔, <double> time→, <integer> instance→) Compute a count of outputtable properties.

tfamily \void outputNames(<integer> integerProperty↔, <char[*](::)> integerPropertyNames↔, <char[*](::)> integerPropertyComments↔, <double(:)> integerPropertyUnitsSI↔, <integer> doubleProperty↔, <char[*](::)> doublePropertyNames↔, <char[*](::)> doublePropertyComments↔, <double(;;)> doublePropertyUnitsSI↔, <double> time→, <integer> instance→) Generate names of outputtable properties.

tfamily \doublezero potential(<double> radius→, <componentType> [componentType]→, <massType> [massType]→, <logical> [haloLoaded]→) Compute the gravitational potential.

tfamily \void readRaw(<integer> fileHandle→) Read a binary dump of the nodeComponent from the
given fileHandle.

tfamily \doublezero rotationCurve(<double> radius→, <componentType> [componentType]→, <massType> [massType]→, <logical> [haloLoaded]→) Compute the rotation curve.

tfamily \doublezero rotationCurveGradient(<double> radius→, <componentType> [componentType]→, <massType> [massType]→, <logical> [haloLoaded]→) Compute the rotation curve gradient.

tfamily \intzero serializeCount() Return a count of the number of evolvable quantities to be evolved.

tfamily \void serializeRates(<double(;;)> array→) Serialize the evolvable rates to an array.

tfamily \void serializeScales(<double(;;)> array→) Serialize the evolvable scales to an array.

tfamily \void serializeValues(<double(;;)> array→) Serialize the evolvable quantities to an array.

tfamily \logicalzero standardIsActive() Return whether the standard implementation of the hotHalo
component class is active.

tfamily \textcolor{red}{\textless type(abundances)\textgreater} strippedAbundances() Get the strippedAbundances
property of the hotHalo component.

tfamily \textcolor{red}{\textless type(varying\_string)(::)\textgreater} strippedAbundancesAttributeMatch(<logical>[requireGettable]→, <logical>[requireSettable]→, <logical>[requireEvolvable]→) Return a list of implementations that provide the given list of attributes for the strippedAbundances property of the hotHalo component.

tfamily \intzero strippedAbundancesCount() Compute the count of evolvable quantities in the strippedAbundances
property of the HotHaloStandard component.

tfamily \textcolor{red}{\textless type(abundances)\textgreater} strippedAbundancesIsGettable() Get the strippedAbundances property of the hotHalo component.
tfamily \logicalzero strippedAbundancesIsSettable() Specify whether the **strippedAbundances** property of the **hotHalo** component is settable.

tfamily \void strippedAbundancesRate(<type(abundances)> value) Cumulate to the rate of the **strippedAbundances** property of the **HotHaloStandard** component.

tfamily \void strippedAbundancesScale(<type(abundances)> value) Set the scale of the **strippedAbundances** property of the **HotHaloStandard** component.

tfamily \void strippedAbundancesSet(<type(abundances)> value) Set the **strippedAbundances** property of the **hotHalo** component.

tfamily \textcolor{red}{\textless double\textgreater} strippedMass() Get the **strippedMass** property of the **hotHalo** component.

tfamily \textcolor{red}{\textlesstype(varying\_string)(:)} strippedMassAttributeMatch(<logical> requireGettable → , <logical> requireSettable → , <logical> requireEvolvable → ) Return a list of implementations that provide the given list off attributes for the **strippedMass** property of the **hotHalo** component.

tfamily \intzero strippedMassCount() Compute the count of evolvable quantities in the **strippedMass** property of the **HotHaloStandard** component.

tfamily \textcolor{red}{\textless type(abundances)\textgreater} trackedOutflowAbundances() Get the **trackedOutflowAbundances** property of the **hotHalo** component.

tfamily \textcolor{red}{\textless type(varying\_string)(:)} trackedOutflowAbundancesAttributeMatch(<logical> requireGettable → , <logical> requireSettable → , <logical> requireEvolvable → ) Return a list of implementations that provide the given list off attributes for the **trackedOutflowAbundances** property of the **hotHalo** component.

tfamily \intzero trackedOutflowAbundancesCount() Compute the count of evolvable quantities in the **trackedOutflowAbundances** property of the **HotHaloOutflowTracking** component.

tfamily \textcolor{red}{\textless type(abundances)\textgreater} trackedOutflowAbundancesIsGettable() Get the **trackedOutflowAbundances** property of the **hotHalo** component.
tfamily \logicalzero trackedOutflowAbundancesIsSettable() Specify whether the trackedOutflowAbundances property of the hotHalo component is settable.

tfamily \void trackedOutflowAbundancesRate(<type(abundances)> value) Cumulate to the rate of the trackedOutflowAbundances property of the HotHaloOutflowTracking component.

tfamily \void trackedOutflowAbundancesScale(<type(abundances)> value) Set the scale of the trackedOutflowAbundances property of the HotHaloOutflowTracking component.

tfamily \void trackedOutflowAbundancesSet(<type(abundances)> value) Set the trackedOutflowAbundances property of the hotHalo component.

```
tfamily \textcolor{red}{\textless double\textgreater} trackedOutflowMass() Get the trackedOutflowMass property of the hotHalo component.
```

```
tfamily \textcolor{red}{\textless type(varying\_string):)\textgreater} trackedOutflowMassAttributeMatch(<logical>[requireGettable]\rightarrow, <logical>[requireSettable]\rightarrow, <logical>[requireEvolvable]\rightarrow) Return a list of implementations that provide the given list of attributes for the trackedOutflowMass property of the hotHalo component.
```

```
tfamily \intzero trackedOutflowMassCount() Compute the count of evolvable quantities in the trackedOutflowMass property of the HotHaloOutflowTracking component.
```

```
tfamily \textcolor{red}{\textless double\textgreater} unaccretedMass() Get the unaccretedMass property of the hotHalo component.
```

```
tfamily \textcolor{red}{\textless type(varying\_string):)\textgreater} unaccretedMassAttributeMatch(<logical>[requireGettable]\rightarrow, <logical>[requireSettable]\rightarrow, <logical>[requireEvolvable]\rightarrow) Return a list of implementations that provide the given list of attributes for the unaccretedMass property of the hotHalo component.
```

```
tfamily \intzero unaccretedMassCount() Compute the count of evolvable quantities in the unaccretedMass property of the HotHaloStandard component.
```

```
tfamily \textcolor{red}{\textless double\textgreater} unaccretedMassIsGettable() Get the unaccretedMass property of the hotHalo component.
```

```
tfamily \logicalzero unaccretedMassIsSettable() Specify whether the unaccretedMass property of the hotHalo component is settable.
```

```
tfamily \textcolor{red}{\textless type(varying\_string):)\textgreater} type() Return the type of this object.
```

```
tfamily \textcolor{red}{\textless double\textgreater} unaccretedMass() Get the unaccretedMass property of the hotHalo component.
```

```
tfamily \textcolor{red}{\textless type(varying\_string):)\textgreater} unaccretedMassAttributeMatch(<logical>[requireGettable]\rightarrow, <logical>[requireSettable]\rightarrow, <logical>[requireEvolvable]\rightarrow) Return a list of implementations that provide the given list of attributes for the unaccretedMass property of the hotHalo component.
```

```
tfamily \intzero unaccretedMassCount() Compute the count of evolvable quantities in the unaccretedMass property of the HotHaloStandard component.
```

```
tfamily \textcolor{red}{\textless double\textgreater} unaccretedMassIsGettable() Get the unaccretedMass property of the hotHalo component.
```

```
tfamily \logicalzero unaccretedMassIsSettable() Specify whether the unaccretedMass property of the hotHalo component is settable.
```

540
16.5. Objects

tfamily \void unaccretedMassRate(<double> value) Cumulate to the rate of the unaccretedMass property of the HotHaloStandard component.

tfamily \void unaccretedMassScale(<double> value) Set the scale of the unaccretedMass property of the HotHaloStandard component.

tfamily \void unaccretedMassSet(<double> value) Set the unaccretedMass property of the hotHalo component.

tfamily \logicalzero verySimpleIsActive() Return whether the verySimple implementation of the hotHalo component class is active.

tfamily nodeComponentHotHaloStandard

tfamily \textcolor{red}{\textless type(abundances)\textgreater} abundances() Get the abundances property of the hotHalo component.

tfamily \textcolor{red}{\textless type(varying\_string)(:)}\textgreater abundancesAttributeMatch(<logical>[requireGettable]→, <logical>[requireSettable]→, <logical>[requireEvolvable]→) Return a list of implementations that provide the given list off attributes for the abundances property of the hotHalo component

tfamily \textcolor{red}{\textless type(abundances)\textgreater} abundancesCold() Get the abundancesCold property of the hotHalo component.

tfamily \textcolor{red}{\textless type(varying\_string)(:)}\textgreater abundancesColdAttributeMatch(<logical>[requireGettable]→, <logical>[requireSettable]→, <logical>[requireEvolvable]→) Return a list of implementations that provide the given list off attributes for the abundancesCold property of the hotHalo component

tfamily \intzero abundancesColdCount() Compute the count of evolvable quantities in the abundancesCold property of the HotHaloColdMode component.

tfamily \textcolor{red}{\textless type(abundances)\textgreater} abundancesColdIsGettable() Get the abundancesCold property of the hotHalo component.

tfamily \logicalzero abundancesColdIsSettable() Specify whether the abundancesCold property of the hotHalo component is settable.

tfamily \void abundancesColdRate(<type(abundances)> value) Cumulate to the rate of the abundancesCold property of the HotHaloColdMode component.

tfamily \void abundancesColdScale(<type(abundances)> value) Set the scale of the abundancesCold property of the HotHaloColdMode component.

tfamily \void abundancesColdSet(<type(abundances)> value) Set the abundancesCold property of the hotHalo component.

tfamily \intzero abundancesCount() Compute the count of evolvable quantities in the abundances property of the HotHaloStandard component.

tfamily \textcolor{red}{\textless type(abundances)\textgreater} abundancesIsGettable() Get the abundances property of the hotHalo component.

tfamily \logicalzero abundancesIsSettable() Specify whether the abundances property of the hotHalo component is settable.
tfamily \textcolor{red}{\textless \text{double}\textgreater} angularMomentum() Get the angularMomentum property of the hotHalo component.

tfamily \textcolor{red}{\textless \text{type(abundances)}\textgreater} abundancesRate(<\text{type(abundances)}> value) Cumulate to the rate of the abundances property of the HotHaloStandard component.

tfamily \textcolor{red}{\textless \text{type(abundances)}\textgreater} abundancesScale(<\text{type(abundances)}> value) Set the scale of the abundances property of the HotHaloStandard component.

tfamily \textcolor{red}{\textless \text{type(abundances)}\textgreater} abundancesSet(<\text{type(abundances)}> value) Set the abundances property of the hotHalo component.

tfamily \textcolor{red}{\textless \text{double}\textgreater} angularMomentumCold() Get the angularMomentumCold property of the hotHalo component.

tfamily \textcolor{red}{\textless \text{type(varying\_string)}\textgreater} angularMomentumColdAttributeMatch(<\text{logical}> requireGettable\rightarrow, <\text{logical}> requireSettable\rightarrow, <\text{logical}> requireEvolvable\rightarrow) Return a list of implementations that provide the given list of attributes for the angularMomentumCold property of the hotHalo component.

tfamily \textcolor{red}{\textless \text{double}\textgreater} angularMomentumColdIsGettable() Get the angularMomentumCold property of the hotHalo component.

tfamily \textcolor{red}{\textless \text{logical}\textgreater} angularMomentumColdIsSettable() Specify whether the angularMomentumCold property of the hotHalo component is settable.

tfamily \int zero angularMomentumColdCount() Compute the count of evolvable quantities in the angularMomentumCold property of the HotHaloColdMode component.

tfamily \textcolor{red}{\textless \text{double}\textgreater} angularMomentumIsGettable() Get the angularMomentum property of the hotHalo component.

tfamily \textcolor{red}{\textless \text{logical}\textgreater} angularMomentumIsSettable() Specify whether the angularMomentum property of the hotHalo component is settable.

tfamily \void angularMomentumRate(<\text{double}> value) Cumulate to the rate of the angularMomentum property of the HotHaloStandard component.

tfamily \void angularMomentumScale(<\text{double}> value) Set the scale of the angularMomentum property of the HotHaloColdMode component.

tfamily \void angularMomentumSet(<\text{double}> value) Set the angularMomentum property of the hotHalo component.

tfamily \int zero angularMomentumCount() Compute the count of evolvable quantities in the angularMomentum property of the HotHaloStandard component.

tfamily \textcolor{red}{\textless \text{double}\textgreater} angularMomentumIsGettable() Get the angularMomentum property of the hotHalo component.

tfamily \textcolor{red}{\textless \text{logical}\textgreater} angularMomentumIsSettable() Specify whether the angularMomentum property of the hotHalo component is settable.
16.5. Objects

tfamily \void angularMomentumScale(<double> value) Set the scale of the angularMomentum property of the HotHaloStandard component.

tfamily \void angularMomentumSet(<double> value) Set the angularMomentum property of the hotHalo component.

tfamily \void builder(<*type(node)> componentDefinition) Build a nodeComponent from a supplied XML definition.

\textcolor{red}{\lesstype(chemicalAbundances) \greater} chemicals() Get the chemicals property of the hotHalo component.

\textcolor{red}{\lesstype(varying\_string) (: \greater)} chemicalsAttributeMatch(<logical>[requireGettable] →, <logical>[requireSettable] →, <logical>[requireEvolvable] →) Return a list of implementations that provide the given list off attributes for the chemicals property of the hotHalo component.

intzero chemicalsCount() Compute the count of evolvable quantities in the chemicals property of the HotHaloStandard component.

\textcolor{red}{\lesstype(chemicalAbundances) \greater} chemicalsIsGettable() Get the chemicals property of the hotHalo component.

logicalzero chemicalsIsSettable() Specify whether the chemicals property of the hotHalo component is settable.

\void chemicalsRate(<type(chemicalAbundances)> value) Cumulate to the rate of the chemicals property of the HotHaloStandard component.

\void chemicalsScale(<type(chemicalAbundances)> value) Set the scale of the chemicals property of the HotHaloStandard component.

\void chemicalsSet(<type(chemicalAbundances)> value) Set the chemicals property of the hotHalo component.

logicalzero coldModeIsActive() Return whether the coldMode implementation of the hotHalo component class is active.

\void createFunctionSet(<function()>) Set the function used to create HotHaloStandard components.

density(<double(3)> positionSpherical →, <componentType>[componentType] →, <massType>[massType] →, <weightBy>[weightBy] →, <integer>[weightIndex] →, <logical>[haloLoaded] →) Compute the density.

deserializeRates(<double(:)> array ←) Deserialize the evolvable rates from an array.

deserializeScales(<double(:)> array ←) Deserialize the evolvable scales from an array.

deserializeValues(<double(:)> array ←) Deserialize the evolvable quantities from an array.

destroy() Destroy the object.

dump() Generate an ASCII dump of all properties.

dumpRaw(<integer> fileHandle →) Generate a binary dump of all properties.

dumpXML() Generate an XML dump of all properties.
16. Coding GALACTICUS

tfamily double zero enclosedMass("double") radius\rightarrow, "componentType" [componentType]\rightarrow, "massType" [massType]\rightarrow, "weightBy" [weightBy]\rightarrow, "integer" [weightIndex]\rightarrow, "logical" [haloLoaded]\rightarrow) Compute the mass enclosed within a radius.

tfamily \textcolor{red}{\textless double\textgreater} heatSource() Get the \texttt{heatSource} property of the \texttt{hotHalo} component.

tfamily \textcolor{red}{\textless textless double\textgreater\textgreater} heatSourceAttributeMatch("logical" [requireGettable]\rightarrow, "logical" [requireSettable]\rightarrow, "logical" [requireEvolvable]\rightarrow) Return a list of implementations that provide the given list of attributes for the \texttt{heatSource} property of the \texttt{hotHalo} component

tfamily \intzero heatSourceCount() Compute the count of evolvable quantities in the \texttt{heatSource} property of the \texttt{HotHaloStandard} component.

tfamily \textcolor{red}{\textless textless double\textgreater\textgreater} heatSourceIsGettable() Get the \texttt{heatSource} property of the \texttt{hotHalo} component.

ntfamily \logicalzero heatSourceIsSettable() Specify whether the \texttt{heatSource} property of the \texttt{hotHalo} component is settable.

tfamily \void heatSourceRate("double" value) Cumulate to the rate of the \texttt{heatSource} property of the \texttt{hotHalo} component.

tfamily \void heatSourceRateFunction("function()" deferredFunction) Set the function to be used for the \texttt{rate} method of the \texttt{heatSource} property of the \texttt{HotHaloStandard} component.

ntfamily \logicalzero heatSourceRateIsAttached() Return whether the rate method of the \texttt{heatSource} property of the \texttt{HotHaloStandard} component has been attached to a function.

ntfamily \textcolor{red}{\textless *type(treeNode)\textgreater} host() Return a pointer to the host \texttt{treeNode} object.

ntfamily \textcolor{red}{\textless type(abundances)\textgreater} hotHaloCoolingAbundances() Get the \texttt{hotHaloCoolingAbundances} property of the \texttt{hotHalo} component.

ntfamily \textcolor{red}{\textless textless type(varying\_string)()\textgreater\textgreater} hotHaloCoolingAbundancesAttributeMatch("logical" [requireGettable]\rightarrow, "logical" [requireSettable]\rightarrow, "logical" [requireEvolvable]\rightarrow) Return a list of implementations that provide the given list of attributes for the \texttt{hotHaloCoolingAbundances} property of the \texttt{hotHalo} component

ntfamily \intzero hotHaloCoolingAbundancesCount() Compute the count of evolvable quantities in the \texttt{hotHaloCoolingAbundances} property of the \texttt{HotHaloStandard} component.

ntfamily \textcolor{red}{\textless type(abundances)\textgreater\textgreater} hotHaloCoolingAbundancesIsGettable() Get the \texttt{hotHaloCoolingAbundances} property of the \texttt{hotHalo} component.

ntfamily \logicalzero hotHaloCoolingAbundancesIsSettable() Specify whether the \texttt{hotHaloCoolingAbundances} property of the \texttt{hotHalo} component is settable.

ntfamily \void hotHaloCoolingAbundancesRate("type(abundances)" value) Cumulate to the rate of the \texttt{hotHaloCoolingAbundances} property of the \texttt{hotHalo} component.

ntfamily \void hotHaloCoolingAbundancesRateFunction("function()" deferredFunction) Set the function to be used for the \texttt{rate} method of the \texttt{hotHaloCoolingAbundances} property of the \texttt{hotHalo} component.
16.5. Objects

tfamily \logicalzero hotHaloCoolingAbundancesRateIsAttached() Return whether the rate method of the hotHaloCoolingAbundances property of the hotHalo component has been attached to a function.

tfamily \textcolor{red}\textless double\textgreater hotHaloCoolingAngularMomentum() Get the hotHaloCoolingAngularMomentum property of the hotHalo component.

tfamily \textcolor{red}\textless double\textgreater hotHaloCoolingAngularMomentumIsGettable() Get the hotHaloCoolingAngularMomentum property of the hotHalo component.

tfamily \logicalzero hotHaloCoolingAngularMomentumIsSettable() Specify whether the hotHaloCoolingAngularMomentum property of the hotHalo component is settable.

tfamily \void hotHaloCoolingAngularMomentumRate(<double> value) Cumulate to the rate of the hotHaloCoolingAngularMomentum property of the hotHalo component.

tfamily \void hotHaloCoolingAngularMomentumRateFunction(<function()> deferredFunction) Set the function to be used for the rate method of the hotHaloCoolingAngularMomentum property of the hotHalo component.

tfamily \logicalzero hotHaloCoolingAngularMomentumRateIsAttached() Return whether the rate method of the hotHaloCoolingAngularMomentum property of the hotHalo component has been attached to a function.

tfamily \textcolor{red}\textless double\textgreater hotHaloCoolingMass() Get the hotHaloCoolingMass property of the hotHalo component.

tfamily \textcolor{red}\textless double\textgreater hotHaloCoolingMassIsGettable() Get the hotHaloCoolingMass property of the hotHalo component.

tfamily \logicalzero hotHaloCoolingMassIsSettable() Specify whether the hotHaloCoolingMass property of the hotHalo component is settable.

tfamily \void hotHaloCoolingMassRate(<double> value) Cumulate to the rate of the hotHaloCoolingMass property of the hotHalo component.

tfamily \void hotHaloCoolingMassRateFunction(<function()> deferredFunction) Set the function to be used for the rate method of the hotHaloCoolingMass property of the hotHalo component.
16. Coding GALACTICUS

tfamily \logicalzero hotHaloCoolingMassRateIsAttached() Return whether the rate method of the hotHalo-CoolingMass property of the hotHalo component has been attached to a function.

tfamily \void initialize() Initialize the object.

tfamily \textcolor{red}{\textless \textless \textgreater \textless \textgreater} isInitialized() Get the isInitialized property of the hotHalo component.

tfamily \textcolor{red}{\textless \textless \textgreater \textless \textgreater} isInitializedAttributeMatch(\logical[requireGettable]→, \logical[requireSettable]→, \logical[requireEvolvable]→) Return a list of implementations that provide the given list off attributes for the isInitialized property of the hotHalo component.

tfamily \logicalzero isInitializedIsGettable() Get the isInitialized property of the hotHalo component.

tfamily \logicalzero isInitializedIsSettable() Specify whether the isInitialized property of the hotHalo component is settable.

tfamily \void isInitializedSet(\logical value) Set the isInitialized property of the hotHalo component.

tfamily \textcolor{red}{\textless \textless \textgreater \textless \textgreater} mass() Get the mass property of the hotHalo component.

tfamily \textcolor{red}{\textless \textless \textgreater \textless \textgreater} massAttributeMatch(\logical[requireGettable]→, \logical[requireSettable]→, \logical[requireEvolvable]→) Return a list of implementations that provide the given list off attributes for the mass property of the hotHalo component.

tfamily \textcolor{red}{\textless \textless \textgreater \textless \textgreater} massCold() Get the massCold property of the hotHalo component.

tfamily \textcolor{red}{\textless \textless \textgreater \textless \textgreater} massColdAttributeMatch(\logical[requireGettable]→, \logical[requireSettable]→, \logical[requireEvolvable]→) Return a list of implementations that provide the given list off attributes for the massCold property of the hotHalo component.

tfamily \intzero massColdCount() Compute the count of evolvable quantities in the massCold property of the HotHaloColdMode component.

tfamily \logicalzero massColdIsGettable() Get the massCold property of the hotHalo component.

tfamily \logicalzero massColdIsSettable() Specify whether the massCold property of the hotHalo component is settable.

tfamily \void massColdRate(\double value) Cumulate to the rate of the massCold property of the HotHaloColdMode component.

tfamily \void massColdScale(\double value) Set the scale of the massCold property of the HotHaloColdMode component.

tfamily \void massColdSet(\double value) Set the massCold property of the hotHalo component.

tfamily \intzero massCount() Compute the count of evolvable quantities in the mass property of the HotHaloStandard component.
16.5. Objects

tfamily \textcolor{red}{\textless double\textgreater} massIsGettable() Get the mass property of the hotHalo component.

tfamily \textcolor{red}{\textless double\textgreater} massSink() Get the massSink property of the hotHalo component.

tfamily \logicalzero massIsSettable() Specify whether the mass property of the hotHalo component is settable.

tfamily \void massRate(<double> value) Cumulate to the rate of the mass property of the HotHaloStandard component.

tfamily \void massRemovalRate() Called whenever the standard hot halo component removes mass from the halo.

tfamily \void massScale(<double> value) Set the scale of the mass property of the HotHaloStandard component.

tfamily \void massSet(<double> value) Set the mass property of the hotHalo component.

tfamily \textcolor{red}{\textless double\textgreater} massSink() Get the massSink property of the hotHalo component.

tfamily \textcolor{red}{\textlesstype(varying_string)(:)} massSinkAttributeMatch(<logical>[requireGettable]→, <logical>[requireSettable]→, <logical>[requireEvolvable]→) Return a list of implementations that provide the given list off attributes for the massSink property of the hotHalo component.

tfamily \intzero massSinkCount() Compute the count of evolvable quantities in the massSink property of the HotHaloStandard component.

tfamily \textcolor{red}{\textless double\textgreater} massSinkIsGettable() Get the massSink property of the hotHalo component.

tfamily \logicalzero massSinkIsSettable() Specify whether the massSink property of the hotHalo component is settable.

tfamily \void massSinkRate(<double> value) Cumulate to the rate of the massSink property of the hotHalo component.

tfamily \void massSinkRateFunction(<function()> deferredFunction) Set the function to be used for the rate method of the massSink property of the HotHaloStandard component.

tfamily \logicalzero massSinkRateIsAttached() Return whether the rate method of the massSink property of the HotHaloStandard component has been attached to a function.

tfamily \void nameFromIndex(<integer> count→, <varying_string>name←) Return the name of a property given is index.

tfamily \logicalzero nullIsActive() Return whether the null implementation of the hotHalo component class is active.

tfamily \void odeStepRatesInitialize() Initialize rates for evolvable properties.

tfamily \void odeStepScalesInitialize() Initialize scales for evolvable properties.

tfamily \textcolor{red}{\textless double\textgreater} outerRadius() Get the outerRadius property of the hotHalo component.
16. Coding Galacticus

tfamily \textcolor{red}{\text<textless type(varying\string):\textgreater>} outerRadiusAttributeMatch(<logical>[requireGettable] →<logical>[requireSettable] →<logical>[requireEvolvable] →) Return a list of implementations that provide the given list of attributes for the outerRadius property of the hotHalo component.

tfamily \intzero outerRadiusCount() Compute the count of evolvable quantities in the outerRadius property of the HotHaloStandard component.

tfamily \void outerRadiusFunction(<function()> deferredFunction) Set the function to be used for the get method of the outerRadius property of the HotHaloStandard component.

tfamily \textcolor{red}{\text<textless double\textgreater>} outerRadiusGrowthRate() Get the outerRadiusGrowthRate property of the HotHaloStandard component.

tfamily \void outerRadiusGrowthRateFunction(procedure(HotHaloStandard outerRadiusGrowthRateInterface) deferredFunction) Set the function for the deferred outerRadiusGrowthRate property of the HotHaloStandard component.

tfamily \logical zero outerRadiusGrowthRateFunctionIsSet() Specify whether the deferred function for the outerRadiusGrowthRate property of the HotHaloStandard component has been set.

tfamily \logical zero outerRadiusIsAttached() Return whether the get method of the outerRadius property of the HotHaloStandard component has been attached to a function.

tfamily \textcolor{red}{\text<textless double\textgreater>} outerRadiusIsGettable() Get the outerRadius property of the hotHalo component.

tfamily \logical zero outerRadiusIsSettable() Specify whether the outerRadius property of the hotHalo component is settable.

tfamily \void outerRadiusRate(<double> value) Cumulate to the rate of the outerRadius property of the HotHaloStandard component.

tfamily \void outerRadiusScale(<double> value) Set the scale of the outerRadius property of the HotHaloStandard component.

tfamily \void outerRadiusSet(<double> value) Set the outerRadius property of the hotHalo component.

tfamily \textcolor{red}{\text<textless type(abundances)\textgreater>} outflowedAbundances() Get the outflowedAbundances property of the hotHalo component.

tfamily \textcolor{red}{\text<textless type(varying\string):\textgreater>} outflowedAbundancesAttributeMatch(<logical>[requireGettable] →<logical>[requireSettable] →<logical>[requireEvolvable] →) Return a list of implementations that provide the given list of attributes for the outflowedAbundances property of the hotHalo component.

tfamily \intzero outflowedAbundancesCount() Compute the count of evolvable quantities in the outflowedAbundances property of the HotHaloStandard component.

tfamily \textcolor{red}{\text<textless type(abundances)\textgreater>} outflowedAbundancesIsGettable() Get the outflowedAbundances property of the hotHalo component.
tfamily \textcolor{red}{\textless{}double\textgreater{}} outflowedAngularMomentum() Get the outflowedAngularMomentum property of the hotHalo component.

tfamily \textcolor{red}{\textless{}double\textgreater{}} outflowedAngularMomentumIsGettable() Get the outflowedAngularMomentum property of the hotHalo component.

tfamily \logicalzero outflowedAngularMomentumIsSettable() Specify whether the outflowedAngularMomentum property of the hotHalo component is settable.

tfamily \void outflowedAngularMomentumRate(<double> value) Cumulate to the rate of the outflowedAngularMomentum property of the HotHaloStandard component.

tfamily \void outflowedAngularMomentumScale(<double> value) Set the scale of the outflowedAngularMomentum property of the HotHaloStandard component.

tfamily \void outflowedAngularMomentumSet(<double> value) Set the outflowedAngularMomentum property of the hotHalo component.

tfamily \intzero outflowedAngularMomentumCount() Compute the count of evolvable quantities in the outflowedAngularMomentum property of the HotHaloStandard component.

16.5. Objects

tfamily \logicalzero outflowedAbundancesIsSettable() Specify whether the outflowedAbundances property of the hotHalo component is settable.

tfamily \void outflowedAbundancesRate(<type(abundances)> value) Cumulate to the rate of the outflowedAbundances property of the HotHaloStandard component.

tfamily \void outflowedAbundancesScale(<type(abundances)> value) Set the scale of the outflowedAbundances property of the HotHaloStandard component.

tfamily \void outflowedAbundancesSet(<type(abundances)> value) Set the outflowedAbundances property of the hotHalo component.

tfamily \textcolor{red}{\textless{}double\textgreater{}} outflowedAngularMomentum() Get the outflowedAngularMomentum property of the hotHalo component.

549
16. Coding GALACTICUS

tfamily \void outflowedMassScale(<double> value) Set the scale of the outflowedMass property of the HotHaloStandard component.

tfamily \void outflowedMassSet(<double> value) Set the outflowedMass property of the hotHalo component.

tfamily \textcolor{red}{\textless\textstring\textgreater} outflowingAbundances() Get the outflowingAbundances property of the hotHalo component.

tfamily \textcolor{red}{\textless\textstring\textgreater} outflowingAbundancesAttributeMatch(<logical>[requireGettable]→, <logical>[requireSettable]→, <logical>[requireEvolvable]→) Return a list of implementations that provide the given list of attributes for the outflowingAbundances property of the hotHalo component.

tfamily \intzero outflowingAbundancesCount() Compute the count of evolvable quantities in the outflowingAbundances property of the HotHaloStandard component.

tfamily \textcolor{red}{\textless\textstring\textgreater} outflowingAbundancesIsGettable() Get the outflowingAbundances property of the hotHalo component.

tfamily \logicalzero outflowingAbundancesIsSettable() Specify whether the outflowingAbundances property of the hotHalo component is settable.

tfamily \void outflowingAbundancesRate(<type(abundances)> value) Cumulate to the rate of the outflowingAbundances property of the hotHalo component.

tfamily \void outflowingAbundancesRateFunction(<function()> deferredFunction) Set the function to be used for the rate method of the outflowingAbundances property of the HotHaloStandard component.

tfamily \logicalzero outflowingAbundancesRateIsAttached() Return whether the rate method of the outflowingAbundances property of the HotHaloStandard component has been attached to a function.

tfamily \textcolor{red}{\textless\textstring\textgreater} outflowingAngularMomentum() Get the outflowingAngularMomentum property of the hotHalo component.

tfamily \textcolor{red}{\textless\textstring\textgreater} outflowingAngularMomentumAttributeMatch(<logical>[requireGettable]→, <logical>[requireSettable]→, <logical>[requireEvolvable]→) Return a list of implementations that provide the given list of attributes for the outflowingAngularMomentum property of the hotHalo component.

tfamily \intzero outflowingAngularMomentumCount() Compute the count of evolvable quantities in the outflowingAngularMomentum property of the HotHaloStandard component.

tfamily \textcolor{red}{\textless\textstring\textgreater} outflowingAngularMomentumIsGettable() Get the outflowingAngularMomentum property of the hotHalo component.

tfamily \logicalzero outflowingAngularMomentumIsSettable() Specify whether the outflowingAngularMomentum property of the hotHalo component is settable.

tfamily \void outflowingAngularMomentumRate(<double> value) Cumulate to the rate of the outflowingAngularMomentum property of the hotHalo component.

tfamily \void outflowingAngularMomentumRateFunction(<function()> deferredFunction) Set the function to be used for the rate method of the outflowingAngularMomentum property of the HotHaloStandard component.
16.5. Objects

tfamily \logicalzero outflowingAngularMomentumRateIsAttached() Return whether the rate method of the outflowingAngularMomentum property of the HotHaloStandard component has been attached to a function.

tfamily \textcolor{red}{\textless double\textgreater} outflowingMass() Get the outflowingMass property of the hotHalo component.

tfamily \textcolor{red}{\textless void\textgreater} outflowReturn() Get the outflowReturn property of the HotHaloStandard component.

tfamily outflowingMassAttributeMatch(<logical>[requireGettable] →, <logical>[requireSettable] →, <logical>[requireEvolvable] →) Return a list of implementations that provide the given list of attributes for the outflowingMass property of the hotHalo component.

tfamily \intzerooutflowingMassCount() Compute the count of evolvable quantities in the outflowingMass property of the HotHaloStandard component.

tfamily \logicalzero outflowingMassIsGettable() Get the outflowingMass property of the hotHalo component.

tfamily \logicalzero outflowingMassIsSettable() Specify whether the outflowingMass property of the hotHalo component is settable.

tfamily \void outflowingMassRate(<double> value) Cumulate to the rate of the outflowingMass property of the hotHalo component.

tfamily \void outflowingMassRateFunction(<function()> deferredFunction) Set the function to be used for the rate method of the outflowingMass property of the HotHaloStandard component.

tfamily \logicalzero outflowingMassRateIsAttached() Return whether the rate method of the outflowingMass property of the HotHaloStandard component has been attached to a function.

tfamily \void outputCount(<integer>integerPropertyCount ↔, <integer>doublePropertyCount ↔, <double> time →, <integer> instance →) Compute a count of outputtable properties.

tfamily \void outputNames(<integer>integerProperty ↔, <char[*]>integerPropertyNames ↔, <char[*]>integerPropertyComments ↔, <double[*]>integerPropertyUnitsSI ↔, <integer>doubleProperty ↔, <char[*]>doublePropertyNames ↔, <char[*]>doublePropertyComments ↔, <double[*]>doublePropertyUnitsSI ↔, <double> time →, <integer> instance →) Generate names of outputtable properties.

tfamily \doublezero potential(<double> radius →, <componentType>[componentType]→, <massType>[massType]→, <logical>[haloLoaded]→) Compute the gravitational potential.
16. Coding Galacticus

tfamily \void readRaw(<integer> fileHandle \rightarrow) Read a binary dump of the nodeComponent from the given fileHandle.

tfamily \double zero rotationCurve(<double> radius \rightarrow, <componentType> [componentType] \rightarrow, <massType> [massType] \rightarrow, <logical> [haloLoaded] \rightarrow) Compute the rotation curve.

tfamily \double zero rotationCurveGradient(<double> radius \rightarrow, <componentType> [componentType] \rightarrow, <massType> [massType] \rightarrow, <logical> [haloLoaded] \rightarrow) Compute the rotation curve gradient.

tfamily \int zero serializeCount() Return a count of the number of evolvable quantities to be evolved.

tfamily \void serializeRates(<double(:)> array \rightarrow) Serialize the evolvable rates to an array.

tfamily \void serializeScales(<double(:)> array \rightarrow) Serialize the evolvable scales to an array.

tfamily \void serializeValues(<double(:)> array \rightarrow) Serialize the evolvable quantities to an array.

tfamily \logical zero standardIsActive() Return whether the standard implementation of the hotHalo component class is active.

tfamily \textcolor{red}{\textless type(abundances)\textgreater} strippedAbundances() Get the strippedAbundances property of the hotHalo component.

tfamily \textcolor{red}{\textless type(varying\_string)(:)\textgreater} strippedAbundancesAttributeMatch(<logical>[requireGettable] \rightarrow, <logical>[requireSettable] \rightarrow, <logical>[requireEvolvable] \rightarrow) Return a list of implementations that provide the given list of attributes for the strippedAbundances property of the hotHalo component.

tfamily \int zero strippedAbundancesCount() Compute the count of evolvable quantities in the strippedAbundances property of the HotHaloStandard component.

tfamily \textcolor{red}{\textless double\textgreater} strippedMass() Get the strippedMass property of the hotHalo component.

tfamily \textcolor{red}{\textless type(varying\_string)(:)\textgreater} strippedMassAttributeMatch(<logical>[requireGettable] \rightarrow, <logical>[requireSettable] \rightarrow, <logical>[requireEvolvable] \rightarrow) Return a list of implementations that provide the given list of attributes for the strippedMass property of the hotHalo component.

tfamily \int zero strippedMassCount() Compute the count of evolvable quantities in the strippedMass property of the HotHaloStandard component.
16.5. Objects

tfamily \textcolor{red}{\textless double\textgreater} strippedMassIsGettable() Get the strippedMass property of the hotHalo component.

tfamily \textcolor{red}{\textless double\textgreater} strippedMassIsSettable() Specify whether the strippedMass property of the hotHalo component is settable.

tfamily \textcolor{red}{\textless double\textgreater} strippedMassRate(<double> value) Cumulate to the rate of the strippedMass property of the HotHaloStandard component.

tfamily \textcolor{red}{\textless double\textgreater} strippedMassScale(<double> value) Set the scale of the strippedMass property of the HotHaloStandard component.

tfamily \textcolor{red}{\textless double\textgreater} strippedMassSet(<double> value) Set the strippedMass property of the hotHalo component.

tfamily \textcolor{red}{\textless double\textgreater} surfaceDensity(<double(3)> positionCylindrical→, <componentType> [componentType]→, <massType> [massType]→, <weightBy> [weightBy]→, <integer> [weightIndex]→, <logical> [haloLoaded]→) Compute the surface density.

tfamily \textcolor{red}{\textless type(abundances)\textgreater} trackedOutflowAbundances() Get the trackedOutflowAbundances property of the hotHalo component.

tfamily \textcolor{red}{\textless type(varying\_string)(:)\textgreater} trackedOutflowAbundancesAttributeMatch(<logical>[requireGettable]→, <logical>[requireSettable]→, <logical>[requireEvolvable]→) Return a list of implementations that provide the given list of attributes for the trackedOutflowAbundances property of the hotHalo component.

tfamily \textcolor{red}{\textless double\textgreater} trackedOutflowAbundancesCount() Compute the count of evolvable quantities in the trackedOutflowAbundances property of the HotHaloOutflowTracking component.

tfamily \textcolor{red}{\textless type(abundances)\textgreater} trackedOutflowAbundancesIsGettable() Get the trackedOutflowAbundances property of the hotHalo component.

tfamily \textcolor{red}{\textless type(abundances)\textgreater} trackedOutflowAbundancesIsSettable() Specify whether the trackedOutflowAbundances property of the hotHalo component is settable.

tfamily \textcolor{red}{\textless type(abundances)\textgreater} trackedOutflowAbundancesRate(<type(abundances)> value) Cumulate to the rate of the trackedOutflowAbundances property of the HotHaloOutflowTracking component.

tfamily \textcolor{red}{\textless type(abundances)\textgreater} trackedOutflowAbundancesScale(<type(abundances)> value) Set the scale of the trackedOutflowAbundances property of the HotHaloOutflowTracking component.

tfamily \textcolor{red}{\textless type(abundances)\textgreater} trackedOutflowAbundancesSet(<type(abundances)> value) Set the trackedOutflowAbundances property of the hotHalo component.

tfamily \textcolor{red}{\textless double\textgreater} trackedOutflowMass() Get the trackedOutflowMass property of the hotHalo component.

tfamily \textcolor{red}{\textless type(abundances)\textgreater} trackedOutflowMassAttributeMatch(<logical>[requireGettable]→, <logical>[requireSettable]→, <logical>[requireEvolvable]→) Return a list of implementations that provide the given list of attributes for the trackedOutflowMass property of the hotHalo component.

tfamily \textcolor{red}{\textless double\textgreater} trackedOutflowMassCount() Compute the count of evolvable quantities in the trackedOutflowMass property of the HotHaloOutflowTracking component.
16. Coding GALACTICUS

tfamily \textcolor{red}{\textless\textless double\textgreater\textgreater} trackedOutflowMassIsGettable() Get the trackedOutflowMass property of the hotHalo component.

tfamily \textcolor{red}{\logicalzero} trackedOutflowMassIsSettable() Specify whether the trackedOutflowMass property of the hotHalo component is settable.

tfamily \void trackedOutflowMassRate(\double value) Cumulate to the rate of the trackedOutflowMass property of the HotHaloOutflowTracking component.

tfamily \void trackedOutflowMassScale(\double value) Set the scale of the trackedOutflowMass property of the HotHaloOutflowTracking component.

tfamily \void trackedOutflowMassSet(\double value) Set the trackedOutflowMass property of the hotHalo component.

tfamily \textcolor{red}{\textless type(varying\_string)\textgreater} type() Return the type of this object.

tfamily \textcolor{red}{\textless double\textgreater} unaccretedMass() Get the unaccretedMass property of the hotHalo component.

tfamily \textcolor{red}{\textlesstype(varying\_string)(:)\textgreater} unaccretedMassAttributeMatch(\logical requirementGettable\rightarrow, \logical requirementSettable\rightarrow, \logical requirementEvolvable\rightarrow) Return a list of implementations that provide the given list of attributes for the unaccretedMass property of the hotHalo component.

tfamily \intzero unaccretedMassCount() Compute the count of evolvable quantities in the unaccretedMass property of the HotHaloStandard component.

tfamily \textcolor{red}{\textless double\textgreater} unaccretedMassIsGettable() Get the unaccretedMass property of the hotHalo component.

tfamily \textcolor{red}{\logicalzero} unaccretedMassIsSettable() Specify whether the unaccretedMass property of the hotHalo component is settable.

tfamily \void unaccretedMassRate(\double value) Cumulate to the rate of the unaccretedMass property of the HotHaloStandard component.

tfamily \void unaccretedMassScale(\double value) Set the scale of the unaccretedMass property of the HotHaloStandard component.

tfamily \void unaccretedMassSet(\double value) Set the unaccretedMass property of the hotHalo component.

tfamily \textcolor{red}{\logicalzero} verySimpleIsActive() Return whether the verySimple implementation of the hotHalo component class is active.

tfamily nodeComponentHotHaloVerySimple

tfamily \textcolor{red}{\textless type(abundances)\textgreater} abundances() Get the abundances property of the hotHalo component.

tfamily \textcolor{red}{\textlesstype(varying\_string)(:)\textgreater} abundancesAttributeMatch(\logical requirementGettable\rightarrow, \logical requirementSettable\rightarrow, \logical requirementEvolvable\rightarrow) Return a list of implementations that provide the given list of attributes for the abundances property of the hotHalo component.
16.5. Objects

tfamily \textcolor{red}{\textless type(abundances)\textgreater} abundancesCold() Get the abundancesCold property of the hotHalo component.

tfamily \textcolor{red}{\textless type(abundances)\textgreater} abundancesColdAttributeMatch(<logical>[requireGettable] →, <logical>[requireSettable] →, <logical>[requireEvolvable] →) Return a list of implementations that provide the given list of attributes for the abundancesCold property of the hotHalo component.

tfamily \intzero abundancesColdCount() Compute the count of evolvable quantities in the abundancesCold property of the HotHaloColdMode component.

tfamily \textcolor{red}{\textless type(abundances)\textgreater} abundancesColdIsGettable() Get the abundancesCold property of the hotHalo component.

tfamily \logicalzero abundancesColdIsSettable() Specify whether the abundancesCold property of the hotHalo component is settable.

tfamily \void abundancesColdRate(<type(abundances)> value) Cumulate to the rate of the abundancesCold property of the HotHaloColdMode component.

tfamily \void abundancesColdScale(<type(abundances)> value) Set the scale of the abundancesCold property of the HotHaloColdMode component.

tfamily \void abundancesColdSet(<type(abundances)> value) Set the abundancesCold property of the hotHalo component.

tfamily \intzero abundancesCount() Compute the count of evolvable quantities in the abundances property of the HotHaloStandard component.

tfamily \textcolor{red}{\textless type(abundances)\textgreater} abundancesIsGettable() Get the abundances property of the hotHalo component.

tfamily \logicalzero abundancesIsSettable() Specify whether the abundances property of the hotHalo component is settable.

tfamily \void abundancesRate(<type(abundances)> value) Cumulate to the rate of the abundances property of the HotHaloStandard component.

tfamily \void abundancesScale(<type(abundances)> value) Set the scale of the abundances property of the HotHaloStandard component.

tfamily \void abundancesSet(<type(abundances)> value) Set the abundances property of the hotHalo component.

tfamily \textcolor{red}{\textless double\textgreater} angularMomentum() Get the angularMomentum property of the hotHalo component.

tfamily \textcolor{red}{\textless type(varying\_string)\textgreater} angularMomentumAttributeMatch(<logical>[requireGettable] →, <logical>[requireSettable] →, <logical>[requireEvolvable] →) Return a list of implementations that provide the given list of attributes for the angularMomentum property of the hotHalo component.

tfamily \textcolor{red}{\textless double\textgreater} angularMomentumCold() Get the angularMomentumCold property of the hotHalo component.
16. Coding GALACTICUS

tfamily \textcolor{red}{\textless{}textless type(varying\_\_string):(::)}\textgreater{} angularMomentumColdAttributeMatch(<logical>[requireGettable]→, <logical>[requireSettable]→, <logical>[requireEvolvable]→) Return a list of implementations that provide the given list of attributes for the angularMomentumCold property of the hotHalo component.

tfamily \intzero angularMomentumColdCount() Compute the count of evolvable quantities in the angularMomentumCold property of the HotHaloColdMode component.

tfamily \textcolor{red}{\textless{}double\textgreater{}} angularMomentumColdIsGettable() Get the angularMomentumCold property of the hotHalo component.

tfamily \logicalzero angularMomentumColdIsSettable() Specify whether the angularMomentumCold property of the hotHalo component is settable.

tfamily \void angularMomentumColdRate(<double> value) Cumulate to the rate of the angularMomentumCold property of the HotHaloColdMode component.

tfamily \void angularMomentumColdScale(<double> value) Set the scale of the angularMomentumCold property of the HotHaloColdMode component.

tfamily \void angularMomentumColdSet(<double> value) Set the angularMomentumCold property of the hotHalo component.

tfamily \intzero angularMomentumCount() Compute the count of evolvable quantities in the angularMomentum property of the HotHaloStandard component.

tfamily \textcolor{red}{\textless{}textless double\textgreater{}} angularMomentumIsGettable() Get the angularMomentum property of the hotHalo component.

tfamily \logicalzero angularMomentumIsSettable() Specify whether the angularMomentum property of the hotHalo component is settable.

tfamily \void angularMomentumRate(<double> value) Cumulate to the rate of the angularMomentum property of the HotHaloStandard component.

tfamily \void angularMomentumScale(<double> value) Set the scale of the angularMomentum property of the HotHaloStandard component.

tfamily \void angularMomentumSet(<double> value) Set the angularMomentum property of the hotHalo component.

tfamily \void builder(<*type(node)>componentDefinition→) Build a nodeComponent from a supplied XML definition.

 elemental \textcolor{red}{\textless{}textless type(chemicalAbundances):(::)}\textgreater{} chemicals() Get the chemicals property of the hotHalo component.

tfamily \textcolor{red}{\textless{}textless type(varying\_\_string):(::)}\textgreater{} chemicalsAttributeMatch(<logical>[requireGettable]→, <logical>[requireSettable]→, <logical>[requireEvolvable]→) Return a list of implementations that provide the given list of attributes for the chemicals property of the hotHalo component.

tfamily \intzero chemicalsCount() Compute the count of evolvable quantities in the chemicals property of the HotHaloStandard component.

tfamily \textcolor{red}{\textless{}textless type(chemicalAbundances):(::)}\textgreater{} chemicalsIsGettable() Get the chemicals property of the hotHalo component.
16.5. Objects

tfamily logicalzero chemicalsIsSettable() Specify whether the chemicals property of the hotHalo component is settable.

tfamily void chemicalsRate(<type(chemicalAbundances)> value) Cumulate to the rate of the chemicals property of the HotHaloStandard component.

tfamily void chemicalsScale(<type(chemicalAbundances)> value) Set the scale of the chemicals property of the HotHaloStandard component.

tfamily void chemicalsSet(<type(chemicalAbundances)> value) Set the chemicals property of the hotHalo component.

tfamily logicalzero coldModeIsActive() Return whether the coldMode implementation of the hotHalo component class is active.

tfamily double zero density(<double(3)> positionSpherical →, <componentType> [componentType] →, <massType> [massType] →, <weightBy> [weightBy] →, <integer> [weightIndex] →, <logical> [haloLoaded] →) Compute the density.

tfamily void deserializeRates(<double(:)> array ←) Deserialize the evolvable rates from an array.

tfamily void deserializeScales(<double(:)> array ←) Deserialize the evolvable scales from an array.

tfamily void deserializeValues(<double(:)> array ←) Deserialize the evolvable quantities from an array.

tfamily void destroy() Destroy the object.

tfamily void dump() Generate an ASCII dump of all properties.

tfamily void dumpRaw(<integer> fileHandle →) Generate a binary dump of all properties.

tfamily void dumpXML() Generate an XML dump of all properties.

tfamily double zero enclosedMass(<double> radius →, <componentType> [componentType] →, <massType> [massType] →, <weightBy> [weightBy] →, <integer> [weightIndex] →, <logical> [haloLoaded] →) Compute the mass enclosed within a radius.

tfamily textcolor{red} \{\textless\textless\textless double\textgreater\textgreater\} heatSource() Get the heatSource property of the hotHalo component.

tfamily textcolor{red} \{\textless\textless\textless type(varying\_string)(:)\textgreater\textgreater\} heatSourceAttributeMatch(<logical> [requireGettable] →, <logical> [requireSettable] →, <logical> [requireEvolvable] →) Return a list of implementations that provide the given list of attributes for the heatSource property of the hotHalo component.

tfamily int zero heatSourceCount() Compute the count of evolvable quantities in the heatSource property of the HotHaloStandard component.

tfamily textcolor{red} \{\textless\textless\textless double\textgreater\textgreater\} heatSourceIsGettable() Get the heatSource property of the hotHalo component.

tfamily logicalzero heatSourceIsSettable() Specify whether the heatSource property of the hotHalo component is settable.

tfamily void heatSourceRate(<double> value) Cumulate to the rate of the heatSource property of the HotHaloStandard component.
16. Coding GALACTICUS

tfamily \textcolor{red}\textless *treeNode\textgreater \ host() Return a pointer to the host TreeNode object.

tfamily \textcolor{red}\textless type(abundances)\textgreater \ hotHaloCoolingAbundances() Get the hotHaloCoolingAbundances property of the HotHalo component.

tfamily \textcolor{red}\textless type(varying\_string)();\textgreater \ hotHaloCoolingAbundancesAttributeMatch(<logical>[requireGettable]→, <logical>[requireSettable]→, <logical>[requireEvolvable]→) Return a list of implementations that provide the given list of attributes for the hotHaloCoolingAbundances property of the hotHalo component.

tfamily \intzero hotHaloCoolingAbundancesCount() Compute the count of evolvable quantities in the hotHaloCoolingAbundances property of the HotHaloStandard component.

tfamily \textcolor{red}\textless double\textgreater \ hotHaloCoolingAngularMomentum() Get the hotHaloCoolingAngularMomentum property of the HotHalo component.

tfamily \textcolor{red}\textless double\textgreater \ hotHaloCoolingAngularMomentumIsGettable() Get the hotHaloCoolingAngularMomentum property of the HotHalo component.

tfamily \logicalzero hotHaloCoolingAngularMomentumIsSettable() Specify whether the hotHaloCoolingAngularMomentum property of the HotHalo component is settable.

tfamily \void hotHaloCoolingAngularMomentumRate(<double> value) Cumulate to the rate of the hotHaloCoolingAngularMomentum property of the HotHalo component.

tfamily \void hotHaloCoolingAngularMomentumRateFunction(<function()> deferredFunction) Set the function to be used for the rate method of the hotHaloCoolingAngularMomentum property of the HotHalo component.

tfamily \logicalzero hotHaloCoolingAngularMomentumRateIsAttached() Return whether the rate method of the hotHaloCoolingAngularMomentum property of the HotHalo component has been attached to a function.

558
16.5. Objects

tfamily \logicalzero hotHaloCoolingAngularMomentumRateIsAttached() Return whether the rate method of the hotHaloCoolingAngularMomentum property of the hotHalo component has been attached to a function.

tfamily \textcolor{red}{\textless \textless \textgreater} hotHaloCoolingMass() Get the hotHaloCoolingMass property of the hotHalo component.

tfamily \textcolor{red}{\textless \textless \textgreater} hotHaloCoolingMassAttributeMatch(<logical>[requireGettable] →, <logical>[requireSettable] →, <logical>[requireEvolvable] →) Return a list of implementations that provide the given list off attributes for the hotHaloCoolingMass property of the hotHalo component.

tfamily \intzero hotHaloCoolingMassCount() Compute the count of evolvable quantities in the hotHaloCoolingMass property of the HotHaloStandard component.

tfamily \textcolor{red}{\textless \textless \textgreater} hotHaloCoolingMassIsGettable() Get the hotHaloCoolingMass property of the hotHalo component.

tfamily \logicalzero hotHaloCoolingMassIsSettable() Specify whether the hotHaloCoolingMass property of the hotHalo component is settable.

tfamily \void hotHaloCoolingMassRate(<double> value) Cumulate to the rate of the hotHaloCoolingMass property of the hotHalo component.

tfamily \void hotHaloCoolingMassRateFunction(<function()> deferredFunction) Set the function to be used for the rate method of the hotHaloCoolingMass property of the hotHalo component.

tfamily \logicalzero hotHaloCoolingMassRateIsAttached() Return whether the rate method of the hotHaloCoolingMass property of the hotHalo component has been attached to a function.

tfamily \void initialize() Initialize the object.

tfamily \textcolor{red}{\textless \logical \textgreater} isInitialized() Get the isInitialized property of the hotHalo component.

tfamily \textcolor{red}{\textless \textless \textgreater} isInitializedAttributeMatch(<logical>[requireGettable] →, <logical>[requireSettable] →, <logical>[requireEvolvable] →) Return a list of implementations that provide the given list of attributes for the isInitialized property of the hotHalo component.

tfamily \textcolor{red}{\textless \logical \textgreater} isInitializedIsGettable() Get the isInitialized property of the hotHalo component.

tfamily \logicalzero isInitializedIsSettable() Specify whether the isInitialized property of the hotHalo component is settable.

tfamily \void isInitializedSet(<logical> value) Set the isInitialized property of the hotHalo component.

tfamily \textcolor{red}{\textless \textless \textgreater} mass() Get the mass property of the hotHalo component.

tfamily \textcolor{red}{\textless \textless \textgreater} massAttributeMatch(<logical>[requireGettable] →, <logical>[requireSettable] →, <logical>[requireEvolvable] →) Return a list of implementations that provide the given list of attributes for the mass property of the hotHalo component.
16. Coding Galacticus

tfamily \textcolor{red}{\textless double\textgreater} massCold() Get the massCold property of the hotHalo component.

tfamily \textcolor{red}{\textless double\textgreater} massColdAttributeMatch(<logical>[requireGettable] → , <logical>[requireSettable] → , <logical>[requireEvolvable] → ) Return a list of implementations that provide the given list off attributes for the massCold property of the hotHalo component.

tfamily \intzero massColdCount() Compute the count of evolvable quantities in the massCold property of the HotHaloColdMode component.

tfamily \textcolor{red}{\textless double\textgreater} massColdIsGettable() Get the massCold property of the hotHalo component.

tfamily \logicalzero massColdIsSettable() Specify whether the massCold property of the hotHalo component is settable.

tfamily \void massColdRate(<double> value) Cumulate to the rate of the massCold property of the HotHaloColdMode component.

tfamily \void massColdSet(<double> value) Set the massCold property of the hotHalo component.

tfamily \intzero massCount() Compute the count of evolvable quantities in the mass property of the HotHaloStandard component.

tfamily \textcolor{red}{\textless double\textgreater} massIsGettable() Get the mass property of the hotHalo component.

tfamily \logicalzero massIsSettable() Specify whether the mass property of the hotHalo component is settable.

tfamily \void massRate(<double> value) Cumulate to the rate of the mass property of the HotHaloStandard component.

tfamily \void massScale(<double> value) Set the scale of the mass property of the HotHaloStandard component.

tfamily \void massSet(<double> value) Set the mass property of the hotHalo component.

tfamily \textcolor{red}{\textless double\textgreater} massSink() Get the massSink property of the hotHalo component.

tfamily \textcolor{red}{\textless double\textgreater} massSinkAttributeMatch(<logical>[requireGettable] → , <logical>[requireSettable] → , <logical>[requireEvolvable] → ) Return a list of implementations that provide the given list off attributes for the massSink property of the hotHalo component.

tfamily \intzero massSinkCount() Compute the count of evolvable quantities in the massSink property of the HotHaloStandard component.

tfamily \textcolor{red}{\textless double\textgreater} massSinkIsGettable() Get the massSink property of the hotHalo component.

tfamily \logicalzero massSinkIsSettable() Specify whether the massSink property of the hotHalo component is settable.
16.5. Objects

tfamily \void massSinkRate(<double> value) Cumulate to the rate of the massSink property of the HotHaloStandard component.

tfamily \void nameFromIndex(<integer> count →, <varying_string> name ←) Return the name of a property given is index.

tfamily \logicalzero nullIsActive() Return whether the null implementation of the hotHalo component class is active.

tfamily \void odeStepRatesInitialize() Initialize rates for evolvable properties.

tfamily \void odeStepScalesInitialize() Initialize scales for evolvable properties.

tfamily \textcolor{red}\textless double\textgreater outerRadius() Get the outerRadius property of the hotHalo component.

tfamily \textcolor{red}\textless type(varying\_string)\textgreater outerRadiusAttributeMatch(<logical>[requireGettable] →, <logical>[requireSettable] →, <logical>[requireEvolvable] →) Return a list of implementations that provide the given list of attributes for the outerRadius property of the hotHalo component.

tfamily \intzero outerRadiusCount() Compute the count of evolvable quantities in the outerRadius property of the HotHaloStandard component.

tfamily \void outerRadiusFunction(<function()> deferredFunction) Set the function to be used for the get method of the outerRadius property of the HotHaloVerySimple component.

tfamily \logicalzero outerRadiusIsAttached() Return whether the get method of the outerRadius property of the HotHaloVerySimple component has been attached to a function.

tfamily \textcolor{red}\textless double\textgreater outerRadiusIsGettable() Get the outerRadius property of the hotHalo component.

tfamily \logicalzero outerRadiusIsSettable() Specify whether the outerRadius property of the hotHalo component is settable.

tfamily \void outerRadiusRate(<double> value) Cumulate to the rate of the outerRadius property of the HotHaloStandard component.

tfamily \void outerRadiusScale(<double> value) Set the scale of the outerRadius property of the HotHaloStandard component.

tfamily \void outerRadiusSet(<double> value) Set the outerRadius property of the hotHalo component.

tfamily \textcolor{red}\textless type(abundances)\textgreater outflowedAbundances() Get the outflowedAbundances property of the hotHalo component.

tfamily \textcolor{red}\textless type(varying\_string)\textgreater outflowedAbundancesAttributeMatch(<logical>[requireGettable] →, <logical>[requireSettable] →, <logical>[requireEvolvable] →) Return a list of implementations that provide the given list of attributes for the outflowedAbundances property of the hotHalo component.

tfamily \intzero outflowedAbundancesCount() Compute the count of evolvable quantities in the outflowedAbundances property of the HotHaloStandard component.
16. Coding Galacticus

tfamily \textcolor{red}{\textless \textless \textless \textless \textless} outflowedAbundancesIsGettable() Get the \textcolor{red}{\textless \textless \textless \textless \textless} outflowedAbundances property of the \textcolor{red}{\textless \textless \textless \textless \textless} hotHalo component.

tfamily \logicalzero outflowedAbundancesIsSettable() Specify whether the \textcolor{red}{\textless \textless \textless \textless \textless} outflowedAbundances property of the \textcolor{red}{\textless \textless \textless \textless \textless} hotHalo component is settable.

tfamily \void outflowedAbundancesRate(<type(abundances)> value) Cumulate to the rate of the \textcolor{red}{\textless \textless \textless \textless \textless} outflowedAbundances property of the \textcolor{red}{\textless \textless \textless \textless \textless} HotHaloStandard component.

tfamily \void outflowedAbundancesScale(<type(abundances)> value) Set the scale of the \textcolor{red}{\textless \textless \textless \textless \textless} outflowedAbundances property of the \textcolor{red}{\textless \textless \textless \textless \textless} HotHaloStandard component.

tfamily \void outflowedAbundancesSet(<type(abundances)> value) Set the \textcolor{red}{\textless \textless \textless \textless \textless} outflowedAbundances property of the \textcolor{red}{\textless \textless \textless \textless \textless} hotHalo component.

tfamily \textcolor{red}{\textless double\textgreater} outflowedAngularMomentum() Get the \textcolor{red}{\textless double\textgreater} outflowedAngularMomentum property of the \textcolor{red}{\textless double\textgreater} hotHalo component.

tfamily \textcolor{red}{\textless double\textgreater} outflowedAngularMomentumAttributeMatch(<logical>[requireGettable] →, <logical>[requireSettable] →, <logical>[requireEvolvable] →) Return a list of implementations that provide the given list of attributes for the \textcolor{red}{\textless double\textgreater} outflowedAngularMomentum property of the \textcolor{red}{\textless double\textgreater} hotHalo component.

tfamily \intzero outflowedAngularMomentumCount() Compute the count of evolvable quantities in the \textcolor{red}{\textless double\textgreater} outflowedAngularMomentum property of the \textcolor{red}{\textless double\textgreater} HotHaloStandard component.

tfamily \textcolor{red}{\textless double\textgreater} outflowedAngularMomentumIsGettable() Get the \textcolor{red}{\textless double\textgreater} outflowedAngularMomentum property of the \textcolor{red}{\textless double\textgreater} hotHalo component.

tfamily \logicalzero outflowedAngularMomentumIsSettable() Specify whether the \textcolor{red}{\textless double\textgreater} outflowedAngularMomentum property of the \textcolor{red}{\textless double\textgreater} hotHalo component is settable.

tfamily \void outflowedAngularMomentumRate(<double> value) Cumulate to the rate of the \textcolor{red}{\textless double\textgreater} outflowedAngularMomentum property of the \textcolor{red}{\textless double\textgreater} HotHaloStandard component.

tfamily \void outflowedAngularMomentumScale(<double> value) Set the scale of the \textcolor{red}{\textless double\textgreater} outflowedAngularMomentum property of the \textcolor{red}{\textless double\textgreater} HotHaloStandard component.

tfamily \void outflowedAngularMomentumSet(<double> value) Set the \textcolor{red}{\textless double\textgreater} outflowedAngularMomentum property of the \textcolor{red}{\textless double\textgreater} hotHalo component.

tfamily \textcolor{red}{\textless double\textgreater} outflowedMass() Get the \textcolor{red}{\textless double\textgreater} outflowedMass property of the \textcolor{red}{\textless double\textgreater} hotHalo component.

tfamily \textcolor{red}{\textless double\textgreater} outflowedMassAttributeMatch(<logical>[requireGettable] →, <logical>[requireSettable] →, <logical>[requireEvolvable] →) Return a list of implementations that provide the given list of attributes for the \textcolor{red}{\textless double\textgreater} outflowedMass property of the \textcolor{red}{\textless double\textgreater} hotHalo component.

tfamily \intzero outflowedMassCount() Compute the count of evolvable quantities in the \textcolor{red}{\textless double\textgreater} outflowedMass property of the \textcolor{red}{\textless double\textgreater} HotHaloStandard component.

tfamily \textcolor{red}{\textless double\textgreater} outflowedMassIsGettable() Get the \textcolor{red}{\textless double\textgreater} outflowedMass property of the \textcolor{red}{\textless double\textgreater} hotHalo component.

tfamily \logicalzero outflowedMassIsSettable() Specify whether the \textcolor{red}{\textless double\textgreater} outflowedMass property of the \textcolor{red}{\textless double\textgreater} hotHalo component is settable.
16.5. Objects

tfamily \void outflowedMassRate(<double> value) Cumulate to the rate of the outflowedMass property of the HotHaloStandard component.

tfamily \void outflowedMassScale(<double> value) Set the scale of the outflowedMass property of the HotHaloStandard component.

tfamily \void outflowedMassSet(<double> value) Set the outflowedMass property of the hotHalo component.

tfamily \textcolor{red}{\textless type(abundances)\textgreater} outflowingAbundances() Get the outflowingAbundances property of the hotHalo component.

tfamily \textcolor{red}{\textless varying\_string\textgreater\textgreater} outflowingAbundancesAttributeMatch(<logical>[requireGettable] →, <logical>[requireSettable] →, <logical>[requireEvolvable] →) Return a list of implementations that provide the given list of attributes for the outflowingAbundances property of the hotHalo component

tfamily \intzero outflowingAbundancesCount() Compute the count of evolvable quantities in the outflowingAbundances property of the HotHaloStandard component.

tfamily \textcolor{red}{\textless type(abundances)\textgreater} outflowingAbundancesIsGettable() Get the outflowingAbundances property of the hotHalo component.

tfamily \logicalzero outflowingAbundancesIsSettable() Specify whether the outflowingAbundances property of the hotHalo component is settable.

tfamily \void outflowingAbundancesRate(<type(abundances) > value) Cumulate to the rate of the outflowingAbundances property of the HotHaloStandard component.

tfamily \textcolor{red}{\textless double\textgreater} outflowingAngularMomentum() Get the outflowingAngularMomentum property of the hotHalo component.

tfamily \textcolor{red}{\textless varying\_string\textgreater\textgreater} outflowingAngularMomentumAttributeMatch(<logical>[requireGettable] →, <logical>[requireSettable] →, <logical>[requireEvolvable] →) Return a list of implementations that provide the given list of attributes for the outflowingAngularMomentum property of the hotHalo component

tfamily \intzero outflowingAngularMomentumCount() Compute the count of evolvable quantities in the outflowingAngularMomentum property of the HotHaloStandard component.

tfamily \textcolor{red}{\textless double\textgreater} outflowingAngularMomentumIsGettable() Get the outflowingAngularMomentum property of the hotHalo component.

tfamily \logicalzero outflowingAngularMomentumIsSettable() Specify whether the outflowingAngularMomentum property of the hotHalo component is settable.

tfamily \void outflowingAngularMomentumRate(<double> value) Cumulate to the rate of the outflowingAngularMomentum property of the HotHaloStandard component.

tfamily \textcolor{red}{\textless double\textgreater} outflowingMass() Get the outflowingMass property of the hotHalo component.

tfamily \textcolor{red}{\textless varying\_string\textgreater\textgreater} outflowingMassAttributeMatch(<logical>[requireGettable] →, <logical>[requireSettable] →, <logical>[requireEvolvable] →) Return a list of implementations that provide the given list of attributes for the outflowingMass property of the hotHalo component.
16. Coding GALACTICUS

tfamily \intzero outflowingMassCount() Compute the count of evolvable quantities in the outflowingMass property of the HotHaloStandard component.

tfamily \textcolor{red}{\textless double\textgreater} outflowingMassIsGettable() Get the outflowingMass property of the hotHalo component.

tfamily \logicalzero outflowingMassIsSettable() Specify whether the outflowingMass property of the hotHalo component is settable.

tfamily \void outflowingMassRate(<double> value) Cumulate to the rate of the outflowingMass property of the hotHalo component.

tfamily \void outflowingMassRateFunction(<function()> deferredFunction) Set the function to be used for the rate method of the outflowingMass property of the HotHaloVerySimple component.

tfamily \logicalzero outflowingMassRateIsAttached() Return whether the rate method of the outflowingMass property of the HotHaloVerySimple component has been attached to a function.

tfamily \logicalzero outflowTrackingIsActive() Return whether the outflowTracking implementation of the hotHalo component class is active.

tfamily \void output(<integer> integerProperty↔, <integer> integerBufferCount↔, <integer> doubleProperty↔, <integer> doubleBufferCount↔, <double> time→, <integer> instance→) Generate values of outputtable properties.

tfamily \void outputCount(<integer>integerPropertyCount↔, <integer>doublePropertyCount↔, <double> time→, <integer> instance→) Compute a count of outputtable properties.

tfamily \void outputNames(<integer>integerProperty↔, <char[*](:)>integerPropertyNames↔, <char[*](:)>integerPropertyComments↔, <double(:)>integerPropertyUnitsSI↔, <integer>doubleProperty↔, <char[*](:)>doublePropertyNames↔, <char[*](:)>doublePropertyComments↔, <double(:)>doublePropertyUnitsSI↔, <double> time→, <integer> instance→) Generate names of outputtable properties.

tfamily \doublezero potential(<double>radius→, <componentType>[componentType]→, <massType>[massType]→, <logical> [haloLoaded]→) Compute the gravitational potential.

tfamily \void readRaw(<integer> fileHandle→) Read a binary dump of the nodeComponent from the given fileHandle.

tfamily \doublezero rotationCurve(<double>radius→, <componentType>[componentType]→, <massType>[massType]→, <logical> [haloLoaded]→) Compute the rotation curve.

tfamily \doublezero rotationCurveGradient(<double>radius→, <componentType>[componentType]→, <massType>[massType]→, <logical> [haloLoaded]→) Compute the rotation curve gradient.

tfamily \intzero serializeCount() Return a count of the number of evolvable quantities to be evolved.

tfamily \void serializeRates(<double(:)> array→) Serialize the evolvable rates to an array.

tfamily \void serializeScales(<double(:)> array→) Serialize the evolvable scales to an array.

tfamily \void serializeValues(<double(:)> array→) Serialize the evolvable quantities to an array.

tfamily \logicalzero standardIsActive() Return whether the standard implementation of the hotHalo component class is active.
16.5. Objects

tfamily \textcolor{red}{\textless type(abundances)\textgreater} strippedAbundances() Get the strippedAbundances property of the hotHalo component.

tfamily \textcolor{red}{\textless type(varying\_string)\textgreater} strippedAbundancesAttributeMatch(<logical>[requireGettable] \rightarrow, <logical>[requireSettable] \rightarrow, <logical>[requireEvolvable] \rightarrow) Return a list of implementations that provide the given list off attributes for the strippedAbundances property of the hotHalo component.

tfamily \intzero strippedAbundancesCount() Compute the count of evolvable quantities in the strippedAbundances property of the HotHaloStandard component.

tfamily \textcolor{red}{\textless type(abundances)\textgreater} strippedAbundancesIsGettable() Get the strippedAbundances property of the hotHalo component.

tfamily \logicalzero strippedAbundancesIsSettable() Specify whether the strippedAbundances property of the hotHalo component is settable.

tfamily \void strippedAbundancesRate(<type(abundances)> value) Cumulate to the rate of the strippedAbundances property of the HotHaloStandard component.

tfamily \void strippedAbundancesScale(<type(abundances)> value) Set the scale of the strippedAbundances property of the HotHaloStandard component.

tfamily \void strippedAbundancesSet(<type(abundances)> value) Set the strippedAbundances property of the hotHalo component.

tfamily \textcolor{red}{\textless double\textgreater} strippedMass() Get the strippedMass property of the hotHalo component.

tfamily \textcolor{red}{\textless type(abundances)\textgreater} strippedMassAttributeMatch(<logical>[requireGettable] \rightarrow, <logical>[requireSettable] \rightarrow, <logical>[requireEvolvable] \rightarrow) Return a list of implementations that provide the given list off attributes for the strippedMass property of the hotHalo component.

tfamily \intzero strippedMassCount() Compute the count of evolvable quantities in the strippedMass property of the HotHaloStandard component.

tfamily \textcolor{red}{\textless double\textgreater} strippedMassIsGettable() Get the strippedMass property of the hotHalo component.

tfamily \logicalzero strippedMassIsSettable() Specify whether the strippedMass property of the hotHalo component is settable.

tfamily \void strippedMassRate(<double> value) Cumulate to the rate of the strippedMass property of the HotHaloStandard component.

tfamily \void strippedMassScale(<double> value) Set the scale of the strippedMass property of the HotHaloStandard component.

tfamily \void strippedMassSet(<double> value) Set the strippedMass property of the hotHalo component.

tfamily \doublezero surfaceDensity(<double(3)> positionCylindrical \rightarrow, <componentType>[componentType] \rightarrow, <massType>[massType] \rightarrow, <weightBy>[weightBy] \rightarrow, <integer>[weightIndex] \rightarrow, <logical>[haloLoaded] \rightarrow) Compute the surface density.
16. Coding GALACTICUS

tfamily \textcolor{red}{\textless type(abundances)\textgreater} trackedOutflowAbundances() Get the trackedOutflowAbundances property of the hotHalo component.

tfamily \textcolor{red}{\textless type(varying\_string):(:)\textgreater} trackedOutflowAbundancesAttributeMatch(<logical>[requireGettable]→, <logical>[requireSettable]→, <logical>[requireEvolvable]→) Return a list of implementations that provide the given list of attributes for the trackedOutflowAbundances property of the hotHalo component.

tfamily \intzero trackedOutflowAbundancesCount() Compute the count of evolvable quantities in the trackedOutflowAbundances property of the HotHaloOutflowTracking component.

tfamily \textcolor{red}{\textless type(abundances)\textgreater} trackedOutflowAbundancesIsGettable() Get the trackedOutflowAbundances property of the hotHalo component.

tfamily \logicalzero trackedOutflowAbundancesIsSettable() Specify whether the trackedOutflowAbundances property of the hotHalo component is settable.

tfamily \void trackedOutflowAbundancesRate(<type(abundances)> value) Cumulate to the rate of the trackedOutflowAbundances property of the HotHaloOutflowTracking component.

tfamily \void trackedOutflowAbundancesScale(<type(abundances)>value) Set the scale of the trackedOutflowAbundances property of the HotHaloOutflowTracking component.

tfamily \void trackedOutflowAbundancesSet(<type(abundances)>value) Set the trackedOutflowAbundances property of the hotHalo component.

tfamily \textcolor{red}{\textless double\textgreater} trackedOutflowMass() Get the trackedOutflowMass property of the hotHalo component.

tfamily \textcolor{red}{\textless type(varying\_string):(:)\textgreater} trackedOutflowMassAttributeMatch(<logical>[requireGettable]→, <logical>[requireSettable]→, <logical>[requireEvolvable]→) Return a list of implementations that provide the given list of attributes for the trackedOutflowMass property of the hotHalo component.

tfamily \intzero trackedOutflowMassCount() Compute the count of evolvable quantities in the trackedOutflowMass property of the HotHaloOutflowTracking component.

tfamily \textcolor{red}{\textless double\textgreater} trackedOutflowMassIsGettable() Get the trackedOutflowMass property of the hotHalo component.

tfamily \logicalzero trackedOutflowMassIsSettable() Specify whether the trackedOutflowMass property of the hotHalo component is settable.

tfamily \void trackedOutflowMassRate(<double> value) Cumulate to the rate of the trackedOutflowMass property of the HotHaloOutflowTracking component.

tfamily \void trackedOutflowMassScale(<double> value) Set the scale of the trackedOutflowMass property of the HotHaloOutflowTracking component.

tfamily \void trackedOutflowMassSet(<double> value) Set the trackedOutflowMass property of the hotHalo component.

tfamily \textcolor{red}{\textless type(varying\_string)\textgreater} type() Return the type of this object.
16.5. Objects

tfamily \textcolor{red}{\textless \textless \textgreater}\text{unaccretedMass() Get the unaccretedMass property of the hotHalo component.}

tfamily \textcolor{red}{\textless \textless \textgreater}\text{unaccretedMassAttributeMatch(<logical>[requireGettable] \rightarrow, <logical>[requireSettable] \rightarrow, <logical>[requireEvolvable] \rightarrow)} Return a list of implementations that provide the given list of attributes for the unaccretedMass property of the hotHalo component.

tfamily \textcolor{red}{\textless \textless \textgreater}\text{unaccretedMassCount() Compute the count of evolvable quantities in the unaccretedMass property of the HotHaloStandard component.}

tfamily \textcolor{red}{\textless \textless \textgreater}\text{unaccretedMassIsGettable() Get the unaccretedMass property of the hotHalo component.}

tfamily \textcolor{red}{\textless \textless \textgreater}\text{unaccretedMassIsSettable() Specify whether the unaccretedMass property of the hotHalo component is settable.}

tfamily \textcolor{red}{\textless \textless \textgreater}\text{unaccretedMassRate(<double> value) Cumulate to the rate of the unaccretedMass property of the HotHaloStandard component.}

tfamily \textcolor{red}{\textless \textless \textgreater}\text{unaccretedMassScale(<double> value) Set the scale of the unaccretedMass property of the HotHaloStandard component.}

tfamily \textcolor{red}{\textless \textless \textgreater}\text{unaccretedMassSet(<double> value) Set the unaccretedMass property of the hotHalo component.}

**tfamily nodeComponentIndices**

tfamily \textcolor{red}{\textless \textless \textgreater}\text{branchTip() Get the branchTip property of the indices component.}

tfamily \textcolor{red}{\textless \textless \textgreater}\text{branchTipAttributeMatch(<logical>[requireGettable] \rightarrow, <logical>[requireSettable] \rightarrow, <logical>[requireEvolvable] \rightarrow)} Return a list of implementations that provide the given list of attributes for the branchTip property of the indices component.

**tfamily nodeComponentIndices**

tfamily \textcolor{red}{\textless \textless \textgreater}\text{branchTipIsGettable() Get the branchTip property of the indices component.}

**tfamily nodeComponentIndices**

tfamily \textcolor{red}{\textless \textless \textgreater}\text{branchTipIsSettable() Specify whether the branchTip property of the indices component is settable.}

**tfamily nodeComponentIndices**

tfamily \textcolor{red}{\textless \textless \textgreater}\text{branchTipSet(<integer(kind=kind_int8)> value) Set the branchTip property of the indices component.}

**tfamily nodeComponentIndices**

tfamily \textcolor{red}{\textless \textless \textgreater}\text{builder(<\text{*type(node)>componentDefinition}) Build a nodeComponent from a supplied XML definition.

**tfamily nodeComponentIndices**

tfamily \textcolor{red}{\textless \textless \textgreater}\text{density(<double(3)> positionSpherical \rightarrow, <componentType> [componentType] \rightarrow, <massType> [massType] \rightarrow, <weightBy> [weightBy] \rightarrow, <integer> [weightIndex] \rightarrow, <logical> [haloLoaded] \rightarrow)} Compute the density.

**tfamily nodeComponentIndices**

tfamily \textcolor{red}{\textless \textless \textgreater}\text{deserializeRates(<double(:)> array \leftarrow)} Deserialize the evolvable rates from an array.

**tfamily nodeComponentIndices**

tfamily \textcolor{red}{\textless \textless \textgreater}\text{deserializeScales(<double(:)> array \leftarrow)} Deserialize the evolvable scales from an array.
tfamily \void deserializeValues(<double(:)> array→) Deserialize the evolvable quantities from an array.

tfamily \void destroy() Destroy the object.

tfamily \void dump() Generate an ASCII dump of all properties.

tfamily \void dumpRaw(<integer> fileHandle→) Generate a binary dump of all properties.

tfamily \void dumpXML() Generate an XML dump of all properties.

tfamily \double zeroEnclosedMass(<double> radius→, <componentType> [componentType]→, <massType> [massType]→, <weightBy> [weightBy]→, <integer> [weightIndex]→, <logical> [haloLoaded]→)
Compute the mass enclosed within a radius.

tfamily \void hotHaloCoolingAbundancesRate(<type(abundances)> value) Cumulate to the rate of the hotHaloCoolingAbundances property of the hotHalo component.

tfamily \void hotHaloCoolingAngularMomentumRate(<double> value) Cumulate to the rate of the hotHaloCoolingAngularMomentum property of the hotHalo component.

tfamily \void hotHaloCoolingMassRate(<double> value) Cumulate to the rate of the hotHaloCoolingMass property of the hotHalo component.

tfamily \void initialize() Initialize the object.

tfamily \void nameFromIndex(<integer> count→, <varying_string> name←) Return the name of a property given is index.

tfamily \logical zero nullIsActive() Return whether the null implementation of the indices component class is active.

tfamily \void odeStepRatesInitialize() Initialize rates for evolvable properties.

tfamily \void odeStepScalesInitialize() Initialize scales for evolvable properties.

tfamily \void output(<integer> integerProperty↔, <integer> integerBufferCount↔, <integer(:,:)> integerBuffer↔, <integer>doubleProperty↔, <integer> doubleBufferCount↔, <double(:,:)> doubleBuffer↔, <double> time→, <integer> instance→) Generate values of outputtable properties.

tfamily \void outputCount(<integer> integerPropertyCount↔, <integer> doublePropertyCount↔, <double> time→, <integer> instance→) Compute a count of outputtable properties.

tfamily \void outputNames(<integer> integerProperty↔, <char[*](::)> integerPropertyNames↔, <char[*](::)> integerPropertyComments↔, <double(:,:)> integerPropertyUnitsSI↔, <integer> doubleProperty↔, <char[*](::)> doublePropertyNames↔, <char[*](::)> doublePropertyComments↔, <double(:,:)> doublePropertyUnitsSI↔, <double> time→, <integer> instance→) Generate names of outputtable properties.

tfamily \double zero potential(<double> radius→, <componentType> [componentType]→, <massType> [massType]→, <logical> [haloLoaded]→) Compute the gravitational potential.

tfamily \double zero rotationCurve(<double> radius→, <componentType> [componentType]→, <massType> [massType]→, <logical> [haloLoaded]→) Compute the rotation curve.
16.5. Objects

tfamily `doublezero rotationCurveGradient(<double> radius →, <componentType> [componentType] →, <massType> [massType] →, <logical> [haloLoaded] →)` Compute the rotation curve gradient.

tfamily `intzero serializeCount()` Return a count of the number of evolvable quantities to be evolved.

tfamily `void serializeRates(<double(:)> array →)` Serialize the evolvable rates to an array.

tfamily `void serializeScales(<double(:)> array →)` Serialize the evolvable scales to an array.

tfamily `void serializeValues(<double(:)> array →)` Serialize the evolvable quantities to an array.

tfamily `logicalzero standardIsActive()` Return whether the standard implementation of the indices component class is active.

tfamily `doublezero surfaceDensity(<double(3)> positionCylindrical →, <componentType> [componentType] →, <massType> [massType] →, <weightBy> [weightBy] →, <integer> [weightIndex] →, <logical> [haloLoaded] →)` Compute the surface density.

tfamily `textcolor{red}{textless type(varying \_string)\textgreater} type()` Return the type of this object.

**tfamily nodeComponentIndicesNull**

tfamily `textcolor{red}{textless integer(kind=kind\_int8)\textgreater} branchTip()` Get the branchTip property of the indices component.

tfamily `textcolor{red}{textless type(varying \_string)\textgreater} branchTipAttributeMatch(<logical>[requireGettable] →, <logical>[requireSettable] →, <logical>[requireEvolvable] →)` Return a list of implementations that provide the given list of attributes for the branchTip property of the indices component.

tfamily `textcolor{red}{textless integer(kind=kind\_int8)\textgreater} branchTipIsGettable()` Get the branchTip property of the indices component.

tfamily `logicalzero branchTipIsSettable()` Specify whether the branchTip property of the indices component is settable.

tfamily `void branchTipSet(<integer(kind=kind\_int8)> value)` Set the branchTip property of the indices component.

tfamily `void builder(<\^\text{type(node)}\textgreater\text{componentDefinition} →)` Build a nodeComponent from a supplied XML definition.

tfamily `doublezero density(<double(3)> positionSpherical →, <componentType> [componentType] →, <massType> [massType] →, <weightBy> [weightBy] →, <integer> [weightIndex] →, <logical> [haloLoaded] →)` Compute the density.

tfamily `void deserializeRates(<double(:)> array ←)` Deserialize the evolvable rates from an array.

tfamily `void deserializeScales(<double(:)> array ←)` Deserialize the evolvable scales from an array.

tfamily `void deserializeValues(<double(:)> array ←)` Deserialize the evolvable quantities from an array.

tfamily `void destroy()` Destroy the object.

tfamily `void dump()` Generate an ASCII dump of all properties.

tfamily `void dumpRaw(<integer> fileHandle →)` Generate a binary dump of all properties.
tfamily \ void dumpXML() Generate an XML dump of all properties.

tfamily \ double zero enclosedMass(<double> radius→, <componentType> [componentType]→, <massType> [massType]→, <weightBy> [weightBy]→, <integer> [weightIndex]→, <logical> [haloLoaded]→) Compute the mass enclosed within a radius.

tfamily \ double zero potential(<double> radius→, <componentType> [componentType]→, <massType> [massType]→, <logical> [haloLoaded]→) Compute the gravitational potential.

tfamily \ void readRaw(<integer> fileHandle→) Read a binary dump of the nodeComponent from the given fileHandle.

tfamily \ double zero rotationCurve(<double> radius→, <componentType> [componentType]→, <massType> [massType]→, <logical> [haloLoaded]→) Compute the rotation curve.

tfamily \ double zero rotationCurveGradient(<double> radius→, <componentType> [componentType]→, <massType> [massType]→, <logical> [haloLoaded]→) Compute the rotation curve gradient.

tfamily \ int zero serializeCount() Return a count of the number of evolvable quantities to be evolved.
16.5. Objects

tfamily \void serializeRates(<double();> array→) Serialize the evolvable rates to an array.

tfamily \void serializeScales(<double();> array→) Serialize the evolvable scales to an array.

tfamily \void serializeValues(<double();> array→) Serialize the evolvable quantities to an array.

tfamily \logicalzero standardIsActive() Return whether the standard implementation of the indices component class is active.

tfamily \doublezero surfaceDensity(<double(3)> positionCylindrical→, <componentType> [componentType]→, <massType> [massType]→, <weightBy> [weightBy]→, <integer> [weightIndex]→, <logical> [haloLoaded]→) Compute the surface density.

tfamily \textcolor{red}{\textless type(varying\_string)\textgreater} type() Return the type of this object.

tfamily nodeComponentIndicesStandard

tfamily \textcolor{red}{\textless integer(kind=kind\_int8)\textgreater} branchTip() Get the branchTip property of the indices component.

tfamily \textcolor{red}{\textless textless type(varying\_string)\textgreater} branchTipAttributeMatch(<logical>[requireGettable]→, <logical>[requireSettable]→, <logical>[requireEvolvable]→) Return a list of implementations that provide the given list of attributes for the branchTip property of the indices component.

tfamily \textcolor{red}{\textless integer(kind=kind\_int8)\textgreater} branchTipIsGettable() Get the branchTip property of the indices component.

tfamily \logicalzero branchTipIsSettable() Specify whether the branchTip property of the indices component is settable.

tfamily \void branchTipSet(<integer(kind=kind\_int8)> value) Set the branchTip property of the indices component.

tfamily \void builder(<*type(node)>componentDefinition→) Build a nodeComponent from a supplied XML definition.

tfamily \doublezero density(<double(3)> positionSpherical→, <componentType> [componentType]→, <massType> [massType]→, <weightBy> [weightBy]→, <integer> [weightIndex]→, <logical> [haloLoaded]→) Compute the density.

tfamily \void deserializeRates(<double();> array←) Deserialize the evolvable rates from an array.

tfamily \void deserializeScales(<double();> array←) Deserialize the evolvable scales from an array.

tfamily \void deserializeValues(<double();> array←) Deserialize the evolvable quantities from an array.

tfamily \void destroy() Destroy the object.

tfamily \void dump() Generate an ASCII dump of all properties.

tfamily \void dumpRaw(<integer> fileHandle→) Generate a binary dump of all properties.

tfamily \void dumpXML() Generate an XML dump of all properties.
16. Coding GALACTICUS

tfamily \doublezero enclosedMass(<double> radius \rightarrow, <componentType> [componentType] \rightarrow, <massType> [massType] \rightarrow, <weightBy> [weightBy] \rightarrow, <integer> [weightIndex] \rightarrow, <logical> [haloLoaded] \rightarrow) Compute the mass enclosed within a radius.

tfamily \textcolor{red}{\textless *type(treeNode)\textgreater} host() Return a pointer to the host \textit{treeNode} object.

tfamily \void hotHaloCoolingAbundancesRate(<type(abundances)> value) Cumulate to the rate of the \textit{hotHaloCoolingAbundances} property of the \textit{hotHalo} component.

tfamily \void hotHaloCoolingAngularMomentumRate(<double> value) Cumulate to the rate of the \textit{hotHaloCoolingAngularMomentum} property of the \textit{hotHalo} component.

tfamily \void hotHaloCoolingMassRate(<double> value) Cumulate to the rate of the \textit{hotHaloCoolingMass} property of the \textit{hotHalo} component.

tfamily \void initialize() Initialize the object.

tfamily \void nameFromIndex(<integer> count \rightarrow, <varying_string> name \leftarrow) Return the name of a property given its index.

tfamily \logicalzero nullIsActive() Return whether the null implementation of the indices component class is active.

tfamily \void odeStepRatesInitialize() Initialize rates for evolvable properties.

tfamily \void odeStepScalesInitialize() Initialize scales for evolvable properties.

tfamily \void output(<integer> integerProperty \leftrightarrow, <integer> integerBufferCount \leftrightarrow, <integer(:,:)> integerBuffer \leftrightarrow, <integer> doubleProperty \leftrightarrow, <integer> doubleBufferCount \leftrightarrow, <double(:,:)> doubleBuffer \leftrightarrow, <double> time \rightarrow, <integer> instance \rightarrow) Generate values of outputtable properties.

tfamily \void outputCount(<integer> integerPropertyCount \leftrightarrow, <integer> doublePropertyCount \leftrightarrow, <double> time \rightarrow, <integer> instance \rightarrow) Compute a count of outputtable properties.

tfamily \void outputNames(<integer> integerProperty \leftrightarrow, <char[*](:)> integerPropertyNames \leftrightarrow, <char[*](:)> integerPropertyComments \leftrightarrow, <double(:)> integerPropertyUnitsSI \leftrightarrow, <integer> doubleProperty \leftrightarrow, <char[*](:)> doublePropertyNames \leftrightarrow, <char[*](:)> doublePropertyComments \leftrightarrow, <double(:)> doublePropertyUnitsSI \leftrightarrow, <double> time \rightarrow, <integer> instance \rightarrow) Generate names of outputtable properties.

tfamily \doublezero potential(<double> radius \rightarrow, <componentType> [componentType] \rightarrow, <massType> [massType] \rightarrow, <logical> [haloLoaded] \rightarrow) Compute the gravitational potential.

tfamily \void readRaw(<integer> fileHandle \leftrightarrow) Read a binary dump of the \textit{nodeComponent} from the given \texttt{fileHandle}.

tfamily \doublezero rotationCurve(<double> radius \rightarrow, <componentType> [componentType] \rightarrow, <massType> [massType] \rightarrow, <logical> [haloLoaded] \rightarrow) Compute the rotation curve.

tfamily \doublezero rotationCurveGradient(<double> radius \rightarrow, <componentType> [componentType] \rightarrow, <massType> [massType] \rightarrow, <logical> [haloLoaded] \rightarrow) Compute the rotation curve gradient.

tfamily \intzero serializeCount() Return a count of the number of evolvable quantities to be evolved.

tfamily \void serializeRates(<double(:)> array \rightarrow) Serialize the evolvable rates to an array.
16.5. Objects

tfamily void serializeScales(<double(:)> array →) Serialize the evolvable scales to an array.

tfamily void serializeValues(<double(:)> array →) Serialize the evolvable quantities to an array.

tfamily logical zero standardIsActive() Return whether the standard implementation of the indices component class is active.

tfamily double zero surfaceDensity(<double(3)> positionCylindrical →, <componentType> [componentType] →, <massType> [massType] →, <weightBy> [weightBy] →, <integer> [weightIndex] →, <logical> [haloLoaded] →) Compute the surface density.

tfamily \textcolor{red}{\textless} type(varying\_string)\textgreater type() Return the type of this object.

tfamily nodeComponentInterOutput
tfamily void builder(<*type(node)> componentDefinition →) Build a nodeComponent from a supplied XML definition.

tfamily double zero density(<double(3)> positionSpherical →, <componentType> [componentType] →, <massType> [massType] →, <weightBy> [weightBy] →, <integer> [weightIndex] →, <logical> [haloLoaded] →) Compute the density.

tfamily void deserializeRates(<double(:)> array ←) Deserialize the evolvable rates from an array.

tfamily void deserializeScales(<double(:)> array ←) Deserialize the evolvable scales from an array.

tfamily void deserializeValues(<double(:)> array ←) Deserialize the evolvable quantities from an array.

tfamily void destroy() Destroy the object.

tfamily \textcolor{red}{\textless} double\textgreater diskStarFormationRate() Get the diskStarFormationRate property of the interOutput component.

tfamily \textcolor{red}{\textless} type(varying\_string)(:)\textgreater diskStarFormationRateAttributeMatcher(<logical> [requireGettable] →, <logical> [requireSettable] →, <logical> [requireEvolvable] →) Return a list of implementations that provide the given list off attributes for the diskStarFormationRate property of the interOutput component

tfamily int zero diskStarFormationRateCount() Compute the count of evolvable quantities in the diskStarFormationRate property of the InterOutputStandard component.

tfamily \textcolor{red}{\textless} double\textgreater diskStarFormationRateIsGettable() Get the diskStarFormationRateIsGettable() Get the diskStarFormationRate property of the interOutput component.

tfamily logical zero diskStarFormationRateIsSettable() Specify whether the diskStarFormationRate property of the interOutput component is settable.

tfamily void diskStarFormationRateRate(<double> value) Cumulate to the rate of the diskStarFormationRate property of the InterOutputStandard component.

tfamily void diskStarFormationRateScale(<double> value) Set the scale of the diskStarFormationRate property of the InterOutputStandard component.

tfamily void diskStarFormationRateSet(<double> value) Set the diskStarFormationRate property of the interOutput component.
tfamily \ void dump() Generate an ASCII dump of all properties.

tfamily \ void dumpRaw(<integer> fileHandle→) Generate a binary dump of all properties.

tfamily \ void dumpXML() Generate an XML dump of all properties.

tfamily \ doublezero enclosedMass(<double> radius→, <componentType>[componentType]→, <massType>[massType]→, <weightBy>[weightBy]→, <integer>[weightIndex]→, <logical>[haloLoaded]→) Compute the mass enclosed within a radius.

tfamily \ textcolor{red}\textless *type(treeNode)\textgreater host() Return a pointer to the host treeNode object.

tfamily \ void hotHaloCoolingAbundancesRate(<type(abundances)> value) Cumulate to the rate of the hotHaloCoolingAbundances property of the hotHalo component.

tfamily \ void hotHaloCoolingAngularMomentumRate(<double> value) Cumulate to the rate of the hotHaloCoolingAngularMomentum property of the hotHalo component.

tfamily \ void hotHaloCoolingMassRate(<double> value) Cumulate to the rate of the hotHaloCoolingMass property of the hotHalo component.

tfamily \ void initialize() Initialize the object.

tfamily \ void nameFromIndex(<integer> count→, <varying_string>name←) Return the name of a property given is index.

tfamily \ logicalzero nullIsActive() Return whether the null implementation of the interOutput component class is active.

tfamily \ void odeStepRatesInitialize() Initialize rates for evolvable properties.

tfamily \ void odeStepScalesInitialize() Initialize scales for evolvable properties.

tfamily \ void output(<integer> integerProperty↔, <integer> integerBufferCount↔, <integer(:,:)>integerBuffer↔, <integer:doubleProperty↔, <integer:doubleBufferCount↔, <double(:,:)>doubleBuffer↔, <double>time→, <integer>instance→) Generate values of outputtable properties.

tfamily \ void outputCount(<integer>integerPropertyCount↔, <integer>doublePropertyCount↔, <double>time→, <integer>instance→) Compute a count of outputtable properties.

tfamily \ void outputNames(<integer>integerProperty↔, <char[*]>integerPropertyNames↔, <char[*]>integerPropertyComments↔, <double:integerPropertyUnitsSI↔, <integer:doubleProperty↔, <char[*]>doublePropertyNames↔, <char[*]>doublePropertyComments↔, <double:doublePropertyUnitsSI↔, <double>time→, <integer>instance→) Generate names of outputtable properties.

tfamily \ doublezero potential(<double> radius→, <componentType>[componentType]→, <massType>[massType]→, <logical>[haloLoaded]→) Compute the gravitational potential.

tfamily \ doublezero rotationCurve(<double> radius→, <componentType>[componentType]→, <massType>[massType]→, <logical>[haloLoaded]→) Compute the rotation curve.

tfamily \ doublezero rotationCurveGradient(<double> radius→, <componentType>[componentType]→, <massType>[massType]→, <logical>[haloLoaded]→) Compute the rotation curve gradient.
16.5. Objects

tfamily intzero serializeCount() Return a count of the number of evolvable quantities to be evolved.

tfamily void serializeRates(<double(:)> array→) Serialize the evolvable rates to an array.

tfamily void serializeScales(<double(:)> array→) Serialize the evolvable scales to an array.

tfamily void serializeValues(<double(:)> array→) Serialize the evolvable quantities to an array.

tfamily textcolor{red}{\textless double\textgreater}spheroidStarFormationRate() Get the spheroidStarFormationRate property of the interOutput component.

tfamily textcolor{red}{\textless type(varying\_string):(\textgreater)}spheroidStarFormationRateAttributeMatch(<logical>[requireGettable]→, <logical>[requireSettable]→, <logical>[requireEvolvable]→) Return a list of implementations that provide the given list of attributes for the spheroidStarFormationRate property of the interOutput component.

tfamily intzero spheroidStarFormationRateCount() Compute the count of evolvable quantities in the spheroidStarFormationRate property of the InterOutputStandard component.

tfamily textcolor{red}{\textless double\textgreater}spheroidStarFormationRateIsGettable() Get the spheroidStarFormationRate property of the interOutput component.

tfamily logicalzerospheroidStarFormationRateIsSettable() Specify whether the spheroidStarFormationRate property of the interOutput component is settable.

tfamily void spheroidStarFormationRateRate(<double> value) Cumulatethe rate of the spheroidStarFormationRate property of the InterOutputStandard component.

tfamily void spheroidStarFormationRateScale(<double> value) Set the scale of the spheroidStarFormationRate property of the InterOutputStandard component.

tfamily void spheroidStarFormationRateSet(<double> value) Set the spheroidStarFormationRate property of the interOutput component.

tfamily logicalzerostandardIsActive() Return whether the standard implementation of the interOutput component class is active.

tfamily doublezerosurfaceDensity(<double(3)> positionCylindrical→, <componentType>[componentType]→, <massType>[massType]→, <weightBy>[weightBy]→, <integer>[weightIndex]→, <logical>[haloLoaded]→) Compute the surface density.

tfamily textcolor{red}{\textless type(varying\_string):(\textgreater)} type() Return the type of this object.

tfamily nodeComponentInterOutputNull

tfamily void builder(<"type(node)"componentDefinition→) Build a nodeComponent from a supplied XML definition.

tfamily doublezerosurfaceDensity(<double(3)> positionSpherical→, <componentType>[componentType]→, <massType>[massType]→, <weightBy>[weightBy]→, <integer>[weightIndex]→, <logical>[haloLoaded]→) Compute the density.

tfamily void deserializerrates(<double(:)> array←) Deserialize the evolvable rates from an array.

tfamily void deserializerratesScales(<double(:)> array←) Deserialize the evolvable scales from an array.
tfamily \void deserializeValues(<double(:)> array←) Deserialize the evolvable quantities from an array.

tfamily \void destroy() Destroy the object.

tfamily \textcolor{red}{\textless double\textgreater} diskStarFormationRate() Get the diskStarFormationRate property of the interOutput component.

tfamily \textcolor{red}{\textless *type(treeNode)\textgreater} host() Return a pointer to the host treeNode object.

tfamily \void hotHaloCoolingAbundancesRate(<type(abundances)> value) Cumulate to the rate of the hotHaloCoolingAbundances property of the hotHalo component.

tfamily \void hotHaloCoolingAngularMomentumRate(<double> value) Cumulate to the rate of the hotHaloCoolingAngularMomentum property of the hotHalo component.

tfamily \void hotHaloCoolingMassRate(<double> value) Cumulate to the rate of the hotHaloCoolingMass property of the hotHalo component.

tfamily \void initialize() Initialize the object.

tfamily \void nameFromIndex(<integer> count→, <varying_string>name←) Return the name of a property given is index.
16.5. Objects

tfamily \logicalzero nullIsActive() Return whether the null implementation of the interOutput component class is active.

tfamily \void odeStepRatesInitialize() Initialize rates for evolvable properties.

tfamily \void odeStepScalesInitialize() Initialize scales for evolvable properties.

tfamily \void output(<integer> integerProperty ↔, <integer> integerBufferCount ↔, <integer(:,:)> integerBuffer ↔, <integer>doubleProperty ↔, <integer> doubleBufferCount ↔, <double(:,:)> doubleBuffer ↔, <double> time →, <integer> instance →) Generate values of outputtable properties.

tfamily \void outputCount(<integer>integerPropertyCount ↔, <integer> doublePropertyCount ↔, <double> time →, <integer> instance →) Compute a count of outputtable properties.

tfamily \void outputNames(<integer>integerProperty ↔, <char[*](:)>integerPropertyNames ↔, <char[*](:)> integerPropertyComments ↔, <double(:)>integerPropertyUnitsSI ↔, <integer>doubleProperty ↔, <char[*](:)>doublePropertyNames ↔, <char[*](:)> doublePropertyComments ↔, <double(:)> doublePropertyUnitsSI ↔, <double> time →, <integer> instance →) Generate names of outputtable properties.

tfamily \doublezeropotential(<double>radius →, <componentType>[componentType]→, <massType>[massType]→, <logical>[haloLoaded]→) Compute the gravitational potential.

tfamily \void readRaw(<integer> fileHandle →) Read a binary dump of the nodeComponent from the given fileHandle.

tfamily \doublezerotationCurve(<double>radius →, <componentType>[componentType]→, <massType>[massType]→, <logical>[haloLoaded]→) Compute the rotation curve.

tfamily \doublezerotationCurveGradient(<double>radius →, <componentType>[componentType]→, <massType>[massType]→, <logical>[haloLoaded]→) Compute the rotation curve gradient.

tfamily \intzero serializeCount() Return a count of the number of evolvable quantities to be evolved.

tfamily \void serializeRates(<double(:)> array →) Serialize the evolvable rates to an array.

tfamily \void serializeScales(<double(:)> array →) Serialize the evolvable scales to an array.

tfamily \void serializeValues(<double(:)> array →) Serialize the evolvable quantities to an array.

tfamily \textcolor{red}{\textless double\textgreater}spheroidStarFormationRate() Get the spheroidStarFormationRate property of the interOutput component.

tfamily \textcolor{red}{\textless type(varying\_string)(:)}\textgreater spheroidStarFormationRateAttributeMatch(<logical>[requireGettable]→, <logical>[requireSettable]→, <logical>[requireEvolvable]→) Return a list of implementations that provide the given list of attributes for the spheroidStarFormationRate property of the interOutput component.

tfamily \intzero spheroidStarFormationRateCount() Compute the count of evolvable quantities in the spheroidStarFormationRate property of the InterOutputStandard component.

tfamily \textcolor{red}{\textless double\textgreater}spheroidStarFormationRateIsGettable() Get the spheroidStarFormationRate property of the interOutput component.

tfamily \logicalzero spheroidStarFormationRateIsSettable() Specify whether the spheroidStarFormationRate property of the interOutput component is settable.
tfamily \void spheroidStarFormationRateRate(<double> value) Cumulate to the rate of the spheroidStarFormationRate property of the InterOutputStandard component.

tfamily \void spheroidStarFormationRateScale(<double> value) Set the scale of the spheroidStarFormationRate property of the InterOutputStandard component.

tfamily \void spheroidStarFormationRateSet(<double> value) Set the spheroidStarFormationRate property of the interOutput component.

tfamily \logical zero standardIsActive() Return whether the standard implementation of the interOutput component class is active.

tfamily \double zero surfaceDensity(<double(3)> positionCylindrical \rightarrow, <componentType> [componentType] \rightarrow, <massType> [massType] \rightarrow, <weightBy> [weightBy] \rightarrow, <integer> [weightIndex] \rightarrow, <logical> [haloLoaded] \rightarrow) Compute the surface density.

tfamily \textcolor{red}{}\textless type(varying \_string)\textgreater\ type() Return the type of this object.

tfamily nodeComponentInterOutputStandard

tfamily \void builder(<\*type(node)> componentDefinition \rightarrow) Build a nodeComponent from a supplied XML definition.

tfamily \double zero density(<double(3)> positionSpherical \rightarrow, <componentType> [componentType] \rightarrow, <massType> [massType] \rightarrow, <weightBy> [weightBy] \rightarrow, <integer> [weightIndex] \rightarrow, <logical> [haloLoaded] \rightarrow) Compute the density.

tfamily \void deserializeRates(<double(:) array ←) Deserialize the evolvable rates from an array.

tfamily \void deserializeScales(<double(:) array ←) Deserialize the evolvable scales from an array.

tfamily \void deserializeValues(<double(:) array ←) Deserialize the evolvable quantities from an array.

tfamily \void destroy() Destroy the object.

tfamily \textcolor{red}{}\textless double\textgreater\ diskStarFormationRate() Get the diskStarFormationRate property of the interOutput component.

tfamily \textcolor{red}{}\textless type(varying \_string)(:)\textgreater\ diskStarFormationRateAttributeMatch(<logical> [requireGettable] \rightarrow, <logical> [requireSettable] \rightarrow, <logical> [requireEvolvable] \rightarrow) Return a list of implementations that provide the given list of attributes for the diskStarFormationRate property of the interOutput component

tfamily \int zero diskStarFormationRateCount() Compute the count of evolvable quantities in the diskStarFormationRate property of the InterOutputStandard component.

tfamily \textcolor{red}{}\textless double\textgreater\ diskStarFormationRateIsGettable() Get the diskStarFormationRate property of the interOutput component.

tfamily \logical zero diskStarFormationRateIsSettable() Specify whether the diskStarFormationRate property of the interOutput component is settable.

tfamily \void diskStarFormationRateRate(<double> value) Cumulate to the rate of the diskStarFormationRate property of the InterOutputStandard component.
tfamily \void diskStarFormationRateScale(<double> value) Set the scale of the diskStarFormationRate property of the InterOutputStandard component.

tfamily \void diskStarFormationRateSet(<double> value) Set the diskStarFormationRate property of the interOutput component.

tfamily \void dump() Generate an ASCII dump of all properties.

tfamily \void dumpRaw(<integer> fileHandle) Generate a binary dump of all properties.

tfamily \void dumpXML() Generate an XML dump of all properties.

tfamily \double zeroenclosedMass(<double> radius→, <componentType> [componentType]→, <massType> [massType]→, <weightBy> [weightBy]→, <integer> [weightIndex]→, <logical> [haloLoaded]→) Compute the mass enclosed within a radius.

tfamily \textcolor{red}{\textless *type(treeNode)\textgreater} host() Return a pointer to the host TreeNode object.

tfamily \void hotHaloCoolingAbundancesRate(<type(abundances)> value) Cumulate to the rate of the hotHaloCoolingAbundances property of the hotHalo component.

tfamily \void hotHaloCoolingAngularMomentumRate(<double> value) Cumulate to the rate of the hotHaloCoolingAngularMomentum property of the hotHalo component.

tfamily \void hotHaloCoolingMassRate(<double> value) Cumulate to the rate of the hotHaloCoolingMass property of the hotHalo component.

tfamily \void initialize() Initialize the object.

tfamily \void nameFromIndex(<integer> count→, <varying_string>name←) Return the name of a property given is index.

tfamily \logical zero nullIsActive() Return whether the null implementation of the interOutput component class is active.

tfamily \void odeStepRatesInitialize() Initialize rates for evolvable properties.

tfamily \void odeStepScalesInitialize() Initialize scales for evolvable properties.

tfamily \void output(<integer> integerProperty↔, <integer> integerBufferCount↔, <integer(:,:)> integerBuffer↔, <integer>doubleProperty↔, <integer> doubleBufferCount↔, <double(:,:)> doubleBuffer↔, <double> time→, <integer> instance→) Generate values of outputtable properties.

tfamily \void outputCount(<integer>integerPropertyCount↔, <integer> doublePropertyCount↔, <double> time→, <integer> instance→) Compute a count of outputtable properties.

tfamily \void outputNames(<integer>integerProperty↔, <char[^]*[;]> integerPropertyNames↔, <char[^]*[;]> integerPropertyComments↔, <double> integerPropertyUnitsSI↔, <integer> doubleProperty↔, <char[^]*[;]> doublePropertyNames↔, <char[^]*[;]> doublePropertyComments↔, <double(:,:)> doublePropertyUnitsSI↔, <double> time→, <integer> instance→) Generate names of outputtable properties.

tfamily \double zero potential(<double> radius→, <componentType> [componentType]→, <massType> [massType]→, <logical> [haloLoaded]→) Compute the gravitational potential.
16. **Coding GALACTICUS**

tfamily \void readRaw(<integer> fileHandle \rightarrow) Read a binary dump of the nodeComponent from the given fileHandle.

tfamily \doublezero rotationCurve(<double> radius \rightarrow, <componentType> [componentType] \rightarrow, <massType> [massType] \rightarrow, <logical> [haloLoaded] \rightarrow) Compute the rotation curve.

tfamily \doublezero rotationCurveGradient(<double> radius \rightarrow, <componentType> [componentType] \rightarrow, <massType> [massType] \rightarrow, <logical> [haloLoaded] \rightarrow) Compute the rotation curve gradient.

tfamily \intzero serializeCount() Return a count of the number of evolvable quantities to be evolved.

tfamily \void serializeRates(<double(:) > array \rightarrow) Serialize the evolvable rates to an array.

tfamily \void serializeScales(<double(:) > array \rightarrow) Serialize the evolvable scales to an array.

tfamily \void serializeValues(<double(:) > array \rightarrow) Serialize the evolvable quantities to an array.

tfamily \textcolor{red}{<double\textgreater}spheroidStarFormationRate() Get the spheroidStarFormationRate property of the interOutput component.

tfamily \textcolor{red}{< type(varying_string):(>)\textgreater}spheroidStarFormationRateAttributeMatch(<logical>[requireGettable] \rightarrow, <logical>[requireSettable] \rightarrow, <logical>[requireEvolvable] \rightarrow) Return a list of implementations that provide the given list of attributes for the spheroidStarFormationRate property of the interOutput component.

tfamily \intzero spheroidStarFormationRateCount() Compute the count of evolvable quantities in the spheroidStarFormationRate property of the InterOutputStandard component.

tfamily \textcolor{red}{< type(varying_string):>} type() Return the type of this object.

tfamily \logicalzero standardIsActive() Return whether the standard implementation of the interOutput component class is active.

tfamily \doublezero surfaceDensity(<double(3)> positionCylindrical \rightarrow, <componentType> [componentType] \rightarrow, <massType> [massType] \rightarrow, <weightBy> [weightBy] \rightarrow, <integer> [weightIndex] \rightarrow, <logical> [haloLoaded] \rightarrow) Compute the surface density.

tfamily \textcolor{red}{< type(varying_string):>} type() Return the type of this object.
tfamily nodeComponentMassFlowStatistics

tfamily \void builder(<\text{node})\text{componentDefinition\rightarrow}) Build a nodeComponent from a supplied XML definition.

tfamily \textcolor{red}{\textless \text{double}\textgreater} cooledMass() Get the cooledMass property of the massFlowStatistics component.

tfamily \textcolor{red}{\textless \text{double}\textgreater} cooledMassAttributeMatch(<\text{logical}[\text{requireGettable}\rightarrow], <\text{logical}[\text{requireSettable}\rightarrow], <\text{logical}[\text{requireEvolvable}\rightarrow]) Return a list of implementations that provide the given list of attributes for the cooledMass property of the massFlowStatistics component.

tfamily \intzero cooledMassCount() Compute the count of evolvable quantities in the cooledMass property of the MassFlowStatisticsStandard component.

tfamily \textcolor{red}{\textless \text{double}\textgreater} cooledMassIsGettable() Get the cooledMass property of the massFlowStatistics component.

tfamily \logicalzero cooledMassIsSettable() Specify whether the cooledMass property of the massFlowStatistics component is settable.

tfamily \void cooledMassRate(<\text{double}> value) Cumulate to the rate of the cooledMass property of the MassFlowStatisticsStandard component.

tfamily \void cooledMassScale(<\text{double}> value) Set the scale of the cooledMass property of the MassFlowStatisticsStandard component.

tfamily \void cooledMassSet(<\text{double}> value) Set the cooledMass property of the massFlowStatistics component.

tfamily \doublezero density(<\text{double}(3)> positionSpherical\rightarrow, <\text{componentType}> [\text{componentType}\rightarrow], <\text{massType}> [\text{massType}\rightarrow], <\text{weightBy}> [\text{weightBy}\rightarrow], <\text{integer}> [\text{weightIndex}\rightarrow], <\text{logical}> [\text{haloLoaded}\rightarrow]) Compute the density.

tfamily \void deserializeRates(<\text{double}(\rightarrow) array←) Deserialize the evolvable rates from an array.

tfamily \void deserializeScales(<\text{double}(\rightarrow) array←) Deserialize the evolvable scales from an array.

tfamily \void deserializeValues(<\text{double}(\rightarrow) array←) Deserialize the evolvable quantities from an array.

tfamily \void destroy() Destroy the object.

tfamily \void dump() Generate an ASCII dump of all properties.

tfamily \void dumpRaw(<\text{integer}> fileHandle\rightarrow) Generate a binary dump of all properties.

tfamily \void dumpXML() Generate an XML dump of all properties.

tfamily \doublezero enclosedMass(<\text{double}> radius\rightarrow, <\text{componentType}> [\text{componentType}\rightarrow], <\text{massType}> [\text{massType}\rightarrow], <\text{weightBy}> [\text{weightBy}\rightarrow], <\text{integer}> [\text{weightIndex}\rightarrow], <\text{logical}> [\text{haloLoaded}\rightarrow]) Compute the mass enclosed within a radius.

tfamily \textcolor{red}{\textless \text{type(treeNode)}\textgreater} host() Return a pointer to the host treeNode object.
tfamily \ void hotHaloCoolingAbundancesRate(<type(abundances)> value) Cumulate to the rate of the hotHaloCoolingAbundances property of the hotHalo component.

tfamily \ void hotHaloCoolingAngularMomentumRate(<double> value) Cumulate to the rate of the hotHaloCoolingAngularMomentum property of the hotHalo component.

tfamily \ void hotHaloCoolingMassRate(<double> value) Cumulate to the rate of the hotHaloCoolingMass property of the hotHalo component.

tfamily \ void initialize() Initialize the object.

tfamily \ void nameFromIndex(<integer> count →, <varying_string>name←) Return the name of a property given is index.

tfamily \ logicalzero nullIsActive() Return whether the null implementation of the massFlowStatistics component class is active.

tfamily \ void odeStepRatesInitialize() Initialize rates for evolvable properties.

tfamily \ void odeStepScalesInitialize() Initialize scales for evolvable properties.

tfamily \ void output(<integer> integerProperty ↔, <integer> integerBufferCount ↔, <integer(:,:)> integerBuffer ↔, <integer>doubleProperty ↔, <integer> doubleBufferCount ↔, <double(:,:)> doubleBuffer ↔, <double> time→, <integer> instance→) Generate values of outputtable properties.

tfamily \ void outputCount(<integer>integerPropertyCount ↔, <integer>doublePropertyCount ↔, <double> time→, <integer> instance→) Compute a count of outputtable properties.

tfamily \ void outputNames(<integer>integerProperty ↔, <char[*](:)>integerPropertyNames ↔, <char[*](:)>integerPropertyComments ↔, <double(:)>integerPropertyUnitsSI ↔, <integer>doubleProperty ↔, <char[*](:)>doublePropertyNames ↔, <char[*](:)>doublePropertyComments ↔, <double(:)> doublePropertyUnitsSI ↔, <double> time→, <integer> instance→) Generate names of outputtable properties.

tfamily \ doublezero potential(<double>radius→, <componentType>[componentType]→, <massType>[massType]→, <logical> [haloLoaded]→) Compute the gravitational potential.

tfamily \ doublezero rotationCurve(<double>radius→, <componentType>[componentType]→, <massType>[massType]→, <logical> [haloLoaded]→) Compute the rotation curve.

tfamily \ doublezero rotationCurveGradient(<double>radius→, <componentType>[componentType]→, <massType>[massType]→, <logical> [haloLoaded]→) Compute the rotation curve gradient.

tfamily \ intzero serializeCount() Return a count of the number of evolvable quantities to be evolved.

tfamily \ void serializeRates(<double(:):> array→) Serialize the evolvable rates to an array.

tfamily \ void serializeScales(<double(:):> array→) Serialize the evolvable scales to an array.

tfamily \ void serializeValues(<double(:):> array→) Serialize the evolvable quantities to an array.

tfamily \ logicalzero standardIsActive() Return whether the standard implementation of the massFlowStatistics component class is active.

tfamily \ doublezero surfaceDensity(<double(3)>positionCylindrical→, <componentType>[componentType]→, <massType>[massType]→, <weightBy>[weightBy]→, <integer> [weightIndex]→, <logical> [haloLoaded]→) Compute the surface density.
16.5. Objects

tfamily \textcolor{red}{\textless type(varying\_\_string)\textgreater} type() Return the type of this object.

tfamily nodeComponentMassFlowStatisticsNull

tfamily \void builder(<*type(node)>componentDefinition→) Build a nodeComponent from a supplied XML definition.

tfamily \textcolor{red}{\textless double\textgreater} cooledMass() Get the cooledMass property of the massFlowStatistics component.

tfamily cooledMassAttributeMatch(<logical>[requireGettable]→, <logical>[requireSettable]→, <logical>[requireEvolvable]→) Return a list of implementations that provide the given list of attributes for the cooledMass property of the massFlowStatistics component.

tfamily \intzero cooledMassCount() Compute the count of evolvable quantities in the cooledMass property of the MassFlowStatisticsStandard component.

tfamily cooledMassIsGettable() Get the cooledMass property of the massFlowStatistics component.

tfamily cooledMassIsSettable() Specify whether the cooledMass property of the massFlowStatistics component is settable.

tfamily \void cooledMassRate(<double> value) Cumulate to the rate of the cooledMass property of the MassFlowStatisticsStandard component.

tfamily \void cooledMassScale(<double>value) Set the scale of the cooledMass property of the MassFlowStatisticsStandard component.

tfamily \void cooledMassSet(<double>value) Set the cooledMass property of the massFlowStatistics component.

tfamily density(<double(3)> positionSpherical→, <componentType> [componentType]→, <massType> [massType]→, <weightBy> [weightBy]→, <integer> [weightIndex]→, <logical> [haloLoaded]→) Compute the density.

tfamily deserializedRates(<double(:)> array←) Deserialize the evolvable rates from an array.

tfamily deserializedScales(<double(:)> array←) Deserialize the evolvable scales from an array.

tfamily deserializedValues(<double(:)> array←) Deserialize the evolvable quantities from an array.

tfamily \void destroy() Destroy the object.

tfamily \void dump() Generate an ASCII dump of all properties.

tfamily \void dumpRaw(<integer> fileHandle→) Generate a binary dump of all properties.

tfamily \void dumpXML() Generate an XML dump of all properties.

tfamily \doublezero enclosedMass(<double> radius→, <componentType> [componentType]→, <massType> [massType]→, <weightBy> [weightBy]→, <integer> [weightIndex]→, <logical> [haloLoaded]→) Compute the mass enclosed within a radius.
tfamily \textcolor{red}{\textless *type(treeNode)\textgreater} host() Return a pointer to the host TreeNode object.

tfamily void hotHaloCoolingAbundancesRate(<type(abundances)> value) Cumulate to the rate of the hotHaloCoolingAbundances property of the hotHalo component.

tfamily void hotHaloCoolingAngularMomentumRate(<double> value) Cumulate to the rate of the hotHaloCoolingAngularMomentum property of the hotHalo component.

tfamily void hotHaloCoolingMassRate(<double> value) Cumulate to the rate of the hotHaloCoolingMass property of the hotHalo component.

tfamily void initialize() Initialize the object.

tfamily void nameFromIndex(<integer> count →, <varying_string>name←) Return the name of a property given is index.

tfamily \logicalzero nullIsActive() Return whether the null implementation of the massFlowStatistics component class is active.

tfamily void odeStepRatesInitialize() Initialize rates for evolvable properties.

tfamily void odeStepScalesInitialize() Initialize scales for evolvable properties.

tfamily void output(<integer> integerProperty ↔, <integer> integerBufferCount ↔, <integer(:,:)> integerBuffer ↔, <integer>doubleProperty ↔, <integer> doubleBufferCount ↔, <double(:,:)> doubleBuffer ↔, <double> time→, <integer> instance→) Generate values of outputtable properties.

tfamily void outputCount(<integer>integerPropertyCount ↔, <integer>doublePropertyCount ↔, <double> time→, <integer> instance→) Compute a count of outputtable properties.

tfamily void outputNames(<integer>integerProperty ↔, <char[*]()> integerPropertyNames ↔, <char[*]()> integerPropertyComments ↔, <double(:)>integerPropertyUnitsSI ↔, <integer>doubleProperty ↔, <char[*]()> doublePropertyNames ↔, <char[*]()> doublePropertyComments ↔, <double(:)> doublePropertyUnitsSI ↔, <double> time→, <integer> instance→) Generate names of outputtable properties.

tfamily \doublezeropotential(<double>radius→, <componentType>[componentType]→, <massType>[massType]→, <logical>[haloLoaded]→) Compute the gravitational potential.

tfamily \void readRaw(<integer>fileHandle→) Read a binary dump of the nodeComponent from the given fileHandle.

tfamily \doublezero rotationCurve(<double>radius→, <componentType>[componentType]→, <massType>[massType]→, <logical>[haloLoaded]→) Compute the rotation curve.

tfamily \doublezero rotationCurveGradient(<double>radius→, <componentType>[componentType]→, <massType>[massType]→, <logical>[haloLoaded]→) Compute the rotation curve gradient.

tfamily \intzero serializeCount() Return a count of the number of evolvable quantities to be evolved.

tfamily \void serializeRates(<double(:)>array→) Serialize the evolvable rates to an array.

tfamily \void serializeScales(<double(:)>array→) Serialize the evolvable scales to an array.

tfamily \void serializeValues(<double(:)>array→) Serialize the evolvable quantities to an array.
tfamily \logicalzero standardIsActive() Return whether the standard implementation of the massFlowStatistics component class is active.

tfamily double surfaceDensity(<double(3)> positionCylindrical→, <componentType> [componentType]→, <massType> [massType]→, <weightBy> [weightBy]→, <integer> [weightIndex]→, <logical> [haloLoaded]→) Compute the surface density.

tfamily {textcolor{red}{\textless type(varying\_string)\textgreater} type()} Return the type of this object.

tfamily nodeComponentMassFlowStatisticsStandard

tfamily \void builder(<*type(node)>componentDefinition→) Build a nodeComponent from a supplied XML definition.

tfamily {textcolor{red}{\textless double\textgreater} cooledMass()} Get the cooledMass property of the massFlowStatistics component.

tfamily {textcolor{red}{\textless double\textgreater} cooledMassAttributeMatch(<logical>[requireGettable]→, <logical>[requireSettable]→, <logical>[requireEvolvable]→)} Return a list of implementations that provide the given list off attributes for the cooledMass property of the massFlowStatistics component.

tfamily {textcolor{red}{\textless double\textgreater} cooledMassIsGettable()} Get the cooledMass property of the massFlowStatistics component.

tfamily \logicalzero cooledMassIsSettable() Specify whether the cooledMass property of the massFlowStatistics component is settable.

tfamily \void cooledMassRate(<double> value) Cumulate to the rate of the cooledMass property of the MassFlowStatisticsStandard component.

tfamily \void cooledMassScale(<double> value) Set the scale of the cooledMass property of the MassFlowStatisticsStandard component.

tfamily \void cooledMassSet(<double> value) Set the cooledMass property of the massFlowStatistics component.

tfamily double density(<double(3)> positionSpherical→, <componentType> [componentType]→, <massType> [massType]→, <weightBy> [weightBy]→, <integer> [weightIndex]→, <logical> [haloLoaded]→) Compute the density.

tfamily \void deserializeRates(<double(:)> array←) Deserialize the evolvable rates from an array.

tfamily \void deserializeScales(<double(:)> array←) Deserialize the evolvable scales from an array.

tfamily \void deserializeValues(<double(:)> array←) Deserialize the evolvable quantities from an array.

tfamily \void destroy() Destroy the object.

tfamily \void dump() Generate an ASCII dump of all properties.

tfamily \void dumpRaw(<integer> fileHandle→) Generate a binary dump of all properties.
16. Coding Galacticus

tfamily \void dumpXML() Generate an XML dump of all properties.

tfamily \doublezero enclosedMass(\double radius→, \componentType [componentType]→, \massType [massType]→, \weightBy [weightBy]→, \integer [weightIndex]→, \logical [haloLoaded]→) Compute the mass enclosed within a radius.

tfamily \textcolor{red}{\textless *type(treeNode)\textgreater} host() Return a pointer to the host treeNode object.

tfamily \void hotHaloCoolingAbundancesRate(\type(abundances) value) Cumulate to the rate of the hotHaloCoolingAbundances property of the hotHalo component.

tfamily \void hotHaloCoolingAngularMomentumRate(\double value) Cumulate to the rate of the hotHaloCoolingAngularMomentum property of the hotHalo component.

tfamily \void hotHaloCoolingMassRate(\double value) Cumulate to the rate of the hotHaloCoolingMass property of the hotHalo component.

tfamily \void initialize() Initialize the object.

// Other functions are similar to the above.

tfamily \void output(\integer integerProperty↔, \integer integerBufferCount↔, \integer(;) integerBuffer↔, \integer doubleProperty↔, \integer doubleBufferCount↔, \double(;) doubleBuffer↔, \double time→, \integer instance→) Generate values of outputtable properties.

tfamily \void outputCount(\integer integerPropertyCount↔, \integer doublePropertyCount↔, \double time→, \integer instance→) Compute a count of outputtable properties.

// Other function mappings are similar to the above.

tfamily \doublezero potential(\double radius→, \componentType [componentType]→, \massType [massType]→, \logical [haloLoaded]→) Compute the gravitational potential.

// Other functions are similar to the above.

tfamily \void readRaw(\integer fileHandle→) Read a binary dump of the nodeComponent from the given fileHandle.

// Other function mappings are similar to the above.

tfamily \doublezero rotationCurve(\double radius→, \componentType [componentType]→, \massType [massType]→, \logical [haloLoaded]→) Compute the rotation curve.

// Other function mappings are similar to the above.

tfamily \doublezero rotationCurveGradient(\double radius→, \componentType [componentType]→, \massType [massType]→, \logical [haloLoaded]→) Compute the rotation curve gradient.

// Other function mappings are similar to the above.

tfamily \integer zero serializeCount() Return a count of the number of evolvable quantities to be evolved.
16.5. Objects

tfamily \void serializeRates(<double(:)> array→) Serialize the evolvable rates to an array.

tfamily \void serializeScales(<double(:)> array→) Serialize the evolvable scales to an array.

tfamily \void serializeValues(<double(:)> array→) Serialize the evolvable quantities to an array.

ntfamily \logical zero standardIsActive() Return whether the standard implementation of the massFlow-
Statistics component class is active.

tfamily \double zero surfaceDensity(<double(3)> positionCylindrical→, <componentType> [compone-
ntypeType]→, <massType> [massType]→, <weightBy> [weightBy]→, <integer> [weightIndex]→,
<logical> [haloLoaded]→) Compute the surface density.

ntfamily \textcolor{red}{\textless type(varying\_string) \textgreater} type() Return the type of this
object.

ntfamily nodeComponentMergingStatistics

tfamily \void builder(<*type(node)>componentDefinition→) Build a nodeComponent from a supplied
XML definition.

ntfamily \double zero density(<double(3)> positionSpherical→, <componentType> [compone-
typeType]→, <massType> [massType]→, <weightBy> [weightBy]→, <integer> [weightIndex]→,
<logical> [haloLoaded]→) Compute the density.

ntfamily \void deserializeRates(<double(:)> array←) Deserialize the evolvable rates from an array.

ntfamily \void deserializeScales(<double(:)> array←) Deserialize the evolvable scales from an array.

ntfamily \void deserializeValues(<double(:)> array←) Deserialize the evolvable quantities from an array.

tfamily \void destroy() Destroy the object.

tfamily \void dump() Generate an ASCII dump of all properties.

ntfamily \void dumpRaw(<integer> fileHandle→) Generate a binary dump of all properties.

tfamily \void dumpXML() Generate an XML dump of all properties.

ntfamily \double zero enclosedMass(<double> radius→, <componentType> [compone-
typeType]→, <massType> [massType]→, <weightBy> [weightBy]→, <integer> [weightIndex]→,
<logical> [haloLoaded]→) Compute the mass enclosed within a radius.

ntfamily \textcolor{red}{\textless double \textgreater} galaxyMajorMergerTime() Get the galaxyMajorMergerTime
property of the mergingStatistics component.

ntfamily \textcolor{red}{\textless double\_type(varying\_string)\textgreater} galaxyMajorMergerTimeAttributeM-
atch(<logical> [requireGettable]→, <logical> [requireSettable]→, <logical> [requireEvolvable]→) Re-
turn a list of implementations that provide the given list off attributes for the galaxyMajorMergerTime
property of the mergingStatistics component

ntfamily \textcolor{red}{\textless double\_type} galaxyMajorMergerTimeIsGettable() Get the galaxyMajorMergerTime
property of the mergingStatistics component.

ntfamily \logical zero galaxyMajorMergerTimeIsSettable() Specify whether the galaxyMajorMergerTime
property of the mergingStatistics component is settable.
tfamily \textcolor{red}{\textless *type(treeNode)\textgreater} host() Return a pointer to the host treeNode object.

tfamily \void hotHaloCoolingMassRate(<double> value) Cumulate to the rate of the hotHaloCoolingMass property of the hotHalo component.

tfamily \void initialize() Initialize the object.

tfamily \void nameFromIndex(<integer> count→, <varying_string>name←) Return the name of a property given is index.

tfamily \textcolor{red}{\textless double\textgreater} nodeFormationTime() Get the nodeFormationTime property of the mergingStatistics component.

tfamily \textcolor{red}{\textless type(varying\_string):\textgreater} nodeFormationTimeAttributeMatch(<logical>[requireGettable]→, <logical>[requireSettable]→, <logical>[requireEvolvable]→) Return a list of implementations that provide the given list of attributes for the nodeFormationTime property of the mergingStatistics component

tfamily \textcolor{red}{\textless integer\textgreater} nodeHierarchyLevel() Get the nodeHierarchyLevel property of the mergingStatistics component.

tfamily \textcolor{red}{\textless type(varying\_string):\textgreater} nodeHierarchyLevelAttributeMatch(<logical>[requireGettable]→, <logical>[requireSettable]→, <logical>[requireEvolvable]→) Return a list of implementations that provide the given list of attributes for the nodeHierarchyLevel property of the mergingStatistics component

tfamily \textcolor{red}{\textless integer\textgreater} nodeHierarchyLevelIsGettable() Get the nodeHierarchyLevel property of the mergingStatistics component.

tfamily \logicalzero nodeHierarchyLevelIsSettable() Specify whether the nodeHierarchyLevel property of the mergingStatistics component is settable.

tfamily \void nodeHierarchyLevelSet(<integer> value) Set the nodeHierarchyLevel property of the mergingStatistics component.

tfamily \textcolor{red}{\textless double\textgreater} nodeMajorMergerTime() Get the nodeMajorMergerTime property of the mergingStatistics component.

tfamily \textcolor{red}{\textless type(treeNode)\textgreater} hotHaloCoolingAbundancesRate(<type(abundances)> value) Cumulate to the rate of the hotHaloCoolingAbundances property of the hotHalo component.

tfamily \void hotHaloCoolingAngularMomentumRate(<double> value) Cumulate to the rate of the hotHaloCoolingAngularMomentum property of the hotHalo component.

tfamily \void hotHaloCoolingMassRate(<double> value) Cumulate to the rate of the hotHaloCoolingMass property of the hotHalo component.

tfamily \void nodeFormationTimeSet(<double> value) Set the nodeFormationTime property of the mergingStatistics component.

tfamily \void nodeHierarchyLevelSet(<integer> value) Set the nodeHierarchyLevel property of the mergingStatistics component.

tfamily \void nodeMajorMergerTimeSet(<double> value) Set the nodeMajorMergerTime property of the mergingStatistics component.
tfamily \textcolor{red}{\textless\textgreater} \nodeMajorMergerTimeAttributeMatch(<logical>[requireGettable]→, <logical>[requireSettable]→, <logical>[requireEvolvable]→) Return a list of implementations that provide the given list off attributes for the nodeMajorMergerTime property of the mergingStatistics component.

tfamily \textcolor{red}{\textless\textgreater} \nodeMajorMergerTimeIsGettable() Get the nodeMajorMergerTime property of the mergingStatistics component.

tfamily \logicalzero \nodeMajorMergerTimeIsSettable() Specify whether the nodeMajorMergerTime property of the mergingStatistics component is settable.

tfamily \void \nodeMajorMergerTimeSet(<double> value) Set the nodeMajorMergerTime property of the mergingStatistics component.

tfamily \logicalzero \nullIsActive() Return whether the null implementation of the mergingStatistics component class is active.

tfamily \void \odeStepRatesInitialize() Initialize rates for evolvable properties.

tfamily \void \odeStepScalesInitialize() Initialize scales for evolvable properties.

tfamily \void \output(<integer> integerProperty↔, <integer> integerBufferCount↔, <integer(:,:)> integerBuffer↔, <integer> doubleProperty↔, <integer> doubleBufferCount↔, <double(:,:)> doubleBuffer↔, <double> time→, <integer> instance→) Generate values of outputtable properties.

tfamily \void \outputCount(<integer> integerPropertyCount↔, <integer> doublePropertyCount↔, <double> time→, <integer> instance→) Compute a count of outputtable properties.

tfamily \void \outputNames(<integer> integerProperty↔, <char[*](:)> integerPropertyNames↔, <char[*](:)> integerPropertyComments↔, <double(:)> integerPropertyUnitsSI↔, <integer> doubleProperty↔, <char[*](:)> doublePropertyNames↔, <char[*](:)> doublePropertyComments↔, <double(:)> doublePropertyUnitsSI↔, <double> time→, <integer> instance→) Generate names of outputtable properties.

tfamily \doublezero \potential(<double> radius→, <componentType>[componentType]→, <massType>[massType]→, <logical>[haloLoaded]→) Compute the gravitational potential.

tfamily \logicalzero \recentIsActive() Return whether the recent implementation of the mergingStatistics component class is active.

tfamily \textcolor{red}{\textless\textgreater} \recentMajorMergerCount() Get the recentMajorMergerCount property of the mergingStatistics component.

tfamily \textcolor{red}{\textless\textgreater} \recentMajorMergerCountAttributeMatch(<logical>[requireGettable]→, <logical>[requireSettable]→, <logical>[requireEvolvable]→) Return a list of implementations that provide the given list off attributes for the recentMajorMergerCount property of the mergingStatistics component.

tfamily \textcolor{red}{\textless\textgreater} \recentMajorMergerCountIsGettable() Get the recentMajorMergerCount property of the mergingStatistics component.

tfamily \logicalzero \recentMajorMergerCountIsSettable() Specify whether the recentMajorMergerCount property of the mergingStatistics component is settable.

tfamily \void \recentMajorMergerCountSet(<integer(:)> value) Set the recentMajorMergerCount property of the mergingStatistics component.
tfamily \doublezero\ rotationCurve(<\ double > radius→, <\ componentType > [componentType]→, <massType> [massType]→, <logical> [haloLoaded]→) Compute the rotation curve.

tfamily \doublezero\ rotationCurveGradient(<\ double > radius→, <\ componentType > [componentType]→, <massType> [massType]→, <logical> [haloLoaded]→) Compute the rotation curve gradient.

tfamily \intzero serializeCount() Return a count of the number of evolvable quantities to be evolved.

tfamily \void serializeRates(<double(:)> array→) Serialize the evolvable rates to an array.

tfamily \void serializeScales(<double(:)> array→) Serialize the evolvable scales to an array.

tfamily \void serializeValues(<double(:)> array→) Serialize the evolvable quantities to an array.

tfamily \logicalzero standardIsActive() Return whether the standard implementation of the mergingStatistics component class is active.

tfamily \doublezero surfaceDensity(<double(3)> positionCylindrical→, <\ componentType > [componentType]→, <massType> [massType]→, <weightBy> [weightBy]→, <integer> [weightIndex]→, <logical> [haloLoaded]→) Compute the surface density.

tfamily \void deserializeRates(<double(:)> array←) Deserialize the evolvable rates from an array.

tfamily \void deserializeScales(<double(:)> array←) Deserialize the evolvable scales from an array.

tfamily \void deserializeValues(<double(:)> array←) Deserialize the evolvable quantities from an array.

tfamily \void destroy() Destroy the object.

tfamily \void dump() Generate an ASCII dump of all properties.

tfamily \void dumpRaw(<integer> fileHandle→) Generate a binary dump of all properties.

tfamily \void dumpXML() Generate an XML dump of all properties.

tfamily \doublezero enclosedMass(<\ double > radius→, <\ componentType > [componentType]→, <massType> [massType]→, <weightBy> [weightBy]→, <integer> [weightIndex]→, <logical> [haloLoaded]→) Compute the mass enclosed within a radius.

tfamily \textcolor{red}{\textless\ double\textgreater} galaxyMajorMergerTime() Get the galaxyMajorMergerTime property of the mergingStatistics component.

tfamily \textcolor{red}{\textless\double\textgreater\textless type(varying\_string):\textgreater} galaxyMajorMergerTimeAttributeMatch(<logical>[requireGettable]→, <logical>[requireSettable]→, <logical>[requireEvolvable]→) Return a list of implementations that provide the given list off attributes for the galaxyMajorMergerTime property of the mergingStatistics component.
tfamily {\textcolor{red}{\textless double\textgreater}} galaxyMajorMergerTimeIsGettable() Get the \texttt{galaxyMajorMergerTime} property of the \texttt{mergingStatistics} component.

tfamily \logicalzero galaxyMajorMergerTimeIsSettable() Specify whether the \texttt{galaxyMajorMergerTime} property of the \texttt{mergingStatistics} component is settable.

tfamily \void galaxyMajorMergerTimeSet(<double> value) Set the \texttt{galaxyMajorMergerTime} property of the \texttt{mergingStatistics} component.

tfamily {\textcolor{red}{\textless *type(treeNode)\textgreater}} host() Return a pointer to the host \texttt{treeNode} object.

tfamily \void hotHaloCoolingAbundancesRate(<type(abundances)> value) Cumulate to the rate of the \texttt{hotHaloCoolingAbundances} property of the \texttt{hotHalo} component.

tfamily \void hotHaloCoolingAngularMomentumRate(<double> value) Cumulate to the rate of the \texttt{hotHaloCoolingAngularMomentum} property of the \texttt{hotHalo} component.

tfamily \void hotHaloCoolingMassRate(<double> value) Cumulate to the rate of the \texttt{hotHaloCoolingMass} property of the \texttt{hotHalo} component.

tfamily \void initialize() Initialize the object.

tfamily \void nameFromIndex(<integer> count \rightarrow, <varying_string>name \leftarrow) Return the name of a property given is index.

tfamily {\textcolor{red}{\textless double\textgreater}} nodeFormationTime() Get the \texttt{nodeFormationTime} property of the \texttt{mergingStatistics} component.

tfamily {\textcolor{red}{\textless type(varying\_string)(:\textgreater)}} nodeFormationTimeAttributeMatch(<logical>[requireGettable] →, <logical>[requireSettable] →, <logical>[requireEvolvable] →) Return a list of implementations that provide the given list off attributes for the \texttt{nodeFormationTime} property of the \texttt{mergingStatistics} component.

tfamily {\textcolor{red}{\textless integer\textgreater}} nodeFormationTimeIsGettable() Get the \texttt{nodeFormationTime} property of the \texttt{mergingStatistics} component.

tfamily \logicalzero nodeFormationTimeIsSettable() Specify whether the \texttt{nodeFormationTime} property of the \texttt{mergingStatistics} component is settable.

tfamily \void nodeFormationTimeSet(<double> value) Set the \texttt{nodeFormationTime} property of the \texttt{mergingStatistics} component.

tfamily {\textcolor{red}{\textless integer\textgreater}} nodeHierarchyLevel() Get the \texttt{nodeHierarchyLevel} property of the \texttt{mergingStatistics} component.

tfamily {\textcolor{red}{\textless type(varying\_string)(:\textgreater)}} nodeHierarchyLevelAttributeMatch(<logical>[requireGettable] →, <logical>[requireSettable] →, <logical>[requireEvolvable] →) Return a list of implementations that provide the given list off attributes for the \texttt{nodeHierarchyLevel} property of the \texttt{mergingStatistics} component.

tfamily {\textcolor{red}{\textless integer\textgreater}} nodeHierarchyLevelIsGettable() Get the \texttt{nodeHierarchyLevel} property of the \texttt{mergingStatistics} component.

tfamily \logicalzero nodeHierarchyLevelIsSettable() Specify whether the \texttt{nodeHierarchyLevel} property of the \texttt{mergingStatistics} component is settable.
tfamily \void nodeHierarchyLevelSet(<integer> value) Set the nodeHierarchyLevel property of the mergingStatistics component.

tfamily \textcolor{red}{\textless\textgreater} nodeMajorMergerTime() Get the nodeMajorMergerTime property of the mergingStatistics component.

tfamily \textcolor{red}{\textless\textgreater} nodeMajorMergerTimeAttributeMatch(<logical> [requireGettable] →, <logical> [requireSettable] →, <logical> [requireEvolvable] →) Return a list of implementations that provide the given list of attributes for the nodeMajorMergerTime property of the mergingStatistics component.

tfamily \textcolor{red}{\textless\textgreater} nodeMajorMergerTimeIsGettable() Get the nodeMajorMergerTime property of the mergingStatistics component.

tfamily \textcolor{red}{\textless\textgreater} nodeMajorMergerTimeIsSettable() Specify whether the nodeMajorMergerTime property of the mergingStatistics component is settable.

tfamily \void nodeMajorMergerTimeSet(<double> value) Set the nodeMajorMergerTime property of the mergingStatistics component.

tfamily \logicalzero nullIsActive() Return whether the null implementation of the mergingStatistics component class is active.

tfamily \void odeStepRatesInitialize() Initialize rates for evolvable properties.

tfamily \void odeStepScalesInitialize() Initialize scales for evolvable properties.

tfamily \void output(<integer> integerProperty ↔, <integer> integerBufferCount ↔, <integer> integerBuffer ↔, <integer> doubleProperty ↔, <integer> doubleBufferCount ↔, <double> doubleBuffer ↔, <double> time →, <integer> instance →) Generate values of outputtable properties.

tfamily \void outputCount(<integer> integerPropertyCount ↔, <integer> doublePropertyCount ↔, <double> time →, <integer> instance →) Compute a count of outputtable properties.

tfamily \void outputNames(<integer> integerProperty ↔, <char[]> integerPropertyNames ↔, <char[]> integerPropertyComments ↔, <double> integerPropertyUnitsSI ↔, <integer> doubleProperty ↔, <char[]> doublePropertyNames ↔, <char[]> doublePropertyComments ↔, <double> doublePropertyUnitsSI ↔, <double> time →, <integer> instance →) Generate names of outputtable properties.

tfamily \doublezero potential(<double> radius →, <componentType> [componentType] →, <massType> [massType] →, <logical> [haloLoaded] →) Compute the gravitational potential.

tfamily \void readRaw(<integer> fileHandle ↔) Read a binary dump of the nodeComponent from the given fileHandle.

tfamily \logicalzero recentIsActive() Return whether the recent implementation of the mergingStatistics component class is active.

tfamily \textcolor{red}{\textless\textgreater} recentMajorMergerCount() Get the recentMajorMergerCount property of the mergingStatistics component.

tfamily \textcolor{red}{\textless\textgreater} recentMajorMergerCountAttributeMatch(<logical> [requireGettable] →, <logical> [requireSettable] →, <logical> [requireEvolvable] →) Return a list of implementations that provide the given list of attributes for the recentMajorMergerCount property of the mergingStatistics component.
16.5. Objects

tfamily \textcolor{red}{\textless integer(:)\textgreater} recentMajorMergerCountIsGettable() Get the recentMajorMergerCount property of the mergingStatistics component.

ntfamily \textcolor{red}{\textless integer(:)\textgreater} recentMajorMergerCountIsSettable() Specify whether the recentMajorMergerCount property of the mergingStatistics component is settable.

ntfamily void recentMajorMergerCountSet(<integer(:)> value) Set the recentMajorMergerCount property of the mergingStatistics component.

ntfamily double zero rotationCurve(<double> radius \rightarrow, <componentType> [componentType] \rightarrow, <massType> [massType] \rightarrow, <logical> [haloLoaded] \rightarrow) Compute the rotation curve.

ntfamily double zero rotationCurveGradient(<double> radius \rightarrow, <componentType> [componentType] \rightarrow, <massType> [massType] \rightarrow, <logical> [haloLoaded] \rightarrow) Compute the rotation curve gradient.

ntfamily int zero serializeCount() Return a count of the number of evolvable quantities to be evolved.

ntfamily void serializeRates(<double(:)> array \rightarrow) Serialize the evolvable rates to an array.

ntfamily void serializeScales(<double(:)> array \rightarrow) Serialize the evolvable scales to an array.

ntfamily void serializeValues(<double(:)> array \rightarrow) Serialize the evolvable quantities to an array.

ntfamily \textcolor{red}{\textless type(varying\_string)\textgreater} type() Return the type of this object.

ntfamily nodeComponentMergingStatisticsRecent

ntfamily void builder(<type(node)>componentDefinition \rightarrow) Build a nodeComponent from a supplied XML definition.

ntfamily double zero density(<double(3)> positionSpherical \rightarrow, <componentType> [componentType] \rightarrow, <massType> [massType] \rightarrow, <weightBy> [weightBy] \rightarrow, <integer> [weightIndex] \rightarrow, <logical> [haloLoaded] \rightarrow) Compute the density.

ntfamily void deserializeRates(<double(:)> array \leftarrow) Deserialize the evolvable rates from an array.

ntfamily void deserializeScales(<double(:)> array \leftarrow) Deserialize the evolvable scales from an array.

ntfamily void deserializeValues(<double(:)> array \leftarrow) Deserialize the evolvable quantities from an array.

ntfamily void destroy() Destroy the object.

ntfamily void dump() Generate an ASCII dump of all properties.

ntfamily void dumpRaw(<integer> fileHandle \rightarrow) Generate a binary dump of all properties.

ntfamily void dumpXML() Generate an XML dump of all properties.
Compute the mass enclosed within a radius.

tfamily \textcolor{red}{\textless double\textgreater }galaxyMajorMergerTime() Get the \texttt{galaxyMajorMergerTime} property of the \texttt{mergingStatistics} component.

tfamily \textcolor{red}{\textlesstype(varying\_string)(:)}galaxyMajorMergerTimeAttributeMatch(<logical>[requireGettable]→, <logical>[requireSettable]→, <logical>[requireEvolvable]→) Return a list of implementations that provide the given list of attributes for the \texttt{galaxyMajorMergerTime} property of the \texttt{mergingStatistics} component.

tfamily \textcolor{red}{\textless double\textgreater }galaxyMajorMergerTimeIsGettable() Get the \texttt{galaxyMajorMergerTime} property of the \texttt{mergingStatistics} component.

tfamily \logicalzero galaxyMajorMergerTimeIsSettable() Specify whether the \texttt{galaxyMajorMergerTime} property of the \texttt{mergingStatistics} component is settable.

tfamily void galaxyMajorMergerTimeSet(<double> value) Set the \texttt{galaxyMajorMergerTime} property of the \texttt{mergingStatistics} component.

tfamily \textcolor{red}{\textless *type(treeNode)\textgreater }host() Return a pointer to the host \texttt{treeNode} object.

tfamily void hotHaloCoolingAbundancesRate(<type(abundances)> value) Cumulate to the rate of the \texttt{hotHaloCoolingAbundances} property of the \texttt{hotHalo} component.

tfamily void hotHaloCoolingAngularMomentumRate(<double> value) Cumulate to the rate of the \texttt{hotHaloCoolingAngularMomentum} property of the \texttt{hotHalo} component.

tfamily void hotHaloCoolingMassRate(<double> value) Cumulate to the rate of the \texttt{hotHaloCoolingMass} property of the \texttt{hotHalo} component.

tfamily void initialize() Initialize the object.

tfamily void nameFromIndex(<integer> count→, <varying_string>name←) Return the name of a property given is index.

tfamily \textcolor{red}{\textless double\textgreater }nodeFormationTime() Get the \texttt{nodeFormationTime} property of the \texttt{mergingStatistics} component.

tfamily \textcolor{red}{\textlesstype(varying\_string)(:)}nodeFormationTimeAttributeMatch(<logical>[requireGettable]→, <logical>[requireSettable]→, <logical>[requireEvolvable]→) Return a list of implementations that provide the given list of attributes for the \texttt{nodeFormationTime} property of the \texttt{mergingStatistics} component.

tfamily \textcolor{red}{\textless double\textgreater }nodeFormationTimeIsGettable() Get the \texttt{nodeFormationTime} property of the \texttt{mergingStatistics} component.

tfamily \logicalzero nodeFormationTimeIsSettable() Specify whether the \texttt{nodeFormationTime} property of the \texttt{mergingStatistics} component is settable.

tfamily void nodeFormationTimeSet(<double> value) Set the \texttt{nodeFormationTime} property of the \texttt{mergingStatistics} component.
16.5. Objects

tfamily \textcolor{red}{\textless integer\textgreater} nodeHierarchyLevel() Get the nodeHierarchyLevel property of the mergingStatistics component.

tfamily \textcolor{red}{\textless integer\textgreater} nodeHierarchyLevelAttributeMatch(\textless logical\[requireGettable\]→, \textless logical\[requireSettable\]→, \textless logical\[requireEvolvable\]→) Return a list of implementations that provide the given list of attributes for the nodeHierarchyLevel property of the mergingStatistics component.

tfamily \textcolor{red}{\textless integer\textgreater} nodeHierarchyLevelIsGettable() Get the nodeHierarchyLevel property of the mergingStatistics component.

tfamily \textcolor{red}{\textless integer\textgreater} nodeHierarchyLevelIsSettable() Specify whether the nodeHierarchyLevel property of the mergingStatistics component is settable.

tfamily \textcolor{red}{\textless integer\textgreater} nodeHierarchyLevelSet(<integer> value) Set the nodeHierarchyLevel property of the mergingStatistics component.

tfamily \textcolor{red}{\textless double\textgreater} nodeMajorMergerTime() Get the nodeMajorMergerTime property of the mergingStatistics component.

tfamily \textcolor{red}{\textless double\textgreater} nodeMajorMergerTimeAttributeMatch(\textless logical\[requireGettable\]→, \textless logical\[requireSettable\]→, \textless logical\[requireEvolvable\]→) Return a list of implementations that provide the given list of attributes for the nodeMajorMergerTime property of the mergingStatistics component.

tfamily \textcolor{red}{\textless double\textgreater} nodeMajorMergerTimeIsGettable() Get the nodeMajorMergerTime property of the mergingStatistics component.

tfamily \textcolor{red}{\textless double\textgreater} nodeMajorMergerTimeIsSettable() Specify whether the nodeMajorMergerTime property of the mergingStatistics component is settable.

tfamily \textcolor{red}{\textless double\textgreater} nodeMajorMergerTimeSet(<double> value) Set the nodeMajorMergerTime property of the mergingStatistics component.

tfamily \textcolor{red}{\textless logical\textgreater} nullIsActive() Return whether the null implementation of the mergingStatistics component class is active.

tfamily \textcolor{red}{\textless logical\textgreater} odeStepRatesInitialize() Initialize rates for evolvable properties.

tfamily \textcolor{red}{\textless logical\textgreater} odeStepScalesInitialize() Initialize scales for evolvable properties.

tfamily \textcolor{red}{\textless integer\textgreater \textless integer\textgreater \textless integer\textgreater \textless double\textgreater \textless double\textgreater \textless double\textgreater \textless integer\textgreater \textless integer\textgreater \textless double\textgreater \textless double\textgreater \textless double\textgreater \textless double\textgreater \textless \[595\]
function readRaw(fileHandle) 
    Read a binary dump of the nodeComponent from the given fileHandle.

function isActive() 
    Return whether the recent implementation of the mergingStatistics component class is active.

function recentMajorMergerCount() 
    Get the recentMajorMergerCount property of the mergingStatistics component.

function recentMajorMergerCountAttributeMatch() 
    Return a list of implementations that provide the given list of attributes for the recentMajorMergerCount property of the mergingStatistics component.

function recentMajorMergerCountIsGettable() 
    Get the recentMajorMergerCount property of the mergingStatistics component.

function recentMajorMergerCountIsSettable() 
    Specify whether the recentMajorMergerCount property of the mergingStatistics component is settable.

function recentMajorMergerCountSet(value) 
    Set the recentMajorMergerCount property of the mergingStatistics component.

function rotationCurve(radius, componentType, massType, haloLoaded) 
    Compute the rotation curve.

function rotationCurveGradient(radius, componentType, massType, haloLoaded) 
    Compute the rotation curve gradient.

function serializeCount() 
    Return a count of the number of evolvable quantities to be evolved.

function serializeRates(array) 
    Serialize the evolvable rates to an array.

function serializeScales(array) 
    Serialize the evolvable scales to an array.

function serializeValues(array) 
    Serialize the evolvable quantities to an array.

function standardIsActive() 
    Return whether the standard implementation of the mergingStatistics component class is active.

function surfaceDensity(positionCylindrical, componentType, massType, haloLoaded) 
    Compute the surface density.

function type() 
    Return the type of this object.

function nodeComponentMergingStatisticsStandard 
    Build a nodeComponent from a supplied XML definition.
16.5. Objects

tfamily \void deserializeRates(<double:>) array← Deserialize the evolvable rates from an array.
tfamily \void deserializeScales(<double:>) array← Deserialize the evolvable scales from an array.
tfamily \void deserializeValues(<double:>) array← Deserialize the evolvable quantities from an array.
tfamily \void destroy() Destroy the object.

tfamily \void dump() Generate an ASCII dump of all properties.
tfamily \void dumpRaw(<integer> fileHandle→) Generate a binary dump of all properties.
tfamily \void dumpXML() Generate an XML dump of all properties.

tfamily \double zeroEnclosedMass(<double> radius→, <componentType> [componentType]→, <massType> [massType]→, <weightBy> [weightBy]→, <integer> [weightIndex]→, <logical> [haloLoaded]→) Compute the mass enclosed within a radius.

tfamily \textcolor{red}{\textless double\textgreater} galaxyMajorMergerTime() Get the galaxyMajorMergerTime property of the mergingStatistics component.

tfamily \textcolor{red}{\textless double\textgreater} galaxyMajorMergerTimeAttributeMatch(<logical> [requireGettable]→, <logical> [requireSettable]→, <logical> [requireEvolvable]→) Return a list of implementations that provide the given list of attributes for the galaxyMajorMergerTime property of the mergingStatistics component.

tfamily \textcolor{red}{\textless double\textgreater} galaxyMajorMergerTimeIsGettable() Get the galaxyMajorMergerTime property of the mergingStatistics component.

tfamily \logical zero galaxyMajorMergerTimeIsSettable() Specify whether the galaxyMajorMergerTime property of the mergingStatistics component is settable.

tfamily \void galaxyMajorMergerTimeSet(<double> value) Set the galaxyMajorMergerTime property of the mergingStatistics component.

tfamily \textcolor{red}{\textless *type(treeNode)\textgreater} host() Return a pointer to the host treeNode object.

tfamily \void hotHaloCoolingAbundancesRate(<type(abundances)> value) Cumulate to the rate of the hotHaloCoolingAbundances property of the hotHalo component.

tfamily \void hotHaloCoolingAngularMomentumRate(<double> value) Cumulate to the rate of the hotHaloCoolingAngularMomentum property of the hotHalo component.

tfamily \void hotHaloCoolingMassRate(<double> value) Cumulate to the rate of the hotHaloCoolingMass property of the hotHalo component.

tfamily \void initialize() Initialize the object.

tfamily \void nameFromIndex(<integer> count→, <varying_string> name←) Return the name of a property given is index.

tfamily \textcolor{red}{\textless double\textgreater} nodeFormationTime() Get the nodeFormationTime property of the mergingStatistics component.
tfamily \textcolor{red}{\textless double \textgreater} nodeFormationTime() Get the \textit{nodeFormationTime} property of the \textit{mergingStatistics} component.

tfamily \textcolor{red}{\textless integer \textgreater} nodeHierarchyLevel() Get the \textit{nodeHierarchyLevel} property of the \textit{mergingStatistics} component.

tfamily \textcolor{red}{\textless double \textgreater} nodeMajorMergerTime() Get the \textit{nodeMajorMergerTime} property of the \textit{mergingStatistics} component.

tfamily void output(<integer> integerProperty ↔, <integer> integerBufferCount ↔, <integer(:,:)> integerBuffer ↔, <integer>doubleProperty ↔, <integer> doubleBufferCount ↔, <double(:,:)> doubleBuffer ↔, <double> time →, <integer> instance →) Generate values of outputtable properties.

tfamily void outputCount(<integer> integerPropertyCount ↔, <integer> doublePropertyCount ↔, <double> time →, <integer> instance →) Compute a count of outputtable properties.

tfamily void outputNames(<integer> integerProperty ↔, <char[*](:) integerPropertyNames ↔, <char[*](:) integerPropertyComments ↔, <double(:)> integerPropertyUnitsSI ↔, <integer> doubleProperty ↔, <char[*](:) doublePropertyNames ↔, <char[*](:) doublePropertyComments ↔, <double(:)> doublePropertyUnitsSI ↔, <double> time →, <integer> instance →) Generate names of outputtable properties.

tfamily double zero potential(<double> radius →, <componentType>[componentType] →, <massType>[massType] →, <logical> [haloLoaded] →) Compute the gravitational potential.

tfamily void readRaw(<integer> fileHandle →) Read a binary dump of the nodeComponent from the given fileHandle.

tfamily logical zero recentIsActive() Return whether the recent implementation of the mergingStatistics component class is active.

tfamily textcolor{red}{textless integer(:)}textgreater recentMajorMergerCount() Get the recentMajorMergerCount property of the mergingStatistics component.

tfamily textcolor{red}{textless type(varying \_string)(:)textgreater} recentMajorMergerCountAttributeMatch(<logical>[requireGettable] →, <logical>[requireSettable] →, <logical>[requireEvolvable] →) Return a list of implementations that provide the given list of attributes for the recentMajorMergerCount property of the mergingStatistics component.

tfamily textcolor{red}{textless integer(:)}textgreater recentMajorMergerCountIsGettable() Get the recentMajorMergerCount property of the mergingStatistics component.

tfamily logical zero recentMajorMergerCountIsSettable() Specify whether the recentMajorMergerCount property of the mergingStatistics component is settable.

tfamily void recentMajorMergerCountSet(<integer(:)> value) Set the recentMajorMergerCount property of the mergingStatistics component.

tfamily double zero rotationCurve(<double> radius →, <componentType>[componentType] →, <massType>[massType] →, <logical> [haloLoaded] →) Compute the rotation curve.

tfamily double zero rotationCurveGradient(<double> radius →, <componentType>[componentType] →, <massType>[massType] →, <logical> [haloLoaded] →) Compute the rotation curve gradient.

tfamily int zero serializeCount() Return a count of the number of evolvable quantities to be evolved.

tfamily void serializeRates(<double(:)> array →) Serialize the evolvable rates to an array.

tfamily void serializeScales(<double(:)> array →) Serialize the evolvable scales to an array.

tfamily void serializeValues(<double(:)> array →) Serialize the evolvable quantities to an array.

tfamily logical zero standardIsActive() Return whether the standard implementation of the mergingStatistics component class is active.
16. Coding GALACTICUS

tfamily double zero surfaceDensity(<double(3)> positionCylindrical\rightarrow, <componentType> \rightarrow, <massType> \rightarrow, <weightBy> \rightarrow, <integer> \rightarrow, <logical> \rightarrow) Compute the surface density.

tfamily text color{red} {textless type(varying\_string)\textgreater} type() Return the type of this object.

ntfamily nodeComponentNBody

tfamily void builder(\*type(node)>componentDefinition\rightarrow) Build a nodeComponent from a supplied XML definition.

tfamily double zero density(<double(3)> positionSpherical\rightarrow, <componentType> \rightarrow, <massType> \rightarrow, <weightBy> \rightarrow, <integer> \rightarrow, <logical> \rightarrow) Compute the density.

tfamily void deserializeRates(<double(:)> array\leftarrow) Deserialize the evolvable rates from an array.

tfamily void deserializeScales(<double(:)> array\leftarrow) Deserialize the evolvable scales from an array.

tfamily void deserializeValues(<double(:)> array\leftarrow) Deserialize the evolvable quantities from an array.

tfamily void destroy() Destroy the object.

tfamily void dump() Generate an ASCII dump of all properties.

tfamily void dumpRaw(<integer> fileHandle\rightarrow) Generate a binary dump of all properties.

tfamily void dumpXML() Generate an XML dump of all properties.

tfamily double zero enclosedMass(<double> radius\rightarrow, <componentType> \rightarrow, <massType> \rightarrow, <weightBy> \rightarrow, <integer> \rightarrow, <logical> \rightarrow) Compute the mass enclosed within a radius.

tfamily text color{red} {textless \*type(treeNode)\textgreater} host() Return a pointer to the host treeNode object.

tfamily void hotHalo CoolingAbundancesRate(<type(abundances)> value) Cumulate to the rate of the hotHalo CoolingAbundances property of the hotHalo component.

tfamily void hotHalo CoolingAngularMomentumRate(<double> value) Cumulate to the rate of the hotHalo CoolingAngularMomentum property of the hotHalo component.

tfamily void hotHalo CoolingMassRate(<double> value) Cumulate to the rate of the hotHalo CoolingMass property of the hotHalo component.

tfamily void initialize() Initialize the object.

tfamily void nameFromIndex(<integer> count\rightarrow, <varying_string> name\leftarrow) Return the name of a property given is index.

tfamily logical zero nullIsActive() Return whether the null implementation of the nBody component class is active.

tfamily void odeStepRatesInitialize() Initialize rates for evolvable properties.

tfamily void odeStepScalesInitialize() Initialize scales for evolvable properties.

tfamily \void serializeScales(<double(:)> array →) Serialize the evolvable scales to an array.

tfamily \void serializeValues(<double(:)> array →) Serialize the evolvable quantities to an array.

tfamily \logical zero standardIsActive() Return whether the standard implementation of the nBody component class is active.

tfamily \double zero surfaceDensity(<double(3)> positionCylindrical →, <componentType>[componentType] →, <massType>[massType] →, <weightBy>[weightBy] →, <integer>[weightIndex] →, <logical>[haloLoaded] →) Compute the surface density.

tfamily \textcolor{red}{\textless type(varying_string)\textgreater} type() Return the type of this object.
tfamily \textcolor{red}{\textless double\textgreater} velocityDispersion() Get the \texttt{velocityDispersion} property of the \texttt{nBody} component.

tfamily \textcolor{red}{\textless type(varying\_string)(:)}\textgreater velocityDispersionAttributeMatch(<\texttt{logical}>\texttt{requireGettable}→, <\texttt{logical}>\texttt{requireSettable}→, <\texttt{logical}>\texttt{requireEvolvable}→) Return a list of implementations that provide the given list of attributes for the \texttt{velocityDispersion} property of the \texttt{nBody} component.

tfamily \textcolor{red}{\textless double\textgreater} velocityDispersionIsGettable() Get the \texttt{velocityDispersion} property of the \texttt{nBody} component.

tfamily \texttt{void velocityDispersionSet(<double> value)} Set the \texttt{velocityDispersion} property of the \texttt{nBody} component.

tfamily \textcolor{red}{\textless type(varying\_string)(:)}\textgreater velocityMaximumAttributeMatch(<\texttt{logical}>\texttt{requireGettable}→, <\texttt{logical}>\texttt{requireSettable}→, <\texttt{logical}>\texttt{requireEvolvable}→) Return a list of implementations that provide the given list of attributes for the \texttt{velocityMaximum} property of the \texttt{nBody} component.

tfamily \textcolor{red}{\textless double\textgreater} velocityMaximum() Get the \texttt{velocityMaximum} property of the \texttt{nBody} component.

tfamily \textcolor{red}{\textless type(varying\_string)(:)}\textgreater velocityMaximumIsGettable() Get the \texttt{velocityMaximum} property of the \texttt{nBody} component.

tfamily \texttt{void velocityMaximumSet(<double> value)} Set the \texttt{velocityMaximum} property of the \texttt{nBody} component.

tfamily \texttt{nodeComponentNBodyNull}

tfamily \texttt{void builder(<\texttt{type(node)}\textgreater componentDefinition→)} Build a \texttt{nodeComponent} from a supplied XML definition.

tfamily \texttt{double density(<double(3)\textgreater positionSpherical→, <\texttt{componentType} [\texttt{componentType}]→, <\texttt{massType} [\texttt{massType}]→, <\texttt{weightBy} [\texttt{weightBy}]→, <\texttt{integer} [\texttt{weightIndex}]→, <\texttt{logical} [\texttt{haloLoaded}]→) Compute the density.

tfamily \texttt{void deserializeRates(<double(:) array←)} Deserialize the evolvable rates from an array.

tfamily \texttt{void deserializeScales(<double(:) array←)} Deserialize the evolvable scales from an array.

tfamily \texttt{void deserializeValues(<double(:) array←)} Deserialize the evolvable quantities from an array.

tfamily \texttt{void destroy()} Destroy the object.

tfamily \texttt{void dump()} Generate an ASCII dump of all properties.

tfamily \texttt{void dumpRaw(<integer> fileHandle→)} Generate a binary dump of all properties.

tfamily \texttt{void dumpXML()} Generate an XML dump of all properties.
16.5. Objects

tfamily\doublezeroenclosedMass(\text{\textless} double\textgreater{} radius\rightarrow, \text{\textless} componentType\textgreater{} [\text{\textless} componentType\textgreater{}]\rightarrow, \text{\textless} massType\textgreater{} [\text{\textless} massType\textgreater{}]\rightarrow, \text{\textless} weightBy\textgreater{} [\text{\textless} weightBy\textgreater{}]\rightarrow, \text{\textless} integer\textgreater{} [\text{\textless} weightIndex\textgreater{}]\rightarrow, \text{\textless} logical\textgreater{} [\text{\textless} haloLoaded\textgreater{}]\rightarrow)
Compute the mass enclosed within a radius.

tfamily\textcolor{red}{\textless}type(treeNode)\textgreater{} host() Return a pointer to the host treeNode object.

tfamily\void hotHaloCoolingAbundancesRate(\text{\textless} type(abundances)\textgreater{} value) Cumulate to the rate of the hotHaloCoolingAbundances property of the hotHalo component.

tfamily\void hotHaloCoolingAngularMomentumRate(\text{\textless} double\textgreater{} value) Cumulate to the rate of the hotHaloCoolingAngularMomentum property of the hotHalo component.

tfamily\void hotHaloCoolingMassRate(\text{\textless} double\textgreater{} value) Cumulate to the rate of the hotHaloCoolingMass property of the hotHalo component.

tfamily\void initialize() Initialize the object.

tfamily\void nameFromIndex(\text{\textless} integer\textgreater{} count\rightarrow, \text{\textless} varying_string\textgreater{} name\leftarrow) Return the name of a property given its index.

tfamily\logicalzero nullIsActive() Return whether the null implementation of the nBody component class is active.

tfamily\void odeStepRatesInitialize() Initialize rates for evolvable properties.

tfamily\void odeStepScalesInitialize() Initialize scales for evolvable properties.

tfamily\void output(\text{\textless} integer\textgreater{} integerProperty\leftrightarrow, \text{\textless} integer\textgreater{} integerBufferCount\leftrightarrow, \text{\textless} integer()\textgreater{} integerBuffer\leftrightarrow, \text{\textless} integer\textgreater{} doubleProperty\leftrightarrow, \text{\textless} integer\textgreater{} doubleBufferCount\leftrightarrow, \text{\textless} double()\textgreater{} doubleBuffer\leftrightarrow, \text{\textless} double\textgreater{} time\rightarrow, \text{\textless} integer\textgreater{} instance\rightarrow) Generate values of outputtable properties.

tfamily\void outputCount(\text{\textless} integer\textgreater{} integerPropertyCount\leftrightarrow, \text{\textless} integer\textgreater{} doublePropertyCount\leftrightarrow, \text{\textless} double\textgreater{} time\rightarrow, \text{\textless} integer\textgreater{} instance\rightarrow) Compute a count of outputtable properties.

tfamily\void outputNames(\text{\textless} integer\textgreater{} integerProperty\leftrightarrow, \text{\textless} char[*]()\textgreater{} integerPropertyNames\leftrightarrow, \text{\textless} char[*]()\textgreater{} integerPropertyComments\leftrightarrow, \text{\textless} double()\textgreater{} integerPropertyUnitsSI\leftrightarrow, \text{\textless} integer\textgreater{} doubleProperty\leftrightarrow, \text{\textless} char[*]()\textgreater{} doublePropertyNames\leftrightarrow, \text{\textless} char[*]()\textgreater{} doublePropertyComments\leftrightarrow, \text{\textless} double()\textgreater{} doublePropertyUnitsSI\leftrightarrow, \text{\textless} double\textgreater{} time\rightarrow, \text{\textless} integer\textgreater{} instance\rightarrow) Generate names of outputtable properties.

tfamily\textcolor{red}{\textless}integer(kind=kind_int8)\textgreater{} particleCount() Get the particleCount property of the nBody component.

tfamily\textcolor{red}{\textless}type(varying\_\textless varying_string\textgreater{}(\textgreater{})\textgreater{} particleCountAttributeMatch(\text{\textless} logical\textgreater{}[\text{\textless} requireGettable\textgreater{}\rightarrow, \text{\textless} logical\textgreater{}[\text{\textless} requireSettable\textgreater{}\rightarrow, \text{\textless} logical\textgreater{}[\text{\textless} requireEvolvable\textgreater{}\rightarrow]) Return a list of implementations that provide the given list of attributes for the particleCount property of the nBody component.

tfamily\textcolor{red}{\textless}integer(kind=kind_int8)\textgreater{} particleCountIsGettable() Get the particleCount property of the nBody component.

tfamily\logicalzero particleCountIsSettable() Specify whether the particleCount property of the nBody component is settable.

tfamily\void particleCountSet(\text{\textless} integer(kind=kind_int8)\textgreater{} value) Set the particleCount property of the nBody component.
16. Coding GALACTICUS

tfamily `\doublezero potential(<double> radius→, <componentType> [componentType]→, <massType> [massType]→, <logical> [haloLoaded]→)` Compute the gravitational potential.

tfamily `\void readRaw(<integer> fileHandle→)` Read a binary dump of the `nodeComponent` from the given `fileHandle`.

tfamily `\doublezero rotationCurve(<double> radius→, <componentType> [componentType]→, <massType> [massType]→, <logical> [haloLoaded]→)` Compute the rotation curve.

tfamily `\doublezero rotationCurveGradient(<double> radius→, <componentType> [componentType]→, <massType> [massType]→, <logical> [haloLoaded]→)` Compute the rotation curve gradient.

tfamily `\intzero serializeCount()` Return a count of the number of evolvable quantities to be evolved.

tfamily `\void serializeRates(<double(:)> array→)` Serialize the evolvable rates to an array.

tfamily `\void serializeScales(<double(:)> array→)` Serialize the evolvable scales to an array.

tfamily `\void serializeValues(<double(:)> array→)` Serialize the evolvable quantities to an array.

tfamily `\logicalzero standardIsActive()` Return whether the standard implementation of the `nBody` component class is active.

tfamily `\doublezero surfaceDensity(<double(3)> positionCylindrical→, <componentType> [componentType]→, <massType> [massType]→, <weightBy> [weightBy]→, <integer> [weightIndex]→, <logical> [haloLoaded]→)` Compute the surface density.

tfamily `\textcolor{red}{\textless type(varying\_string)\textgreater} type()` Return the type of this object.

tfamily `\textcolor{red}{\textless double\textgreater} velocityDispersion()` Get the `velocityDispersion` property of the `nBody` component.

tfamily `\textcolor{red}{\textless type(varying\_string)(:)\textgreater} velocityDispersionAttributeMatch(<logical>[requireGettable]→, <logical>[requireSettable]→, <logical>[requireEvolvable]→)` Return a list of implementations that provide the given list of attributes for the `velocityDispersion` property of the `nBody` component.

tfamily `\textcolor{red}{\textless double\textgreater} velocityDispersionIsGettable()` Get the `velocityDispersion` property of the `nBody` component.

tfamily `\logicalzero velocityDispersionIsSettable()` Specify whether the `velocityDispersion` property of the `nBody` component is settable.

tfamily `\void velocityDispersionSet(<double> value)` Set the `velocityDispersion` property of the `nBody` component.

tfamily `\textcolor{red}{\textless double\textgreater} velocityMaximum()` Get the `velocityMaximum` property of the `nBody` component.

tfamily `\textcolor{red}{\textless type(varying\_string)(:)\textgreater} velocityMaximumAttributeMatch(<logical>[requireGettable]→, <logical>[requireSettable]→, <logical>[requireEvolvable]→)` Return a list of implementations that provide the given list of attributes for the `velocityMaximum` property of the `nBody` component.
tfamily \textcolor{red}{\{\textless\texttt{double}\textgreater\} velocityMaximumIsGettable() Get the velocityMaximum property of the \texttt{nBody} component.

tfamily \textcolor{red}{\textless\texttt{logical}\textgreater\} velocityMaximumIsSettable() Specify whether the velocityMaximum property of the \texttt{nBody} component is settable.

tfamily void velocityMaximumSet(<double> value) Set the velocityMaximum property of the \texttt{nBody} component.

tfamily nodeComponentNBodyStandard

tfamily \textcolor{red}{\textless\texttt{type(node)}\textgreater host() Return a pointer to the host \texttt{treeNode} object.

tfamily \textcolor{red}{\textless\texttt{logical}\textgreater\} nullIsActive() Return whether the null implementation of the \texttt{nBody} component class is active.

tfamily void odeStepRatesInitialize() Initialize rates for evolvable properties.
16. Coding GALACTICUS

tfamily | void odeStepScalesInitialize() Initialize scales for evolvable properties.

tfamily | void output(<integer> integerProperty↔, <integer> integerBufferCount↔, <integer(:,:)> integerBuffer↔, <integer>doubleProperty↔, <integer> doubleBufferCount↔, <double(:,:)> doubleBuffer↔, <double> time→, <integer> instance→) Generate values of outputtable properties.

tfamily | void outputCount(<integer>integerPropertyCount↔, <integer> doublePropertyCount↔, <double> time→, <integer> instance→) Compute a count of outputtable properties.

tfamily | void outputNames(<integer>integerProperty↔, <char[*](::)>integerPropertyNames↔, <char[*](::)>integerPropertyComments↔, <double(:)>integerPropertyUnitsSI↔, <integer>doubleProperty ↔, <char[*](::)> doublePropertyNames ↔, <char[*](::)> doublePropertyComments ↔, <double(:)> doublePropertyUnitsSI ↔, <double> time→, <integer> instance→) Generate names of outputtable properties.

tfamily | textcolor {red} {\textless integer(kind=kind\_int8)\textgreater} particleCount() Get the particleCount property of the nBody component.

tfamily | textcolor {red} {\textless varchar\_field(varying\_string)(::)\textgreater} particleCountAttributeMatch(<logical> [requireGettable]→, <logical> [requireSettable]→, <logical> [requireEvolvable]→) Return a list of implementations that provide the given list off attributes for the particleCount property of the nBody component.

tfamily | textcolor {red} {\textless integer(kind=kind\_int8)\textgreater} particleCountIsGettable() Get the particleCount property of the nBody component.

tfamily | logical zero particleCountIsSettable() Specify whether the particleCount property of the nBody component is settable.

tfamily | void particleCountSet(<integer(kind=kind\_int8)> value) Set the particleCount property of the nBody component.

tfamily | double zero potential(<double> radius→, <componentType> [componentType]→, <massType> [massType]→, <logical> [haloLoaded]→) Compute the gravitational potential.

tfamily | void readRaw(<integer> fileHandle→) Read a binary dump of the nodeComponent from the given fileHandle.

tfamily | double zero rotationCurve(<double> radius→, <componentType> [componentType]→, <massType> [massType]→, <logical> [haloLoaded]→) Compute the rotation curve.

tfamily | double zero rotationCurveGradient(<double> radius→, <componentType> [componentType]→, <massType> [massType]→, <logical> [haloLoaded]→) Compute the rotation curve gradient.

tfamily | int zero serializeCount() Return a count of the number of evolvable quantities to be evolved.

tfamily | void serializeRates(<double(:)> array→) Serialize the evolvable rates to an array.

tfamily | void serializeScales(<double(:)> array→) Serialize the evolvable scales to an array.

tfamily | void serializeValues(<double(:)> array→) Serialize the evolvable quantities to an array.

tfamily | logical zero standardIsActive() Return whether the standard implementation of the nBody component class is active.

tfamily | double zero surfaceDensity(<double(3)> positionCylindrical→, <componentType> [componentType]→, <massType> [massType]→, <weightBy> [weightBy]→, <integer> [weightIndex]→, <logical> [haloLoaded]→) Compute the surface density.
16.5. Objects

tfamily \textcolor{red}{\textless type(varying\_string)\textgreater} type() Return the type of this object.

tfamily \textcolor{red}{\textless double\textgreater} velocityDispersion() Get the velocityDispersion property of the nBody component.

tfamily \textcolor{red}{\textless type(varying\_string)(:)\textgreater} velocityDispersionAttributeMatch(<logical>[requireGettable]→, <logical>[requireSettable]→, <logical>[requireEvolvable]→) Return a list of implementations that provide the given list of attributes for the velocityDispersion property of the nBody component.

tfamily \textcolor{red}{\textless double\textgreater} velocityDispersionIsGettable() Get the velocityDispersion property of the nBody component.

Specify whether the velocityDispersion property of the nBody component is settable.

tfamily \void velocityDispersionSet(<double> value) Set the velocityDispersion property of the nBody component.

Compute the density.

tfamily \void deserializesRates(<double(:)> array←) Deserialize the evolvable rates from an array.

Deserializes the evolvable scales from an array.

tfamily \void deserializesValues(<double(:)> array←) Deserialize the evolvable quantities from an array.

Destroy the object.

tfamily \void dump() Generate an ASCII dump of all properties.
16. Coding GALACTICUS

tfamily \void dumpRaw(<integer> fileHandle) Generate a binary dump of all properties.

tfamily \void dumpXML() Generate an XML dump of all properties.

tfamily \double zero enclosedMass(<double> radius, <componentType> [componentType], <massType> [massType], <weightBy> [weightBy], <integer> [weightIndex], <logical> [haloLoaded]) Compute the mass enclosed within a radius.

tfamily \textcolor{red}{\textless type(treeNode)\textgreater} host() Return a pointer to the host \texttt{treeNode} object.

tfamily \void hotHaloCoolingAbundancesRate(<type(abundances)> value) Cumulate to the rate of the \texttt{hotHaloCoolingAbundances} property of the \texttt{hotHalo} component.

tfamily \void hotHaloCoolingAngularMomentumRate(<double> value) Cumulate to the rate of the \texttt{hotHaloCoolingAngularMomentum} property of the \texttt{hotHalo} component.

tfamily \void hotHaloCoolingMassRate(<double> value) Cumulate to the rate of the \texttt{hotHaloCoolingMass} property of the \texttt{hotHalo} component.

tfamily \void initialize() Initialize the object.

tfamily \void nameFromIndex(<integer> count, <varying_string> name) Return the name of a property given is index.

tfamily \logical zero nullIsActive() Return whether the null implementation of the position component class is active.

tfamily \void odeStepRatesInitialize() Initialize rates for evolvable properties.

tfamily \void odeStepScalesInitialize() Initialize scales for evolvable properties.

tfamily \void output(<integer> integerProperty, <integer> integerBufferCount, <integer(:,:)> integerBuffer, <integer> doubleProperty, <integer(:,:)> doubleBuffer, <double> time, <integer> instance) Generate values of outputtable properties.

tfamily \void outputCount(<integer> integerPropertyCount, <integer> doublePropertyCount, <double> time, <integer> instance) Compute a count of outputtable properties.

tfamily \void outputNames(<integer> integerProperty, <char[*](:)> integerPropertyNames, <char[*](:)> integerPropertyComments, <double(:)> integerPropertyUnitsSI, <integer> doubleProperty, <char[*](:)> doublePropertyNames, <char[*](:)> doublePropertyComments, <double(:)> doublePropertyUnitsSI, <double> time, <integer> instance) Generate names of outputtable properties.

tfamily \textcolor{red}{\textless double(:\textgreater)} position() Get the \texttt{position} property of the \texttt{position} component.

tfamily \textcolor{red}{\textless type(varying_string)\textgreater} positionAttributeMatch(<logical>[requireGettable], <logical>[requireSettable], <logical>[requireEvolvable]) Return a list of implementations that provide the given list off attributes for the \texttt{position} property of the \texttt{position} component.

tfamily \textcolor{red}{\textless history\textgreater} positionHistory() Get the \texttt{positionHistory} property of the \texttt{position} component.
16.5. Objects

Return a list of implementations that provide the given list of attributes for the \texttt{positionHistory} property of the \texttt{position} component.

Get the \texttt{positionHistory} property of the \texttt{position} component.

Specify whether the \texttt{positionHistory} property of the \texttt{position} component is settable.

Set the \texttt{positionHistory} property of the \texttt{position} component.

Specify whether the \texttt{positionHistory} property of the \texttt{position} component is settable.

Set the \texttt{position} property of the \texttt{position} component.

Specify whether the \texttt{position} property of the \texttt{position} component is settable.

Set the \texttt{position} property of the \texttt{position} component.

Return whether the preset implementation of the \texttt{position} component class is active.

Compute the gravitational potential.

Compute the rotation curve.

Compute the rotation curve gradient.

Return a count of the number of evolvable quantities to be evolved.

Serialize the evolvable rates to an array.

Serialize the evolvable scales to an array.

Serialize the evolvable quantities to an array.

Compute the surface density.

Return the type of this object.

Get the \texttt{velocity} property of the \texttt{position} component.

Return a list of implementations that provide the given list of attributes for the \texttt{velocity} property of the \texttt{position} component.

Get the \texttt{velocity} property of the \texttt{position} component.
tfamily \logicalzero velocityIsSettable() Specify whether the velocity property of the position component is settable.

tfamily \void velocitySet(<double()> value) Set the velocity property of the position component.

**tfamily nodeComponentPositionNull**

**tfamily \void builder(<*type(node)>componentDefinition→) Build a nodeComponent from a supplied XML definition.**

**tfamily \doublezero density(<double(3)> positionSpherical→, <componentType>[componentType]→, <massType>[massType]→, <weightBy>[weightBy]→, <integer>[weightIndex]→, <logical>[haloLoaded]→) Compute the density.**

tfamily \textcolor{red}{\textless \text{type}(\text{history})(::)\textgreater} positionHistoryIsSettable() Specify whether the positionHistory property of the position component is settable.

tfamily \void positionHistorySet(<\text{type}(\text{history})> value) Set the positionHistory property of the position component.

tfamily \textcolor{red}{\textless \text{double}(::)\textgreater} positionIsGettable() Get the position property of the position component.

tfamily \textcolor{red}{\textless \text{double}(::)\textgreater} positionIsSettable() Specify whether the position property of the position component is settable.

tfamily \void positionSet(<\text{double}(::)> value) Set the position property of the position component.

tfamily \doublezero potential(<\text{double}> radius→, <\text{componentType}>\[componentType\]→, <\text{massType}>\[massType\]→, <\text{logical}>\[haloLoaded\]→) Compute the gravitational potential.

tfamily \textcolor{red}{\textless \text{logical}\textgreater} presetIsActive() Return whether the preset implementation of the position component class is active.

tfamily \void readRaw(<\text{integer}> fileHandle→) Read a binary dump of the nodeComponent from the given fileHandle.

tfamily \doublezero rotationCurve(<\text{double}> radius→, <\text{componentType}>\[componentType\]→, <\text{massType}>\[massType\]→, <\text{logical}>\[haloLoaded\]→) Compute the rotation curve.
Galacticus

### Coding

#### Functions

- **rotationCurveGradient**: Computes the rotation curve gradient.
  ```
  tfamily \textcolor{red}{\textless double\textgreater\ rotationCurveGradient( <double> radius\rightarrow , <componentType> \rightarrow [componentType]\rightarrow , <massType> \rightarrow [massType]\rightarrow , <logical> \rightarrow [haloLoaded]\rightarrow )}
  ```

- **serializeCount**: Returns a count of the number of evolvable quantities to be evolved.
  ```
  tfamily \textcolor{red}{\textless double\textgreater\ serializeCount()}
  ```

- **serializeRates**: Serializes the evolvable rates to an array.
  ```
  tfamily \textcolor{red}{\textless double(:)\ serializeRates( <double(:)> array\rightarrow )}
  ```

- **serializeScales**: Serializes the evolvable scales to an array.
  ```
  tfamily \textcolor{red}{\textless double(:)\ serializeScales( <double(:)> array\rightarrow )}
  ```

- **serializeValues**: Serializes the evolvable quantities to an array.
  ```
  tfamily \textcolor{red}{\textless double(:)\ serializeValues( <double(:)> array\rightarrow )}
  ```

- **surfaceDensity**: Computes the surface density.
  ```
  tfamily \textcolor{red}{\textless double(3)>\ surfaceDensity( <double(3)> positionCylindrical\rightarrow , <componentType> \rightarrow , <massType> \rightarrow , <weightBy> \rightarrow , <integer> \rightarrow , <logical> \rightarrow [haloLoaded]\rightarrow )}
  ```

- **type**: Returns the type of this object.
  ```
  tfamily \textcolor{red}{\textless type(varying_string)>\ type()}
  ```

- **velocity**: Gets the velocity property of the position component.
  ```
  tfamily \textcolor{red}{\textless double(:)>\ velocity()}
  ```

- **velocityAttributeMatch**: Returns a list of implementations that provide the given list off attributes for the velocity property of the position component.
  ```
  tfamily \textcolor{red}{\textless type(varying_string)(:)>\ velocityAttributeMatch( <logical>[requireGettable]\rightarrow , <logical>[requireSettable]\rightarrow , <logical>[requireEvolvable]\rightarrow )}
  ```

- **velocityIsGettable**: Gets the velocity property of the position component.
  ```
  tfamily \textcolor{red}{\textless double(:)>\ velocityIsGettable()}
  ```

- **velocityIsSettable**: Specifies whether the velocity property of the position component is settable.
  ```
  tfamily \textcolor{red}{\textless logical\textgreater\ velocityIsSettable()}
  ```

- **velocitySet**: Sets the velocity property of the position component.
  ```
  tfamily \textcolor{red}{\textless double(:)>\ velocitySet( <double(:)> value\rightarrow )}
  ```

- **nodeComponentPositionPreset**: Builds a nodeComponent from a supplied XML definition.
  ```
  tfamily \textcolor{red}{\textless *type(node)>\ nodeComponentPositionPreset( <type(node)> componentDefinition\rightarrow )}
  ```

- **density**: Computes the density.
  ```
  tfamily \textcolor{red}{\textless double(3)>\ density( <double(3)> positionSpherical\rightarrow , <componentType> \rightarrow , <massType> \rightarrow , <weightBy> \rightarrow , <integer> \rightarrow , <logical> \rightarrow [haloLoaded]\rightarrow )}
  ```

- **deserializeRates**: Deserializes the evolvable rates from an array.
  ```
  tfamily \textcolor{red}{\textless double(:)>\ deserializeRates( <double(:)> array\rightarrow )}
  ```

- **deserializeScales**: Deserializes the evolvable scales from an array.
  ```
  tfamily \textcolor{red}{\textless double(:)>\ deserializeScales( <double(:)> array\rightarrow )}
  ```

- **deserializeValues**: Deserializes the evolvable quantities from an array.
  ```
  tfamily \textcolor{red}{\textless double(:)>\ deserializeValues( <double(:)> array\rightarrow )}
  ```

- **destroy**: Destroys the object.
  ```
  tfamily \textcolor{red}{\textless logical\textgreater\ destroy()}
  ```

- **dump**: Generates an ASCII dump of all properties.
  ```
  tfamily \textcolor{red}{\textless logical\textgreater\ dump()}
  ```

- **dumpRaw**: Generates a binary dump of all properties.
  ```
  tfamily \textcolor{red}{\textless integer\textgreater\ dumpRaw( <integer> fileHandle\rightarrow )}
  ```

- **dumpXML**: Generates an XML dump of all properties.
  ```

  ```
16.5. Objects

tfamily double zero enclosedMass (double radius \rightarrow, componentType \rightarrow, massType \rightarrow, weightBy \rightarrow, integer \rightarrow, logical \rightarrow) Compute the mass enclosed within a radius.

tfamily red textless *type(treeNode) greater* host() Return a pointer to the host TreeNode object.

tfamily void hotHaloCoolingAbundancesRate (type(abundances) value) Cumulate to the rate of the hotHaloCoolingAbundances property of the hotHalo component.

tfamily void hotHaloCoolingAngularMomentumRate (double value) Cumulate to the rate of the hotHaloCoolingAngularMomentum property of the hotHalo component.

tfamily void hotHaloCoolingMassRate (double value) Cumulate to the rate of the hotHaloCoolingMass property of the hotHalo component.

tfamily void initialize() Initialize the object.

tfamily void nameFromIndex (integer count \rightarrow, varying_string name \leftarrow) Return the name of a property given is index.

tfamily logical zero nullIsActive() Return whether the null implementation of the position component class is active.

tfamily void odeStepRatesInitialize() Initialize rates for evolvable properties.

tfamily void odeStepScalesInitialize() Initialize scales for evolvable properties.

tfamily void output (integer integerProperty \leftrightarrow, integer integerBufferCount \leftrightarrow, integer[;] integerBuffer \leftrightarrow, integer doubleProperty \leftrightarrow, integer doubleBufferCount \leftrightarrow, double[;] doubleBuffer \leftrightarrow, double time \rightarrow, integer instance \rightarrow) Generate values of outputtable properties.

tfamily void outputCount (integer integerPropertyCount \leftrightarrow, integer doublePropertyCount \leftrightarrow, double time \rightarrow, integer instance \rightarrow) Compute a count of outputtable properties.

tfamily void outputNames (integer integerProperty \leftrightarrow, char[*](;) integerPropertyNames \leftrightarrow, char[*](;) integerPropertyComments \leftrightarrow, double[;] integerPropertyUnitsSI \leftrightarrow, integer doubleProperty \leftrightarrow, char[*](;) doublePropertyNames \leftrightarrow, char[*](;) doublePropertyComments \leftrightarrow, double[;] doublePropertyUnitsSI \leftrightarrow, double time \rightarrow, integer instance \rightarrow) Generate names of outputtable properties.

tfamily red textless double greater* position() Get the position property of the position component.

tfamily red textless type(varying_string)(;) greater positionAttributeMatch (logical [requireGettable], logical [requireSettable], logical [requireEvolvable]) Return a list of implementations that provide the given list off attributes for the position property of the position component.

tfamily red textless history greater positionHistory() Get the positionHistory property of the position component.

tfamily red textless type(history)(;) greater positionHistoryAttributeMatch (logical [requireGettable], logical [requireSettable], logical [requireEvolvable]) Return a list of implementations that provide the given list off attributes for the positionHistory property of the position component.
positionHistoryIsGettable() Get the positionHistory property of the position component.

tfamily \logicalzero positionHistoryIsSettable() Specify whether the positionHistory property of the position component is settable.

void positionHistorySet(<type(history)> value) Set the positionHistory property of the position component.

positionIsGettable() Get the position property of the position component.

positionIsSettable() Specify whether the position property of the position component is settable.

void positionSet(<double(:)> value) Set the position property of the position component.

potential(<double> radius \rightarrow componentType \rightarrow massType \rightarrow logical \rightarrow haloLoaded \rightarrow) Compute the gravitational potential.

presetIsActive() Return whether the preset implementation of the position component class is active.

readRaw(<integer> fileHandle \rightarrow) Read a binary dump of the nodeComponent from the given fileHandle.

rotationCurve(<double> radius \rightarrow componentType \rightarrow massType \rightarrow logical \rightarrow haloLoaded \rightarrow) Compute the rotation curve.

rotationCurveGradient(<double> radius \rightarrow componentType \rightarrow massType \rightarrow logical \rightarrow haloLoaded \rightarrow) Compute the rotation curve gradient.

serializeCount() Return a count of the number of evolvable quantities to be evolved.

serializeRates(<double(:)> array \rightarrow) Serialize the evolvable rates to an array.

serializeScales(<double(:)> array \rightarrow) Serialize the evolvable scales to an array.

serializeValues(<double(:)> array \rightarrow) Serialize the evolvable quantities to an array.

surfaceDensity(<double(3)> positionCylindrical \rightarrow componentType \rightarrow massType \rightarrow weightBy \rightarrow integer \rightarrow logical \rightarrow haloLoaded \rightarrow) Compute the surface density.

tfamily \textcolor{red}{\textless type(varying\_string)\textgreater} type() Return the type of this object.

tfamily \textcolor{red}{\textless double(:)\textgreater} velocity() Get the velocity property of the position component.

velocityAttributeMatch(<logical>[requireGettable] \rightarrow, <logical>[requireSettable] \rightarrow, <logical>[requireEvolvable] \rightarrow) Return a list of implementations that provide the given list of attributes for the velocity property of the position component.

velocityIsGettable() Get the velocity property of the position component.
16.5. Objects

tfamily \logicalzero velocityIsSettable() Specify whether the velocity property of the position component is settable.

tfamily \void velocitySet(<double(:)> value) Set the velocity property of the position component.

tfamily nodeComponentSatellite

tfamily \textcolor{red}{\textless double\textgreater} boundMass() Get the boundMass property of the satellite component.

tfamily \textcolor{red}{\textlesstype(varying\_string)(:)}\textgreater boundMassAttributeMatch(<logical>[requireGettable]→, <logical>[requireSettable]→, <logical>[requireEvolvable]→) Return a list of implementations that provide the given list off attributes for the boundMass property of the satellite component.

tfamily \intzero boundMassCount() Compute the count of evolvable quantities in the boundMass property of the SatelliteStandard component.

tfamily \textcolor{red}{\textlesstype(history)\textgreater} boundMassHistory() Get the boundMassHistory property of the satellite component.

tfamily \textcolor{red}{\textlesstype(history)\textgreater} boundMassHistoryAttributeMatch(<logical>[requireGettable]→, <logical>[requireSettable]→, <logical>[requireEvolvable]→) Return a list of implementations that provide the given list off attributes for the boundMassHistory property of the satellite component.

tfamily \logicalzero boundMassHistoryIsSettable() Specify whether the boundMassHistory property of the satellite component is settable.

tfamily \void boundMassHistorySet(<type(history)> value) Set the boundMassHistory property of the satellite component.

tfamily \textcolor{red}{\textlesstype(history)\textgreater} boundMassIsGettable() Get the boundMass property of the satellite component.

tfamily \logicalzero boundMassIsSettable() Specify whether the boundMass property of the satellite component is settable.

tfamily \void boundMassRate(<double> value) Cumulate to the rate of the boundMass property of the SatelliteStandard component.

tfamily \void boundMassScale(<double> value) Set the scale of the boundMass property of the SatelliteStandard component.

tfamily \void boundMassSet(<double> value) Set the boundMass property of the satellite component.

tfamily \void builder(<*type(node)>componentDefinition→) Build a nodeComponent from a supplied XML definition.

tfamily \doublezero density(<double(3)> positionSpherical→, <componentType> [componentType]→, <massType> [massType]→, <weightBy> [weightBy]→, <integer> [weightIndex]→, <logical> [haloLoaded]→) Compute the density.

tfamily \void deserializeRates(<double(:)> array←) Deserialize the evolvable rates from an array.
tfamily \textcolor{red}{\textless \textbf{double}():\textgreater} deserializeScales(<double(:)> array←) Deserialize the evolvable scales from an array.
tfamily \textcolor{red}{\textless \textbf{double}():\textgreater} deserializeValues(<double(:)> array←) Deserialize the evolvable quantities from an array.
tfamily \void destroy() Destroy the object.
tfamily \void dump() Generate an ASCII dump of all properties.
tfamily \void dumpRaw(<integer> fileHandle→) Generate a binary dump of all properties.
tfamily \void dumpXML() Generate an XML dump of all properties.
tfamily \textcolor{red}{\textless \textbf{double}():\textgreater} enclosedMass(<double> radius→, <componentType>:componentType→, <massType>:massType→, <weightBy>:weightBy→, <integer>:weightIndex→, <logical>:haloLoaded→) Compute the mass enclosed within a radius.
tfamily \void hotHaloCoolingAbundancesRate(<type(abundances)> value) Cumulate to the rate of the hotHaloCoolingAbundances property of the hotHalo component.
tfamily \void hotHaloCoolingAngularMomentumRate(<double> value) Cumulate to the rate of the hotHaloCoolingAngularMomentum property of the hotHalo component.
tfamily \void hotHaloCoolingMassRate(<double> value) Cumulate to the rate of the hotHaloCoolingMass property of the hotHalo component.
tfamily \void initialize() Initialize the object.
tfamily \textcolor{red}{\textless \textbf{double}():\textgreater} mergeTime() Get the mergeTime property of the Satellite component.
tfamily \textcolor{red}{\textless \textbf{type(varying\_string):\textgreater}} mergeTimeAttributeMatch(<logical>:requireGettable→, <logical>:requireSettable→, <logical>:requireEvolvable→) Return a list of implementations that provide the given list off attributes for the mergeTime property of the Satellite component.
tfamily \int zero mergeTimeCount() Compute the count of evolvable quantities in the mergeTime property of the SatelliteVerySimple component.
tfamily \textcolor{red}{\textless \textbf{double}():\textgreater} mergeTimeIsGettable() Get the mergeTime property of the Satellite component.
tfamily \logical zero mergeTimeIsSettable() Specify whether the mergeTime property of the Satellite component is settable.
tfamily \void mergeTimeRate(<double> value) Cumulate to the rate of the mergeTime property of the SatelliteVerySimple component.
tfamily \void mergeTimeScale(<double> value) Set the scale of the mergeTime property of the SatelliteVerySimple component.
tfamily \void mergeTimeSet(<double> value) Set the mergeTime property of the Satellite component.
tfamily \void nameFromIndex(<integer> count→, <varying_string>:name←) Return the name of a property given is index.
16.5. Objects

tfamily \textcolor{red}{\langle\text{double}\rangle}\text{position()}\text{Get the position property of the satellite component.}
16. Coding Galacticus

tfamily \textcolor{red}{\textless string\textgreater} positionAttributeMatch(\textcolor{red}{\textless logical\textgreater}[requireGettable] →, \textcolor{red}{\textless logical\textgreater}[requireSettable] →, \textcolor{red}{\textless logical\textgreater}[requireEvolvable] →) Return a list of implementations that provide the given list of attributes for the position property of the satellite component.

tfamily \intzero positionCount() Compute the count of evolvable quantities in the position property of the SatelliteOrbiting component.

tfamily \textcolor{red}{\textless double\textgreater} positionIsGettable() Get the position property of the satellite component.

tfamily \logicalzero positionIsSettable() Specify whether the position property of the satellite component is settable.

tfamily \void positionRate(\textcolor{red}{\textless double\textgreater} value) Cumulate to the rate of the position property of the SatelliteOrbiting component.

tfamily \void positionScale(\textcolor{red}{\textless double\textgreater} value) Set the scale of the position property of the SatelliteOrbiting component.

tfamily \void positionSet(\textcolor{red}{\textless double\textgreater} value) Set the position property of the satellite component.

tfamily \doublezero potential(\textcolor{red}{\textless double\textgreater} radius →, \textcolor{red}{\textless componentType\textgreater}[componentType] →, \textcolor{red}{\textless massType\textgreater}[massType] →, \textcolor{red}{\textless logical\textgreater}[haloLoaded] →) Compute the gravitational potential.

tfamily \logicalzero presetIsActive() Return whether the preset implementation of the satellite component class is active.

tfamily \doublezero rotationCurve(\textcolor{red}{\textless double\textgreater} radius →, \textcolor{red}{\textless componentType\textgreater}[componentType] →, \textcolor{red}{\textless massType\textgreater}[massType] →, \textcolor{red}{\textless logical\textgreater}[haloLoaded] →) Compute the rotation curve.

tfamily \doublezero rotationCurveGradient(\textcolor{red}{\textless double\textgreater} radius →, \textcolor{red}{\textless componentType\textgreater}[componentType] →, \textcolor{red}{\textless massType\textgreater}[massType] →, \textcolor{red}{\textless logical\textgreater}[haloLoaded] →) Compute the rotation curve gradient.

tfamily \intzero serializeCount() Return a count of the number of evolvable quantities to be evolved.

tfamily \void serializeRates(\textcolor{red}{\textless double\textgreater} array→) Serialize the evolvable rates to an array.

tfamily \void serializeScales(\textcolor{red}{\textless double\textgreater} array→) Serialize the evolvable scales to an array.

tfamily \void serializeValues(\textcolor{red}{\textless double\textgreater} array→) Serialize the evolvable quantities to an array.

tfamily \logicalzero standardIsActive() Return whether the standard implementation of the satellite component class is active.

tfamily \doublezero surfaceDensity(\textcolor{red}{\textless double\textgreater}(3) positionCylindrical→, \textcolor{red}{\textless componentType\textgreater}[componentType]→, \textcolor{red}{\textless massType\textgreater}[massType]→, \textcolor{red}{\textless weightBy\textgreater}[weightBy]→, \textcolor{red}{\textless integer\textgreater}[weightIndex]→, \textcolor{red}{\textless logical\textgreater}[haloLoaded]→) Compute the surface density.

tfamily \textcolor{red}{\textless double\textgreater} tidalHeatingNormalized() Get the tidalHeatingNormalized property of the satellite component.

tfamily \textcolor{red}{\textless type\textgreater(varying\_string\_type}\textgreater} tidalHeatingNormalizedAttributeMatch(\textcolor{red}{\textless logical\textgreater}[requireGettable] →, \textcolor{red}{\textless logical\textgreater}[requireSettable] →, \textcolor{red}{\textless logical\textgreater}[requireEvolvable] →) Return a list of implementations that provide the given list of attributes for the tidalHeatingNormalized property of the satellite component.
tfamily\intzerotidalHeatingNormalizedCount() Compute the count of evolvable quantities in the tidalHeatingNormalized property of the SatelliteOrbiting component.

tfamily\textcolor{red}{\textless\textgreater} tidalHeatingNormalizedIsGettable() Get the tidalHeatingNormalized property of the satellite component.

tfamily\logicalzero tidalHeatingNormalizedIsSettable() Specify whether the tidalHeatingNormalized property of the satellite component is settable.

tfamily\void tidalHeatingNormalizedRate(<double> value) Cumulate to the rate of the tidalHeatingNormalized property of the SatelliteOrbiting component.

tfamily\void tidalHeatingNormalizedScale(<double> value) Set the scale of the tidalHeatingNormalized property of the SatelliteOrbiting component.

tfamily\void tidalHeatingNormalizedSet(<double> value) Set the tidalHeatingNormalized property of the satellite component.

tfamily\textcolor{red}{\textless\textgreater} tidalTensorPathIntegrated() Get the tidalTensorPathIntegrated property of the satellite component.

tfamily\textcolor{red}{\textless \textgreater} tidalTensorPathIntegratedAttributeMatch(<logical>[requireGettable] \rightarrow, <logical>[requireSettable] \rightarrow, <logical>[requireEvolvable] \rightarrow) Return a list of implementations that provide the given list of attributes for the tidalTensorPathIntegrated property of the satellite component.

tfamily\intzerotidalTensorPathIntegratedCount() Compute the count of evolvable quantities in the tidalTensorPathIntegrated property of the SatelliteOrbiting component.

tfamily\textcolor{red}{\textless\textgreater} tidalTensorPathIntegratedIsGettable() Get the tidalTensorPathIntegrated property of the satellite component.

tfamily\logicalzero tidalTensorPathIntegratedIsSettable() Specify whether the tidalTensorPathIntegrated property of the satellite component is settable.

tfamily\void tidalTensorPathIntegratedRate(<type(tensorRank2Dimension3Symmetric)> value) Cumulate to the rate of the tidalTensorPathIntegrated property of the SatelliteOrbiting component.

tfamily\void tidalTensorPathIntegratedScale(<type(tensorRank2Dimension3Symmetric)> value) Set the scale of the tidalTensorPathIntegrated property of the SatelliteOrbiting component.

tfamily\void tidalTensorPathIntegratedSet(<type(tensorRank2Dimension3Symmetric)> value) Set the tidalTensorPathIntegrated property of the satellite component.

tfamily\textcolor{red}{\textless double\textgreater} timeOfMerging() Get the timeOfMerging property of the satellite component.

tfamily\textcolor{red}{\textless\textgreater} timeOfMergingAttributeMatch(<logical>[requireGettable] \rightarrow, <logical>[requireSettable] \rightarrow, <logical>[requireEvolvable] \rightarrow) Return a list of implementations that provide the given list of attributes for the timeOfMerging property of the satellite component.

tfamily\textcolor{red}{\textless double\textgreater} timeOfMergingIsGettable() Get the timeOfMerging property of the satellite component.
tfamily \textcolor{red}{\textless type(varying\_string)\textgreater} type() Return the type of this object.

tfamily \textcolor{red}{\textless double(:)\textgreater} velocity() Get the velocity property of the satellite component.

tfamily \textcolor{red}{\textless type(keplerOrbit)\textgreater} virialOrbit() Get the virialOrbit property of the satellite component.

tfamily \textcolor{red}{\textless type(keplerOrbit)\textgreater} virialOrbitIsGettable() Get the virialOrbit property of the satellite component.

tfamily \textcolor{red}{\textless type(keplerOrbit)\textgreater} virialOrbitSet(\textcolor{red}{\textless type(keplerOrbit)\textgreater} value) Set the virialOrbit property of the satellite component.
16.5. Objects

tfamily nodeComponentSatelliteNull

tfamily \textcolor{red}{\textless \textasciitilde \textgreater } \text{boundMass}() Get the \textit{boundMass} property of the \textit{satellite} component.

tfamily \textcolor{red}{\textless \textasciitilde \textgreater } \text{boundMassAttributeMatch}(<\textit{logical}>[\text{requireGettable}→, <\textit{logical}>[\text{requireSettable}→, <\textit{logical}>[\text{requireEvolvable}→]) Return a list of implementations that provide the given list of attributes for the \textit{boundMass} property of the \textit{satellite} component.

tfamily \intzero \text{boundMassCount()} Compute the count of evolvable quantities in the \textit{boundMass} property of the \textit{SatelliteStandard} component.

tfamily \textcolor{red}{\textless \textasciitilde \textgreater } \text{boundMassHistory}() Get the \textit{boundMassHistory} property of the \textit{satellite} component.

tfamily \textcolor{red}{\textless \textasciitilde \textgreater } \text{boundMassHistoryAttributeMatch}(<\textit{logical}>[\text{requireGettable}→, <\textit{logical}>[\text{requireSettable}→, <\textit{logical}>[\text{requireEvolvable}→]) Return a list of implementations that provide the given list of attributes for the \textit{boundMassHistory} property of the \textit{satellite} component.

tfamily \textcolor{red}{\textless \textasciitilde \textgreater } \text{boundMassHistoryIsGettable()} Get the \textit{boundMassHistory} property of the \textit{satellite} component.

tfamily \textcolor{red}{\textless \textasciitilde \textgreater } \text{boundMassHistoryIsSettable()} Specify whether the \textit{boundMassHistory} property of the \textit{satellite} component is settable.

tfamily \void \text{boundMassHistorySet}(<\textit{type(history)}> value) Set the \textit{boundMassHistory} property of the \textit{satellite} component.

tfamily \textcolor{red}{\textless \textasciitilde \textgreater } \text{boundMassIsGettable()} Get the \textit{boundMass} property of the \textit{satellite} component.

tfamily \textcolor{red}{\textless \textasciitilde \textgreater } \text{boundMassIsSettable()} Specify whether the \textit{boundMass} property of the \textit{satellite} component is settable.

tfamily \void \text{boundMassRate}(<\textit{double}> value) Cumulate to the rate of the \textit{boundMass} property of the \textit{SatelliteStandard} component.

tfamily \void \text{boundMassScale}(<\textit{double}> value) Set the scale of the \textit{boundMass} property of the \textit{SatelliteStandard} component.

tfamily \void \text{boundMassSet}(<\textit{double}> value) Set the \textit{boundMass} property of the \textit{satellite} component.

tfamily \void \text{builder}(<\textit{type(node)}> componentDefinition→) Build a \textit{nodeComponent} from a supplied XML definition.

tfamily \void \text{density}(<\textit{double}(3)> positionSpherical→, <\textit{componentType}> [componentType]→, <\textit{massType}> [massType]→, <\textit{weightBy}> [weightBy]→, <\textit{integer}> [weightIndex]→, <\textit{logical}> [haloLoaded]→) Compute the density.

tfamily \void \text{deserializeRates}(<\textit{double}(:)> array←) Deserialize the evolvable rates from an array.

tfamily \void \text{deserializeScales}(<\textit{double}(:)> array←) Deserialize the evolvable scales from an array.

tfamily \void \text{deserializeValues}(<\textit{double}(:)> array←) Deserialize the evolvable quantities from an array.

tfamily \void \text{destroy}() Destroy the object.
16. Coding GALACTICUS

tfamily \void dump() Generate an ASCII dump of all properties.

tfamily \void dumpRaw(<integer> fileHandle→) Generate a binary dump of all properties.

tfamily \void dumpXML() Generate an XML dump of all properties.

tfamily \double zero enclosedMass(<double> radius→, <componentType> [componentType]→, <massType> [massType]→, <weightBy> [weightBy]→, <integer> [weightIndex]→, <logical> [haloLoaded]→) Compute the mass enclosed within a radius.

tfamily \textcolor{red}{\textless *type(treeNode)\textgreater} host() Return a pointer to the host treeNode object.

tfamily \void hotHaloCoolingAbundancesRate(<type(abundances)> value) Cumulate to the rate of the hotHaloCoolingAbundances property of the hotHalo component.

tfamily \void hotHaloCoolingAngularMomentumRate(<double> value) Cumulate to the rate of the hotHaloCoolingAngularMomentum property of the hotHalo component.

tfamily \void hotHaloCoolingMassRate(<double> value) Cumulate to the rate of the hotHaloCoolingMass property of the hotHalo component.

tfamily \void initialize() Initialize the object.

tfamily \textcolor{red}{\textless double\textgreater} mergeTime() Get the mergeTime property of the satellite component.

tfamily \textcolor{red}{\textless type(varying_string)()\textgreater} mergeTimeAttributeMatch(<logical> [requireGettable]→, <logical> [requireSettable]→, <logical> [requireEvolvable]→) Return a list of implementations that provide the given list off attributes for the mergeTime property of the satellite component.

tfamily \int zero mergeTimeCount() Compute the count of evolvable quantities in the mergeTime property of the SatelliteVerySimple component.

tfamily \textcolor{red}{\textless double\textgreater} mergeTimeIsGettable() Get the mergeTime property of the satellite component.

tfamily \logical zero mergeTimeIsSettable() Specify whether the mergeTime property of the satellite component is settable.

tfamily \void mergeTimeRate(<double> value) Cumulate to the rate of the mergeTime property of the SatelliteVerySimple component.

tfamily \void mergeTimeScale(<double> value) Set the scale of the mergeTime property of the SatelliteVerySimple component.

tfamily \void mergeTimeSet(<double> value) Set the mergeTime property of the satellite component.

tfamily \void nameFromIndex(<integer> count→, <varying_string> name←) Return the name of a property given is index.

tfamily \textcolor{red}{\textless integer(kind=kind_int8)\textgreater} nodeIndex() Get the nodeIndex property of the satellite component.

tfamily \textcolor{red}{\textless type(varying_string)()\textgreater} nodeIndexAttributeMatch(<logical> [requireGettable]→, <logical> [requireSettable]→, <logical> [requireEvolvable]→) Return a list of implementations that provide the given list off attributes for the nodeIndex property of the satellite component.
16.5. Objects

tfamily \textcolor{red}{\textless textless type(longIntegerHistory)\textgreater} nodeIndexHistory() Get the nodeIndexHistory property of the satellite component.

tfamily \textcolor{red}{\textless textless type(varying\textless String\textgreater)\textgreater} nodeIndexHistoryAttributeMatch(\textless logical\textgreater [requireGettable] →, \textless logical\textgreater [requireSettable] →, \textless logical\textgreater [requireEvolvable] →) Return a list of implementations that provide the given list of attributes for the nodeIndexHistory property of the satellite component.

tfamily \textcolor{red}{\textless textless type(longIntegerHistory)\textgreater} nodeIndexHistoryIsGettable() Get the nodeIndexHistory property of the satellite component.

tfamily \textcolor{red}{\textless textless type(longIntegerHistory)\textgreater} nodeIndexHistoryIsSettable() Specify whether the nodeIndexHistory property of the satellite component is settable.

tfamily \textcolor{red}{\textless textless type(longIntegerHistory)\textgreater} nodeIndexHistorySet(\textless type(longIntegerHistory)\textgreater value) Set the nodeIndexHistory property of the satellite component.

tfamily \textcolor{red}{\textless integer(kind=kind\_int8)\textgreater} nodeIndexIsGettable() Get the nodeIndex property of the satellite component.

tfamily \textcolor{red}{\textless integer(kind=kind\_int8)\textgreater} nodeIndexIsSettable() Specify whether the nodeIndex property of the satellite component is settable.

tfamily \textcolor{red}{\textless integer(kind=kind\_int8)\textgreater} nullIsActive() Return whether the null implementation of the satellite component class is active.

tfamily \textcolor{red}{\textless integer(kind=kind\_int8)\textgreater} odeStepRatesInitialize() Initialize rates for evolvable properties.

tfamily \textcolor{red}{\textless integer(kind=kind\_int8)\textgreater} odeStepScalesInitialize() Initialize scales for evolvable properties.

tfamily \textcolor{red}{\textless integer(kind=kind\_int8)\textgreater} orbitingIsActive() Return whether the orbiting implementation of the satellite component class is active.

tfamily \textcolor{red}{\textless integer(kind=kind\_int8)\textgreater} output(<integer> integerProperty ↔, <integer> integerBufferCount ↔, <integer(:,:)> integerBuffer ↔, <integer>doubleProperty ↔, <integer> doubleBufferCount ↔, <double(:,:)> doubleBuffer ↔, <double> time →, <integer> instance →) Generate values of outputtable properties.

tfamily \textcolor{red}{\textless integer(kind=kind\_int8)\textgreater} outputCount(<integer> integerPropertyCount ↔, <integer> doublePropertyCount ↔, <double> time →, <integer> instance →) Compute a count of outputtable properties.

tfamily \textcolor{red}{\textless integer(kind=kind\_int8)\textgreater} outputNames(<integer> integerProperty ↔, <char\[*\](:)> integerPropertyNames ↔, <char\[*\](:)> integerPropertyComments ↔, <double(:)> integerPropertyUnitsSI ↔, <integer> doubleProperty ↔, <char\[*\](:)> doublePropertyNames ↔, <char\[*\](:)> doublePropertyComments ↔, <double(:)> doublePropertyUnitsSI ↔, <double> time →, <integer> instance →) Generate names of outputtable properties.

tfamily \textcolor{red}{\textless textless double\textless :\textgreater} position() Get the position property of the satellite component.

tfamily \textcolor{red}{\textless textless type(varying\textless String\textgreater)\textgreater} positionAttributeMatch(\textless logical\textgreater [requireGettable] →, \textless logical\textgreater [requireSettable] →, \textless logical\textgreater [requireEvolvable] →) Return a list of implementations that provide the given list of attributes for the position property of the satellite component.

tfamily \textcolor{red}{\textless integer\textgreater} positionCount() Compute the count of evolvable quantities in the position property of the SatelliteOrbiting component.
16. Coding Galacticus

tfamily \textcolor{red}{\textless\textless\textless\textgreater\textgreater\textgreater} positionIsGettable() Get the position property of the satellite component.

tfamily \textcolor{red}{\textless\textless\textless\textgreater\textgreater} positionIsSettable() Specify whether the position property of the satellite component is settable.

tfamily \textcolor{red}{\textless\textless\textless\textgreater\textgreater} positionRate(<double(:)> value) Cumulate to the rate of the position property of the SatelliteOrbiting component.

tfamily \textcolor{red}{\textless\textless\textless\textgreater\textgreater} positionScale(<double(:)> value) Set the scale of the position property of the SatelliteOrbiting component.

tfamily \textcolor{red}{\textless\textless\textless\textgreater\textgreater} positionSet(<double(:)> value) Set the position property of the satellite component.

tfamily \textcolor{red}{\textless\textless\textless\textgreater\textgreater} potential(<double> radius \rightarrow, <componentType> [componentType] \rightarrow, <massType> [massType] \rightarrow, <logical> [haloLoaded] \rightarrow) Compute the gravitational potential.

tfamily \textcolor{red}{\textless\textless\textless\textgreater\textgreater} presetIsActive() Return whether the preset implementation of the satellite component class is active.

tfamily \textcolor{red}{\textless\textless\textless\textgreater\textgreater} readRaw(<integer> fileHandle \rightarrow) Read a binary dump of the nodeComponent from the given fileHandle.

tfamily \textcolor{red}{\textless\textless\textless\textgreater\textgreater} rotationCurve(<double> radius \rightarrow, <componentType> [componentType] \rightarrow, <massType> [massType] \rightarrow, <logical> [haloLoaded] \rightarrow) Compute the rotation curve.

tfamily \textcolor{red}{\textless\textless\textless\textgreater\textgreater} rotationCurveGradient(<double> radius \rightarrow, <componentType> [componentType] \rightarrow, <massType> [massType] \rightarrow, <logical> [haloLoaded] \rightarrow) Compute the rotation curve gradient.

tfamily \textcolor{red}{\textless\textless\textless\textgreater\textgreater} serializeCount() Return a count of the number of evolvable quantities to be evolved.

tfamily \textcolor{red}{\textless\textless\textless\textgreater\textgreater} serializeRates(<double(:)> array \rightarrow) Serialize the evolvable rates to an array.

tfamily \textcolor{red}{\textless\textless\textless\textgreater\textgreater} serializeScales(<double(:)> array \rightarrow) Serialize the evolvable scales to an array.

tfamily \textcolor{red}{\textless\textless\textless\textgreater\textgreater} serializeValues(<double(:)> array \rightarrow) Serialize the evolvable quantities to an array.

tfamily \textcolor{red}{\textless\textless\textless\textgreater\textgreater} standardIsActive() Return whether the standard implementation of the satellite component class is active.

tfamily \textcolor{red}{\textless\textless\textless\textgreater\textgreater} surfaceDensity(<double(3)> positionCylindrical \rightarrow, <componentType> [componentType] \rightarrow, <massType> [massType] \rightarrow, <weightBy> [weightBy] \rightarrow, <integer> [weightIndex] \rightarrow, <logical> [haloLoaded] \rightarrow) Compute the surface density.

tfamily \textcolor{red}{\textless\textless\textless\textgreater\textgreater} tidalHeatingNormalized() Get the tidalHeatingNormalized property of the satellite component.

tfamily \textcolor{red}{\textless\textless\textless\textgreater\textgreater} tidalHeatingNormalizedAttributeMatch(<logical> [requireGettable] \rightarrow, <logical> [requireSettable] \rightarrow, <logical> [requireEvolvable] \rightarrow) Return a list of implementations that provide the given list of attributes for the tidalHeatingNormalized property of the satellite component.

tfamily \textcolor{red}{\textless\textless\textless\textgreater\textgreater} tidalHeatingNormalizedCount() Compute the count of evolvable quantities in the tidalHeatingNormalized property of the SatelliteOrbiting component.

tfamily \textcolor{red}{\textless\textless\textless\textgreater\textgreater} tidalHeatingNormalizedIsGettable() Get the tidalHeatingNormalized property of the satellite component.
16.5. Objects

tfamily \logicalzero tidalHeatingNormalizedIsSettable() Specify whether the tidalHeatingNormalized property of the satellite component is settable.

tfamily \void tidalHeatingNormalizedRate(<double> value) Cumulate to the rate of the tidalHeatingNormalized property of the SatelliteOrbiting component.

tfamily \void tidalHeatingNormalizedScale(<double> value) Set the scale of the tidalHeatingNormalized property of the SatelliteOrbiting component.

tfamily \void tidalHeatingNormalizedSet(<double> value) Set the tidalHeatingNormalized property of the satellite component.

tfamily \void tidalHeatingNormalizedSet(<double> value) Set the tidalHeatingNormalized property of the SatelliteOrbiting component.

tfamily \void tidalHeatingNormalizedSet(<double> value) Set the tidalHeatingNormalized property of the satellite component.

tfamily \void tidalHeatingNormalizedSet(<double> value) Set the tidalHeatingNormalized property of the SatelliteOrbiting component.

tfamily \void tidalHeatingNormalizedSet(<double> value) Set the tidalHeatingNormalized property of the satellite component.

tfamily \void tidalHeatingNormalizedSet(<double> value) Set the tidalHeatingNormalized property of the satellite component.

tfamily \intzero tidalTensorPathIntegratedCount() Compute the count of evolvable quantities in the tidalTensorPathIntegrated property of the SatelliteOrbiting component.

tfamily \void tidalTensorPathIntegratedRate(<type(tensorRank2Dimension3Symmetric)> value) Cumulate to the rate of the tidalTensorPathIntegrated property of the SatelliteOrbiting component.

tfamily \void tidalTensorPathIntegratedScale(<type(tensorRank2Dimension3Symmetric)> value) Set the scale of the tidalTensorPathIntegrated property of the SatelliteOrbiting component.

tfamily \void tidalTensorPathIntegratedSet(<type(tensorRank2Dimension3Symmetric)> value) Set the tidalTensorPathIntegrated property of the satellite component.

tfamily \void tidalTensorPathIntegratedSet(<double> value) Set the timeOfMerging property of the satellite component.

tfamily \void timeOfMergingSet(<double> value) Set the timeOfMerging property of the satellite component.

```plaintext
tfamily \intzero boundMassCount() Compute the count of evolvable quantities in the boundMass property of the SatelliteStandard component.

tfamily \textcolor{red}{\textless type(history)}\textgreater boundMassHistory() Get the boundMassHistory property of the satellite component.

tfamily \textcolor{red}{\textless type(varying\_string)}\textgreater boundMassHistoryAttributeMatch(<logical>[requireGettable]→, <logical>[requireSettable]→, <logical>[requireEvolvable]→) Return a list of implementations that provide the given list off attributes for the boundMassHistory property of the satellite component.

tfamily \textcolor{red}{\textless type(history)}\textgreater boundMassHistoryIsGettable() Get the boundMassHistory property of the satellite component.

tfamily \logicalzero boundMassHistoryIsSettable() Specify whether the boundMassHistory property of the satellite component is settable.

tfamily \void boundMassHistorySet(<type(history)> value) Set the boundMassHistory property of the satellite component.

tfamily \textcolor{red}{\textless double}\textgreater boundMassIsGettable() Get the boundMass property of the satellite component.

tfamily \logicalzero boundMassIsSettable() Specify whether the boundMass property of the satellite component is settable.

tfamily \void boundMassRate(<double> value) Cumulate to the rate of the boundMass property of the SatelliteStandard component.

tfamily \void boundMassScale(<double>value) Set the scale of the boundMass property of the SatelliteStandard component.

tfamily \void boundMassSet(<double> value) Set the boundMass property of the satellite component.

tfamily \void builder(<\type(node)>componentDefinition) Build a nodeComponent from a supplied XML definition.

tfamily \void density(<double(3)> positionSpherical→, <componentType> [componentType]→, <massType> [massType]→, <weightBy> [weightBy]→, <integer> [weightIndex]→, <logical> [haloLoaded]→) Compute the density.

tfamily \void deserializeRates(<double(:)> array←) Deserialize the evolvable rates from an array.

tfamily \void deserializeScales(<double(:)> array←) Deserialize the evolvable scales from an array.

tfamily \void deserializeValues(<double(:)> array←) Deserialize the evolvable quantities from an array.

tfamily \void destroy() Destroy the object.

tfamily \void dump() Generate an ASCII dump of all properties.

tfamily \void dumpRaw(<integer> fileHandle→) Generate a binary dump of all properties.

tfamily \void dumpXML() Generate an XML dump of all properties.
```
tfamily doublezero enclosedMass(<double> radius \rightarrow, <componentType> [componentType] \rightarrow, <massType> [massType] \rightarrow, <weightBy> [weightBy] \rightarrow, <integer> [weightIndex] \rightarrow, <logical> [haloLoaded] \rightarrow)
Compute the mass enclosed within a radius.

tfamily textcolor{red}{'textless *type(treeNode)\textgreater} host() Return a pointer to the host
   treeNode object.

tfamily void hotHaloCoolingAbundancesRate(<type(abundances)> value) Cumulate to the rate of the
   hotHaloCoolingAbundances property of the hotHalo component.

tfamily void hotHaloCoolingAngularMomentumRate(<double> value) Cumulate to the rate of the
   hotHaloCoolingAngularMomentum property of the hotHalo component.

tfamily void hotHaloCoolingMassRate(<double> value) Cumulate to the rate of the hotHaloCoolingMass
   property of the hotHalo component.

tfamily void initialize() Initialize the object.

tfamily textcolor{red}{'textless double\textgreater} mergeTime() Get the mergeTime property of the
   satellite component.

tfamily textcolor{red}{'textless type(varying\_string)\textgreater} mergeTimeAttributeMatch(<logical>[requireGettable] \rightarrow, <logical>[requireSettable] \rightarrow, <logical>[requireEvolvable] \rightarrow) Return a list of implementations that
   provide the given list off attributes for the mergeTime property of the satellite component

tfamily intzero mergeTimeCount() Compute the count of evolvable quantities in the mergeTime prop-
   erty of the SatelliteVerySimple component.

tfamily textcolor{red}{'textless double\textgreater} mergeTimeIsGettable() Get the mergeTime prop-
   erty of the satellite component.

tfamily logicalzero mergeTimeIsSettable() Specify whether the mergeTime property of the satellite
   component is settable.

tfamily void mergeTimeRate(<double> value) Cumulate to the rate of the mergeTime property of the
   SatelliteVerySimple component.

tfamily void mergeTimeSet(<double> value) Set the mergeTime property of the SatelliteVerySimple
   component.

tfamily void nameFromIndex(<integer> count \rightarrow, <varying_string>name \leftarrow) Return the name of a
   property given is index.

tfamily textcolor{red}{'textless integer(kind=kind\_int8)\textgreater} nodeIndex() Get the nodeIndex
   property of the satellite component.

tfamily textcolor{red}{'textless type(varying\_string)\textgreater} nodeIndexAttributeMatch(<logical>[requireGettable] \rightarrow, <logical>[requireSettable] \rightarrow, <logical>[requireEvolvable] \rightarrow) Return a list of implementations that
   provide the given list off attributes for the nodeIndex property of the satellite component

tfamily textcolor{red}{'textless type(longIntegerHistory)\textgreater} nodeIndexHistory() Get the nodeIndexHistory
   property of the satellite component.
16.5. Objects

tfamily \textcolor{red}{\textless type(varying\_string)(:\textgreater)} nodeIndexHistoryAttributeMatch(<logical>[requireGettable]→, <logical>[requireSettable]→, <logical>[requireEvolvable]→) Return a list of implementations that provide the given list off attributes for the nodeIndexHistory property of the satellite component.

tfamily \textcolor{red}{\textless type(longIntegerHistory)\textgreater} nodeIndexHistoryIsGettable() Get the nodeIndexHistory property of the satellite component.

tfamily \logicalzero nodeIndexHistoryIsSettable() Specify whether the nodeIndexHistory property of the satellite component is settable.

tfamily \void nodeIndexHistorySet(<type(longIntegerHistory)> value) Set the nodeIndexHistory property of the satellite component.

tfamily \logicalzero nodeIndexIsGettable() Get the nodeIndex property of the satellite component.

tfamily \logicalzero nodeIndexIsSettable() Specify whether the nodeIndex property of the satellite component is settable.

tfamily \void nullIsActive() Return whether the null implementation of the satellite component class is active.

tfamily \void odeStepRatesInitialize() Initialize rates for evolvable properties.

tfamily \void odeStepScalesInitialize() Initialize scales for evolvable properties.

tfamily \logicalzero orbitingIsActive() Return whether the orbiting implementation of the satellite component class is active.

tfamily \void output(<integer> integerProperty ↔, <integer> integerBufferCount ↔, <integer(_:,:)> integerBuffer ↔, <integer>doubleProperty ↔, <integer> doubleBufferCount ↔, <double(_:,:)> doubleBuffer ↔, <double> time →, <integer> instance →) Generate values of outputtable properties.

tfamily \void outputCount(<integer>integerPropertyCount ↔, <integer>doublePropertyCount ↔, <double> time →, <integer> instance →) Compute a count of outputtable properties.

tfamily \void outputNames(<integer>integerProperty ↔, <char[*](:)>integerPropertyNames ↔, <char[*](:)>integerPropertyComments ↔, <double(:)>integerPropertyUnitsSI ↔, <integer>doubleProperty ↔, <char[*](:)>doublePropertyNames ↔, <char[*](:)>doublePropertyComments ↔, <double(:)>doublePropertyUnitsSI ↔, <double> time →, <integer> instance →) Generate names of outputtable properties.

tfamily \textcolor{red}{\textless double(:)\textgreater} position() Get the position property of the satellite component.

tfamily \textcolor{red}{\textless type(varying\_string)(:\textgreater)} positionAttributeMatch(<logical>[requireGettable]→, <logical>[requireSettable]→, <logical>[requireEvolvable]→) Return a list of implementations that provide the given list off attributes for the position property of the satellite component.

tfamily \textcolor{red}{\textless type(longIntegerHistory)\textgreater} positionIsGettable() Get the position property of the satellite component.
16. **Coding Galacticus**

tfamily `logical zero positionIsSettable()` Specify whether the `position` property of the `satellite` component is settable.

tfamily `void positionRate(<double(:)> value)` Cumulate to the rate of the `position` property of the `SatelliteOrbiting` component.

tfamily `void positionScale(<double(:)> value)` Set the scale of the `position` property of the `SatelliteOrbiting` component.

tfamily `void positionSet(<double(:)> value)` Set the `position` property of the `satellite` component.

tfamily `double zero potential(<double> radius \rightarrow, <componentType> [componentType] \rightarrow, <massType> [massType] \rightarrow, <logical> [haloLoaded] \rightarrow)` Compute the gravitational potential.

tfamily `logical zero presetIsActive()` Return whether the preset implementation of the satellite component class is active.

tfamily `void readRaw(<integer> fileHandle \rightarrow)` Read a binary dump of the `nodeComponent` from the given `fileHandle`.

tfamily `double zero rotationCurve(<double> radius \rightarrow, <componentType> [componentType] \rightarrow, <massType> [massType] \rightarrow, <logical> [haloLoaded] \rightarrow)` Compute the rotation curve.

tfamily `double zero rotationCurveGradient(<double> radius \rightarrow, <componentType> [componentType] \rightarrow, <massType> [massType] \rightarrow, <logical> [haloLoaded] \rightarrow)` Compute the rotation curve gradient.

tfamily `int zero serializeCount()` Return a count of the number of evolvable quantities to be evolved.

tfamily `void serializeRates(<double(:)> array \rightarrow)` Serialize the evolvable rates to an array.

tfamily `void serializeScales(<double(:)> array \rightarrow)` Serialize the evolvable scales to an array.

tfamily `void serializeValues(<double(:)> array \rightarrow)` Serialize the evolvable quantities to an array.

tfamily `logical zero standardIsActive()` Return whether the standard implementation of the satellite component class is active.

tfamily `double zero surfaceDensity(<double(3)> positionCylindrical \rightarrow, <componentType> [componentType] \rightarrow, <massType> [massType] \rightarrow, <weightBy> [weightBy] \rightarrow, <integer> [weightIndex] \rightarrow, <logical> [haloLoaded] \rightarrow)` Compute the surface density.

tfamily `textcolor {red} {textless double textgreater} tidalHeatingNormalized()` Get the `tidalHeatingNormalized` property of the `satellite` component.

tfamily `textcolor {red} {textless varying \_string(): textgreater} tidalHeatingNormalizedAttributeMatch([<logical> [requireGettable] \rightarrow, <logical> [requireSettable] \rightarrow, <logical> [requireEvolvable] \rightarrow)` Return a list of implementations that provide the given list of attributes for the `tidalHeatingNormalized` property of the `satellite` component.

tfamily `int zero tidalHeatingNormalizedCount()` Compute the count of evolvable quantities in the `tidalHeatingNormalized` property of the `SatelliteOrbiting` component.

tfamily `textcolor {red} {textless double textgreater} tidalHeatingNormalizedIsGettable()` Get the `tidalHeatingNormalized` property of the `satellite` component.

tfamily `logical zero tidalHeatingNormalizedIsSettable()` Specify whether the `tidalHeatingNormalized` property of the `satellite` component is settable.
16.5. Objects

tfamily \void tidalHeatingNormalizedRate(\textsf{double} value) Cumulate to the rate of the \texttt{tidalHeatingNormalized} property of the \texttt{SatelliteOrbiting} component.

tfamily \void tidalHeatingNormalizedScale(\textsf{double} value) Set the scale of the \texttt{tidalHeatingNormalized} property of the \texttt{SatelliteOrbiting} component.

tfamily \void tidalHeatingNormalizedSet(\textsf{double} value) Set the \texttt{tidalHeatingNormalized} property of the \texttt{Satellite} component.

tfamily \textcolor{red}{\textlesstype(tensorRank2Dimension3Symmetric)\textgreater} tidalTensorPathIntegrated() Get the \texttt{tidalTensorPathIntegrated} property of the \texttt{Satellite} component.

tfamily \textcolor{red}{\textlesstype(varying\_string)(:)} tidalTensorPathIntegratedAttributeMatch(\textsf{logical} \rightarrow, \textsf{logical} \rightarrow, \textsf{logical} \rightarrow) Return a list of implementations that provide the given list of attributes for the \texttt{tidalTensorPathIntegrated} property of the \texttt{Satellite} component.

tfamily \intzero tidalTensorPathIntegratedCount() Compute the count of evolvable quantities in the \texttt{tidalTensorPathIntegrated} property of the \texttt{SatelliteOrbiting} component.

tfamily \textcolor{red}{\textlesstype(tensorRank2Dimension3Symmetric)\textgreater} tidalTensorPathIntegratedIsGettable() Get the \texttt{tidalTensorPathIntegrated} property of the \texttt{Satellite} component.

tfamily \logicalzero tidalTensorPathIntegratedIsSettable() Specify whether the \texttt{tidalTensorPathIntegrated} property of the \texttt{Satellite} component is settable.

tfamily \void tidalTensorPathIntegratedRate(\textsf{type(tensorRank2Dimension3Symmetric)} value) Cumulate to the rate of the \texttt{tidalTensorPathIntegrated} property of the \texttt{SatelliteOrbiting} component.

tfamily \void tidalTensorPathIntegratedScale(\textsf{type(tensorRank2Dimension3Symmetric)} value) Set the scale of the \texttt{tidalTensorPathIntegrated} property of the \texttt{SatelliteOrbiting} component.

tfamily \void tidalTensorPathIntegratedSet(\textsf{type(tensorRank2Dimension3Symmetric)} value) Set the \texttt{tidalTensorPathIntegrated} property of the \texttt{Satellite} component.

tfamily \textcolor{red}{\textlesstype(varying\_string)\textgreater} timeOfMerging() Get the \texttt{timeOfMerging} property of the \texttt{Satellite} component.

tfamily \textcolor{red}{\textlesstype(varying\_string)(:)} timeOfMergingAttributeMatch(\textsf{logical} \rightarrow, \textsf{logical} \rightarrow, \textsf{logical} \rightarrow) Return a list of implementations that provide the given list of attributes for the \texttt{timeOfMerging} property of the \texttt{Satellite} component.

tfamily \textcolor{red}{\textlesstype(varying\_string)\textgreater} timeOfMergingIsGettable() Get the \texttt{timeOfMerging} property of the \texttt{Satellite} component.

tfamily \logicalzero timeOfMergingIsSettable() Specify whether the \texttt{timeOfMerging} property of the \texttt{Satellite} component is settable.

tfamily \void timeOfMergingSet(\textsf{double} value) Set the \texttt{timeOfMerging} property of the \texttt{Satellite} component.

tfamily \textcolor{red}{\textlesstype(varying\_string)\textgreater} type() Return the type of this object.
16. Coding GALACTICUS

tfamily \textcolor{red}{\textless double(:)\textgreater} velocity() Get the velocity property of the satellite component.

tfamily \textcolor{red}{\textless type(varying\_string)(:)\textgreater} velocityAttributeMatch(<logical>[requireGettable]\rightarrow,<logical>[requireSettable]\rightarrow,<logical>[requireEvolvable]\rightarrow) Return a list of implementations that provide the given list off attributes for the velocity property of the satellite component.

tfamily \intzero velocityCount() Compute the count of evolvable quantities in the velocity property of the SatelliteOrbiting component.

tfamily \textcolor{red}{\textless double(:)\textgreater} velocityIsGettable() Get the velocity property of the satellite component.

tfamily \logicalzero velocityIsSettable() Specify whether the velocity property of the satellite component is settable.

tfamily void velocityRate(<double(:)> value) Cumulate to the rate of the velocity property of the SatelliteOrbiting component.

tfamily void velocityScale(<double(:)> value) Set the scale of the velocity property of the SatelliteOrbiting component.

tfamily \logicalzero verySimpleIsActive() Return whether the verySimple implementation of the satellite component class is active.

tfamily \textcolor{red}{\textless type(keplerOrbit)\textgreater} virialOrbit() Get the virialOrbit property of the satellite component.

tfamily \textcolor{red}{\textless type(varying\_string)(:)\textgreater} virialOrbitAttributeMatch(<logical>[requireGettable]\rightarrow,<logical>[requireSettable]\rightarrow,<logical>[requireEvolvable]\rightarrow) Return a list of implementations that provide the given list off attributes for the virialOrbit property of the satellite component.

tfamily \textcolor{red}{\textless type(keplerOrbit)\textgreater} virialOrbitIsGettable() Get the virialOrbit property of the satellite component.

tfamily \logicalzero virialOrbitIsSettable() Specify whether the virialOrbit property of the satellite component is settable.

tfamily \void virialOrbitSet(<type(keplerOrbit)> value) Set the virialOrbit property of the satellite component.

tfamily nodeComponentSatellitePreset

tfamily \textcolor{red}{\textless double(:)\textgreater} boundMass() Get the boundMass property of the satellite component.

tfamily \textcolor{red}{\textless type(varying\_string)(:)\textgreater} boundMassAttributeMatch(<logical>[requireGettable]\rightarrow,<logical>[requireSettable]\rightarrow,<logical>[requireEvolvable]\rightarrow) Return a list of implementations that provide the given list off attributes for the boundMass property of the satellite component.

tfamily \intzero boundMassCount() Compute the count of evolvable quantities in the boundMass property of the SatelliteStandard component.
16.5. Objects

tfamily {textcolor{red}\{textless type(history)\textgreater}} boundMassHistory() Get the boundMassHistory property of the satellite component.

tfamily {textcolor{red}\{textless type(varying_string)\textgreater}} boundMassHistoryAttributeMatch(<logical>[requireGettable] →, <logical>[requireSettable] →, <logical>[requireEvolvable] →) Return a list of implementations that provide the given list of attributes for the boundMassHistory property of the satellite component.

tfamily {textcolor{red}\{textless type(history)\textgreater}} boundMassHistoryIsGettable() Get the boundMassHistory property of the satellite component.

tfamily {logicalzero} boundMassHistoryIsSettable() Specify whether the boundMassHistory property of the satellite component is settable.

tfamily {void} boundMassHistorySet(<type(history)> value) Set the boundMassHistory property of the satellite component.

tfamily {textcolor{red}\{textless double\textgreater}} boundMassIsGettable() Get the boundMass property of the satellite component.

tfamily {logicalzero} boundMassIsSettable() Specify whether the boundMass property of the satellite component is settable.

tfamily {void} boundMassRate(<double> value) Cumulate to the rate of the boundMass property of the SatelliteStandard component.

tfamily {void} boundMassScale(<double> value) Set the scale of the boundMass property of the SatelliteStandard component.

tfamily {void} boundMassSet(<double> value) Set the boundMass property of the satellite component.

tfamily {void} builder(<*type(node)> componentDefinition →) Build a nodeComponent from a supplied XML definition.

tfamily {doublezero} density(<double(3)> positionSpherical →, <componentType>[componentType] →, <massType>[massType] →, <weightBy>[weightBy] →, <integer>[weightIndex] →, <logical>[haloLoaded] →) Compute the density.

tfamily {void} deserializeRates(<double(:)> array ←) Deserialize the evolvable rates from an array.

tfamily {void} deserializeScales(<double(:)> array ←) Deserialize the evolvable scales from an array.

tfamily {void} deserializeValues(<double(:)> array ←) Deserialize the evolvable quantities from an array.

tfamily {void} destroy() Destroy the object.

tfamily {void} dump() Generate an ASCII dump of all properties.

tfamily {void} dumpRaw(<integer> fileHandle →) Generate a binary dump of all properties.

tfamily {void} dumpXML() Generate an XML dump of all properties.

tfamily {doublezero} enclosedMass(<double> radius →, <componentType>[componentType] →, <massType>[massType] →, <weightBy>[weightBy] →, <integer>[weightIndex] →, <logical>[haloLoaded] →) Compute the mass enclosed within a radius.
16. Coding Galacticus

tfamily \textcolor{red}{\textless *type(treeNode)\textgreater} host() Return a pointer to the host
\textcolor{red}{\textless type(abundances)\textgreater} hotHaloCoolingAbundancesRate() Cumulate to the rate of the
hotHaloCoolingAbundances property of the hotHalo component.

tfamily \textcolor{red}{\textless double\textgreater} hotHaloCoolingAngularMomentumRate() Cumulate to the rate of the
hotHaloCoolingAngularMomentum property of the hotHalo component.

tfamily \textcolor{red}{\textless double\textgreater} hotHaloCoolingMassRate() Cumulate to the rate of the hotHaloCoolingMass
property of the hotHalo component.

tfamily \void initialize() Initialize the object.

tfamily \textcolor{red}{\textless double\textgreater} mergeTime() Get the mergeTime property of the
\textcolor{red}{\textless varying\_string\textgreater	extless:	extgreater} mergeTimeAttributeMatch() Return a list of implementations that
provide the given list off attributes for the mergeTime property of the satellite component

tfamily \intzero mergeTimeCount() Compute the count of evolvable quantities in the mergeTime property of the SatelliteVerySimple component.

tfamily \textcolor{red}{\textless double\textgreater} mergeTimeIsGettable() Get the mergeTime property of the
\textcolor{red}{\textlesstype(longIntegerHistory)\textgreater} mergeTimeScale() Set the scale of the mergeTime property of the SatelliteVerySimple component.

tfamily \void mergeTimeSet() Set the mergeTime property of the satellite component.

tfamily \void nameFromIndex() Specify whether the mergeTime property of the satellite component is settable.

tfamily \void mergeTimeRate() Cumulate to the rate of the mergeTime property of the SatelliteVerySimple component.

tfamily \void nodeIndex() Get the nodeIndex property of the satellite component.

tfamily \textcolor{red}{\textless varying\_string\textgreater} nodeIndexAttributeMatch() Return a list of implementations that
provide the given list off attributes for the nodeIndex property of the satellite component

tfamily \textcolor{red}{\textlesstype(longIntegerHistory)\textgreater} nodeIndexHistory() Get the nodeIndexHistory property of the satellite component.
16.5. Objects

tfamily \textcolor{red}{\textless type(longIntegerHistory)\textgreater} nodeIndexHistoryIsGettable() Get the nodeIndexHistory property of the satellite component.

tfamily \logicalzero nodeIndexHistoryIsSettable() Specify whether the nodeIndexHistory property of the satellite component is settable.

tfamily \void nodeIndexHistorySet(<type(longIntegerHistory)> value) Set the nodeIndexHistory property of the satellite component.

tfamily \textcolor{red}{\textless integer(kind=kind\_int8)\textgreater} nodeIndexIsGettable() Get the nodeIndex property of the satellite component.

tfamily \logicalzero nodeIndexIsSettable() Specify whether the nodeIndex property of the satellite component is settable.

tfamily \logicalzero nullIsActive() Return whether the null implementation of the satellite component class is active.

tfamily \void odeStepRatesInitialize() Initialize rates for evolvable properties.

tfamily \void odeStepScalesInitialize() Initialize scales for evolvable properties.

tfamily \logicalzero orbitingIsActive() Return whether the orbiting implementation of the satellite component class is active.

tfamily \void output(<integer> integerProperty ↔, <integer> integerBufferCount ↔, <integer(;)> integerBuffer ↔, <integer> doubleProperty ↔, <integer> doubleBufferCount ↔, <double(;)> doubleBuffer ↔, <double> time →, <integer> instance →) Generate values of outputtable properties.

tfamily \void outputCount(<integer> integerPropertyCount ↔, <integer> doublePropertyCount ↔, <double> time →, <integer> instance →) Compute a count of outputtable properties.

tfamily \void outputNames(<integer> integerProperty ↔, <char[*]()> integerPropertyNames ↔, <char[*]()> integerPropertyComments ↔, <double(;)> integerPropertyUnitsSI ↔, <integer> doubleProperty ↔, <char[*]()> doublePropertyNames ↔, <char[*]()> doublePropertyComments ↔, <double(;)> doublePropertyUnitsSI ↔, <double> time →, <integer> instance →) Generate names of outputtable properties.

16.5. Objects

tfamily \textcolor{red}{\textless double(;)\textgreater} position() Get the position property of the satellite component.

tfamily \textcolor{red}{\textless type(varying\_string)(;)\textgreater} positionAttributeMatch(<logical>[requireGettable]->, <logical>[requireSettable]->, <logical>[requireEvolvable]->) Return a list of implementations that provide the given list off attributes for the position property of the satellite component.

tfamily \intzero positionCount() Compute the count of evolvable quantities in the position property of the SatelliteOrbiting component.

tfamily \textcolor{red}{\textless double(;)\textgreater} positionIsGettable() Get the position property of the satellite component.

tfamily \logicalzero positionIsSettable() Specify whether the position property of the satellite component is settable.

tfamily \void positionRate(<double(;)> value) Cumulate to the rate of the position property of the SatelliteOrbiting component.
tfamily \ void positionScale\textless double\textgreater\ value) Set the scale of the position property of the SatelliteOrbiting component.

tfamily \ void positionSet\textless double\textgreater\ value) Set the position property of the satellite component.

tfamily \ double zero potential\textless double\textgreater\ radius→, \ componentType\textgreater\ [componentType]→, \ massType\textgreater\ [massType]→, \ logical\ [haloLoaded]→) Compute the gravitational potential.

tfamily \ logical zero presetIsActive() Return whether the preset implementation of the satellite component class is active.

tfamily \ void readRaw\textless integer\textgreater\ fileHandle→) Read a binary dump of the nodeComponent from the given fileHandle.

tfamily \ double zero rotationCurve\textless double\textgreater\ radius→, \ componentType\textgreater\ [componentType]→, \ massType\textgreater\ [massType]→, \ logical\ [haloLoaded]→) Compute the rotation curve.

tfamily \ double zero rotationCurveGradient\textless double\textgreater\ radius→, \ componentType\textgreater\ [componentType]→, \ massType\textgreater\ [massType]→, \ logical\ [haloLoaded]→) Compute the rotation curve gradient.

tfamily \ int zero serializeCount() Return a count of the number of evolvable quantities to be evolved.

tfamily \ void serializeRates\textless double\textgreater\ array→) Serialize the evolvable rates to an array.

tfamily \ void serializeScales\textless double\textgreater\ array→) Serialize the evolvable scales to an array.

tfamily \ void serializeValues\textless double\textgreater\ array→) Serialize the evolvable quantities to an array.

tfamily \ logical zero standardIsActive() Return whether the standard implementation of the satellite component class is active.

tfamily \ double zero surfaceDensity\textless double(3)\textgreater\ positionCylindrical→, \ componentType\textgreater\ [componentType]→, \ massType\textgreater\ [massType]→, \ weightBy\textless string\textgreater\ [weightBy]→, \ integer\ [weightIndex]→, \ logical\ [haloLoaded]→) Compute the surface density.

tfamily \ double \textcolor{red}{\textless double\textgreater} tidalHeatingNormalized() Get the tidalHeatingNormalized property of the satellite component.

tfamily \ double \textcolor{red}{\textless double\textgreater\ type(varying_string):} tidalHeatingNormalizedAttributeMatch\textless logical\ [requireGettable]→, \ logical\ [requireSettable]→, \ logical\ [requireEvolvable]→) Return a list of implementations that provide the given list off attributes for the tidalHeatingNormalized property of the satellite component

tfamily \ int zero tidalHeatingNormalizedCount() Compute the count of evolvable quantities in the tidalHeatingNormalized property of the SatelliteOrbiting component.

tfamily \ double \textcolor{red}{\textless double\textgreater\ type} tidalHeatingNormalizedIsGettable() Get the tidalHeatingNormalized property of the satellite component.

tfamily \ logical zero tidalHeatingNormalizedIsSettable() Specify whether the tidalHeatingNormalized property of the satellite component is settable.

tfamily \ void tidalHeatingNormalizedRate\textless double\textgreater\ value) Cumulate to the rate of the tidalHeatingNormalized property of the SatelliteOrbiting component.

tfamily \ void tidalHeatingNormalizedScale\textless double\textgreater\ value) Set the scale of the tidalHeatingNormalized property of the SatelliteOrbiting component.
16.5. Objects

tfamily \void tidalHeatingNormalizedSet(<double> value) Set the tidalHeatingNormalized property of the satellite component.

tfamily \textcolor{red}{\textless\text{textless type(tensorRank2Dimension3Symmetric)\textgreater}} tidalTensorPathIntegrated() Get the tidalTensorPathIntegrated property of the satellite component.

tfamily \textcolor{red}{\textless\text{textless type(varying\_string)\textgreater}} tidalTensorPathIntegratedAttributeMatch(<logical>[requireGettable] → , <logical>[requireSettable] → , <logical>[requireEvolvable] → ) Return a list of implementations that provide the given list of attributes for the tidalTensorPathIntegrated property of the satellite component.

tfamily \intzero tidalTensorPathIntegratedCount() Compute the count of evolvable quantities in the tidalTensorPathIntegrated property of the SatelliteOrbiting component.

tfamily \textcolor{red}{\textless\text{textless type(tensorRank2Dimension3Symmetric)\textgreater}} tidalTensorPathIntegratedIsGettable() Get the tidalTensorPathIntegrated property of the satellite component.

tfamily \logicalzero tidalTensorPathIntegratedIsSettable() Specify whether the tidalTensorPathIntegrated property of the satellite component is settable.

tfamily \void tidalTensorPathIntegratedRate(<type(tensorRank2Dimension3Symmetric)> value) Cumulate to the rate of the tidalTensorPathIntegrated property of the SatelliteOrbiting component.

tfamily \void tidalTensorPathIntegratedScale(<type(tensorRank2Dimension3Symmetric)> value) Set the scale of the tidalTensorPathIntegrated property of the SatelliteOrbiting component.

tfamily \void tidalTensorPathIntegratedSet(<type(tensorRank2Dimension3Symmetric)> value) Set the tidalTensorPathIntegrated property of the satellite component.

tfamily \\textcolor{red}{\textless\text{type(varying\_string)\textgreater}} type() Return the type of this object.

tfamily \\textcolor{red}{\textless\text{textless type(varying\_string)\textgreater}} velocity() Get the velocity property of the satellite component.

tfamily \\textcolor{red}{\textless\text{textless type(varying\_string)\textgreater}} velocityAttributeMatch(<logical>[requireGettable] → , <logical>[requireSettable] → , <logical>[requireEvolvable] → ) Return a list of implementations that provide the given list of attributes for the velocity property of the satellite component.
tfamily `\intzero` velocityCount() Compute the count of evolvable quantities in the `velocity` property of the `SatelliteOrbiting` component.

tfamily `\textcolor{red}{\textless double(:)\textgreater}` velocityIsGettable() Get the `velocity` property of the `satellite` component.

tfamily `\logicalzero` velocityIsSettable() Specify whether the `velocity` property of the `satellite` component is settable.

tfamily `\void` velocityRate(<`double(:)`> value) Cumulate to the rate of the `velocity` property of the `SatelliteOrbiting` component.

tfamily `\void` velocityScale(<`double(:)`> value) Set the scale of the `velocity` property of the `SatelliteOrbiting` component.

tfamily `\void` velocitySet(<`double(:)`> value) Set the `velocity` property of the `satellite` component.

tfamily `\logicalzero` verySimpleIsActive() Return whether the verySimple implementation of the `satellite` component class is active.

tfamily `\textcolor{red}{\textless type(keplerOrbit)\textgreater}` virialOrbit() Get the `virialOrbit` property of the `satellite` component.

tfamily `\textcolor{red}{\textlesstype(varying_string)(:)\textgreater}` virialOrbitAttributeMatch(<`logical`>[requireGettable]→, <`logical`>[requireSettable]→, <`logical`>[requireEvolvable]→) Return a list of implementations that provide the given list off attributes for the `virialOrbit` property of the `satellite` component

tfamily `\textcolor{red}{\textlesstype(keplerOrbit)\textgreater}` virialOrbitIsGettable() Get the `virialOrbit` property of the `satellite` component.

tfamily `\logicalzero` virialOrbitIsSettable() Specify whether the `virialOrbit` property of the `satellite` component is settable.

tfamily `\void` virialOrbitSet(<`type(keplerOrbit)`> value) Set the `virialOrbit` property of the `satellite` component.

tfamily `\textcolor{red}{\textless double\textgreater}` boundMass() Get the `boundMass` property of the `satellite` component.

tfamily `\textcolor{red}{\textlesstype(varying_string)(:)\textgreater}` boundMassAttributeMatch(<`logical`>[requireGettable]→, <`logical`>[requireSettable]→, <`logical`>[requireEvolvable]→) Return a list of implementations that provide the given list off attributes for the `boundMass` property of the `satellite` component

tfamily `\intzero` boundMassCount() Compute the count of evolvable quantities in the `boundMass` property of the `SatelliteStandard` component.

tfamily `\textcolor{red}{\textlesstype(history)(:)\textgreater}` boundMassHistory() Get the `boundMassHistory` property of the `satellite` component.

tfamily `\textcolor{red}{\textlesstype(varying_string)(:)\textgreater}` boundMassHistoryAttributeMatch(<`logical`>[requireGettable]→, <`logical`>[requireSettable]→, <`logical`>[requireEvolvable]→) Return a list of implementations that provide the given list off attributes for the `boundMassHistory` property of the `satellite` component
16.5. Objects

tfamily \textcolor{red}{\textless type(history)\textgreater} boundMassHistoryIsGettable() Get the boundMassHistory property of the satellite component.

tfamily \logicalzero boundMassHistoryIsSettable() Specify whether the boundMassHistory property of the satellite component is settable.

tfamily \void boundMassHistorySet(<type(history)> value) Set the boundMassHistory property of the satellite component.

tfamily \textcolor{red}{\textless double\textgreater} boundMassIsGettable() Get the boundMass property of the satellite component.

tfamily \logicalzero boundMassIsSettable() Specify whether the boundMass property of the satellite component is settable.

tfamily \void boundMassRate(<double> value) Cumulate to the rate of the boundMass property of the SatelliteStandard component.

tfamily \void boundMassScale(<double> value) Set the scale of the boundMass property of the SatelliteStandard component.

tfamily \void boundMassSet(<double> value) Set the boundMass property of the satellite component.

tfamily \void builder(<type(node)>componentDefinition →) Build a nodeComponent from a supplied XML definition.

tfamily \doublezero density(<double(3)> positionSpherical→, <componentType> [componentType]→, <massType> [massType]→, <weightBy> [weightBy]→, <integer> [weightIndex]→, <logical> [haloLoaded]→) Compute the density.

tfamily \void deserializeRates(<double(:)> array←) Deserialize the evolvable rates from an array.

tfamily \void deserializeScales(<double(:)> array←) Deserialize the evolvable scales from an array.

tfamily \void deserializeValues(<double(:)> array←) Deserialize the evolvable quantities from an array.

tfamily \void destroy() Destroy the object.

tfamily \void dump() Generate an ASCII dump of all properties.

tfamily \void dumpRaw(<integer> fileHandle→) Generate a binary dump of all properties.

tfamily \void dumpXML() Generate an XML dump of all properties.

tfamily \doublezero enclosedMass(<double> radius→, <componentType> [componentType]→, <massType> [massType]→, <weightBy> [weightBy]→, <integer> [weightIndex]→, <logical> [haloLoaded]→) Compute the mass enclosed within a radius.

tfamily \textcolor{red}{\textless type(treeNode)\textgreater} host() Return a pointer to the host TreeNode object.

tfamily \void hotHaloCoolingAbundancesRate(<type(abundances)> value) Cumulate to the rate of the hotHaloCoolingAbundances property of the hotHalo component.

tfamily \void hotHaloCoolingAngularMomentumRate(<double> value) Cumulate to the rate of the hotHaloCoolingAngularMomentum property of the hotHalo component.
tfamily \void hotHaloCoolingMassRate(<double> value) Cumulate to the rate of the hotHaloCoolingMass property of the hotHalo component.

tfamily \void initialize() Initialize the object.

tfamily \textcolor{red}{\textless double\textgreater} mergeTime() Get the mergeTime property of the satellite component.

tfamily \textcolor{red}{\textless double\textgreater} mergeTime() Get the mergeTime property of the satellite component.

tfamily \textcolor{red}{\textless double\textgreater} mergeTimeIsGettable() Get the mergeTime property of the satellite component.

tfamily \logical zero mergeTimeIsSettable() Specify whether the mergeTime property of the satellite component is settable.

tfamily \void mergeTimeRate(<double> value) Cumulate to the rate of the mergeTime property of the SatelliteVerySimple component.

tfamily \void mergeTimeScale(<double> value) Set the scale of the mergeTime property of the SatelliteVerySimple component.

tfamily \void mergeTimeSet(<double> value) Set the mergeTime property of the satellite component.

tfamily \void nameFromIndex(<integer> count →, <varying_string> name ←) Return the name of a property given is index.

tfamily \textcolor{red}{\textless integer(kind=kind_int8)\textgreater} nodeIndex() Get the nodeIndex property of the satellite component.

tfamily \textcolor{red}{\textless type(varying_string)\textgreater} nodeIndexHistory() Get the nodeIndexHistory property of the satellite component.

tfamily \textcolor{red}{\textless type(longIntegerHistory)\textgreater} nodeIndexHistory() Get the nodeIndexHistory property of the satellite component.

tfamily \textcolor{red}{\textless type(longIntegerHistory)\textgreater} nodeIndexHistoryIsGettable() Get the nodeIndexHistory property of the satellite component.

tfamily \logical zero nodeIndexHistoryIsSettable() Specify whether the nodeIndexHistory property of the satellite component is settable.

tfamily \void nodeIndexHistorySet(<type(longIntegerHistory)> value) Set the nodeIndexHistory property of the satellite component.
16.5. Objects

tfamily \textcolor{red}{\textless integer(kind=kind\_int8)\textgreater} nodeIndexIsGettable() Get the
nodeIndex property of the satellite component.

tfamily \logicalzero nodeIndexIsSettable() Specify whether the nodeIndex property of the satellite
cOMPONENT is settable.

tfamily \logicalzero nullIsActive() Return whether the null implementation of the satellite component
class is active.

tfamily \void odeStepRatesInitialize() Initialize rates for evolvable properties.

tfamily \void odeStepScalesInitialize() Initialize scales for evolvable properties.

tfamily \logicalzero orbitingIsActive() Return whether the orbiting implementation of the satellite com-
ponent class is active.

tfamily \void output(<integer> integerProperty↔, <integer> integerBufferCount↔, <integer(:,:)> integerBuffer↔, <integer>doubleProperty↔, <integer> doubleBufferCount↔, <double(:,:)> doubleBuffer↔, <double> time→, <integer> instance→) Generate values of outputtable properties.

tfamily \void outputCount(<integer>integerPropertyCount↔, <integer>doublePropertyCount↔, <double> time→, <integer> instance→) Compute a count of outputtable properties.

tfamily \void outputNames(<integer>integerProperty↔, <char[\ast](::)>integerPropertyNames↔, <char[\ast](::)>integerPropertyComments↔, <double(:)>integerPropertyUnitsSI↔, <integer>doubleProperty↔, <char[\ast](::)>doublePropertyNames↔, <char[\ast](::)>doublePropertyComments↔, <double(:)>doublePropertyUnitsSI↔, <double> time→, <integer> instance→) Generate names of outputtable properties.

tfamily \textcolor{red}{\textless double(:)\textgreater} position() Get the position property of the satellite component.

tfamily \textcolor{red}{\textlesstype(varying\_string)(::)\textgreater} positionAttributeMatch(<logical>[requireGettable]→, <logical>[requireSettable]→, <logical>[requireEvolvable]→) Return a list of implementations that provide the given list off attributes for the position property of the satellite component

tfamily \intzero positionCount() Compute the count of evolvable quantities in the position property of the SatelliteOrbiting component.

tfamily \textcolor{red}{\textless double(:)\textgreater} positionIsGettable() Get the position prop-
erty of the satellite component.

tfamily \logicalzero positionIsSettable() Specify whether the position property of the satellite comp-
ONENT is settable.

tfamily \void positionRate(<double(:)> value) Cumulate to the rate of the position property of the SatelliteOrbiting component.

tfamily \void positionScale(<double(:)> value) Set the scale of the position property of the SatelliteOrbiting component.

tfamily \void positionSet(<double(:)> value) Set the position property of the satellite component.

tfamily \doublezero potential(<double> radius→, <componentType>[componentType]→, <massType>[massType]→, <logical>[haloLoaded]→) Compute the gravitational potential.
tfamily \logicalzero presetIsActive() Return whether the preset implementation of the satellite component class is active.

tfamily \void readRaw(<integer> fileHandle →) Read a binary dump of the nodeComponent from the given fileHandle.

tfamily \doublezero rotationCurve(<double> radius →, <componentType> [componentType] →, <massType> [massType] →, <logical> [haloLoaded] →) Compute the rotation curve.

tfamily \doublezero rotationCurveGradient(<double> radius →, <componentType> [componentType] →, <massType> [massType] →, <logical> [haloLoaded] →) Compute the rotation curve gradient.

tfamily \intzero serializeCount() Return a count of the number of evolvable quantities to be evolved.

tfamily \void serializeRates(<double(:)> array →) Serialize the evolvable rates to an array.

tfamily \void serializeScales(<double(:)> array →) Serialize the evolvable scales to an array.

tfamily \void serializeValues(<double(:)> array →) Serialize the evolvable quantities to an array.

tfamily \logicalzero standardIsActive() Return whether the standard implementation of the satellite component class is active.

tfamily \doublezero surfaceDensity(<double(3)> positionCylindrical →, <componentType> [componentType] →, <massType> [massType] →, <weightBy> [weightBy] →, <integer> [weightIndex] →, <logical> [haloLoaded] →) Compute the surface density.

tfamily \textcolor{red}{\textless double\textgreater} tidalHeatingNormalized() Get the tidalHeatingNormalized property of the satellite component.

tfamily \textcolor{red}{\textless type(varying\_string)(:)\textgreater} tidalHeatingNormalizedAttributeMatch(<logical>[requireGettable] →, <logical>[requireSettable] →, <logical>[requireEvolvable] →) Return a list of implementations that provide the given list of attributes for the tidalHeatingNormalized property of the SatelliteOrbiting component.

tfamily \intzero tidalHeatingNormalizedCount() Compute the count of evolvable quantities in the tidalHeatingNormalized property of the SatelliteOrbiting component.

tfamily \textcolor{red}{\textless double\textgreater} tidalHeatingNormalizedIsGettable() Get the tidalHeatingNormalized property of the satellite component.

tfamily \logicalzero tidalHeatingNormalizedIsSettable() Specify whether the tidalHeatingNormalized property of the satellite component is settable.

tfamily \void tidalHeatingNormalizedRate(<double> value) Cumulate to the rate of the tidalHeatingNormalized property of the SatelliteOrbiting component.

tfamily \void tidalHeatingNormalizedScale(<double> value) Set the scale of the tidalHeatingNormalized property of the SatelliteOrbiting component.

tfamily \void tidalHeatingNormalizedSet(<double> value) Set the tidalHeatingNormalized property of the satellite component.

tfamily \textcolor{red}{\textless type(tensorRank2Dimension3Symmetric):\textgreater} tidalTensorPathIntegrated() Get the tidalTensorPathIntegrated property of the satellite component.
tfamily \textcolor{red}\{	extless type(varying\_string)()\textgreater\} \textgreater tidalTensorPathIntegratedAttributeMatch(<logical>[requireGettable]→, <logical>[requireSettable]→, <logical>[requireEvolvable]→)

Return a list of implementations that provide the given list of attributes for the tidalTensorPathIntegrated property of the satellite component.

tfamily \intzero tidalTensorPathIntegratedCount() Compute the count of evolvable quantities in the tidalTensorPathIntegrated property of the SatelliteOrbiting component.

tfamily \textcolor{red}\{\textless type(tensorRank2Dimension3Symmetric)()\textgreater\} tidalTensorPathIntegratedIsGettable() Get the tidalTensorPathIntegrated property of the satellite component.

tfamily \logicalzero tidalTensorPathIntegratedIsSettable() Specify whether the tidalTensorPathIntegrated property of the satellite component is settable.

tfamily \void tidalTensorPathIntegratedRate(<type(tensorRank2Dimension3Symmetric)> value) Cummulate to the rate of the tidalTensorPathIntegrated property of the SatelliteOrbiting component.

tfamily \void tidalTensorPathIntegratedScale(<type(tensorRank2Dimension3Symmetric)> value) Set the scale of the tidalTensorPathIntegrated property of the SatelliteOrbiting component.

tfamily \void tidalTensorPathIntegratedSet(<type(tensorRank2Dimension3Symmetric)> value) Set the tidalTensorPathIntegrated property of the satellite component.

tfamily \textcolor{red}\{\textless double\textgreater\} timeOfMerging() Get the timeOfMerging property of the satellite component.

tfamily \textcolor{red}\{\textless type(varying\_string)()\textgreater\} timeOfMergingAttributeMatch(<logical>[requireGettable]→, <logical>[requireSettable]→, <logical>[requireEvolvable]→)

Return a list of implementations that provide the given list of attributes for the timeOfMerging property of the satellite component.

tfamily \textcolor{red}\{\textless double\textgreater\} timeOfMergingIsGettable() Get the timeOfMerging property of the satellite component.

tfamily \logicalzero timeOfMergingIsSettable() Specify whether the timeOfMerging property of the satellite component is settable.

tfamily \void timeOfMergingSet(<double> value) Set the timeOfMerging property of the satellite component.

tfamily \textcolor{red}\{\textless type(varying\_string)()\textgreater\} type() Return the type of this object.

tfamily \textcolor{red}\{\textless double()\textgreater\} velocity() Get the velocity property of the satellite component.

tfamily \textcolor{red}\{\textless type(varying\_string)()\textgreater\} velocityAttributeMatch(<logical>[requireGettable]→, <logical>[requireSettable]→, <logical>[requireEvolvable]→)

Return a list of implementations that provide the given list of attributes for the velocity property of the satellite component.

tfamily \intzero velocityCount() Compute the count of evolvable quantities in the velocity property of the SatelliteOrbiting component.

tfamily \textcolor{red}\{\textless double()\textgreater\} velocityIsGettable() Get the velocity property of the satellite component.
tfamily \textcolor{red}{\textless type(keplerOrbit)\textgreater} virialOrbit() Get the virialOrbit property of the satellite component.

tfamily \textcolor{red}{\textless double\textgreater} boundMass() Get the boundMass property of the satellite component.

tfamily \textcolor{red}{\textless type(keplerOrbit)\textgreater} virialOrbitAttributeMatch(\textcolor{red}{\textless logical\textgreater}[requireGettable] \rightarrow, \textcolor{red}{\textless logical\textgreater}[requireSettable] \rightarrow, \textcolor{red}{\textless logical\textgreater}[requireEvolvable] \rightarrow) Return a list of implementations that provide the given list of attributes for the virialOrbit property of the satellite component.

tfamily \void virialOrbitFunction(<function()> deferredFunction) Set the function to be used for the get method of the virialOrbit property of the SatelliteStandard component.

tfamily \logicalzero virialOrbitIsAttached() Return whether the get method of the virialOrbit property of the SatelliteStandard component has been attached to a function.

tfamily \void virialOrbitSet(<type(keplerOrbit)> value) Set the virialOrbit property of the satellite component.

tfamily \void virialOrbitSetFunction(<function()> deferredFunction) Set the function to be used for the set method of the virialOrbit property of the SatelliteStandard component.

tfamily \logicalzero virialOrbitSetIsAttached() Return whether the set method of the virialOrbit property of the SatelliteStandard component has been attached to a function.

tfamily \void virialOrbitSetValue(<type(keplerOrbit)> value) Set the virialOrbit property of the satellite component.

tfamily \textcolor{red}{\textless double\textgreater} virialOrbitValue() Get the virialOrbit property of the satellite component.

tfamily nodeComponentSatelliteVerySimple

tfamily \logicalzero velocityIsSettable() Specify whether the velocity property of the satellite component is settable.

tfamily \void velocityRate(<double()> value) Cumulate to the rate of the velocity property of the SatelliteOrbiting component.

tfamily \void velocityScale(<double()> value) Set the scale of the velocity property of the SatelliteOrbiting component.

tfamily \void velocitySet(<double()> value) Set the velocity property of the satellite component.

tfamily \logicalzero verySimpleIsActive() Return whether the verySimple implementation of the satellite component class is active.

tfamily \void velocityRate(<double()> value) Cumulate to the rate of the velocity property of the SatelliteOrbiting component.

tfamily \void velocityScale(<double()> value) Set the scale of the velocity property of the SatelliteOrbiting component.

tfamily \void velocitySet(<double()> value) Set the velocity property of the satellite component.

tfamily \logicalzero verySimpleIsActive() Return whether the verySimple implementation of the satellite component class is active.

644
16.5. Objects

tfamily \textcolor{red}{\textless} intzero boundMassCount() Compute the count of evolvable quantities in the boundMass property of the SatelliteStandard component.

tfamily \textcolor{red}{\textless} type(history)\textgreater boundMassHistory() Get the boundMassHistory property of the satellite component.

tfamily \textcolor{red}{\textless} type(varying\_string)(:)\textgreater boundMassHistoryAttributeMatch(<logical>[requireGettable]→, <logical>[requireSettable]→, <logical>[requireEvolvable]→) Return a list of implementations that provide the given list off attributes for the boundMassHistory property of the satellite component.

tfamily \textcolor{red}{\textless} type(history)\textgreater boundMassHistoryIsGettable() Get the boundMassHistory property of the satellite component.

tfamily \textcolor{red}{\textless} type(history)\textgreater boundMassHistoryIsSettable() Specify whether the boundMassHistory property of the satellite component is settable.

tfamily \void boundMassHistorySet(<type(history)> value) Set the boundMassHistory property of the satellite component.

tfamily \void destruction boundMassScale(<double> value) Set the scale of the boundMass property of the SatelliteStandard component.

tfamily \void boundMassSet(<double> value) Set the boundMass property of the satellite component.

tfamily \void builder(<type(node)>componentDefinition→) Build a nodeComponent from a supplied XML definition.

tfamily \doublezero density(<double(3)> positionSpherical→, <componentType>[componentType]→, <massType>[massType]→, <weightBy>[weightBy]→, <integer>[weightIndex]→, <logical>[haloLoaded]→) Compute the density.

tfamily \void deserializeRates(<double(:)> array←) Deserialize the evolvable rates from an array.

tfamily \void deserializeScales(<double(:)> array←) Deserialize the evolvable scales from an array.

tfamily \void deserializeValues(<double(:)> array←) Deserialize the evolvable quantities from an array.

tfamily \void destroy() Destroy the object.

tfamily \void dump() Generate an ASCII dump of all properties.

tfamily \void dumpRaw(<integer> fileHandle→) Generate a binary dump of all properties.

tfamily \void dumpXML() Generate an XML dump of all properties.
tfamily\[\text{double}\]enclosedMass(\text{<double>}radius\rightarrow,\text{<componentType>}[\text{componentType}]\rightarrow,\text{<massType>}[\text{massType}]\rightarrow,\text{<weightBy>}[\text{weightBy}]\rightarrow,\text{<integer>}[\text{weightIndex}]\rightarrow,\text{<logical>}[\text{haloLoaded}]\rightarrow)
Compute the mass enclosed within a radius.

tfamily\{\text{red}\}{*\text{type}(\text{treeNode})*}\text{host()}\text{Return a pointer to the host treeNode object.}

tfamily \textcolor{red}{\textless \textsf{double}(;;):\textgreater} position() Get the position property of the satellite component.

tfamily \textcolor{red}{\textless \textsf{type(varying\_string)(;)::textgreater}} positionAttributeMatch(<\textsf{logical}:[requireGettable]\rightarrow,<\textsf{logical}:[requireSettable]\rightarrow,<\textsf{logical}:[requireEvolvable]\rightarrow) Return a list of implementations that provide the given list of attributes for the position property of the satellite component.

tfamily \int zero positionCount() Compute the count of evolvable quantities in the position property of the SatelliteOrbiting component.

tfamily \textcolor{red}{\textless \textsf{double}(;;):\textgreater} positionIsGettable() Get the position property of the satellite component.
16. Coding Galacticus

tfamily \logicalzero positionIsSettable() Specify whether the position property of the satellite component is settable.

tfamily \void positionRate(<double():> value) Cumulate to the rate of the position property of the SatelliteOrbiting component.

tfamily \void positionScale(<double():> value) Set the scale of the position property of the SatelliteOrbiting component.

tfamily \void positionSet(<double():> value) Set the position property of the satellite component.

tfamily \double zero potential(<double> radius →, <componentType> [componentType] →, <massType> [massType] →, <logical> [haloLoaded] →) Compute the gravitational potential.

tfamily \logicalzero presetIsActive() Return whether the preset implementation of the satellite component class is active.

tfamily \void readRaw(<integer> fileHandle →) Read a binary dump of the nodeComponent from the given fileHandle.

tfamily \double zero rotationCurve(<double> radius →, <componentType> [componentType] →, <massType> [massType] →, <logical> [haloLoaded] →) Compute the rotation curve.

tfamily \double zero rotationCurveGradient(<double> radius →, <componentType> [componentType] →, <massType> [massType] →, <logical> [haloLoaded] →) Compute the rotation curve gradient.

tfamily \intzero serializeCount() Return a count of the number of evolvable quantities to be evolved.

tfamily \void serializeRates(<double():> array →) Serialize the evolvable rates to an array.

tfamily \void serializeScales(<double():> array →) Serialize the evolvable scales to an array.

tfamily \void serializeValues(<double():> array →) Serialize the evolvable quantities to an array.

tfamily \logicalzero standardIsActive() Return whether the standard implementation of the satellite component class is active.

tfamily \double zero surfaceDensity(<double(3)> positionCylindrical →, <componentType> [componentType] →, <massType> [massType] →, <weightBy> [weightBy] →, <integer> [weightIndex] →, <logical> [haloLoaded] →) Compute the surface density.

tfamily \textcolor{red}{\textless double\textgreater} tidalHeatingNormalized() Get the tidalHeatingNormalized property of the satellite component.

tfamily \textcolor{red}{\textless varying\_string\rangle::\textgreater} tidalHeatingNormalizedAttributeMatch(<logical> [requireGettable] →, <logical> [requireSettable] →, <logical> [requireEvolvable] →) Return a list of implementations that provide the given list of attributes for the tidalHeatingNormalized property of the satellite component.

tfamily \intzero tidalHeatingNormalizedCount() Compute the count of evolvable quantities in the tidalHeatingNormalized property of the SatelliteOrbiting component.

tfamily \textcolor{red}{\textless double\textgreater} tidalHeatingNormalizedIsGettable() Get the tidalHeatingNormalized property of the satellite component.

tfamily \logicalzero tidalHeatingNormalizedIsSettable() Specify whether the tidalHeatingNormalized property of the satellite component is settable.
16.5. Objects

tfamily \void tidalHeatingNormalizedRate(<double> value) Cumulate to the rate of the tidalHeatingNormalized property of the SatelliteOrbiting component.

tfamily \void tidalHeatingNormalizedScale(<double> value) Set the scale of the tidalHeatingNormalized property of the SatelliteOrbiting component.

tfamily \void tidalHeatingNormalizedSet(<double> value) Set the tidalHeatingNormalized property of the satellite component.

tfamily \textcolor{red}{\textless type(tensorRank2Dimension3Symmetric)\textgreater} tidalTensorPathIntegrated() Get the tidalTensorPathIntegrated property of the satellite component.

tfamily \textcolor{red}{\textless type(varying_string)(:)\textgreater} tidalTensorPathIntegratedAttributeMatch(<logical>[requireGettable]→, <logical>[requireSettable]→, <logical>[requireEvolvable]→) Return a list of implementations that provide the given list off attributes for the tidalTensorPathIntegrated property of the satellite component.

tfamily \intzero tidalTensorPathIntegratedCount() Compute the count of evolvable quantities in the tidalTensorPathIntegrated property of the SatelliteOrbiting component.

tfamily \textcolor{red}{\textless type(tensorRank2Dimension3Symmetric)\textgreater} tidalTensorPathIntegratedIsGettable() Get the tidalTensorPathIntegrated property of the satellite component.

tfamily \logicalzero tidalTensorPathIntegratedIsSettable() Specify whether the tidalTensorPathIntegrated property of the satellite component is settable.

tfamily \void tidalTensorPathIntegratedRate(<type(tensorRank2Dimension3Symmetric)> value) Cumulate to the rate of the tidalTensorPathIntegrated property of the SatelliteOrbiting component.

tfamily \void tidalTensorPathIntegratedScale(<type(tensorRank2Dimension3Symmetric)> value) Set the scale of the tidalTensorPathIntegrated property of the SatelliteOrbiting component.

tfamily \void tidalTensorPathIntegratedSet(<type(tensorRank2Dimension3Symmetric)> value) Set the tidalTensorPathIntegrated property of the satellite component.

tfamily \textcolor{red}{\textless double\textgreater} timeOfMerging() Get the timeOfMerging property of the satellite component.

tfamily \textcolor{red}{\textless type(varying_string)(:)\textgreater} timeOfMergingAttributeMatch(<logical>[requireGettable]→, <logical>[requireSettable]→, <logical>[requireEvolvable]→) Return a list of implementations that provide the given list off attributes for the timeOfMerging property of the satellite component.

tfamily \textcolor{red}{\textless double\textgreater} timeOfMergingIsGettable() Get the timeOfMerging property of the satellite component.

tfamily \logicalzero timeOfMergingIsSettable() Specify whether the timeOfMerging property of the satellite component is settable.

tfamily \void timeOfMergingSet(<double> value) Set the timeOfMerging property of the satellite component.

tfamily \textcolor{red}{\textless type(varying_string)\textgreater} type() Return the type of this object.
tfamily \textcolor{red}{\textless double(:)\textgreater} velocity() Get the velocity property of the satellite component.

tfamily \textcolor{red}{\textless type(varying\_string):\textgreater} velocityAttributeMatch(\textcolor{red}{\textless logical:\textgreater[requireGettable]} →, \textcolor{red}{\textless logical:\textgreater[requireSettable]} →, \textcolor{red}{\textless logical:\textgreater[requireEvolvable]} →) Return a list of implementations that provide the given list off attributes for the velocity property of the satellite component.

tfamily \intzero velocityCount() Compute the count of evolvable quantities in the velocity property of the SatelliteOrbiting component.

tfamily \textcolor{red}{\textless double(:)\textgreater} velocityIsGettable() Get the velocity property of the satellite component.

tfamily \logicalzero velocityIsSettable() Specify whether the velocity property of the satellite component is settable.

tfamily \void velocityRate(<double(:)> value) Cumulate to the rate of the velocity property of the SatelliteOrbiting component.

tfamily \void velocityScale(<double(:)> value) Set the scale of the velocity property of the SatelliteOrbiting component.

tfamily \void velocitySet(<double(:)> value) Set the velocity property of the satellite component.

tfamily \logicalzero verySimpleIsActive() Return whether the verySimple implementation of the satellite component class is active.

tfamily \textcolor{red}{\textless type(keplerOrbit):\textgreater} virialOrbit() Get the virialOrbit property of the satellite component.

tfamily \textcolor{red}{\textless type(varying\_string):\textgreater} virialOrbitAttributeMatch(\textcolor{red}{\textless logical:\textgreater[requireGettable]} →, \textcolor{red}{\textless logical:\textgreater[requireSettable]} →, \textcolor{red}{\textless logical:\textgreater[requireEvolvable]} →) Return a list of implementations that provide the given list off attributes for the virialOrbit property of the satellite component.

tfamily \void virialOrbitSet(<type(keplerOrbit)> value) Set the virialOrbit property of the satellite component.

tfamily \logicalzero virialOrbitIsSettable() Specify whether the virialOrbit property of the satellite component is settable.

tfamily \void virialOrbitSet(<type(keplerOrbit)> value) Set the virialOrbit property of the satellite component.

tfamily nodeComponentSpheroid

tfamily \textcolor{red}{\textless type(keplerOrbit):\textgreater} abundancesGas() Get the abundancesGas property of the spheroid component.

tfamily \textcolor{red}{\textless type(varying\_string):\textgreater} abundancesGasAttributeMatch(\textcolor{red}{\textless logical:\textgreater[requireGettable]} →, \textcolor{red}{\textless logical:\textgreater[requireSettable]} →, \textcolor{red}{\textless logical:\textgreater[requireEvolvable]} →) Return a list of implementations that provide the given list off attributes for the abundancesGas property of the spheroid component.

tfamily \intzero abundancesGasCount() Compute the count of evolvable quantities in the abundancesGas property of the SpheroidStandard component.
16.5. Objects

tfamily \textcolor{red}{\textless type(abundances)\textgreater} abundancesGasIsGettable() Get the
abundancesGas property of the spheroid component.

tfamily \textcolor{red}{\textless type(abundances)\textgreater} abundancesGasIsSettable() Specify whether the abundancesGas property of the
spheroid component is settable.

tfamily void abundancesGasRate(<type(abundances)> value) Cumulate to the rate of the abundancesGas
property of the SpheroidStandard component.

tfamily void abundancesGasScale(<type(abundances)> value) Set the scale of the abundancesGas
property of the SpheroidStandard component.

tfamily void abundancesGasSet(<type(abundances)> value) Set the abundancesGas property of the
spheroid component.

abundancesGasRate(<type(abundances)>value)

abundancesGasScale(<type(abundances)> value)

abundancesGasSet(<type(abundances)> value)

abundancesGasIsGettable()

abundancesGasIsSettable()

abundancesGasRate(<type(abundances)> value)

abundancesGasScale(<type(abundances)> value)

abundancesGasSet(<type(abundances)> value)

abundancesGasIsGettable()

abundancesGasIsSettable()

abundancesGasRate(<type(abundances)> value)

abundancesGasScale(<type(abundances)> value)

abundancesGasSet(<type(abundances)> value)

abundancesGasIsGettable()

abundancesGasIsSettable()

abundancesGasRate(<type(abundances)> value)

abundancesGasScale(<type(abundances)> value)

abundancesGasSet(<type(abundances)> value)

abundancesGasIsGettable()

abundancesGasIsSettable()

abundancesGasRate(<type(abundances)> value)

abundancesGasScale(<type(abundances)> value)

abundancesGasSet(<type(abundances)> value)

abundancesGasIsGettable()

abundances_gas_is_settable()

abundances_gas_rate(<type(abundances)> value)

abundances_gas_scale(<type(abundances)> value)

abundances_gas_set(<type(abundances)> value)

abundances_gas_is_gettable()

abundances_gas_is_settable()
tfamily logical zero angularMomentumIsSettable() Specify whether the \textit{angularMomentum} property of the \textit{spheroid} component is settable.

tfamily void angularMomentumRate(\textcolor{red}{\textless} double \textcolor{red}{\textgreater} value) Cumulate to the rate of the \textit{angularMomentum} property of the \textit{SpheroidStandard} component.

tfamily void angularMomentumScale(\textcolor{red}{\textless} double \textcolor{red}{\textgreater} value) Set the scale of the \textit{angularMomentum} property of the \textit{SpheroidStandard} component.

tfamily void angularMomentumSet(\textcolor{red}{\textless} double \textcolor{red}{\textgreater} value) Set the \textit{angularMomentum} property of the \textit{spheroid} component.

tfamily void builder(\textcolor{red}{\textless} \textit{type(node)} \textcolor{red}{\textgreater} componentDefinition \textcolor{red}{\rightarrow}) Build a \textit{nodeComponent} from a supplied XML definition.

tfamily double zero density(\textcolor{red}{\textless} double(3) \textcolor{red}{\textgreater} positionSpherical \textcolor{red}{\rightarrow}, \textcolor{red}{\textless} \textit{componentType} \textcolor{red}{\textgreater} [\textcolor{red}{\textgreater} componentType \textcolor{red}{\rightarrow}], \textcolor{red}{\textless} \textit{massType} \textcolor{red}{\textgreater} [\textcolor{red}{\textgreater} massType \textcolor{red}{\rightarrow}], \textcolor{red}{\textless} \textit{weightBy} \textcolor{red}{\textgreater} [\textcolor{red}{\textgreater} weightBy \textcolor{red}{\rightarrow}], \textcolor{red}{\textless} \textit{integer} \textcolor{red}{\textgreater} [\textcolor{red}{\textgreater} weightIndex \textcolor{red}{\rightarrow}], \textcolor{red}{\textless} \textit{logical} \textcolor{red}{\textgreater} [\textcolor{red}{\textgreater} haloLoaded \textcolor{red}{\rightarrow}]) Compute the density.

tfamily void deserializeRates(\textcolor{red}{\textless} double(\textcolor{red}{\textgreater}) array \textcolor{red}{\leftarrow}) Deserialize the evolvable rates from an array.

tfamily void deserializeScales(\textcolor{red}{\textless} double(\textcolor{red}{\textgreater}) array \textcolor{red}{\leftarrow}) Deserialize the evolvable scales from an array.

tfamily void deserializeValues(\textcolor{red}{\textless} double(\textcolor{red}{\textgreater}) array \textcolor{red}{\leftarrow}) Deserialize the evolvable quantities from an array.

tfamily void destroy() Destroy the object.

tfamily void dump() Generate an ASCII dump of all properties.

tfamily void dumpRaw(\textcolor{red}{\textless} \textit{integer} \textcolor{red}{\textgreater} fileHandle \textcolor{red}{\rightarrow}) Generate a binary dump of all properties.

tfamily void dumpXML() Generate an XML dump of all properties.

tfamily double zero enclosedMass(\textcolor{red}{\textless} double \textcolor{red}{\textgreater} radius \textcolor{red}{\rightarrow}, \textcolor{red}{\textless} \textit{componentType} \textcolor{red}{\textgreater} [\textcolor{red}{\textgreater} componentType \textcolor{red}{\rightarrow}], \textcolor{red}{\textless} \textit{massType} \textcolor{red}{\textgreater} [\textcolor{red}{\textgreater} massType \textcolor{red}{\rightarrow}], \textcolor{red}{\textless} \textit{weightBy} \textcolor{red}{\textgreater} [\textcolor{red}{\textgreater} weightBy \textcolor{red}{\rightarrow}], \textcolor{red}{\textless} \textit{integer} \textcolor{red}{\textgreater} [\textcolor{red}{\textgreater} weightIndex \textcolor{red}{\rightarrow}], \textcolor{red}{\textless} \textit{logical} \textcolor{red}{\textgreater} [\textcolor{red}{\textgreater} haloLoaded \textcolor{red}{\rightarrow}]) Compute the mass enclosed within a radius.

tfamily \textcolor{red}{\textless} \textit{double(\textcolor{red}{\textgreater}) \textcolor{red}{\textgreater}} energyGasInput() Get the \textit{energyGasInput} property of the \textit{spheroid} component.

tfamily \textcolor{red}{\textless} \textit{double(\textcolor{red}{\textgreater}) \textcolor{red}{\textgreater}} energyGasInputAttributeMatch(\textcolor{red}{\textless} \textit{logical(\textcolor{red}{\textgreater}) \textcolor{red}{\textgreater}} requireGettable \textcolor{red}{\rightarrow}, \textcolor{red}{\textless} \textit{logical(\textcolor{red}{\textgreater}) \textcolor{red}{\textgreater}} requireSettable \textcolor{red}{\rightarrow}, \textcolor{red}{\textless} \textit{logical(\textcolor{red}{\textgreater}) \textcolor{red}{\textgreater}} requireEvolvable \textcolor{red}{\rightarrow}) Return a list of implementations that provide the given list off attributes for the \textit{energyGasInput} property of the \textit{spheroid} component.

tfamily int zero energyGasInputCount() Compute the count of evolvable quantities in the \textit{energyGasInput} property of the \textit{SpheroidStandard} component.

tfamily \textcolor{red}{\textless} \textit{double(\textcolor{red}{\textgreater}) \textcolor{red}{\textgreater}} energyGasInputIsGettable() Get the \textit{energyGasInput} property of the \textit{spheroid} component.

tfamily logical zero energyGasInputIsSettable() Specify whether the \textit{energyGasInput} property of the \textit{spheroid} component is settable.

tfamily void energyGasInputRate(\textcolor{red}{\textless} double \textcolor{red}{\textgreater} value) Cumulate to the rate of the \textit{energyGasInput} property of the \textit{SpheroidStandard} component.
16.5. Objects

- halfMassRadius() Get the halfMassRadius property of the spheroid component.

- halfMassRadiusAttributeMatch() Return a list of implementations that provide the given list of attributes for the halfMassRadius property of the spheroid component.

- halfMassRadiusIsGettable() Get the halfMassRadius property of the spheroid component.

- halfMassRadiusIsSettable() Specify whether the halfMassRadius property of the spheroid component is settable.

- host() Return a pointer to the host TreeNode object.

- hotHaloCoolingAbundancesRate() Cumulate to the rate of the hotHaloCoolingAbundances property of the hotHalo component.

- hotHaloCoolingAngularMomentumRate() Cumulate to the rate of the hotHaloCoolingAngularMomentum property of the hotHalo component.

- hotHaloCoolingMassRate() Cumulate to the rate of the hotHaloCoolingMass property of the hotHalo component.

- initialize() Initialize the object.

- isInitialized() Get the isInitialized property of the spheroid component.

- isInitializedAttributeMatch() Return a list of implementations that provide the given list of attributes for the isInitialized property of the spheroid component.

- isInitializedIsGettable() Get the isInitialized property of the spheroid component.

- isInitializedIsSettable() Specify whether the isInitialized property of the spheroid component is settable.

- isInitializedSet() Set the isInitialized property of the spheroid component.

- luminositiesStellar() Get the luminositiesStellar property of the spheroid component.

- luminositiesStellarAttributeMatch() Return a list of implementations that provide the given list of attributes for the luminositiesStellar property of the spheroid component.

- luminositiesStellarCount() Compute the count of evolvable quantities in the luminositiesStellar property of the SpheroidStandard component.

- luminositiesStellarIsGettable() Get the luminositiesStellar property of the spheroid component.
tfamily \textcolor{red}{\textless \textgreater} luminositiesStellarIsSettable() Specify whether the luminositiesStellar property of the spheroid component is settable.

tfamily \void luminositiesStellarRate(\textcolor{type(stellarLuminosities)} value) Cumulate to the rate of the luminositiesStellar property of the SpheroidStandard component.

tfamily \void luminositiesStellarScale(\textcolor{type(stellarLuminosities)} value) Set the scale of the luminositiesStellar property of the SpheroidStandard component.

tfamily \void luminositiesStellarSet(\textcolor{type(stellarLuminosities)} value) Set the luminositiesStellar property of the spheroid component.

tfamily \textcolor{red}{\textless \textgreater} massGas() Get the massGas property of the spheroid component.

tfamily \textcolor{red}{\textless \textgreater} massGasAttributeMatch(\textcolor{logical\[requireGettable\]} \rightarrow, \textcolor{logical\[requireSettable\]} \rightarrow, \textcolor{logical\[requireEvolvable\]} \rightarrow) Return a list of implementations that provide the given list off attributes for the massGas property of the spheroid component

tfamily \intzero massGasCount() Compute the count of evolvable quantities in the massGas property of the SpheroidStandard component.

tfamily \textcolor{red}{\textless \textgreater} massGasIsGettable() Get the massGas property of the spheroid component.

tfamily \logicalzero massGasIsSettable() Specify whether the massGas property of the spheroid component is settable.

tfamily \void massGasRate(\textcolor{double} value) Cumulate to the rate of the massGas property of the SpheroidStandard component.

tfamily \void massGasScale(\textcolor{double} value) Set the scale of the massGas property of the SpheroidStandard component.

tfamily \void massGasSet(\textcolor{double} value) Set the massGas property of the spheroid component.

tfamily \textcolor{red}{\textless \textgreater} massGasSink() Get the massGasSink property of the spheroid component.

tfamily \textcolor{red}{\textless \textgreater} massGasSinkAttributeMatch(\textcolor{logical\[requireGettable\]} \rightarrow, \textcolor{logical\[requireSettable\]} \rightarrow, \textcolor{logical\[requireEvolvable\]} \rightarrow) Return a list of implementations that provide the given list off attributes for the massGasSink property of the spheroid component

tfamily \intzero massGasSinkCount() Compute the count of evolvable quantities in the massGasSink property of the SpheroidStandard component.

tfamily \textcolor{red}{\textless \textgreater} massGasSinkIsGettable() Get the massGasSink property of the spheroid component.

tfamily \logicalzero massGasSinkIsSettable() Specify whether the massGasSink property of the spheroid component is settable.

tfamily \void massGasSinkRate(\textcolor{double} value) Cumulate to the rate of the massGasSink property of the SpheroidStandard component.
16.5. Objects

tfamily \textcolor{red}{\textless double\textgreater} massStellar() Get the massStellar property of the spheroid component.

tfamily \textcolor{red}{\textless double\textgreater} massStellarAttributeMatch(<logical>[requireGettable] →, <logical>[requireSettable] →, <logical>[requireEvolvable] →) Return a list of implementations that provide the given list off attributes for the massStellar property of the spheroid component.

tfamily \intzero massStellarCount() Compute the count of evolvable quantities in the massStellar property of the SpheroidStandard component.

tfamily \textcolor{red}{\textless double\textgreater} massStellarIsGettable() Get the massStellar property of the spheroid component.

tfamily \logicalzero massStellarIsSettable() Specify whether the massStellar property of the spheroid component is settable.

tfamily \void massStellarRate(<double> value) Cumulate to the rate of the massStellar property of the SpheroidStandard component.

tfamily \void massStellarScale(<double> value) Set the scale of the massStellar property of the SpheroidStandard component.

tfamily \void massStellarSet(<double> value) Set the massStellar property of the spheroid component.

tfamily \void nameFromIndex(<integer> count →, <varying_string> name ←) Return the name of a property given is index.

tfamily \logicalzero nullIsActive() Return whether the null implementation of the spheroid component class is active.

tfamily \void odeStepRatesInitialize() Initialize rates for evolvable properties.

tfamily \void odeStepScalesInitialize() Initialize scales for evolvable properties.

tfamily \void output(<integer> integerProperty ↔, <integer> integerBufferCount ↔, <integer(:,:)> integerBuffer ↔, <integer> doubleProperty ↔, <integer> doubleBufferCount ↔, <double(:,:)> doubleBuffer ↔, <double> time →, <integer> instance →) Generate values of outputtable properties.

tfamily \void outputCount(<integer> integerPropertyCount ↔, <integer> doublePropertyCount ↔, <double> time →, <integer> instance →) Compute a count of outputtable properties.

tfamily \void outputNames(<integer> integerProperty ↔, <char[*](:)> integerPropertyNames ↔, <char[*](:)> integerPropertyComments ↔, <double(:)> integerPropertyUnitsSI ↔, <integer> doubleProperty ↔, <char[*](:)> doublePropertyNames ↔, <char[*](:)> doublePropertyComments ↔, <double(:)> doublePropertyUnitsSI ↔, <double> time →, <integer> instance →) Generate names of outputtable properties.

tfamily \doublezero potential(<double> radius →, <componentType>[componentType] →, <massType>[massType] →, <logical> [haloLoaded] →) Compute the gravitational potential.

tfamily \textcolor{red}{\textless textless double\textgreater} radius() Get the radius property of the spheroid component.
16. Coding Galacticus

tfamily \textcolor{red}{\textless type(varying_string):>}\textgreater radiusAttributeMatch(<logical>[requireGettable]→, <logical>[requireSettable]→, <logical>[requireEvolvable]→) Return a list of implementations that provide the given list of attributes for the radius property of the spheroid component.

tfamily \textcolor{red}{\textless double\textgreater} radiusIsGettable() Get the radius property of the spheroid component.

tfamily \textcolor{red}{\textless type(history):>}\textgreater\textless double\textgreater starFormationRate() Get the starFormationRate property of the spheroid component.

tfamily \textcolor{red}{\textless type(history):>\textgreater} starFormationHistory() Get the starFormationHistory property of the spheroid component.

tfamily \textcolor{red}{\textless type(history):>\textgreater} starFormationHistoryAttributeMatch(<logical>[requireGettable]→, <logical>[requireSettable]→, <logical>[requireEvolvable]→) Return a list of implementations that provide the given list of attributes for the starFormationHistory property of the spheroid component.

tfamily \intzero starFormationHistoryCount() Compute the count of evolvable quantities in the starFormationHistory property of the SpheroidStandard component.

tfamily \textcolor{red}{\textless type(history):>\textgreater} starFormationHistoryIsGettable() Get the starFormationHistory property of the spheroid component.

tfamily \textcolor{red}{\textless type(history):>\textgreater} starFormationHistoryIsSettable() Specify whether the starFormationHistory property of the spheroid component is settable.

tfamily \textcolor{red}{\textless type(history):>\textgreater} starFormationHistoryRate(<type(history)> value) Cumulate to the rate of the starFormationHistory property of the SpheroidStandard component.

tfamily \textcolor{red}{\textless type(history):>\textgreater} starFormationHistoryScale(<type(history)> value) Set the scale of the starFormationHistory property of the SpheroidStandard component.

tfamily \textcolor{red}{\textless type(history):>\textgreater} starFormationHistorySet(<type(history)> value) Set the starFormationHistory property of the spheroid component.

tfamily \textcolor{red}{\textless double\textgreater} starFormationRate() Get the starFormationRate property of the spheroid component.
16.5. Objects

tfamily \textcolor{red}{\textless type(varying\_string)\textgreater} starFormationRateAttributeMatch(<logical> [requireGettable]\rightarrow, <logical> [requireSettable]\rightarrow, <logical> [requireEvolvable]\rightarrow) Return a list of implementations that provide the given list of attributes for the starFormationRate property of the spheroid component.

tfamily \textcolor{red}{\textless double\textgreater} starFormationRateIsGettable() Get the starFormationRate property of the spheroid component.

tfamily \textcolor{red}{\textless boolean\textgreater} starFormationRateIsSettable() Specify whether the starFormationRate property of the spheroid component is settable.

tfamily \textcolor{red}{\textless type(history)\textgreater} stellarPropertiesHistory() Get the stellarPropertiesHistory property of the spheroid component.

tfamily \textcolor{red}{\textless type(varying\_string)\textgreater} stellarPropertiesHistoryAttributeMatch(<logical> [requireGettable]\rightarrow, <logical> [requireSettable]\rightarrow, <logical> [requireEvolvable]\rightarrow) Return a list of implementations that provide the given list of attributes for the stellarPropertiesHistory property of the spheroid component.

tfamily \int zero stellarPropertiesHistoryCount() Compute the count of evolvable quantities in the stellarPropertiesHistory property of the SpheroidStandard component.

tfamily \textcolor{red}{\textless type(history)\textgreater} stellarPropertiesHistoryIsGettable() Get the stellarPropertiesHistory property of the spheroid component.

tfamily \textcolor{red}{\textless boolean\textgreater} stellarPropertiesHistoryIsSettable() Specify whether the stellarPropertiesHistory property of the spheroid component is settable.

tfamily \textcolor{red}{\textless type(history)>\textless double\textgreater} stellarPropertiesHistoryRate(<type(history)> value) Cumulate to the rate of the stellarPropertiesHistory property of the SpheroidStandard component.

tfamily \textcolor{red}{\textless type(history)>\textless double\textgreater} stellarPropertiesHistoryScale(<type(history)> value) Set the scale of the stellarPropertiesHistory property of the SpheroidStandard component.

tfamily \textcolor{red}{\textless type(history)>\textless double\textgreater} stellarPropertiesHistorySet(<type(history)> value) Set the stellarPropertiesHistory property of the spheroid component.

tfamily \textcolor{red}{\textless double\textgreater} surfaceDensity(<double(3)> positionCylindrical\rightarrow, <componentType> [componentType]\rightarrow, <massType> [massType]\rightarrow, <weightBy> [weightBy]\rightarrow, <integer> [weightIndex]\rightarrow, <logical> [haloLoaded]\rightarrow) Compute the surface density.

tfamily \textcolor{red}{\textless type(varying\_string)\textgreater} type() Return the type of this object.

tfamily \textcolor{red}{\textless double\textgreater} velocity() Get the velocity property of the spheroid component.

tfamily \textcolor{red}{\textless type(varying\_string)\textgreater} velocityAttributeMatch(<logical> [requireGettable]\rightarrow, <logical> [requireSettable]\rightarrow, <logical> [requireEvolvable]\rightarrow) Return a list of implementations that provide the given list of attributes for the velocity property of the spheroid component.

tfamily \textcolor{red}{\textless double\textgreater} velocityIsGettable() Get the velocity property of the spheroid component.

tfamily \textcolor{red}{\textless boolean\textgreater} velocityIsSettable() Specify whether the velocity property of the spheroid component is settable.

tfamily \textcolor{red}{\textless double\textgreater} velocitySet(<double> value) Set the velocity property of the spheroid component.
tfamily nodeComponentSpheroidNull

- abundancesGas() Get the abundancesGas property of the spheroid component.
- abundancesGasAttributeMatch(<logical>[requireGettable]→, <logical>[requireSettable]→, <logical>[requireEvolvable]→) Return a list of implementations that provide the given list off attributes for the abundancesGas property of the spheroid component.
- abundancesGasCount() Compute the count of evolvable quantities in the abundancesGas property of the SpheroidStandard component.
- abundancesGasIsGettable() Get the abundancesGas property of the spheroid component.
- abundancesGasIsSettable() Specify whether the abundancesGas property of the spheroid component is settable.
- abundancesGasRate(<type(abundances)> value) Cumulate to the rate of the abundancesGas property of the SpheroidStandard component.
- abundancesGasScale(<type(abundances)> value) Set the scale of the abundancesGas property of the SpheroidStandard component.
- abundancesGasSet(<type(abundances)> value) Set the abundancesGas property of the spheroid component.

- abundancesStellar() Get the abundancesStellar property of the spheroid component.
- abundancesStellarAttributeMatch(<logical>[requireGettable]→, <logical>[requireSettable]→, <logical>[requireEvolvable]→) Return a list of implementations that provide the given list off attributes for the abundancesStellar property of the spheroid component.
- abundancesStellarCount() Compute the count of evolvable quantities in the abundancesStellar property of the SpheroidStandard component.
- abundancesStellarIsGettable() Get the abundancesStellar property of the spheroid component.
- abundancesStellarIsSettable() Specify whether the abundancesStellar property of the spheroid component is settable.
- abundancesStellarRate(<type(abundances)> value) Cumulate to the rate of the abundancesStellar property of the SpheroidStandard component.
- abundancesStellarScale(<type(abundances)> value) Set the scale of the abundancesStellar property of the SpheroidStandard component.
- abundancesStellarSet(<type(abundances)> value) Set the abundancesStellar property of the spheroid component.

- angularMomentum() Get the angularMomentum property of the spheroid component.
16.5. Objects

tfamily \textcolor{red}{\textlesstype(varying \\ _string):}{\textgreater} angularMomentumAttributeMatch(<logical>[requireGettable] {\rightarrow}, <logical>[requireSettable] {\rightarrow}, <logical>[requireEvolvable] {\rightarrow})

Return a list of implementations that provide the given list of attributes for the angularMomentum property of the spheroid component.

tfamily \textcolor{red}{\textless double \textgreater} angularMomentumCount() Compute the count of evolvable quantities in the angularMomentum property of the SpheroidStandard component.

tfamily \textcolor{red}{\textlesstype(varying \_string):}{\textgreater} angularMomentumIsGettable() Get the angularMomentum property of the spheroid component.

tfamily \textcolor{red}{\textlesstype(varying \_string):}{\textgreater} angularMomentumIsSettable() Specify whether the angularMomentum property of the spheroid component is settable.

tfamily \textcolor{red}{\textlesstype(varying \_string):}{\textgreater} angularMomentumSet(<double> value) Set the angularMomentum property of the spheroid component.

tfamily \textcolor{red}{\textlesstype(varying \_string):}{\textgreater} angularMomentumRate(<double> value) Cumulate to the rate of the angularMomentum property of the SpheroidStandard component.

tfamily \textcolor{red}{\textlesstype(varying \_string):}{\textgreater} angularMomentumScale(<double> value) Set the scale of the angularMomentum property of the SpheroidStandard component.

tfamily \textcolor{red}{\textlesstype(varying \_string):}{\textgreater} angularMomentumSet(<double> value) Set the angularMomentum property of the spheroid component.

tfamily \textcolor{red}{\textlesstype(varying \_string):}{\textgreater} energyGasInputAttributeMatch(<logical>[requireGettable] {\rightarrow}, <logical>[requireSettable] {\rightarrow}, <logical>[requireEvolvable] {\rightarrow})

Return a list of implementations that provide the given list of attributes for the energyGasInput property of the spheroid component.

tfamily \textcolor{red}{\textlesstype(varying \_string):}{\textgreater} energyGasInputCount() Compute the count of evolvable quantities in the energyGasInput property of the SpheroidStandard component.
tfamily \textcolor{red}{\textless double\textgreater} energyGasInputIsGettable() Get the energyGasInput property of the spheroid component.

tfamily \textcolor{red}{\textless logical\textgreater} energyGasInputIsSettable() Specify whether the energyGasInput property of the spheroid component is settable.

tfamily \textcolor{red}{\textless double\textgreater} energyGasInputRate(<double> value) Cumulate to the rate of the energyGasInput property of the SpheroidStandard component.

tfamily \textcolor{red}{\textless double\textgreater} halfMassRadius() Get the halfMassRadius property of the spheroid component.

tfamily \textcolor{red}{\textlesstype(varying\_string)(:)}\textgreater halfMassRadiusAttributeMatch(<logical>[requireGettable] \rightarrow, <logical>[requireSettable] \rightarrow, <logical>[requireEvolvable] \rightarrow) Return a list of implementations that provide the given list off attributes for the halfMassRadius property of the spheroid component.

tfamily \textcolor{red}{\textless double\textgreater} halfMassRadiusIsGettable() Get the halfMassRadius property of the spheroid component.

tfamily \textcolor{red}{\textless logical\textgreater} halfMassRadiusIsSettable() Specify whether the halfMassRadius property of the spheroid component is settable.

tfamily \textcolor{red}{\textless type(treeNode)\textgreater} host() Return a pointer to the host treeNode object.

tfamily \textcolor{red}{\textless type(abundances)\textgreater} hotHaloCoolingAbundancesRate(<type(abundances)> value) Cumulate to the rate of the hotHaloCoolingAbundances property of the hotHalo component.

tfamily \textcolor{red}{\textless double\textgreater} hotHaloCoolingAngularMomentumRate(<double> value) Cumulate to the rate of the hotHaloCoolingAngularMomentum property of the hotHalo component.

tfamily \textcolor{red}{\textless double\textgreater} hotHaloCoolingMassRate(<double>value) Cumulate to the rate of the hotHaloCoolingMass property of the hotHalo component.

tfamily \textcolor{red}{\textless logical\textgreater} isInitialized() Get the isInitialized property of the spheroid component.

tfamily \textcolor{red}{\textlesstype(varying\_string)(:)}\textgreater isInitializedAttributeMatch(<logical>[requireGettable] \rightarrow, <logical>[requireSettable] \rightarrow, <logical>[requireEvolvable] \rightarrow) Return a list of implementations that provide the given list off attributes for the isInitialized property of the spheroid component.

tfamily \textcolor{red}{\textless logical\textgreater} isInitializedIsGettable() Get the isInitialized property of the spheroid component.

tfamily \textcolor{red}{\textless logical\textgreater} isInitializedIsSettable() Specify whether the isInitialized property of the spheroid component is settable.

tfamily \textcolor{red}{\textless logical\textgreater} isInitializedSet(<logical> value) Set the isInitialized property of the spheroid component.

tfamily \textcolor{red}{\textless type(stellarLuminosities)\textgreater} luminositiesStellar() Get the luminositiesStellar property of the spheroid component.
16.5. Objects

tfamily \textcolor{red}{{\textless type(varying\_string):}{\textgreater}} luminositiesStellarAttributeMatch(<logical>[requireGettable] \to, <logical>[requireSettable] \to, <logical>[requireEvolvable] \to) Return a list of implementations that provide the given list off attributes for the luminositiesStellar property of the spheroid component.

tfamily \intzero luminositiesStellarCount() Compute the count of evolvable quantities in the luminositiesStellar property of the SpheroidStandard component.

tfamily \textcolor{red}{{\textless type(stellarLuminosities):}{\textgreater}} luminositiesStellarIsGettable() Get the luminositiesStellar property of the spheroid component.

tfamily \logicalzero luminositiesStellarIsSettable() Specify whether the luminositiesStellar property of the spheroid component is settable.

tfamily \void luminositiesStellarRate(<type(stellarLuminosities)> value) Cumulate to the rate of the luminositiesStellar property of the SpheroidStandard component.

tfamily \void luminositiesStellarScale(<type(stellarLuminosities)>value) Set the scale of the luminositiesStellar property of the SpheroidStandard component.

tfamily \void luminositiesStellarSet(<type(stellarLuminosities)> value) Set the luminositiesStellar property of the spheroid component.

tfamily \textcolor{red}{\textless double\textgreater} massGas() Get the massGas property of the spheroid component.

tfamily \textcolor{red}{{\textless type(varying\_string):}{\textgreater}} massGasAttributeMatch(<logical>[requireGettable] \to, <logical>[requireSettable] \to, <logical>[requireEvolvable] \to) Return a list of implementations that provide the given list off attributes for the massGas property of the spheroid component.

tfamily \intzero massGasCount() Compute the count of evolvable quantities in the massGas property of the SpheroidStandard component.

tfamily \textcolor{red}{\textless double\textgreater} massGasIsGettable() Get the massGas property of the spheroid component.

tfamily \logicalzero massGasIsSettable() Specify whether the massGas property of the spheroid component is settable.

tfamily \void massGasRate(<double> value) Cumulate to the rate of the massGas property of the SpheroidStandard component.

tfamily \void massGasScale(<double> value) Set the scale of the massGas property of the SpheroidStandard component.

tfamily \void massGasSet(<double> value) Set the massGas property of the spheroid component.

tfamily \textcolor{red}{\textless type(varying\_string):}{\textgreater}} massGasSinkAttributeMatch(<logical>[requireGettable] \to, <logical>[requireSettable] \to, <logical>[requireEvolvable] \to) Return a list of implementations that provide the given list off attributes for the massGasSink property of the spheroid component.

tfamily \intzero massGasSinkCount() Compute the count of evolvable quantities in the massGasSink property of the SpheroidStandard component.
tfamily \textcolor{red}{\textless double\textgreater} massGasSinkIsGettable() Get the massGasSink property of the spheroid component.

tfamily \textcolor{red}{\textless double\textgreater} massGasSinkRate(<double> value) Cumulate to the rate of the massGasSink property of the SpheroidStandard component.

tfamily \textcolor{red}{\textless double\textgreater} massStellar() Get the massStellar property of the spheroid component.

tfamily \textcolor{red}{\textlesstype(varying\_string)(::)} massStellarAttributeMatch(<logical>[requireGettable] – > <logical>[requireSettable] – > <logical>[requireEvolvable] – >) Return a list of implementations that provide the given list off attributes for the massStellar property of the spheroid component.

tfamily \intzero massStellarCount() Compute the count of evolvable quantities in the massStellar property of the SpheroidStandard component.

tfamily \textcolor{red}{\textless double\textgreater} massStellarIsGettable() Get the massStellar property of the spheroid component.

tfamily \logicalzero massStellarIsSettable() Specify whether the massStellar property of the spheroid component is settable.

tfamily \void massStellarRate(<double> value) Cumulate to the rate of the massStellar property of the SpheroidStandard component.

tfamily \void massStellarScale(<double> value) Set the scale of the massStellar property of the SpheroidStandard component.

tfamily \void massStellarSet(<double> value) Set the massStellar property of the spheroid component.

tfamily \void nameFromIndex(<integer> count – >, <varying_string>name – >) Return the name of a property given is index.

tfamily \logicalzero nullIsActive() Return whether the null implementation of the spheroid component class is active.

tfamily \void odeStepRatesInitialize() Initialize rates for evolvable properties.

tfamily \void odeStepScalesInitialize() Initialize scales for evolvable properties.

16.5. Objects

tfamily \doublezero potential{\textcolor{red}\textless double\textgreater\ radius\rightarrow, \textcolor{red}\textless componentType\textgreater\ [componentType]\rightarrow, \textcolor{red}\textless massType\textgreater\ [massType]\rightarrow, \textcolor{red}\textless logical\textgreater\ [haloLoaded]\rightarrow} Compute the gravitational potential.

tfamily \textcolor{red}\textless double\textgreater\ radius() Get the \textcolor{red}radius property of the \textcolor{red}spheroid component.

tfamily \textcolor{red}\textless type(varying\_\_string)(:\textgreater\ radiusAttributeMatch{\textcolor{red}\textless logical\textgreater\ [requireGettable]\rightarrow, \textcolor{red}\textless logical\textgreater\ [requireSettable]\rightarrow, \textcolor{red}\textless logical\textgreater\ [requireEvolvable]\rightarrow}) Return a list of implementations that provide the given list of attributes for the \textcolor{red}radius property of the \textcolor{red}spheroid component.

tfamily \textcolor{red}\textless double\textgreater\ radiusIsGettable() Get the \textcolor{red}radius property of the \textcolor{red}spheroid component.

\textcolor{red}\logicalzero radiusIsSettable() Specify whether the \textcolor{red}radius property of the \textcolor{red}spheroid component is settable.

tfamily \textcolor{red}\void\ radiusSet{\textcolor{red}\textless double\textgreater\ value} Set the \textcolor{red}radius property of the \textcolor{red}spheroid component.

tfamily \textcolor{red}\void\ readRaw{\textcolor{red}\textless integer\textgreater\ fileHandle\rightarrow} Read a binary dump of the \textcolor{red}nodeComponent from the given \textcolor{red}fileHandle.

tfamily \doublezero rotationCurve{\textcolor{red}\textless double\textgreater\ radius\rightarrow, \textcolor{red}\textless componentType\textgreater\ [componentType]\rightarrow, \textcolor{red}\textless massType\textgreater\ [massType]\rightarrow, \textcolor{red}\textless logical\textgreater\ [haloLoaded]\rightarrow} Compute the rotation curve.

tfamily \doublezero rotationCurveGradient{\textcolor{red}\textless double\textgreater\ radius\rightarrow, \textcolor{red}\textless componentType\textgreater\ [componentType]\rightarrow, \textcolor{red}\textless massType\textgreater\ [massType]\rightarrow, \textcolor{red}\textless logical\textgreater\ [haloLoaded]\rightarrow} Compute the rotation curve gradient.

tfamily \intzero serializeCount() Return a count of the number of evolvable quantities to be evolved.

tfamily \textcolor{red}\void\ serializeRates{\textcolor{red}\textless double(:)\textgreater\ array\rightarrow} Serialize the evolvable rates to an array.

tfamily \textcolor{red}\void\ serializeScales{\textcolor{red}\textless double(:)\textgreater\ array\rightarrow} Serialize the evolvable scales to an array.

tfamily \textcolor{red}\void\ serializeValues{\textcolor{red}\textless double(:)\textgreater\ array\rightarrow} Serialize the evolvable quantities to an array.

\textcolor{red}\logicalzero standardIsActive() Return whether the standard implementation of the \textcolor{red}spheroid component class is active.

\textcolor{red}\void\ starFormationHistoryRate{\textcolor{red}\textless type(history)\textgreater\ value} Cumulate to the rate of the \textcolor{red}starFormationHistory property of the \textcolor{red}SpheroidStandard component.

\textcolor{red}\intzero starFormationHistoryCount() Compute the count of evolvable quantities in the \textcolor{red}starFormationHistory property of the \textcolor{red}SpheroidStandard component.

\textcolor{red}\void\ starFormationHistoryIsGettable() Get the \textcolor{red}starFormationHistory property of the \textcolor{red}spheroid component.

\textcolor{red}\logicalzero starFormationHistoryIsSettable() Specify whether the \textcolor{red}starFormationHistory property of the \textcolor{red}spheroid component is settable.

\textcolor{red}\void\ starFormationHistoryRate{\textcolor{red}\textless type(history)\textgreater\ value} Cumulate to the rate of the \textcolor{red}starFormationHistory property of the \textcolor{red}SpheroidStandard component.
tfamily \ void \ starFormationHistoryScale(<type(history)> value) Set the scale of the \starFormationHistory property of the \SpheroidStandard component.

tfamily \ void \ starFormationHistorySet(<type(history)> value) Set the \starFormationHistory property of the \spheroid component.

tfamily \ textcolor{red}{\textless double\textgreater} starFormationRate() Get the \starFormationRate property of the \spheroid component.

tfamily \ textcolor{red}{\textless double\textgreater} starFormationRateAttributeMatch(<logical>[requireGettable] \rightarrow, <logical>[requireSettable] \rightarrow, <logical>[requireEvolvable] \rightarrow) Return a list of implementations that provide the given list of attributes for the \starFormationRate property of the \spheroid component.

tfamily \ textcolor{red}{\textless double\textgreater} starFormationRateIsGettable() Get the \starFormationRate property of the \spheroid component.

tfamily \ logicalzero starFormationRateIsSettable() Specify whether the \starFormationRate property of the \spheroid component is settable.

tfamily \ textcolor{red}{\textless double\textgreater} stellarPropertiesHistory() Get the \stellarPropertiesHistory property of the \spheroid component.

tfamily \ textcolor{red}{\textless varying\_string\textgreater} stellarPropertiesHistoryAttributeMatch(<logical>[requireGettable] \rightarrow, <logical>[requireSettable] \rightarrow, <logical>[requireEvolvable] \rightarrow) Return a list of implementations that provide the given list of attributes for the \stellarPropertiesHistory property of the \spheroid component.

tfamily \ intzero stellarPropertiesHistoryCount() Compute the count of evolvable quantities in the \stellarPropertiesHistory property of the \SpheroidStandard component.

tfamily \ textcolor{red}{\textless varying\_string\textgreater} type() Return the type of this object.

tfamily \ textcolor{red}{\textless double\textgreater} velocity() Get the \velocity property of the \spheroid component.
16.5. Objects

tfamily \textcolor{red}{\textless type(varying\_string)():\textgreater} velocityAttributeMatch(<logical>[requireGettable]→, <logical>[requireSettable]→, <logical>[requireEvolvable]→) Return a list of implementations that provide the given list of attributes for the velocity property of the spheroid component.

tfamily \textcolor{red}{\textlesstype(double):} velocityIsGettable() Get the velocity property of the spheroid component.

tfamily \logicalzero velocityIsSettable() Specify whether the velocity property of the spheroid component is settable.

tfamily \textcolor{red}{\textless type(double):} velocitySet(<double> value) Set the velocity property of the spheroid component.

tfamily nodeComponentSpheroidStandard

tfamily \textcolor{red}{\textless type(abundances):\textgreater} abundancesGas() Get the abundancesGas property of the spheroid component.

tfamily \textcolor{red}{\textlesstype(varying\_string):\textgreater} abundancesGasAttributeMatch(<logical>[requireGettable]→, <logical>[requireSettable]→, <logical>[requireEvolvable]→) Return a list of implementations that provide the given list of attributes for the abundancesGas property of the spheroid component.

tfamily \textcolor{red}{\textless type(abundances):\textgreater} abundancesGasIsGettable() Get the abundancesGas property of the spheroid component.

tfamily \logicalzero abundancesGasIsSettable() Specify whether the abundancesGas property of the spheroid component is settable.

tfamily \textcolor{red}{\textless type(abundances):\textgreater} abundancesGasRate(<type(abundances)> value) Cumulate to the rate of the abundancesGas property of the SpheroidStandard component.

tfamily \textcolor{red}{\textless type(abundances):\textgreater} abundancesGasScale(<type(abundances)> value) Set the scale of the abundancesGas property of the SpheroidStandard component.

tfamily \textcolor{red}{\textless type(abundances):\textgreater} abundancesGasSet(<type(abundances)> value) Set the abundancesGas property of the spheroid component.

tfamily \textcolor{red}{\textless type(abundances):\textgreater} abundancesStellar() Get the abundancesStellar property of the spheroid component.

tfamily \textcolor{red}{\textlesstype(varying\_string):\textgreater} abundancesStellarAttributeMatch(<logical>[requireGettable]→, <logical>[requireSettable]→, <logical>[requireEvolvable]→) Return a list of implementations that provide the given list of attributes for the abundancesStellar property of the spheroid component.

tfamily \textcolor{red}{\textless type(abundances):\textgreater} abundancesStellarCount() Compute the count of evolvable quantities in the abundancesStellar property of the SpheroidStandard component.

tfamily \textcolor{red}{\textless type(abundances):\textgreater} abundancesStellarIsGettable() Get the abundancesStellar property of the spheroid component.

tfamily \logicalzero abundancesStellarIsSettable() Specify whether the abundancesStellar property of the spheroid component is settable.
tfamily \ void abundancesStellarRate(\textcolor{red}{\textless type(abundances)\textgreater} value) Cumulate to the rate of the abundancesStellar property of the SpheroidStandard component.

tfamily \ void abundancesStellarScale(\textcolor{red}{\textless type(abundances)\textgreater} value) Set the scale of the abundancesStellar property of the SpheroidStandard component.

tfamily \ void abundancesStellarSet(\textcolor{red}{\textless type(abundances)\textgreater} value) Set the abundancesStellar property of the spheroid component.

tfamily \textcolor{red}{\textless double\textgreater} angularMomentum() Get the angularMomentum property of the spheroid component.

tfamily \textcolor{red}{\textless type(varying\_string)(:\textgreater} angularMomentumAttributeMatch(\textcolor{red}{\textless logical\textgreater} [requireGettable] , \textcolor{red}{\textless logical\textgreater} [requireSettable] , \textcolor{red}{\textless logical\textgreater} [requireEvolvable] ) Return a list of implementations that provide the given list off attributes for the angularMomentum property of the spheroid component

tfamily \intzero angularMomentumCount() Compute the count of evolvable quantities in the angularMomentum property of the SpheroidStandard component.

tfamily \textcolor{red}{\textless double\textgreater} angularMomentumIsGettable() Get the angularMomentum property of the spheroid component.

tfamily \logicalzero angularMomentumIsSettable() Specify whether the angularMomentum property of the spheroid component is settable.

tfamily \ void angularMomentumRate(\textcolor{red}{\textless double\textgreater} value) Cumulate to the rate of the angularMomentum property of the SpheroidStandard component.

tfamily \ void angularMomentumScale(\textcolor{red}{\textless double\textgreater} value) Set the scale of the angularMomentum property of the SpheroidStandard component.

tfamily \ void angularMomentumSet(\textcolor{red}{\textless double\textgreater} value) Set the angularMomentum property of the spheroid component.

tfamily \ void builder(\textcolor{red}{\textless type(node)\textgreater} componentDefinition\textcolor{red}{\rightarrow}) Build a nodeComponent from a supplied XML definition.

tfamily \ void createFunctionSet(\textcolor{red}{\textless function()\textgreater}) Set the function used to create SpheroidStandard components.

tfamily \ doublezero density(\textcolor{red}{\textless double(3)\textgreater} positionSpherical\textcolor{red}{\rightarrow}, \textcolor{red}{\textless componentType\textgreater} [componentType]\textcolor{red}{\rightarrow}, \textcolor{red}{\textless massType\textgreater} [massType]\textcolor{red}{\rightarrow}, \textcolor{red}{\textless weightBy\textgreater} [weightBy]\textcolor{red}{\rightarrow}, \textcolor{red}{\textless integer\textgreater} [weightIndex]\textcolor{red}{\rightarrow}, \textcolor{red}{\textless logical\textgreater} [haloLoaded]\textcolor{red}{\rightarrow}) Compute the density.

tfamily \ void deserializeRates(\textcolor{red}{\textless double(:)\textgreater} array\textcolor{red}{\leftarrow}) Deserialize the evolvable rates from an array.

tfamily \ void deserializeScales(\textcolor{red}{\textless double(:)\textgreater} array\textcolor{red}{\leftarrow}) Deserialize the evolvable scales from an array.

tfamily \ void deserializeValues(\textcolor{red}{\textless double(:)\textgreater} array\textcolor{red}{\leftarrow}) Deserialize the evolvable quantities from an array.

tfamily \ void destroy() Destroy the object.

tfamily \ void dump() Generate an ASCII dump of all properties.

tfamily \ void dumpRaw(\textcolor{red}{\textless integer\textgreater} fileHandle\textcolor{red}{\rightarrow}) Generate a binary dump of all properties.
tfamily \textcolor{red}{\textless \textbf{double}\textgreater} energyGasInput() Get the \textit{energyGasInput} property of the \textit{spheroid} component.

tfamily \textcolor{red}{\textless \textbf{string}\textgreater\textgreater} energyGasInputAttributeMatch() Return a list of implementations that provide the given list of attributes for the \textit{energyGasInput} property of the \textit{spheroid} component.

tfamily \textcolor{red}{\textless \textbf{double}\textgreater} energyGasInputIsGettable() Get the \textit{energyGasInput} property of the \textit{spheroid} component.

tfamily \textcolor{red}{\textbf{logical}} energyGasInputIsSettable() Specify whether the \textit{energyGasInput} property of the \textit{spheroid} component is settable.

tfamily \void energyGasInputRate(<\textbf{double}> value) Cumulate to the rate of the \textit{energyGasInput} property of the \textit{spheroid} component.

tfamily \void energyGasInputRateFunction(<\textbf{function}()> deferredFunction) Set the function to be used for the \textit{rate} method of the \textit{energyGasInput} property of the \textit{SpheroidStandard} component.

tfamily \textcolor{red}{\textbf{logical}} energyGasInputRateIsAttached() Return whether the rate method of the \textit{energyGasInput} property of the \textit{SpheroidStandard} component has been attached to a function.

tfamily \textcolor{red}{\textless \textbf{double}\textgreater} halfMassRadius() Get the \textit{halfMassRadius} property of the \textit{spheroid} component.

tfamily \textcolor{red}{\textless \textbf{string}\textgreater\textgreater} halfMassRadiusAttributeMatch() Return a list of implementations that provide the given list of attributes for the \textit{halfMassRadius} property of the \textit{spheroid} component.

tfamily \textcolor{red}{\textless \textbf{double}\textgreater} halfMassRadiusIsGettable() Get the \textit{halfMassRadius} property of the \textit{spheroid} component.

tfamily \textcolor{red}{\textbf{logical}} halfMassRadiusIsSettable() Specify whether the \textit{halfMassRadius} property of the \textit{spheroid} component is settable.

tfamily \textcolor{red}{\textbf{*type(treeNode)}} host() Return a pointer to the host \textit{treeNode} object.

tfamily \void hotHaloCoolingAbundancesRate(<\textbf{type(abundances)}> value) Cumulate to the rate of the \textit{hotHaloCoolingAbundances} property of the \textit{hotHalo} component.

tfamily \void hotHaloCoolingAngularMomentumRate(<\textbf{double}> value) Cumulate to the rate of the \textit{hotHaloCoolingAngularMomentum} property of the \textit{hotHalo} component.

tfamily \void hotHaloCoolingMassRate(<\textbf{double}> value) Cumulate to the rate of the \textit{hotHaloCoolingMass} property of the \textit{hotHalo} component.
tfamily \void initialize() Initialize the object.

tfamily \textcolor{red}{\textless logical\textgreater} isInitialized() Get the isInitialized property of the spheroid component.

tfamily \textcolor{red}{\textless logical\textgreater} isInitializedAttributeMatch(<logical>[requireGettable]→, <logical>[requireSettable]→, <logical>[requireEvolvable]→) Return a list of implementations that provide the given list off attributes for the isInitialized property of the spheroid component

tfamily \textcolor{red}{\textless logical\textgreater} isInitializedIsGettable() Get the isInitialized property of the spheroid component.

tfamily \logicalzero isInitializedIsSettable() Specify whether the isInitialized property of the spheroid component is settable.

tfamily \void isInitializedSet(<logical> value) Set the isInitialized property of the spheroid component.

tfamily \textcolor{red}{\textless type(stellarLuminosities)\textgreater} luminositiesStellar() Get the luminositiesStellar property of the spheroid component.

tfamily \textcolor{red}{\textless type(varying\_string):(\textgreater)} luminositiesStellarAttributeMatch(<logical>[requireGettable]→, <logical>[requireSettable]→, <logical>[requireEvolvable]→) Return a list of implementations that provide the given list off attributes for the luminositiesStellar property of the spheroid component

tfamily \intzero luminositiesStellarCount() Compute the count of evolvable quantities in the luminositiesStellar property of the SpheroidStandard component.

tfamily \textcolor{red}{\textless double\textgreater} luminositiesStellarIsGettable() Get the luminositiesStellar property of the spheroid component.

tfamily \logicalzero luminositiesStellarIsSettable() Specify whether the luminositiesStellar property of the spheroid component is settable.

tfamily \void luminositiesStellarRate(<type(stellarLuminosities)> value) Cumulate to the rate of the luminositiesStellar property of the SpheroidStandard component.

tfamily \void luminositiesStellarScale(<type(stellarLuminosities)>value) Set the scale of the luminositiesStellar property of the SpheroidStandard component.

tfamily \void luminositiesStellarSet(<type(stellarLuminosities)> value) Set the luminositiesStellar property of the spheroid component.

tfamily \textcolor{red}{\textless double\textgreater} massGas() Get the massGas property of the spheroid component.

tfamily \textcolor{red}{\textless type(varying\_string):(\textgreater)} massGasAttributeMatch(<logical>[requireGettable]→, <logical>[requireSettable]→, <logical>[requireEvolvable]→) Return a list of implementations that provide the given list off attributes for the massGas property of the spheroid component

tfamily \intzero massGasCount() Compute the count of evolvable quantities in the massGas property of the SpheroidStandard component.

tfamily \textcolor{red}{\textless double\textgreater} massGasIsGettable() Get the massGas property of the spheroid component.
Objects

- **Objects:**
  - `tfamily logicalzero massGasIsSettable()` Specify whether the `massGas` property of the `spheroid` component is settable.
  - `tfamily void massGasRate(<double> value)` Cumulate to the rate of the `massGas` property of the `SpheroidStandard` component.
  - `tfamily void massGasScale(<double> value)` Set the scale of the `massGas` property of the `SpheroidStandard` component.
  - `tfamily void massGasSet(<double> value)` Set the `massGas` property of the `spheroid` component.
  - `tfamily textcolor{red}{<double> massGasSink() Get the `massGasSink` property of the `spheroid` component.}
  - `tfamily textcolor{red}{textless double{textgreater} massGasSinkAttributeMatch(<logical>[requireGettable]→, <logical>[requireSettable]→, <logical>[requireEvolvable]→) Return a list of implementations that provide the given list off attributes for the `massGasSink` property of the `spheroid` component.}
  - `tfamily intzero massGasSinkCount() Compute the count of evolvable quantities in the `massGasSink` property of the `SpheroidStandard` component.
  - `tfamily textcolor{red}{textless double{textgreater} massGasSinkIsGettable() Get the `massGasSink` property of the `spheroid` component.}
  - `tfamily logicalzero massGasSinkIsSettable()` Specify whether the `massGasSink` property of the `spheroid` component is settable.
  - `tfamily void massGasSinkRate(<double> value)` Cumulate to the rate of the `massGasSink` property of the `SpheroidStandard` component.
  - `tfamily void massGasSinkRateFunction(<function()> deferredFunction) Set the function to be used for the `rate` method of the `massGasSink` property of the `SpheroidStandard` component.
  - `tfamily logicalzero massGasSinkRateIsAttached() Return whether the rate method of the `massGasSink` property of the `SpheroidStandard` component has been attached to a function.
  - `tfamily textcolor{red}{<double> massStellar() Get the `massStellar` property of the `spheroid` component.}
  - `tfamily textcolor{red}{textless type(varying\_string)(::)textgreater} massStellarAttributeMatch(<logical>[requireGettable]→, <logical>[requireSettable]→, <logical>[requireEvolvable]→) Return a list of implementations that provide the given list off attributes for the `massStellar` property of the `spheroid` component.
  - `tfamily intzero massStellarCount() Compute the count of evolvable quantities in the `massStellar` property of the `SpheroidStandard` component.
  - `tfamily textcolor{red}{textless double{textgreater} massStellarIsGettable() Get the `massStellar` property of the `spheroid` component.}
  - `tfamily logicalzero massStellarIsSettable()` Specify whether the `massStellar` property of the `spheroid` component is settable.
  - `tfamily void massStellarRate(<double> value)` Cumulate to the rate of the `massStellar` property of the `SpheroidStandard` component.
16. Coding GALACTICUS

tfamily \void massStellarScale(<double> value) Set the scale of the massStellar property of the SpheroidStandard component.

tfamily \void massStellarSet(<double> value) Set the massStellar property of the spheroid component.

tfamily \void nameFromIndex(<integer> count →, <varying_string> name ←) Return the name of a property given is index.

tfamily \logicalzero nullIsActive() Return whether the null implementation of the spheroid component class is active.

tfamily \void odeStepRatesInitialize() Initialize rates for evolvable properties.

tfamily \void odeStepScalesInitialize() Initialize scales for evolvable properties.

tfamily \void output(<integer> integerProperty ↔, <integer> integerBufferCount ↔, <integer(:,:)> integerBuffer ↔, <integer>doubleProperty ↔, <integer> doubleBufferCount ↔, <double(:,:)> doubleBuffer ↔, <double> time →, <integer> instance →) Generate values of outputtable properties.

tfamily \void outputCount(<integer>integerPropertyCount ↔, <integer>doublePropertyCount ↔, <double> time →, <integer> instance →) Compute a count of outputtable properties.

tfamily \void outputNames(<integer>integerProperty ↔, <char[*,:]>integerPropertyNames ↔, <char[*,:]>integerPropertyComments ↔, <double(:,:)>integerPropertyUnitsSI ↔, <integer>doubleProperty ↔, <char[*,:]>doublePropertyNames ↔, <char[*,:]>doublePropertyComments ↔, <double(:,:)>doublePropertyUnitsSI ↔, <double> time →, <integer> instance →) Generate names of outputtable properties.

tfamily \doublezeropotential(<double> radius →, <componentType> [componentType] →, <massType> [massType] →, <logical> [haloLoaded] →) Compute the gravitational potential.

tfamily \textcolor{red}{\textless double\textgreater} radius() Get the radius property of the spheroid component.

tfamily \textcolor{red}{\textless double\textgreater} radiusAttributeMatch(<logical>[requireGettable] →, <logical>[requireSettable] →, <logical>[requireEvolvable] →) Return a list of implementations that provide the given list off attributes for the radius property of the spheroid component.

tfamily \textcolor{red}{\textless double\textgreater} radiusIsGettable() Get the radius property of the spheroid component.

tfamily \logicalzero radiusIsSettable() Specify whether the radius property of the spheroid component is settable.

tfamily \void radiusSet(<double> value) Set the radius property of the spheroid component.

tfamily \void readRaw(<integer> fileHandle →) Read a binary dump of the nodeComponent from the given fileHandle.

tfamily \doublezerorotationCurve(<double> radius →, <componentType> [componentType] →, <massType> [massType] →, <logical> [haloLoaded] →) Compute the rotation curve.

tfamily \doublezerorotationCurveGradient(<double> radius →, <componentType> [componentType] →, <massType> [massType] →, <logical> [haloLoaded] →) Compute the rotation curve gradient.
16.5. Objects

tfamily \intzero serializeCount() Return a count of the number of evolvable quantities to be evolved.

tfamily \void serializeRates(<double(:)> array) Serialize the evolvable rates to an array.

tfamily \void serializeScales(<double(:)> array) Serialize the evolvable scales to an array.

tfamily \void serializeValues(<double(:)> array) Serialize the evolvable quantities to an array.

tfamily \logicalzero standardIsActive() Return whether the standard implementation of the spheroid component class is active.

tfamily \textcolor{red}{\textless{} type(history)\textgreater{}} starFormationHistory() Get the \texttt{starFormationHistory} property of the \texttt{spheroid} component.

tfamily \textcolor{red}{\textless{} type(varying\_string)\textgreater{}} starFormationHistoryAttributeMatch(<logical>[requireGettable], <logical>[requireSettable], <logical>[requireEvolvable]) Return a list of implementations that provide the given list of attributes for the \texttt{starFormationHistory} property of the \texttt{spheroid} component.

tfamily \intzero starFormationHistoryCount() Compute the count of evolvable quantities in the \texttt{starFormationHistory} property of the \texttt{SpheroidStandard} component.

tfamily \textcolor{red}{\textless{} type(history)\textgreater{}} starFormationHistoryIsGettable() Get the \texttt{starFormationHistory} property of the \texttt{spheroid} component.

tfamily \logicalzero starFormationHistoryIsSettable() Specify whether the \texttt{starFormationHistory} property of the \texttt{spheroid} component is settable.

tfamily \void starFormationHistoryRate(<type(history)> value) Cumulate to the rate of the \texttt{starFormationHistory} property of the \texttt{SpheroidStandard} component.

tfamily \void starFormationHistoryScale(<type(history)> value) Set the scale of the \texttt{starFormationHistory} property of the \texttt{SpheroidStandard} component.

tfamily \void starFormationHistorySet(<type(history)> value) Set the \texttt{starFormationHistory} property of the \texttt{spheroid} component.

tfamily \textcolor{red}{\textless{} double\textgreater{}} starFormationRate() Get the \texttt{starFormationRate} property of the \texttt{spheroid} component.

tfamily \textcolor{red}{\textless{} type(varying\_string)\textgreater{}} starFormationRateAttributeMatch(<logical>[requireGettable], <logical>[requireSettable], <logical>[requireEvolvable]) Return a list of implementations that provide the given list of attributes for the \texttt{starFormationRate} property of the \texttt{spheroid} component.

tfamily \void starFormationRateFunction(<function()> deferredFunction) Set the function to be used for the \texttt{get} method of the \texttt{starFormationRate} property of the \texttt{SpheroidStandard} component.

tfamily \logicalzero starFormationRateIsAttached() Return whether the \texttt{get} method of the \texttt{starFormationRate} property of the \texttt{SpheroidStandard} component has been attached to a function.

tfamily \textcolor{red}{\textless{} double\textgreater{}} starFormationRateIsGettable() Get the \texttt{starFormationRate} property of the \texttt{spheroid} component.

tfamily \logicalzero starFormationRateIsSettable() Specify whether the \texttt{starFormationRate} property of the \texttt{spheroid} component is settable.
tfamily\textcolor{red}{\textless type(history)\textgreater} stellarPropertiesHistory() Get the stellarPropertiesHistory property of the \texttt{spheroid} component.

tfamily\textcolor{red}{\textless type(varying\_string)\textgreater} stellarPropertiesHistoryAttributeMatch(<logical>[requireGettable] \rightarrow, <logical>[requireSettable] \rightarrow, <logical>[requireEvolvable] \rightarrow) Return a list of implementations that provide the given list of attributes for the stellarPropertiesHistory property of the \texttt{spheroid} component.

tfamily\intzero stellarPropertiesHistoryCount() Compute the count of evolvable quantities in the stellarPropertiesHistory property of the \texttt{SpheroidStandard} component.

tfamily\textcolor{red}{\textless type(history)\textgreater} stellarPropertiesHistoryIsGettable() Get the stellarPropertiesHistory property of the \texttt{spheroid} component.

tfamily\textcolor{red}{\textless double\textgreater} velocity() Get the velocity property of the \texttt{spheroid} component.

672
tfamily\ void deserializeRates(<double(:)> array ←) Deserialize the evolvable rates from an array.

**Example:**
```cpp
// Deserialize evolvable rates
void deserializeRates(double[] rates);
```

**Implementation:**
```cpp
// C++ implementation
void deserializeRates(double[] rates) {
    // Deserialize rates from an array
}
```

**Description:**
- The `deserializeRates` method takes an array of doubles as input, which represents the evolvable rates of an object.
- It deserializes the rates from the given array.

### Other Deserialization Methods
- `deserializeScales(<double(:)> array ←)`
- `deserializeValues(<double(:)> array ←)`

**Destroy Method:**
- `void destroy()`

**Dump Methods:**
- `void dump()` Generate an ASCII dump of all properties.
- `void dumpRaw(<integer> fileHandle ←)` Generate a binary dump of all properties.
- `void dumpXML()` Generate an XML dump of all properties.

**Null Is Active Method:**
- `logical zero nullIsActive()`

**Initialize Method:**
- `void initialize()`

**Name From Index Method:**
- `void nameFromIndex(<integer> count →, <varying_string> name ←)`

**Ode Step Rates Initialize Method:**
- `void odeStepRatesInitialize()` Initialize rates for evolvable properties.

**Ode Step Scales Initialize Method:**
- `void odeStepScalesInitialize()` Initialize scales for evolvable properties.

**Output Method:**
- `void output(<integer> integerProperty ↔, <integer> integerBufferCount ↔, <integer(:,:)> integerBuffer ↔, <integer> doubleProperty ↔, <integer> doubleBufferCount ↔, <double(:,:)> doubleBuffer ↔, <double> time →, <integer> instance →)` Generate values of outputtable properties.

**Output Count Method:**
- `void outputCount(<integer> integerPropertyCount ↔, <integer> doublePropertyCount ↔, <double> time →, <integer> instance →)` Compute a count of outputtable properties.

**Output Names Method:**
- `void outputNames(<integer> integerProperty ↔, <char[*](:)> integerPropertyNames ↔, <char[*](::)> integerPropertyComments ↔, <double(:)> integerPropertyUnitsSI ↔, <integer> doubleProperty ↔, <char[*](::)> doublePropertyNames ↔, <char[*](::)> doublePropertyComments ↔, <double(:)> doublePropertyUnitsSI ↔, <double> time →, <integer> instance →)` Generate names of outputtable properties.

**Potential Method:**
- `double zero potential(<double> radius →, <componentType > [componentType] →, <massType> [massType] →, <logical> [haloLoaded] →)`

**Example:**
```cpp
// Compute gravitational potential
double potential(double radius, componentType compType, massType massType, logical haloLoaded);
```
16. Coding **GALACTICUS**

tfamily \logicalzero preset3DIsActive() Return whether the preset3D implementation of the spin component class is active.

tfamily \logicalzero presetIsActive() Return whether the preset implementation of the spin component class is active.

tfamily \logicalzero randomIsActive() Return whether the random implementation of the spin component class is active.

tfamily \doublezero rotationCurve(<double> radius→, <componentType> [componentType]→, <massType> [massType]→, <logical> [haloLoaded]→) Compute the rotation curve.

tfamily \doublezero rotationCurveGradient(<double> radius→, <componentType> [componentType]→, <massType> [massType]→, <logical> [haloLoaded]→) Compute the rotation curve gradient.

tfamily \intzero serializeCount() Return a count of the number of evolvable quantities to be evolved.

tfamily \void serializeRates(<double(:)> array→) Serialize the evolvable rates to an array.

tfamily \void serializeScales(<double(:)> array→) Serialize the evolvable scales to an array.

tfamily \void serializeValues(<double(:)> array→) Serialize the evolvable quantities to an array.

tfamily \textcolor{red}{\textless double\textgreater} spin() Get the spin property of the spin component.

tfamily \textcolor{red}{\textlesstype(varying\_string)(:)} spinAttributeMatch(<logical>[requireGettable]→, <logical>[requireSettable]→, <logical>[requireEvolvable]→) Return a list of implementations that provide the given list off attributes for the spin property of the spin component.

tfamily \intzero spinCount() Compute the count of evolvable quantities in the spin property of the SpinPreset component.

tfamily \textcolor{red}{\textless double\textgreater} spinGrowthRate() Get the spinGrowthRate property of the spin component.

tfamily \textcolor{red}{\textlesstype(varying\_string)(:)} spinGrowthRateAttributeMatch(<logical>[requireGettable]→, <logical>[requireSettable]→, <logical>[requireEvolvable]→) Return a list of implementations that provide the given list off attributes for the spinGrowthRate property of the spin component.

tfamily \textcolor{red}{\textless double\textgreater} spinGrowthRateIsGettable() Get the spinGrowthRate property of the spin component.

tfamily \logicalzero spinGrowthRateIsSettable() Specify whether the spinGrowthRate property of the spin component is settable.

tfamily \void spinGrowthRateSet(<double> value) Set the spinGrowthRate property of the spin component.

tfamily \textcolor{red}{\textless double\textgreater} spinIsGettable() Get the spin property of the spin component.

tfamily \logicalzero spinIsSettable() Specify whether the spin property of the spin component is settable.

tfamily \void spinRate(<double> value) Cumulate to the rate of the spin property of the SpinPreset component.
16.5. Objects

tfamily \void spinScale(<double> value) Set the scale of the \texttt{spin} property of the \texttt{SpinPreset} component.

tfamily \void spinSet(<double> value) Set the \texttt{spin} property of the \texttt{spin} component.

tfamily \texttt{spinVector()} Get the \texttt{spinVector} property of the \texttt{spin} component.

tfamily \texttt{spinVectorAttributeMatch(<logical>[requireGettable\rightarrow, <logical>[requireSettable\rightarrow, <logical>[requireEvolvable\rightarrow]) Return a list of implementations that provide the given list of attributes for the \texttt{spinVector} property of the \texttt{spin} component.

tfamily \intzero spinVectorCount() Compute the count of evolvable quantities in the \texttt{spinVector} property of the \texttt{SpinPreset3D} component.

tfamily \texttt{spinVectorGrowthRate()} Get the \texttt{spinVectorGrowthRate} property of the \texttt{spin} component.

tfamily \texttt{spinVectorGrowthRateAttributeMatch(<logical>[requireGettable\rightarrow, <logical>[requireSettable\rightarrow, <logical>[requireEvolvable\rightarrow]) Return a list of implementations that provide the given list of attributes for the \texttt{spinVectorGrowthRate} property of the \texttt{spin} component.

tfamily \texttt{spinVectorGrowthRateIsGettable()} Get the \texttt{spinVectorGrowthRate} property of the \texttt{spin} component.

tfamily \logicalzero spinVectorGrowthRateIsSettable() Specify whether the \texttt{spinVectorGrowthRate} property of the \texttt{spin} component is settable.

tfamily \void spinVectorGrowthRateSet(<double(:)> value) Set the \texttt{spinVectorGrowthRate} property of the \texttt{spin} component.

tfamily \texttt{spinVectorIsGettable()} Get the \texttt{spinVector} property of the \texttt{spin} component.

tfamily \logicalzero spinVectorIsSettable() Specify whether the \texttt{spinVector} property of the \texttt{spin} component is settable.

tfamily \void spinVectorRate(<double(:)> value) Cumulate to the rate of the \texttt{spinVector} property of the \texttt{SpinPreset3D} component.

tfamily \void spinVectorScale(<double(:)> value) Set the scale of the \texttt{spinVector} property of the \texttt{SpinPreset3D} component.

tfamily \void spinVectorSet(<double(:)> value) Set the \texttt{spinVector} property of the \texttt{spin} component.

tfamily \doublezero surfaceDensity(<double(3)> positionCylindrical\rightarrow, <componentType>[componentType\rightarrow, <massType>[massType\rightarrow, <weightBy>[weightBy\rightarrow, <integer>[weightIndex\rightarrow, <logical>[haloLoaded\rightarrow]) Compute the surface density.

tfamily \texttt{type()} Return the type of this object.
tfamily nodeComponentSpinNull

tfamily \ void builder(\*type(node)>componentDefinition\rightarrow) Build a nodeComponent from a supplied XML definition.

tfamily \ double zero\ density(\*double(3)> positionSpherical\rightarrow, \*componentType \ [\text{componentType}\rightarrow, \*massType \ [\text{massType}\rightarrow, \*weightBy \ [\text{weightBy}\rightarrow, \*integer \ [\text{weightIndex}\rightarrow, \*logical > \text{haloLoaded}]\rightarrow) Compute the density.

tfamily \ void\ deserializeRates(\*double(:)> array\leftarrow) Deserialize the evolvable rates from an array.

tfamily \ void\ deserializeScales(\*double(:)> array\leftarrow) Deserialize the evolvable scales from an array.

tfamily \ void\ deserializeValues(\*double(:)> array\leftarrow) Deserialize the evolvable quantities from an array.

tfamily \ void destroy() Destroy the object.

tfamily \ void dump() Generate an ASCII dump of all properties.

tfamily \ void\ dumpRaw(\*integer> fileHandle\rightarrow) Generate a binary dump of all properties.

tfamily \ void\ dumpXML() Generate an XML dump of all properties.

tfamily \ double zero\ enclosedMass(\*double> radius\rightarrow, \*componentType \ [\text{componentType}\rightarrow, \*massType \ [\text{massType}\rightarrow, \*weightBy \ [\text{weightBy}\rightarrow, \*integer \ [\text{weightIndex}\rightarrow, \*logical > \text{haloLoaded}]\rightarrow) Compute the mass enclosed within a radius.

tfamily \ textcolor{red}{\textless type(treeNode)\textgreater} host() Return a pointer to the host treeNode object.

tfamily \ void\ hotHaloCoolingAbundancesRate(\*type(abundances)> value) Cumulate to the rate of the hotHaloCoolingAbundances property of the hotHalo component.

tfamily \ void\ hotHaloCoolingAngularMomentumRate(\*double> value) Cumulate to the rate of the hotHaloCoolingAngularMomentum property of the hotHalo component.

tfamily \ void\ hotHaloCoolingMassRate(\*double> value) Cumulate to the rate of the hotHaloCoolingMass property of the hotHalo component.

tfamily \ void initialize() Initialize the object.

tfamily \ void\ nameFromIndex(\*integer> count\rightarrow, \*varying_string> name\leftarrow) Return the name of a property given is index.

tfamily \ logical zero nullIsActive() Return whether the null implementation of the spin component class is active.

tfamily \ void\ odeStepRatesInitialize() Initialize rates for evolvable properties.

tfamily \ void\ odeStepScalesInitialize() Initialize scales for evolvable properties.

tfamily \ void\ output(\*integer> integerProperty\leftarrow, \*integer> integerBufferCount\leftarrow, \*integer(\*):> integerBuffer\leftarrow, \*integer> doubleProperty\leftarrow, \*integer> doubleBufferCount\leftarrow, \*double(\*):> doubleBuffer\leftarrow, \*double> time\rightarrow, \*integer> instance\rightarrow) Generate values of outputtable properties.

tfamily \ void\ outputCount(\*integer> integerPropertyCount\leftarrow, \*integer> doublePropertyCount\leftarrow, \*double> time\rightarrow, \*integer> instance\rightarrow) Compute a count of outputtable properties.
16.5. Objects

tfamily void outputNames(<integer> integerProperty, <char[*]) integerPropertyNames, <char[*]) integerPropertyComments, <double()> integerPropertyUnitsSI, <integer> doubleProperty, <char[*]) doublePropertyNames, <char[*]) doublePropertyComments, <double()> doublePropertyUnitsSI, <double>() time, <integer>() instance) Generate names of outputtable properties.

tfamily doublezero potential(<double>() radius, <componentType>() componentType, <massType>() massType, <logical> haloLoaded) Compute the gravitational potential.

tfamily logicalzero preset3DIsActive() Return whether the preset3D implementation of the spin component class is active.

tfamily logicalzero presetIsActive() Return whether the preset implementation of the spin component class is active.

tfamily logicalzero randomIsActive() Return whether the random implementation of the spin component class is active.

tfamily void readRaw(<integer>() fileHandle) Read a binary dump of the nodeComponent from the given fileHandle.

tfamily doublezero rotationCurve(<double>() radius, <componentType>() componentType, <massType>() massType, <logical> haloLoaded) Compute the rotation curve.

tfamily doublezero rotationCurveGradient(<double>() radius, <componentType>() componentType, <massType>() massType, <logical> haloLoaded) Compute the rotation curve gradient.

tfamily intzero serializeCount() Return a count of the number of evolvable quantities to be evolved.

tfamily void serializeRates(<double>() array) Serialize the evolvable rates to an array.

tfamily void serializeScales(<double>() array) Serialize the evolvable scales to an array.

tfamily void serializeValues(<double>() array) Serialize the evolvable quantities to an array.

tfamily textcolor{red}{} textless double{} textgreater{} spin() Get the spin property of the spin component.

tfamily textcolor{red}{} textless type(varying\_string()){} textgreater{} spinAttributeMatch(<logical>() requireGettable, <logical>() requireSettable, <logical>() requireEvolvable) Return a list of implementations that provide the given list of attributes for the spin property of the spin component.

tfamily intzero spinCount() Compute the count of evolvable quantities in the spin property of the SpinPreset component.

tfamily textcolor{red}{} textless double{} textgreater{} spinGrowthRate() Get the spinGrowthRate property of the spin component.

tfamily textcolor{red}{} textless type(varying\_string()){} textgreater{} spinGrowthRateAttributeMatch(<logical>() requireGettable, <logical>() requireSettable, <logical>() requireEvolvable) Return a list of implementations that provide the given list of attributes for the spinGrowthRate property of the spin component.

tfamily textcolor{red}{} textless double{} textgreater{} spinGrowthRateIsGettable() Get the spinGrowthRate property of the spin component.
tfamily \logicalzero spinGrowthRateIsSettable() Specify whether the spinGrowthRate property of the spin component is settable.

tfamily \void spinGrowthRateSet(<double> value) Set the spinGrowthRate property of the spin component.

tfamily \textcolor{red}\textless double\textgreater \isGettable() Get the spin property of the spin component.

tfamily \logicalzero spinIsSettable() Specify whether the spin property of the spin component is settable.

tfamily \void spinRate(<double> value) Cumulate to the rate of the spin property of the SpinPreset component.

tfamily \void spinScale(<double> value) Set the scale of the spin property of the SpinPreset component.

tfamily \void spinSet(<double> value) Set the spin property of the spin component.

\textcolor{red}\textless double\textgreater \textgreater \isGettable() Get the spinVector property of the spin component.

tfamily \textcolor{red}\textless type(varying\_string)(\_):\textgreater \AttributeMatch(<logical>[requireGettable] →, <logical>[requireSettable] →, <logical>[requireEvolvable] →) Return a list of implementations that provide the given list of attributes for the spinVector property of the spin component.

tfamily \intzero spinVectorCount() Compute the count of evolvable quantities in the spinVector property of the SpinPreset3D component.

\textcolor{red}\textless double\textgreater \isGettable() Get the spinVector property of the spin component.

\textcolor{red}\textless type(varying\_string)(\_):\textgreater \AttributeMatch(<logical>[requireGettable] →, <logical>[requireSettable] →, <logical>[requireEvolvable] →) Return a list of implementations that provide the given list of attributes for the spinVectorGrowthRate property of the spin component.

\textcolor{red}\textless double\textgreater \isGettable() Get the spinVector property of the spin component.

\logicalzero spinVectorGrowthRateIsSettable() Specify whether the spinVectorGrowthRate property of the spin component is settable.

\void spinVectorGrowthRateSet(<double>:value) Set the spinVectorGrowthRate property of the spin component.

\textcolor{red}\textless double\textgreater \isGettable() Get the spinVector property of the spin component.

\logicalzero spinVectorIsSettable() Specify whether the spinVector property of the spin component is settable.

\void spinVectorRate(<double>:value) Cumulate to the rate of the spinVector property of the SpinPreset3D component.
16.5. Objects

tfamily \void spinVectorScale(<double>(); value) Set the scale of the spinVector property of the SpinPreset3D component.

tfamily \void spinVectorSet(<double>(); value) Set the spinVector property of the spin component.

tfamily \doublezero surfaceDensity(<double(3)> positionCylindrical→, <componentType> [componentType]→, <massType> [massType]→, <weightBy> [weightBy]→, <integer> [weightIndex]→, <logical> [haloLoaded]→) Compute the surface density.

tfamily \textcolor{red}{\textless type(varying\_string)\textgreater} type() Return the type of this object.

tfamily nodeComponentSpinPreset

tfamily \void builder(<*type(node)>componentDefinition→) Build a nodeComponent from a supplied XML definition.

tfamily \doublezero density(<double(3)> positionSpherical→, <componentType> [componentType]→, <massType> [massType]→, <weightBy> [weightBy]→, <integer> [weightIndex]→, <logical> [haloLoaded]→) Compute the density.

tfamily \void deserializeRates(<double>(); array←) Deserialize the evolvable rates from an array.

tfamily \void deserializeScales(<double>(); array←) Deserialize the evolvable scales from an array.

tfamily \void deserializeValues(<double>(); array←) Deserialize the evolvable quantities from an array.

tfamily \void destroy() Destroy the object.

tfamily \void dump() Generate an ASCII dump of all properties.

tfamily \void dumpRaw(<integer> fileHandle→) Generate a binary dump of all properties.

tfamily \void dumpXML() Generate an XML dump of all properties.

tfamily \doublezero enclosedMass(<double> radius→, <componentType> [componentType]→, <massType> [massType]→, <weightBy> [weightBy]→, <integer> [weightIndex]→, <logical> [haloLoaded]→) Compute the mass enclosed within a radius.

tfamily \textcolor{red}{\textless *type(treeNode)\textgreater} host() Return a pointer to the host treeNode object.

tfamily \void hotHaloCoolingAbundancesRate(<type(abundances)> value) Cumulate to the rate of the hotHaloCoolingAbundances property of the hotHalo component.

tfamily \void hotHaloCoolingAngularMomentumRate(<double> value) Cumulate to the rate of the hotHaloCoolingAngularMomentum property of the hotHalo component.

tfamily \void hotHaloCoolingMassRate(<double> value) Cumulate to the rate of the hotHaloCoolingMass property of the hotHalo component.

tfamily \void initialize() Initialize the object.

tfamily \void nameFromIndex(<integer> count→, <varying_string> name←) Return the name of a property given is index.
tfamily \logicalzero nullIsActive() Return whether the null implementation of the spin component class is active.

tfamily \void odeStepRatesInitialize() Initialize rates for evolvable properties.

tfamily \void odeStepScalesInitialize() Initialize scales for evolvable properties.

tfamily \void output(<integer> integerProperty\leftrightarrow, <integer> integerBufferCount\leftrightarrow, <integer(:,:)> integerBuffer\leftrightarrow, <integer>doubleProperty\leftrightarrow, <integer> doubleBufferCount\leftrightarrow, <double(:,:)> doubleBuffer\leftrightarrow, <double> time\rightarrow, <integer> instance\rightarrow) Generate values of outputtable properties.

tfamily \void outputCount(<integer>integerPropertyCount\leftrightarrow, <integer> doublePropertyCount\leftrightarrow, <double> time\rightarrow, <integer> instance\rightarrow) Compute a count of outputtable properties.

tfamily \void outputNames(<integer> integerProperty\leftrightarrow, <char\[*](:)> integerPropertyNames\leftrightarrow, <char\[*](:)> integerPropertyComments\leftrightarrow, <double(:)> integerPropertyUnitsSI\leftrightarrow, <integer> doubleProperty\leftrightarrow, <char\[*](:)> doublePropertyNames\leftrightarrow, <char\[*](:)> doublePropertyComments\leftrightarrow, <double(:)> doublePropertyUnitsSI\leftrightarrow, <double> time\rightarrow, <integer> instance\rightarrow) Generate names of outputtable properties.

tfamily \doublezero potential(<double> radius\rightarrow, <componentType> [componentType]\rightarrow, <massType> [massType]\rightarrow, <logical> [haloLoaded]\rightarrow) Compute the gravitational potential.

tfamily \logicalzero preset3DIsActive() Return whether the preset3D implementation of the spin component class is active.

tfamily \logicalzero presetIsActive() Return whether the preset implementation of the spin component class is active.

tfamily \logicalzero randomIsActive() Return whether the random implementation of the spin component class is active.

tfamily \void readRaw(<integer> fileHandle\rightarrow) Read a binary dump of the nodeComponent from the given fileHandle.

tfamily \doublezero rotationCurve(<double> radius\rightarrow, <componentType> [componentType]\rightarrow, <massType> [massType]\rightarrow, <logical> [haloLoaded]\rightarrow) Compute the rotation curve.

tfamily \doublezero rotationCurveGradient(<double> radius\rightarrow, <componentType> [componentType]\rightarrow, <massType> [massType]\rightarrow, <logical> [haloLoaded]\rightarrow) Compute the rotation curve gradient.

tfamily \intzero serializeCount() Return a count of the number of evolvable quantities to be evolved.

tfamily \void serializeRates(<double(:)> array\rightarrow) Serialize the evolvable rates to an array.

tfamily \void serializeScales(<double(:)> array\rightarrow) Serialize the evolvable scales to an array.

tfamily \void serializeValues(<double(:)> array\rightarrow) Serialize the evolvable quantities to an array.

tfamily \textcolor{red}{\textless double\textgreater} spin() Get the spin property of the spin component.

tfamily \textcolor{red}{\textless double\textgreater} spinAttributeMatch(<logical>[requireGettable]\rightarrow, <logical>[requireSettable]\rightarrow, <logical>[requireEvolvable]\rightarrow) Return a list of implementations that provide the given list off attributes for the spin property of the spin component.
16.5. Objects

fam styl \textcolor{red}{\textless double\textgreater} spinCount() Compute the count of evolvable quantities in the spin property of the SpinPreset component.

tfamily \void odeStepRatesInitialize() Initialize rates for evolvable properties.

tfamily \void odeStepScalesInitialize() Initialize scales for evolvable properties.

tfamily \void output(\integer integerProperty\leftrightarrow, \integer integerBufferCount\leftrightarrow, \integer(:;) integerBuffer\leftrightarrow, \integer doubleProperty\leftrightarrow, \integer doubleBufferCount\leftrightarrow, \double(:;) doubleBuffer\leftrightarrow, \double time\rightarrow, \integer instance\rightarrow) Generate values of outputtable properties.

tfamily \void outputCount(\integer integerPropertyCount\leftrightarrow, \integer doublePropertyCount\leftrightarrow, \double time\rightarrow, \integer instance\rightarrow) Compute a count of outputtable properties.

tfamily \void outputNames(\integer integerProperty\leftrightarrow, \char[*](:) integerPropertyNames\leftrightarrow, \char[*](:) integerPropertyComments\leftrightarrow, \double(:) integerPropertyUnitsSI\leftrightarrow, \integer doubleProperty\leftrightarrow, \char[*](:) doublePropertyNames\leftrightarrow, \char[*](:) doublePropertyComments\leftrightarrow, \double(:) doublePropertyUnitsSI\leftrightarrow, \double time\rightarrow, \integer instance\rightarrow) Generate names of outputtable properties.

tfamily \doublezero potential(\double radius\rightarrow, \componentType componentType\rightarrow, \massType massType\rightarrow, \logical haloLoaded\rightarrow) Compute the gravitational potential.

tfamily \logicalzero preset3DIsActive() Return whether the preset3D implementation of the spin component class is active.

tfamily \logicalzero presetIsActive() Return whether the preset implementation of the spin component class is active.

tfamily \logicalzero randomIsActive() Return whether the random implementation of the spin component class is active.
tfamily \**\textfamilydefault\void\**\txtfamilydefault{readRaw}(\<\text{integer}\> fileHandle →) Read a binary dump of the nodeComponent from the given fileHandle.

tfamily \**\textfamilydefault{doublezero}\**\txtfamilydefault{rotationCurve}(\<\text{double}\> radius →, \<\text{componentType}\> [componentType] →, \<\text{massType}\> [massType] →, \<\text{logical}\> [haloLoaded] →) Compute the rotation curve.

tfamily \**\textfamilydefault{doublezero}\**\txtfamilydefault{rotationCurveGradient}(\<\text{double}\> radius →, \<\text{componentType}\> [componentType] →, \<\text{massType}\> [massType] →, \<\text{logical}\> [haloLoaded] →) Compute the rotation curve gradient.

tfamily \**\textfamilydefault{intzero} serializeCount()\** Return a count of the number of evolvable quantities to be evolved.

tfamily \**\textfamilydefault{void} serializeRates(\<\text{double}(:)\> array →)\** Serialize the evolvable rates to an array.

tfamily \**\textfamilydefault{void} serializeScales(\<\text{double}(:)\> array →)\** Serialize the evolvable scales to an array.

tfamily \**\textfamilydefault{void} serializeValues(\<\text{double}(:)\> array →)\** Serialize the evolvable quantities to an array.

tfamily \**\textcolor{red}{{\text{double}\textgreater}}\**\txtfamilydefault{spin()}\** Get the spin property of the spin component.

tfamily \**\textcolor{red}{{\text{type(varying_string)(:)}\textgreater}}\**\txtfamilydefault{spinAttributeMatch}(\<\text{logical}\> [requireGettable] →, \<\text{logical}\> [requireSettable] →, \<\text{logical}\> [requireEvolvable] →) Return a list of implementations that provide the given list off attributes for the spin property of the spin component

tfamily \**\textfamilydefault{intzero} spinCount()\** Compute the count of evolvable quantities in the spin property of the SpinPreset component.

tfamily \**\textcolor{red}{{\text{double}\textgreater}}\**\txtfamilydefault{spinGrowthRate()}\** Get the spinGrowthRate property of the spin component.

tfamily \**\textcolor{red}{{\text{type(varying_string)(:)}\textgreater}}\**\txtfamilydefault{spinGrowthRateAttributeMatch}(\<\text{logical}\> [requireGettable] →, \<\text{logical}\> [requireSettable] →, \<\text{logical}\> [requireEvolvable] →) Return a list of implementations that provide the given list off attributes for the spinGrowthRate property of the spin component

tfamily \**\textcolor{red}{{\text{double}\textgreater}}\**\txtfamilydefault{spinGrowthRateIsGettable()}\** Get the spinGrowthRate property of the spin component.

tfamily \**\textfamilydefault{logicalzero} spinGrowthRateIsSettable()\** Specify whether the spinGrowthRate property of the spin component is settable.

tfamily \**\textfamilydefault{void} spinGrowthRateSet(\<\text{double}\> value)\** Set the spinGrowthRate property of the spin component.

tfamily \**\textcolor{red}{{\text{double}\textgreater}}\**\txtfamilydefault{spinIsGettable()}\** Get the spin property of the spin component.

tfamily \**\textfamilydefault{logicalzero} spinIsSettable()\** Specify whether the spin property of the spin component is settable.

tfamily \**\textfamilydefault{void} spinRate(\<\text{double}\> value)\** Cumulate to the rate of the spin property of the SpinPreset component.

tfamily \**\textfamilydefault{void} spinScale(\<\text{double}\> value)\** Set the scale of the spin property of the SpinPreset component.

tfamily \**\textfamilydefault{void} spinSet(\<\text{double}\> value)\** Set the spin property of the spin component.
tfamily \textcolor{red}{\textless textless double(:)\textgreater} \spinVector() Get the \textbf{spinVector} property of the \textbf{spin} component.

tfamily \textcolor{red}{\textless textless type(varying\_string)(:)\textgreater} \spinVectorAttributeMatch(<logical>[requireGettable]→, <logical>[requireSettable]→, <logical>[requireEvolvable]→) Return a list of implementations that provide the given list of attributes for the \textbf{spinVector} property of the \textbf{spin} component.

tfamily \textcolor{red}{\textless double(:)\textgreater} \spinVectorCount() Compute the count of evolvable quantities in the \textbf{spinVector} property of the \textbf{SpinPreset3D} component.

tfamily \textcolor{red}{\textless double(:)\textgreater} \spinVectorGrowthRate() Get the \textbf{spinVectorGrowthRate} property of the \textbf{spin} component.

tfamily \textcolor{red}{\textless double(:)\textgreater} \spinVectorGrowthRateAttributeMatch(<logical>[requireGettable]→, <logical>[requireSettable]→, <logical>[requireEvolvable]→) Return a list of implementations that provide the given list of attributes for the \textbf{spinVectorGrowthRate} property of the \textbf{spin} component.

tfamily \textcolor{red}{\textless double(:)\textgreater} \spinVectorGrowthRateIsGettable() Get the \textbf{spinVectorGrowthRate} property of the \textbf{spin} component.

tfamily \textcolor{red}{\textless double(:)\textgreater} \spinVectorGrowthRateIsSettable() Specify whether the \textbf{spinVectorGrowthRate} property of the \textbf{spin} component is settable.

tfamily \textcolor{red}{\textless double(:)\textgreater} \spinVectorGrowthRateSet(<double(:)> value) Set the \textbf{spinVectorGrowthRate} property of the \textbf{spin} component.

tfamily \textcolor{red}{\textless textless double(:)\textgreater} \spinVectorIsGettable() Get the \textbf{spinVector} property of the \textbf{spin} component.

tfamily \textcolor{red}{\textless logical\textgreater} \spinVectorIsSettable() Specify whether the \textbf{spinVector} property of the \textbf{spin} component is settable.

tfamily \textcolor{red}{\textless double(:)\textgreater} \spinVectorRate(<double(:)> value) Cumulate to the rate of the \textbf{spinVector} property of the \textbf{SpinPreset3D} component.

tfamily \textcolor{red}{\textless double(:)\textgreater} \spinVectorScale(<double(:)> value) Set the scale of the \textbf{spinVector} property of the \textbf{SpinPreset3D} component.

tfamily \textcolor{red}{\textless double(:)\textgreater} \spinVectorSet(<double(:)> value) Set the \textbf{spinVector} property of the \textbf{spin} component.

tfamily \textcolor{red}{\textless doublearf\_3>(positionCylindrical→, <componentType>[componentType]→, <massType>[massType]→, <weightBy>[weightBy]→, <integer>[weightIndex]→, <logical>[haloLoaded]→) Compute the surface density.

tfamily \textcolor{red}{\textless textless type(varying\_string)\textgreater} \textbf{type}() Return the type of this object.

tfamily progenitorIterator

   tfamily \textcolor{red}{\textless textless *class(nodeData)\textgreater} \textbf{current}(<class(nodeData)(:)> nodes→) Return a pointer to the current progenitor.

tfamily \textcolor{red}{\textless class(nodeData)\textgreater} \textbf{descendentSet}(<class(nodeData)> node→, <class(nodeData)(:)> nodes→) Set the target descendent node and initialize the iterator.
16.5. Objects

tfamily \logicalzero exist() Return true if any progenitors exist, false otherwise.

tfamily \textcolor{red}{\textless integer(kind=kind\_int8)\textgreater} index(<class(nodeData)(:)> nodes→) Return the index of the current progenitor.

tfamily \logicalzero next(<class(nodeData)(:)> nodes→) Move to the next progenitor. Returns true if the next progenitor exists, false otherwise.

tfamily radiationStructure

tfamily \void define(<integer(:)> radiationTypes→) Define the radiation components active in a given radiation object.

tfamily \doublezero flux(<double> wavelength→, <integer(:)> [radiationType]→) Return the flux (in units of ergs cm\(^2\) s\(^{-1}\) Hz\(^{-1}\) ster\(^{-1}\)) of the given radiation structure.

tfamily \doublezero integrateOverCrossSection(<double> wavelength→, <integer(:)> [radiationType]→) Integrates the flux (in units of ergs cm\(^2\) s\(^{-1}\) Hz\(^{-1}\) ster\(^{-1}\)) of the given radiation structure between the wavelengths given in wavelengthRange over a cross section specified by the function crossSectionFunction.

tfamily \logicalzero isDefined() Return true if the radiation component is defined, false otherwise.

tfamily \void set(<*type(treeNode)>thisNode) Set the radiation components in the radiation object.

tfamily \doublezero temperature(<integer(:)> [radiationType]→) Return the temperature (in units of Kelvin) of the given radiation structure.

tfamily \doublezero time() The cosmic time at which this radiation object was set.

tfamily regEx

tfamily \void destroy() Destroy the regex.

tfamily \logicalzero matches(<character(len=*>) string→) Return true if a regular expression matches the supplied string.

tfamily rootFinder

tfamily \doublezero find(<double> [rootGuess]|<double(2)> [rootRange]) Find the root of the function given an initial guess or range.

tfamily \logicalzero isInitialized() Return the initialization state of a rootFinder object.

tfamily \void rangeExpand(<double> [rangeExpandUpward]→,<double> [rangeExpandDownward]→, <rangeExpand> [rangeExpandType]→, <double> [rangeUpwardLimit]→, <double> [rangeDownwardLimit]→, <rangeExpandSignExpect> [rangeExpandDownwardSignExpect]→, <rangeExpandSignExpect> [rangeExpandUpwardSignExpect]→) Specify how the initial range will be expanded in a rootFinder object to bracket the root.

tfamily \void rootFunction(<function(<double> x→) rootFunction) Set the function that evaluates \(f(x)\) to use in a rootFinder object.

tfamily \void tolerance(<double> [toleranceAbsolute]→, <double> [toleranceRelative]→) Set the tolerance to use in a rootFinder object.

tfamily \void type(<type(fgsl_root_fsolver_type>) solverType→) Set the type of algorithm to use in a rootFinder object.
tfamily satelliteMergingTimescalesBoylanKolchin2008

tfamily logical isFinalizable() Return true if this object can be finalized.

tfamily void stateRestore(<integer> stateFile →) Restore the state of the object from file.

tfamily void stateSnapshot() Stores a snapshot of the object state.

tfamily void stateStore(<integer> stateFile →) Store the state of the object to file.

tfamily double precision timeUntilMerging() Return the time (in Gyr) until the satellite will merge with its host given the current orbit.

tfamily satelliteMergingTimescalesClass

tfamily logical isFinalizable() Return true if this object can be finalized.

tfamily void stateRestore(<integer> stateFile →) Restore the state of the object from file.

tfamily void stateSnapshot() Stores a snapshot of the object state.

tfamily void stateStore(<integer> stateFile →) Store the state of the object to file.

tfamily double precision timeUntilMerging() Return the time (in Gyr) until the satellite will merge with its host given the current orbit.

tfamily satelliteMergingTimescalesInfinite

tfamily logical isFinalizable() Return true if this object can be finalized.

tfamily void stateRestore(<integer> stateFile →) Restore the state of the object from file.

tfamily void stateSnapshot() Stores a snapshot of the object state.

tfamily void stateStore(<integer> stateFile →) Store the state of the object to file.

tfamily double precision timeUntilMerging() Return the time (in Gyr) until the satellite will merge with its host given the current orbit.

tfamily satelliteMergingTimescalesJiang2008

tfamily logical isFinalizable() Return true if this object can be finalized.

tfamily void stateRestore(<integer> stateFile →) Restore the state of the object from file.

tfamily void stateSnapshot() Stores a snapshot of the object state.

tfamily void stateStore(<integer> stateFile →) Store the state of the object to file.

tfamily double precision timeUntilMerging() Return the time (in Gyr) until the satellite will merge with its host given the current orbit.
16.5. Objects

tfamily satelliteMergingTimescalesLaceyCole1993

tfamily logical isFinalizable() Return true if this object can be finalized.

tfamily void stateRestore(<integer> stateFile →) Restore the state of the object from file.

tfamily void stateSnapshot() Stores a snapshot of the object state.

tfamily void stateStore(<integer> stateFile →) Store the state of the object to file.

tfamily double precision timeUntilMerging() Return the time (in Gyr) until the satellite will merge with its host given the current orbit.

tfamily double precision timeUntilMergingMassDependence() Return the mass-dependent part of the time (in Gyr) until the satellite will merge with its host.

tfamily satelliteMergingTimescalesLaceyCole1993Tormen

tfamily logical isFinalizable() Return true if this object can be finalized.

tfamily void stateRestore(<integer> stateFile →) Restore the state of the object from file.

tfamily void stateSnapshot() Stores a snapshot of the object state.

tfamily void stateStore(<integer> stateFile →) Store the state of the object to file.

tfamily double precision timeUntilMerging() Return the time (in Gyr) until the satellite will merge with its host given the current orbit.

tfamily double precision timeUntilMergingMassDependence() Return the mass-dependent part of the time (in Gyr) until the satellite will merge with its host.

tfamily satelliteMergingTimescalesNull

tfamily logical isFinalizable() Return true if this object can be finalized.

tfamily void stateRestore(<integer> stateFile →) Restore the state of the object from file.

tfamily void stateSnapshot() Stores a snapshot of the object state.

tfamily void stateStore(<integer> stateFile →) Store the state of the object to file.

tfamily double precision timeUntilMerging() Return the time (in Gyr) until the satellite will merge with its host given the current orbit.

tfamily satelliteMergingTimescalesPreset

tfamily logical isFinalizable() Return true if this object can be finalized.

tfamily void stateRestore(<integer> stateFile →) Restore the state of the object from file.

tfamily void stateSnapshot() Stores a snapshot of the object state.

tfamily void stateStore(<integer> stateFile →) Store the state of the object to file.

tfamily double precision timeUntilMerging() Return the time (in Gyr) until the satellite will merge with its host given the current orbit.
16. Coding GALACTICUS

tfamily satelliteMergingTimescalesVillalobos2013

tfamily logical isFinalizable() Return true if this object can be finalized.

tfamily void stateRestore(<integer> stateFile →) Restore the state of the object from file.

tfamily void stateSnapshot() Stores a snapshot of the object state.

tfamily void stateStore(<integer> stateFile →) Store the state of the object to file.

tfamily double precision timeUntilMerging() Return the time (in Gyr) until the satellite will merge with its host given the current orbit.

tfamily satelliteMergingTimescalesWetzelWhite2010

tfamily logical isFinalizable() Return true if this object can be finalized.

tfamily void stateRestore(<integer> stateFile →) Restore the state of the object from file.

tfamily void stateSnapshot() Stores a snapshot of the object state.

tfamily void stateStore(<integer> stateFile →) Store the state of the object to file.

tfamily double precision timeUntilMerging() Return the time (in Gyr) until the satellite will merge with its host given the current orbit.

tfamily semaphore

tfamily \void close() Close the semaphore.

tfamily \void post() Post to (i.e. release) a semaphore.

tfamily \void unlink() Unlink a semaphore.

tfamily \void wait() Wait for a semaphore to become available.

tfamily spectraPostprocessorClass

tfamily void apply(<double precision> wavelength→,<double precision> age→,<double precision> redshift→,<double precision> modifier↔) Apply postprocessing to a spectrum.

tfamily logical isFinalizable() Return true if this object can be finalized.

tfamily spectraPostprocessorIdentity

tfamily void apply(<double precision> wavelength→,<double precision> age→,<double precision> redshift→,<double precision> modifier↔) Apply postprocessing to a spectrum.

tfamily logical isFinalizable() Return true if this object can be finalized.

tfamily spectraPostprocessorInoue2014

tfamily void apply(<double precision> wavelength→,<double precision> age→,<double precision> redshift→,<double precision> modifier↔) Apply postprocessing to a spectrum.

tfamily logical isFinalizable() Return true if this object can be finalized.
16.5. Objects

tfamily spectraPostprocessorLycSuppress
tfamily void apply(<double precision> wavelength→, <double precision> age→, <double precision> redshift→, <double precision> modifier↔) Apply postprocessing to a spectrum.
tfamily logical isFinalizable() Return true if this object can be finalized..

tfamily spectraPostprocessorMadau1995
tfamily void apply(<double precision> wavelength→, <double precision> age→, <double precision> redshift→, <double precision> modifier↔) Apply postprocessing to a spectrum.
tfamily logical isFinalizable() Return true if this object can be finalized..

tfamily spectraPostprocessorMeiksin2006
tfamily void apply(<double precision> wavelength→, <double precision> age→, <double precision> redshift→, <double precision> modifier↔) Apply postprocessing to a spectrum.
tfamily logical isFinalizable() Return true if this object can be finalized..

tfamily spectraPostprocessorRecent
tfamily void apply(<double precision> wavelength→, <double precision> age→, <double precision> redshift→, <double precision> modifier↔) Apply postprocessing to a spectrum.
tfamily logical isFinalizable() Return true if this object can be finalized..

tfamily stellarLuminosities
tfamily \textcolor{red}{\textless} StellarLuminosities\textgreater add(<type(stellarLuminosities)> stellarLuminosities2→) Add two stellarLuminosities.
tfamily \void builder(<*type(node)> stellarLuminositiesDefinition→) Build a stellar luminosities object from a provided XML description.
tfamily \void deserialize(<double(:)> array→) Deserialize a stellar luminosities object from an array.
tfamily \void destroy() Destroy a stellar luminosities object.
tfamily \textcolor{red}{\textless} StellarLuminosities\textgreater divide(<double> divisor→) Divide stellar luminosities by a scalar.
tfamily \void dump() Dump a stellar luminosities object.
tfamily \void dumpRaw(<integer> fileHandle→) Dump a stellar luminosities object to binary.
tfamily \void increment(<type(stellarLuminosities)> addStellarLuminosities→) Increment a stellar luminosities object.
tfamily \intzero index(<type(varying_string)> name→) Return the index to a luminosity specified by name.
tfamily \logicalzero isOutput(<integer> index→, <double> time→) Return true if the indexed luminosity is to be output at the given time.
tfamily \logicalzero isZero() Return true if a stellar luminosities object is zero.

tfamily \doublezero luminosity(<integer> index\rightarrow) Return the $i^{th}$ luminosity.

tfamily \intzero luminosityCount() Return the total number of luminosities tracked.

tfamily \intzero luminosityOutputCount(<double> time\rightarrow) Return the number of luminosities to be output at the given time.

tfamily \textcolor{red}{\textlesstype(stellarLuminosities)\textgreater} multiply(<double> multiplier\rightarrow) Multiply stellar luminosities by a scalar.

tfamily \textcolor{red}{\textlesstype(varying\_string)\textgreater} name(<integer> index\rightarrow) Return the name of a luminosity specified by index.

tfamily \void output(<integer> integerProperty\leftrightarrow, <integer> integerBufferCount\leftrightarrow, <integer>(::)> integerBuffer\leftrightarrow, <integer>doubleProperty\leftrightarrow, <integer>doubleBufferCount\leftrightarrow, <double>(::)> doubleBuffer\leftrightarrow, <double> time\rightarrow, <integer> instance\rightarrow) Store a stellar luminosities object in the output buffers.

tfamily \void outputCount(<integer>integerPropertyCount\leftrightarrow, <integer>doublePropertyCount\leftrightarrow, <double> time\rightarrow, <integer> instance\rightarrow) Specify the count of a stellar luminosities object for output.

tfamily \void outputNames(<integer>integerProperty\leftrightarrow, <char[*](:)>integerPropertyNames\leftrightarrow, <char[*](:)>integerPropertyComments\leftrightarrow, <double(:)>integerPropertyUnitsSI\leftrightarrow, <integer>doubleProperty\leftrightarrow, <char[*](:)>doublePropertyNames\leftrightarrow, <char[*](:)>doublePropertyComments\leftrightarrow, <double(:)>doublePropertyUnitsSI\leftrightarrow, <double> time\rightarrow, <integer> instance\rightarrow) Specify the names of stellar luminosities object properties for output.

tfamily \void readRaw(<integer> fileHandle\rightarrow) Read a stellar luminosities object from binary.

tfamily \void reset() Reset a stellar luminosities object.

tfamily \void serialize(<double(:)> array\leftarrow) Serialize a stellar luminosities object to an array.

tfamily \intzero serializeCount() Return a count of the number of properties in a serialized stellar luminosities object.

tfamily \void setLuminosities(<double> mass\rightarrow, <integer> imfSelected\rightarrow, <double> currentTime\rightarrow, <\textlesstype(abundances)> fuelAbundances\rightarrow) Set the luminosities using a single stellar population.

tfamily \void setToUnity() Set a stellar luminosities object to unity.

tfamily \textcolor{red}{\textlesstype(stellarLuminosities)\textgreater} subtract(<\textlesstype(stellarLuminosities)> stellarLuminosities2\rightarrow) Subtract one abundance from another.

tfamily table

tfamily \void destroy() Destroy the table.
tfamily table1D

tfamily \ void destroy() Destroy the table.

tfamily \ double zero interpolate(<double> x, <integer> [table]) Interpolate to x in the table\textsuperscript{th} table.

tfamily \ double zero interpolateGradient(<double> x, <integer> [table]) Interpolate the gradient to x in the table\textsuperscript{th} table.

tfamily \ logical zero isMonotonic(<enumeration> [direction Decreasing | direction Increasing], <logical> [allowEqual], <integer> [table]) Return true if the table y-values are monotonic. Optionally, the direction of monotonicity can be specified via the \texttt{direction} argument—by default either direction is allowed. By default consecutive equal values are considered non-monotonic. This behavior can be changed via the optional \texttt{allowEqual} argument. If \texttt{table} is specified then the \texttt{table}\textsuperscript{th} table is used for the y-values, otherwise the first table is used.

tfamily \ void reverse(<type(table>) reversedSelf, <integer> [table]) Reverse the table (i.e. swap x and y components) and return in \texttt{reversedSelf}. If \texttt{table} is specified then the \texttt{table}\textsuperscript{th} table is used for the y-values, otherwise the first table is used.

tfamily \ int zero size() Return the size (i.e. number of x-values) in the table.

tfamily \ double zero x(<integer> i) Return the \(i\)th x-value.

tfamily \ double zero xEffective(<double> x) Return the effective value of x to use in table interpolations.

tfamily \ double one xs(<integer> i) Return an array of all x-values.

tfamily \ double zero y(<integer> i, <integer> [table]) Return the \(i\)th y-value. If \texttt{table} is specified then the \texttt{table}\textsuperscript{th} table is used for the y-values, otherwise the first table is used.

tfamily \ double one ys(<integer> i, <integer> [table]) Return an array of all y-values. If \texttt{table} is specified then the \texttt{table}\textsuperscript{th} table is used for the y-values, otherwise the first table is used.

tfamily table1DGeneric

tfamily \ void create(<double(:)> x, <integer> [tableCount]) Create the object with the specified x values, and with \texttt{tableCount} tables.

tfamily \ void destroy() Destroy the table.

tfamily \ double zero interpolate(<double> x, <integer> [table]) Interpolate to x in the table\textsuperscript{th} table.

tfamily \ double zero interpolateGradient(<double> x, <integer> [table]) Interpolate the gradient to x in the table\textsuperscript{th} table.

tfamily \ logical zero isMonotonic(<enumeration> [direction Decreasing | direction Increasing], <logical> [allowEqual], <integer> [table]) Return true if the table y-values are monotonic. Optionally, the direction of monotonicity can be specified via the \texttt{direction} argument—by default either direction is allowed. By default consecutive equal values are considered non-monotonic. This behavior can be changed via the optional \texttt{allowEqual} argument. If \texttt{table} is specified then the \texttt{table}\textsuperscript{th} table is used for the y-values, otherwise the first table is used.

tfamily \ void populate(<double>|<double(:)> y, <integer> [i], <integer> [table]) Populate the \texttt{table}\textsuperscript{th} table with elements y. If y is a scalar, then the index, i, of the element to set must also be specified.
16. Coding Galacticus

tfamily \void reverse(<type(table>) reversedSelf,<integer> [table]) Reverse the table (i.e. swap x and y components) and return in \textit{reversedSelf}. If \textit{table} is specified then the \textit{table}th table is used for the \textit{y}-values, otherwise the first table is used.

tfamily \intzero size() Return the size (i.e. number of \textit{x}-values) in the table.

tfamily \doublezero x(<integer> i) Return the \textit{i}th \textit{x}-value.

tfamily \doublezero xEffective(<double> x) Return the effective value of \textit{x} to use in table interpolations.

tfamily \doubleone xs(<integer> i) Return an array of all \textit{x}-values.

tfamily \doublezero y(<integer> i,<integer> [table]) Return the \textit{i}th \textit{y}-value. If \textit{table} is specified then the \textit{table}th table is used for the \textit{y}-values, otherwise the first table is used.

tfamily \doubleone ys(<integer> i,<integer> [table]) Return an array of all \textit{y}-values. If \textit{table} is specified then the \textit{table}th table is used for the \textit{y}-values, otherwise the first table is used.

tfamily table1DLinearCSpline

tfamily \void create(<double>xMinimum,<double>xMaximum,<integer>xCount,<integer>[tableCount]) Create the object with \textit{x}-values spanning the range \textit{xMinimum} to \textit{xMaximum} in \textit{xCount} steps, and with \textit{tableCount} tables.

tfamily \void destroy() Destroy the table.

tfamily \doublezero interpolate(<double> x,<integer> [table]) Interpolate to \textit{x} in the \textit{table}th table.

tfamily \doublezero interpolateGradient(<double> x,<integer> [table]) Interpolate the gradient to \textit{x} in the \textit{table}th table.

tfamily \logicalzero isMonotonic(<enumeration>[directionDecreasing|directionIncreasing],<logical>[allowEqual],<integer> [table]) Return true if the table \textit{y}-values are monotonic. Optionally, the direction of monotonicity can be specified via the \textit{direction} argument—by default either direction is allowed. By default consecutive equal values are considered non-monotonic. This behavior can be changed via the optional \textit{allowEqual} argument. If \textit{table} is specified then the \textit{table}th table is used for the \textit{y}-values, otherwise the first table is used.

tfamily \void populate(<double>|<double(:)> y,<integer> [i],<integer> [table]) Populate the \textit{table}th table with elements \textit{y}. If \textit{y} is a scalar, then the index, \textit{i}, of the element to set must also be specified.

tfamily \void reverse(<type(table>) reversedSelf,<integer> [table]) Reverse the table (i.e. swap \textit{x} and \textit{y} components) and return in \textit{reversedSelf}. If \textit{table} is specified then the \textit{table}th table is used for the \textit{y}-values, otherwise the first table is used.

tfamily \intzero size() Return the size (i.e. number of \textit{x}-values) in the table.

tfamily \doublezero x(<integer> i) Return the \textit{i}th \textit{x}-value.

tfamily \doublezero xEffective(<double> x) Return the effective value of \textit{x} to use in table interpolations.

tfamily \doubleone xs(<integer> i) Return an array of all \textit{x}-values.

tfamily \doublezero y(<integer> i,<integer> [table]) Return the \textit{i}th \textit{y}-value. If \textit{table} is specified then the \textit{table}th table is used for the \textit{y}-values, otherwise the first table is used.

tfamily \doubleone ys(<integer> i,<integer> [table]) Return an array of all \textit{y}-values. If \textit{table} is specified then the \textit{table}th table is used for the \textit{y}-values, otherwise the first table is used.
16.5. Objects

tfamily 1DLinearLinear

\texttt{void create(<double> xMinimum, <double> xMaximum, <integer> xCount, <integer> [tableCount])}
Create the object with \textit{x}-values spanning the range \texttt{xMinimum} to \texttt{xMaximum} in \texttt{xCount} steps, and with \texttt{tableCount} tables.

tfamily  \texttt{void destroy()} Destroy the table.

ntfamily \texttt{double zero interpolate(<double> x, <integer> [table])} Interpolate to \texttt{x} in the \texttt{table}th table.

ntfamily \texttt{double zero interpolateGradient(<double> x, <integer> [table])} Interpolate the gradient to \texttt{x} in the \texttt{table}th table.

tfamily \texttt{logical zero isMonotonic(<enumeration> [directionDecreasing|directionIncreasing], <logical> [allowEqual], <integer> [table])} Return true if the table \textit{y}-values are monotonic. Optionally, the direction of monotonicity can be specified via the \texttt{direction} argument—by default either direction is allowed. By default consecutive equal values are considered non-monotonic. This behavior can be changed via the optional \texttt{allowEqual} argument. If \texttt{table} is specified then the \texttt{table}th table is used for the \textit{y}-values, otherwise the first table is used.

ntfamily \texttt{void populate(<double>|<double(:)> y, <integer> [i], <integer> [table])} Populate the \texttt{table}th table with elements \texttt{y}. If \texttt{y} is a scalar, then the index, \texttt{i}, of the element to set must also be specified.

ntfamily \texttt{void reverse(<type(table)> reversedSelf, <integer> [table])} Reverse the table (i.e. swap \textit{x} and \textit{y} components) and return in \texttt{reversedSelf}. If \texttt{table} is specified then the \texttt{table}th table is used for the \textit{y}-values, otherwise the first table is used.

ntfamily \texttt{int zero size()} Return the size (i.e. number of \textit{x}-values) in the table.

ntfamily \texttt{double zero x(<integer> i)} Return the \texttt{i}th \textit{x}-value.

ntfamily \texttt{double zero xEffective( <double> x)} Return the effective value of \texttt{x} to use in table interpolations.

ntfamily \texttt{double one xs(<integer> i)} Return an array of all \textit{x}-values.

ntfamily \texttt{double zero y(<integer> i, <integer> [table])} Return the \texttt{i}th \textit{y}-value. If \texttt{table} is specified then the \texttt{table}th table is used for the \textit{y}-values, otherwise the first table is used.

ntfamily \texttt{double one ys(<integer> i, <integer> [table])} Return an array of all \textit{y}-values. If \texttt{table} is specified then the \texttt{table}th table is used for the \textit{y}-values, otherwise the first table is used.

tfamily 1DLogarithmicCSpline

\texttt{void create(<double> xMinimum, <double> xMaximum, <integer> xCount, <integer> [tableCount])}
Create the object with \textit{x}-values spanning the range \texttt{xMinimum} to \texttt{xMaximum} in \texttt{xCount} steps, and with \texttt{tableCount} tables.

tfamily \texttt{void destroy()} Destroy the table.

ntfamily \texttt{double zero interpolate(<double> x, <integer> [table])} Interpolate to \texttt{x} in the \texttt{table}th table.

ntfamily \texttt{double zero interpolateGradient(<double> x, <integer> [table])} Interpolate the gradient to \texttt{x} in the \texttt{table}th table.
\textbf{16. Coding Galacticus}

tfamily \logicalzero isMonotonic(\texttt{\ang{enumeration}>}, \texttt{\ang{directionDecreasing}|\ang{directionIncreasing}}, \texttt{\ang{logical} \ang{allowEqual}}, \texttt{\ang{integer}> \ang{table}}) Return true if the table \textit{y}-values are monotonic. Optionally, the direction of monotonicity can be specified via the \texttt{direction} argument—by default either direction is allowed. By default consecutive equal values are considered non-monotonic. This behavior can be changed via the optional \texttt{allowEqual} argument. If \texttt{table} is specified then the \textit{table}th table is used for the \textit{y}-values, otherwise the first table is used.

tfamily \void populate(\langle \texttt{double} \rangle | \langle \texttt{double(:)} \rangle \textit{y}, \langle \texttt{integer} \rangle \mathit{i}, \langle \texttt{integer} \rangle \mathit{table}) Populate the \textit{table}th table with elements \textit{y}. If \textit{y} is a scalar, then the index, \textit{i}, of the element to set must also be specified.

tfamily \void reverse(\texttt{\ang{type(table)} > reversedSelf}, \langle \texttt{integer} \rangle \mathit{table}) Reverse the table (i.e. swap \textit{x} and \textit{y} components) and return in \texttt{reversedSelf}. If \texttt{table} is specified then the \textit{table}th table is used for the \textit{y}-values, otherwise the first table is used.

tfamily \intzero size() Return the size (i.e. number of \textit{x}-values) in the table.

tfamily \doublezero \textit{x}(\langle \texttt{integer} \rangle \mathit{i}) Return the \textit{i}th \textit{x}-value.

tfamily \doublezero \textit{xEffective}(\langle \texttt{double} > \textit{x}) Return the effective value of \textit{x} to use in table interpolations.

tfamily \doubleone \textit{xs}(\langle \texttt{integer} \rangle \mathit{i}) Return an array of all \textit{x}-values.

tfamily \doublezero \textit{y}(\langle \texttt{integer} \rangle \mathit{i}, \langle \texttt{integer} \rangle \mathit{table}) Return the \textit{i}th \textit{y}-value. If \texttt{table} is specified then the \textit{table}th table is used for the \textit{y}-values, otherwise the first table is used.

tfamily \doubleone \textit{ys}(\langle \texttt{integer} \rangle \mathit{i}, \langle \texttt{integer} \rangle \mathit{table}) Return an array of all \textit{y}-values. If \texttt{table} is specified then the \textit{table}th table is used for the \textit{y}-values, otherwise the first table is used.

tfamily table1DLogarithmicLinear

tfamily \void create(\langle \texttt{double} > \mathit{xMinimum}, \langle \texttt{double} > \mathit{xMaximum}, \langle \texttt{integer} \rangle \mathit{xCount}, \langle \texttt{integer} \rangle \mathit{tableCount}) Create the object with \textit{x}-values spanning the range \textit{xMinimum} to \textit{xMaximum} in \textit{xCount} steps, and with \textit{tableCount} tables.

tfamily \void destroy() Destroy the table.

tfamily \doublezero \textit{interpolate}(\langle \texttt{double} > \mathit{x}, \langle \texttt{integer} \rangle \mathit{table}) Interpolate to \textit{x} in the \textit{table}th table.

tfamily \doublezero \textit{interpolateGradient}(\langle \texttt{double} > \mathit{x}, \langle \texttt{integer} \rangle \mathit{table}) Interpolate the gradient to \textit{x} in the \textit{table}th table.

tfamily \logicalzero isMonotonic(\texttt{\ang{enumeration}>}, \texttt{\ang{directionDecreasing}|\ang{directionIncreasing}}, \texttt{\ang{logical} \ang{allowEqual}}, \texttt{\ang{integer}> \ang{table}}) Return true if the table \textit{y}-values are monotonic. Optionally, the direction of monotonicity can be specified via the \texttt{direction} argument—by default either direction is allowed. By default consecutive equal values are considered non-monotonic. This behavior can be changed via the optional \texttt{allowEqual} argument. If \texttt{table} is specified then the \textit{table}th table is used for the \textit{y}-values, otherwise the first table is used.

tfamily \void populate(\langle \texttt{double} \rangle | \langle \texttt{double(:)} \rangle \textit{y}, \langle \texttt{integer} \rangle \mathit{i}, \langle \texttt{integer} \rangle \mathit{table}) Populate the \textit{table}th table with elements \textit{y}. If \textit{y} is a scalar, then the index, \textit{i}, of the element to set must also be specified.

tfamily \void reverse(\texttt{\ang{type(table)} > reversedSelf}, \langle \texttt{integer} \rangle \mathit{table}) Reverse the table (i.e. swap \textit{x} and \textit{y} components) and return in \texttt{reversedSelf}. If \texttt{table} is specified then the \textit{table}th table is used for the \textit{y}-values, otherwise the first table is used.

\textfamily \intzero size() Return the size (i.e., number of x-values) in the table.

\textfamily \doublezero x(<integer> i) Return the i\textsuperscript{th} x-value.

\textfamily \doublezero xEffective(<double> x) Return the effective value of \(x\) to use in table interpolations.

\textfamily \doubleone xs(<integer> i) Return an array of all x-values.

\textfamily \doublezero y(<integer> i,<integer> [table]) Return the i\textsuperscript{th} y-value. If \texttt{table} is specified then the \(i\textsuperscript{th}\) table is used for the y-values, otherwise the first table is used.

\textfamily \doubleone ys(<integer> i,<integer> [table]) Return an array of all y-values. If \texttt{table} is specified then the \(i\textsuperscript{th}\) table is used for the y-values, otherwise the first table is used.

\textfamily tensorRank2Dimension3Symmetric

\textfamily \textcolor{red}{\textless type(tensorRank2Dimension3Symmetric)\textgreater}add(<type(tensorRank2Dimension3Symmetric)> tensorRank2Dimension3Symmetric2 \rightarrow) Add two tensors.

\textfamily \void builder(<\*type(node)> tensorRank2Dimension3SymmetricDefinition \rightarrow) Build tensor object from a provided XML description.

\textfamily \doublezero contract() Contract a tensor, returning \(T_{ij}\).

\textfamily \void deserialize(<double(:)> tensorArray \rightarrow) Deserialize the tensor object from an array.

\textfamily \void destroy() Destroy a tensor object.

\textfamily \textcolor{red}{\textless type(tensorRank2Dimension3Symmetric)\textgreater}divide(<double> divisor \rightarrow) Divide a tensor by a scalar.

\textfamily \doublezero doubleContract(<type(tensorRank2Dimension3Symmetric)> tensor1) Return the double contraction of two tensors, \(A_{ij}B_{ij}\).

\textfamily \void dump() Dump the tensor object.

\textfamily \void dumpRaw(<integer> fileHandle \rightarrow) Dump the tensor object to binary.

\textfamily \logicalzero equality(<type(tensorRank2Dimension3Symmetric)> self \rightarrow, <double(3,3)> matrix \rightarrow) Return true if a tensor and a matrix are equal.

\textfamily \textcolor{red}{\textless type(tensorRank2Dimension3Symmetric)\textgreater}fromMatrix(double(3,3) matrix) Construct a matrix from a tensor object.

\textfamily \void increment(<type(tensorRank2Dimension3Symmetric)> addTensor \rightarrow) Increment the tensor object.

\textfamily \logicalzero isZero() Return true if a tensor object is zero.

\textfamily \textcolor{red}{\textless type(tensorRank2Dimension3Symmetric)\textgreater}multiply(<double> multiplier \rightarrow) Multiply a tensor by a scalar.

\textfamily \void readRaw(<integer> fileHandle \rightarrow) Read the tensor object from binary.

\textfamily \void reset() Reset elements to zero.

\textfamily \void serialize(<double(:)> tensorArray \leftarrow) Serialize the tensor object to an array.
tfamily \intzero serializeCount() Return a count of the number of properties in a serialized tensor object.

tfamily \void setToIdentity() Set a tensor object to the identity (i.e. all diagonal elements 1, all other elements 0).

tfamily \void setToUnity() Set all elements of the tensor object to unity.

tfamily \textcolor{red}{\textless*class(tensorRank2Dimension3Symmetric)\textgreater} subtract(<type(tensorRank2Dimension3Symmetric)> tensor1, <type(tensorRank2Dimension3Symmetric)> tensor2) Subtract one tensor from another.

tfamily \textcolor{red}{\textless*class(nodeComponentAgeStatistics)\textgreater} ageStatistics(<integer> [instance]→, <logical> [autoCreate]→) Return a ageStatistics component member of the node. If no instance is specified, return the first instance. If autoCreate is true then create a single instance of the component if none exists in the node.

tfamily \intzero ageStatisticsCount() Returns the number of ageStatistics components in the node.

tfamily \void ageStatisticsCreate(<class(nodeComponentAgeStatistics)> [template]→) Create a ageStatistics component in the node. If no template is specified use the active implementation of this class.

tfamily \void ageStatisticsDestroy() Destroy the ageStatistics component(s) of the node.

tfamily \void ageStatisticsMove(<type(treeNode)> targetNode ↔) HASH(0x154d348)

tfamily \void ageStatisticsRemove(<integer> [instance]→) Remove an instance of the ageStatistics component, shifting other instances to keep the array contiguous. If no instance is specified, the first instance is assumed.

tfamily \textcolor{red}{\textless*class(nodeComponentBasic)\textgreater} basic(<integer> [instance]→, <logical> [autoCreate]→) Return a basic component member of the node. If no instance is specified, return the first instance. If autoCreate is true then create a single instance of the component if none exists in the node.

tfamily \intzero basicCount() Returns the number of basic components in the node.

tfamily \void basicCreate(<class(nodeComponentBasic)> [template]→) Create a basic component in the node. If no template is specified use the active implementation of this class.

tfamily \void basicDestroy() Destroy the basic component(s) of the node.

tfamily \void basicMove(<type(treeNode)> targetNode ↔) HASH(0x152eb70)

tfamily \void basicRemove(<integer> [instance]→) Remove an instance of the basic component, shifting other instances to keep the array contiguous. If no instance is specified, the first instance is assumed.

tfamily \textcolor{red}{\textless*class(nodeComponentBlackHole)\textgreater} blackHole(<integer> [instance]→, <logical> [autoCreate]→) Return a blackHole component member of the node. If no instance is specified, return the first instance. If autoCreate is true then create a single instance of the component if none exists in the node.
16.5. Objects

tfamily \intzero blackHoleCount() Returns the number of blackHole components in the node.
tfamily \void blackHoleCreate(<class(nodeComponentBlackHole)> [template]→) Create a blackHole component in the node. If no template is specified use the active implementation of this class.
tfamily \void blackHoleDestroy() Destroy the blackHole component(s) of the node.
tfamily \void blackHoleMove(<type(treeNode)> targetNode↔) HASH(0x1552808)
tfamily \void blackHoleRemove(<integer> [instance]→) Remove an instance of the blackHole component, shifting other instances to keep the array contiguous. If no instance is specified, the first instance is assumed.
tfamily \void componentBuilder(<*type(node)> nodeDefinition→) Build components in this node given an XML description of their properties.
tfamily \void copyNodeTo(<class(treeNode)> targetNode↔, <logical> [skipFormationNode]→) Make a copy of the node in targetNode. If skipFormationNode is true then do not copy any pointer to the formation node.
tfamily \textcolor{red}{\textless *type(nodeEvent)\textgreater} createEvent() Create a nodeEvent object in this node.
tfamily \textcolor{red}{\textless *class(nodeComponentDarkMatterProfile)\textgreater} darkMatterProfile(<integer> [instance]→, <logical> [autoCreate]→) Return a darkMatterProfile component member of the node. If no instance is specified, return the first instance. If autoCreate is true then create a single instance of the component if none exists in the node.
tfamily \intzero darkMatterProfileCount() Returns the number of darkMatterProfile components in the node.
tfamily \void darkMatterProfileCreate(<class(nodeComponentDarkMatterProfile)> [template]→) Create a darkMatterProfile component in the node. If no template is specified use the active implementation of this class.
tfamily \void darkMatterProfileDestroy() Destroy the darkMatterProfile component(s) of the node.
tfamily \void darkMatterProfileMove(<type(treeNode)> targetNode↔) HASH(0x1556478)
tfamily \void darkMatterProfileRemove(<integer> [instance]→) Remove an instance of the darkMatterProfile component, shifting other instances to keep the array contiguous. If no instance is specified, the first instance is assumed.
tfamily \void deserializeRates(<double(:)> array→) Deserialize rates from array.
tfamily \void deserializeScales(<double(:)> array→) Deserialize scales from array.
tfamily \void deserializeValues(<double(:)> array→) Deserialize values from array.
tfamily \void destroy() Destroy this node.
tfamily \textcolor{red}{\textless *class(nodeComponentDisk)\textgreater} disk(<integer> [instance]→, <logical> [autoCreate]→) Return a disk component member of the node. If no instance is specified, return the first instance. If autoCreate is true then create a single instance of the component if none exists in the node.
tfamily `\textcolor{red}\textless*\text{intzero}\textgreater\text{diskCount()}` Returns the number of `disk` components in the node.

tfamily `\textcolor{red}\textless*\text{void diskCreate(<class(nodeComponentDisk)> [template]→)}` Create a `disk` component in the node. If no `template` is specified use the active implementation of this class.

tfamily `\textcolor{red}\textless*\text{void diskDestroy()}` Destroy the `disk` component(s) of the node.

tfamily `\textcolor{red}\textless*\text{void diskMove(<type(treeNode)> targetNode↔) HASH(0x15abd98)}`

tfamily `\textcolor{red}\textless*\text{void diskRemove(<integer> [instance]→)}` Remove an instance of the disk component, shifting other instances to keep the array contiguous. If no `instance` is specified, the first instance is assumed.

tfamily `\textcolor{red}\textless*\text{void dump()}` Generate an ASCII dump of all content of a node.

tfamily `\textcolor{red}\textless*\text{void dumpRaw(<integer> fileHandle→)}` Generate a binary dump of all content of a node.

tfamily `\textcolor{red}\textless*\text{void dumpXML()}` Generate an XML dump of all content of a node.

tfamily `\textcolor{red}\textless*\text{intzero dynamicsStatisticsCount()}` Returns the number of `dynamicsStatistics` components in the node.

tfamily `\textcolor{red}\textless*\text{void dynamicsStatisticsCreate(<class(nodeComponentDynamicsStatistics)> [template]→)}` Create a `dynamicsStatistics` component in the node. If no `template` is specified use the active implementation of this class.

tfamily `\textcolor{red}\textless*\text{void dynamicsStatisticsDestroy()}` Destroy the `dynamicsStatistics` component(s) of the node.

tfamily `\textcolor{red}\textless*\text{void dynamicsStatisticsMove(<type(treeNode)> targetNode↔) HASH(0x154d030)}`

tfamily `\textcolor{red}\textless*\text{void dynamicsStatisticsRemove(<integer> [instance]→)}` Remove an instance of the dynamicsStatistics component, shifting other instances to keep the array contiguous. If no `instance` is specified, the first instance is assumed.

tfamily `\textcolor{red}\textless*\text{type(treeNode)	extgreater earliestProgenitor()}` Return a pointer to the earliest progenitor (along the main branch) of this node.

tfamily `\textcolor{red}\textless*\text{class(nodeComponentFormationTime)	extgreater formationTime(<integer> [instance]→, <logical> [autoCreate]→)}` Return a formationTime component member of the node. If no `instance` is specified, return the first instance. If `autoCreate` is `true` then create a single instance of the component if none exists in the node.

tfamily `\textcolor{red}\textless*\text{intzero formationTimeCount()}` Returns the number of `formationTime` components in the node.

tfamily `\textcolor{red}\textless*\text{void formationTimeCreate(<class(nodeComponentFormationTime)> [template]→)}` Create a `formationTime` component in the node. If no `template` is specified use the active implementation of this class.

tfamily `\textcolor{red}\textless*\text{void formationTimeDestroy()}` Destroy the `formationTime` component(s) of the node.

tfamily `\textcolor{red}\textless*\text{void formationTimeMove(<type(treeNode)> targetNode↔) HASH(0x15527f0)}`
16.5. Objects

tfamily \void formationTimeRemove(<integer> [instance] \rightarrow) Remove an instance of the formationTime component, shifting other instances to keep the array contiguous. If no instance is specified, the first instance is assumed.

tfamily \textcolor{red}{\textless*class(nodeComponentHostHistory)\textgreater} hostHistory(<integer> [instance] \rightarrow, <logical> [autoCreate] \rightarrow) Return a hostHistory component member of the node. If no instance is specified, return the first instance. If autoCreate is true then create a single instance of the component if none exists in the node.

tfamily \intzero hostHistoryCount() Returns the number of hostHistory components in the node.

tfamily \void hostHistoryCreate(<class(nodeComponentHostHistory)> [template] \rightarrow) Create a hostHistory component in the node. If no template is specified use the active implementation of this class.

tfamily \void hostHistoryDestroy() Destroy the hostHistory component(s) of the node.

tfamily \void hostHistoryMove(<type(treeNode)> targetNode \leftrightarrow) HASH(0x1558a18)

tfamily \void hostHistoryRemove(<integer> [instance] \rightarrow) Remove an instance of the hostHistory component, shifting other instances to keep the array contiguous. If no instance is specified, the first instance is assumed.

tfamily \textcolor{red}{\textless*class(nodeComponentHotHalo)\textgreater} hotHalo(<integer> [instance] \rightarrow, <logical> [autoCreate] \rightarrow) Return a hotHalo component member of the node. If no instance is specified, return the first instance. If autoCreate is true then create a single instance of the component if none exists in the node.

tfamily \intzero hotHaloCount() Returns the number of hotHalo components in the node.

tfamily \void hotHaloCreate(<class(nodeComponentHotHalo)> [template] \rightarrow) Create a hotHalo component in the node. If no template is specified use the active implementation of this class.

tfamily \void hotHaloDestroy() Destroy the hotHalo component(s) of the node.

tfamily \void hotHaloMove(<type(treeNode)> targetNode \leftrightarrow) HASH(0x150af68)

tfamily \void hotHaloRemove(<integer> [instance] \rightarrow) Remove an instance of the hotHalo component, shifting other instances to keep the array contiguous. If no instance is specified, the first instance is assumed.

tfamily \textcolor{red}{\textless integer(kind\_int8)\textgreater} index() Return the index of this node.

tfamily \void indexSet(<integer(kind\_int8)> index \rightarrow) Set the index of this node.

tfamily \textcolor{red}{\textless*class(nodeComponentIndices)\textgreater} indices(<integer> [instance] \rightarrow, <logical> [autoCreate] \rightarrow) Return a indices component member of the node. If no instance is specified, return the first instance. If autoCreate is true then create a single instance of the component if none exists in the node.

tfamily \intzero indicesCount() Returns the number of indices components in the node.

tfamily \void indicesCreate(<class(nodeComponentIndices)> [template] \rightarrow) Create a indices component in the node. If no template is specified use the active implementation of this class.

tfamily \void indicesDestroy() Destroy the indices component(s) of the node.
tfamily \void indicesMove(<\text{type}(\text{treeNode})> \text{targetNode} \leftrightarrow) \text{HASH}(0x1550198)

tfamily \void indicesRemove(<\text{integer}> [\text{instance}]\rightarrow) \text{Remove an instance of the indices component, shifting other instances to keep the array contiguous. If no \text{instance} is specified, the first instance is assumed.}

tfamily \void initialize(<\text{integer}(\text{kind_int8})> \text{index} \rightarrow) \text{Initialize this node (assigns a unique identifier, creates generic components).}

tfamily \textcolor{red}{\langle*\text{class(nodeComponentInterOutput)}\rangle} \text{interOutput}(<\text{integer}> \text{[instance]}\rightarrow, <\text{logical}> [\text{autoCreate}]\rightarrow) \text{Return a interOutput component member of the node. If no \text{instance} is specified, return the first instance. If \text{autoCreate} is \text{true} then create a single instance of the component if none exists in the node.}

tfamily \text{intzero} \text{interOutputCount}() \text{Returns the number of \text{interOutput} components in the node.}

tfamily \void \text{interOutputCreate}(<\text{class(nodeComponentInterOutput)}>[\text{template}]\rightarrow) \text{Create a \text{interOutput} component in the node. If no \text{template} is specified use the active implementation of this class.}

tfamily \void \text{interOutputDestroy}() \text{Destroy the \text{interOutput} component(s) of the node.}

tfamily \void \text{interOutputMove}(<\text{type}(\text{treeNode})> \text{targetNode} \leftrightarrow) \text{HASH}(0x15581a8)

tfamily \void \text{interOutputRemove}(<\text{integer}> [\text{instance}]\rightarrow) \text{Remove an instance of the \text{interOutput} component, shifting other instances to keep the array contiguous. If no \text{instance} is specified, the first instance is assumed.}

tfamily \logicalzero \text{isOnMainBranch}() \text{Return true if this node is on the main branch of its tree, false otherwise.}

tfamily \logicalzero \text{isPrimaryProgenitor}() \text{Return true if this node is the primary progenitor of its descendent, false otherwise.}

tfamily \logicalzero \text{isPrimaryProgenitorOf(<\text{integer}(\text{kind_int8})> \text{targetNodeIndex} \rightarrow|<*\text{type}(\text{treeNode})> \text{targetNode} \rightarrow)} \text{Return true is this node is the primary progenitor of the specified (by index or pointer) node, false otherwise.}

tfamily \logicalzero \text{isProgenitorOf(<\text{integer}(\text{kind_int8})> \text{targetNodeIndex} \rightarrow|<*\text{type}(\text{treeNode})> \text{targetNode} \rightarrow)} \text{Return true is this node is a progenitor of the specified (by index or pointer) node, false otherwise.}

tfamily \logicalzero \text{isSatellite}() \text{Return true if this node is a satellite, false otherwise.}

tfamily \textcolor{red}{\langle*\text{type}(\text{treeNode})\rangle} \text{lastSatellite}() \text{Return a pointer to the last satellite in the list of satellites belonging to this node.}

tfamily \text{doublezero} mapDouble0(<*\text{function()}> \text{mapFunction}) \text{Map a scalar double function over components.}

tfamily \void mapVoid(<*\text{function()}> \text{mapFunction}) \text{Map a void function over components.}

tfamily \textcolor{red}{\langle*\text{class(nodeComponentMassFlowStatistics)}\rangle} \text{massFlowStatistics}(<\text{integer}> [\text{instance}]\rightarrow, <\text{logical}> [\text{autoCreate}]\rightarrow) \text{Return a massFlowStatistics component member of the node. If no \text{instance} is specified, return the first instance. If \text{autoCreate} is \text{true} then create a single instance of the component if none exists in the node.}
16.5. Objects

tfamily \texttt{\textcolor{red}{\textless *type(treeNode)\textgreater} mergeWith()} Return a pointer to the node with which this node will merge.

tfamily \texttt{\textcolor{red}{\textless *class(nodeComponentMergingStatistics)\textgreater} mergingStatistics(<integer>[instance]\rightarrow, <logical>[autoCreate]\rightarrow)} Return a mergingStatistics component member of the node. If no instance is specified, return the first instance. If autoCreate is true then create a single instance of the component if none exists in the node.

tfamily \texttt{\textcolor{red}{\textless varying\_string\textgreater} nameFromIndex(<integer>index\rightarrow)} Return the name of a property given its index in a node.

tfamily \texttt{\textcolor{red}{\textless*class(nodeComponentNBody)\textgreater} nBody(<integer>[instance]\rightarrow, <logical>[autoCreate]\rightarrow)} Return a nBody component member of the node. If no instance is specified, return the first instance. If autoCreate is true then create a single instance of the component if none exists in the node.

tfamily \texttt{\textcolor{red}{\textless varying\_string\textgreater} nameFromIndex(<integer> index\rightarrow)} Return the name of a property given its index in a node.

tfamily \texttt{\textcolor{red}{\textless *type(treeNode)\textgreater} mergeWith()} Return a pointer to the node with which this node will merge.
tfamily \void nBodyMove(<\text{type}\langle\text{treeNode}\rangle> targetNode\leftarrow) HASH(0x1558ec8)

tfamily \void nBodyRemove(<\text{integer}> [\text{instance}]\rightarrow) Remove an instance of the nBody component, shifting other instances to keep the array contiguous. If no \text{instance} is specified, the first instance is assumed.

tfamily \void odeStepRatesInitialize() Initialize rates of evolvable properties.

tfamily \void odeStepScalesInitialize() Initialize tolerance scales of evolvable properties.

tfamily \void output(<\text{integer}> integerProperty\leftrightarrow, <\text{integer}> integerBufferCount\leftrightarrow, <\text{integer}\langle:\rangle> integerBuffer\leftrightarrow, <\text{integer}> doubleProperty\leftrightarrow, <\text{integer}> doubleBufferCount\leftrightarrow, <\text{double}\langle:\rangle> doubleBuffer\leftrightarrow, <\text{double}> time\rightarrow) Populate output buffers with properties for a node.

tfamily \void outputCount(<\text{integer}> integerPropertyCount\leftrightarrow, <\text{integer}> doublePropertyCount\leftrightarrow, <\text{double}> time\rightarrow) Increment the count of properties to output for a node.

tfamily \void outputNames(<\text{integer}> integerProperty\leftrightarrow, <\text{char}\langle\text{\*}\rangle\langle:\rangle> integerPropertyNames\leftrightarrow, <\text{char}\langle\text{\*}\rangle\langle:\rangle> integerPropertyComments\leftrightarrow, <\text{double}\langle:\rangle> integerPropertyUnitsSI\leftrightarrow, <\text{integer}> doubleProperty\leftrightarrow, <\text{char}\langle\text{\*}\rangle\langle:\rangle> doublePropertyNames\leftrightarrow, <\text{char}\langle\text{\*}\rangle\langle:\rangle> doublePropertyComments\leftrightarrow, <\text{double}\langle:\rangle> doublePropertyUnitsSI\leftrightarrow, <\text{double}> time\rightarrow) Establish the names of properties to output for a node.

tfamily \\textcolor{red}\langle\text{\*class}(<\text{nodeComponentPosition}\rangle)\textgreater\ texttt{position(<\text{integer}> [\text{instance}]\rightarrow, <\text{logical}> [\text{autoCreate}]\rightarrow)} Return a position component member of the node. If no \text{instance} is specified, return the first instance. If \text{autoCreate} is \texttt{true} then create a single instance of the component if none exists in the node.

tfamily \\texttt{positionCount()} Returns the number of \texttt{position} components in the node.

tfamily \\void positionCreate(<\text{class}\langle\text{nodeComponentPosition}\rangle> [\text{template}]\rightarrow) Create a \text{position} component in the node. If no \texttt{template} is specified use the active implementation of this class.

tfamily \\void positionDestroy() Destroy the \texttt{position} component(s) of the node.

tfamily \\void positionMove(<\text{type}\langle\text{treeNode}\rangle> targetNode\leftarrow) HASH(0x150fe38)

tfamily \\void positionRemove(<\text{integer}> [\text{instance}]\rightarrow) Remove an instance of the position component, shifting other instances to keep the array contiguous. If no \text{instance} is specified, the first instance is assumed.

tfamily \\void readRaw(<\text{integer}> fileHandle\rightarrow) Read a binary dump of all content of a node.

tfamily \\void removeFromHost() Remove this node from the satellite population of its host halo.

tfamily \\void removeFromMergee() Remove this node from the list of mergees associated with its merge target.

tfamily \\void removePairedEvent(<\text{type}\langle\text{nodeEvent}\rangle> event\rightarrow) Remove a paired \text{nodeEvent} from this node.

tfamily \textcolor{red}\langle\text{\*class}\langle\text{nodeComponentSatellite}\rangle\textgreater\ satellite(<\text{integer}> [\text{instance}]\rightarrow, <\text{logical}> [\text{autoCreate}]\rightarrow) Return a satellite component member of the node. If no \text{instance} is specified, return the first instance. If \text{autoCreate} is \texttt{true} then create a single instance of the component if none exists in the node.

tfamily \\texttt{satelliteCount()} Returns the number of \texttt{satellite} components in the node.
16.5. Objects

tfamily \void satelliteCreate(<class(nodeComponentSatellite)> [template]->) Create a satellite component in the node. If no template is specified use the active implementation of this class.

tfamily \void satelliteDestroy() Destroy the satellite component(s) of the node.

tfamily \void satelliteMove(<type(treeNode)> targetNode<->) HASH(0x15504b0)

tfamily \void satelliteRemove(<integer> [instance]->) Remove an instance of the satellite component, shifting other instances to keep the array contiguous. If no instance is specified, the first instance is assumed.

tfamily \intzero serializeCount() Return a count of the number of evolvable properties of the serialized object.

tfamily \void serializeRates(<double(:)> array<->) Serialize rates to array.

tfamily \void serializeScales(<double(:)> array<->) Serialize scales to array.

tfamily \void serializeValues(<double(:)> array<->) Serialize values to array.

tfamily \textcolor{red}{\textless*class(nodeComponentSpheroid)\textgreater}spheroid(<integer>[instance]->, <logical> [autoCreate]->) Return a spheroid component member of the node. If no instance is specified, return the first instance. If autoCreate is true then create a single instance of the component if none exists in the node.

tfamily \intzero spheroidCount() Returns the number of spheroid components in the node.

tfamily \void spheroidCreate(<class(nodeComponentSpheroid)> [template]->) Create a spheroid component in the node. If no template is specified use the active implementation of this class.

tfamily \void spheroidDestroy() Destroy the spheroid component(s) of the node.

tfamily \void spheroidMove(<type(treeNode)> targetNode<->) HASH(0x15526a0)

tfamily \void spheroidRemove(<integer> [instance]->) Remove an instance of the spheroid component, shifting other instances to keep the array contiguous. If no instance is specified, the first instance is assumed.

tfamily \textcolor{red}{\textless*class(nodeComponentSpin)\textgreater}spin(<integer>[instance]->, <logical> [autoCreate]->) Return a spin component member of the node. If no instance is specified, return the first instance. If autoCreate is true then create a single instance of the component if none exists in the node.

tfamily \intzero spinCount() Returns the number of spin components in the node.

tfamily \void spinCreate(<class(nodeComponentSpin)> [template]->) Create a spin component in the node. If no template is specified use the active implementation of this class.

tfamily \void spinDestroy() Destroy the spin component(s) of the node.

tfamily \void spinMove(<type(treeNode)> targetNode<->) HASH(0x1558370)

tfamily \void spinRemove(<integer> [instance]->) Remove an instance of the spin component, shifting other instances to keep the array contiguous. If no instance is specified, the first instance is assumed.
16. Coding GALACTICUS

tfamily \textcolor{red}{\textless \textless type(varying\_string)\textgreater} type() Return the type of this node.

tfamily \textcolor{red}{\textless integer(kind\_int8)\textgreater} uniqueID() Return the unique identifier for this node.

tfamily \textcolor{red}{\textless integer(kind\_int8)\textgreater} uniqueIDSet(<integer(kind_int8>) uniqueID\rightarrow) Set the unique identifier for this node.

tfamily \void walkBranch(<type(treeNode)> startNode\leftrightarrow, <type(treeNode)> nextNode\leftrightarrow) Return a pointer to the next node when performing a walk of a single branch of the tree, excluding satellites.

tfamily \void walkBranchWithSatellites(<type(treeNode)> startNode\leftrightarrow, <type(treeNode)> nextNode\leftrightarrow) Return a pointer to the next node when performing a walk of a single branch of the tree, including satellites.

tfamily \void walkTree(<type(treeNode)> nextNode\leftrightarrow) Return a pointer to the next node when performing a walk of the entire tree, excluding satellites.

tfamily \void walkTreeUnderConstruction(<type(treeNode)> nextNode\leftrightarrow) Return a pointer to the next node when performing a walk of a tree under construction.

tfamily \void walkTreeWithSatellites(<type(treeNode)> nextNode\leftrightarrow) Return a pointer to the next node when performing a walk of the entire tree, including satellites.

tfamily universe

tfamily \textcolor{red}{\textless *type(universeEvent)\textgreater} createEvent() Create a treeEvent object in this universe.

tfamily \textcolor{red}{\textless *type(mergerTree)\textgreater} popTree() Pop a mergerTree from this universe.

tfamily \void pushTree(<type(mergerTree)> thisTree\rightarrow) Pop a mergerTree from this universe.

tfamily \void removeEvent(<type(universeEvent)> event\rightarrow) Remove a treeEvent from this universe.

tfamily virialDensityContrastBryanNorman1998

tfamily double precision densityContrast(<double precision> time\rightarrow, <double precision> expansionFactor\rightarrow, <logical> collapsing\rightarrow) Returns the virial density contrast at the given epoch.

tfamily double precision densityContrastRateOfChange(<double precision> time\rightarrow, <double precision> expansionFactor\rightarrow, <logical> collapsing\rightarrow) Returns the rate of change of virial density contrast at the given epoch.

tfamily logical isFinalizable() Return true if this object can be finalized.

tfamily void stateRestore(<integer> stateFile\rightarrow) Restore the state of the object to file.

tfamily void stateStore(<integer> stateFile\rightarrow) Store the state of the object to file.
16.5. Objects

tfamily virialDensityContrastClass

tfamily double precision densityContrast(<double precision> time→,<double precision> expansionFactor→,<logical> collapsing→) Returns the virial density contrast at the given epoch.

tfamily double precision densityContrastRateOfChange(<double precision> time→,<double precision> expansionFactor→,<logical> collapsing→) Returns the rate of change of virial density contrast at the given epoch.

tfamily logical isFinalizable() Return true if this object can be finalized.

tfamily void stateRestore(<integer> stateFile→) Restore the state of the object to file.

tfamily void stateStore(<integer> stateFile→) Store the state of the object to file.

tfamily virialDensityContrastFixed

tfamily double precision densityContrast(<double precision> time→,<double precision> expansionFactor→,<logical> collapsing→) Returns the virial density contrast at the given epoch.

tfamily double precision densityContrastRateOfChange(<double precision> time→,<double precision> expansionFactor→,<logical> collapsing→) Returns the rate of change of virial density contrast at the given epoch.

tfamily logical isFinalizable() Return true if this object can be finalized.

tfamily void stateRestore(<integer> stateFile→) Restore the state of the object to file.

tfamily void stateStore(<integer> stateFile→) Store the state of the object to file.

tfamily virialDensityContrastFriendsOfFriends

tfamily double precision densityContrast(<double precision> time→,<double precision> expansionFactor→,<logical> collapsing→) Returns the virial density contrast at the given epoch.

tfamily double precision densityContrastRateOfChange(<double precision> time→,<double precision> expansionFactor→,<logical> collapsing→) Returns the rate of change of virial density contrast at the given epoch.

tfamily logical isFinalizable() Return true if this object can be finalized.

tfamily void stateRestore(<integer> stateFile→) Restore the state of the object to file.

tfamily void stateStore(<integer> stateFile→) Store the state of the object to file.

tfamily virialDensityContrastKitayamaSuto1996

tfamily double precision densityContrast(<double precision> time→,<double precision> expansionFactor→,<logical> collapsing→) Returns the virial density contrast at the given epoch.

tfamily double precision densityContrastRateOfChange(<double precision> time→,<double precision> expansionFactor→,<logical> collapsing→) Returns the rate of change of virial density contrast at the given epoch.

tfamily logical isFinalizable() Return true if this object can be finalized.

tfamily void stateRestore(<integer> stateFile→) Restore the state of the object to file.

tfamily void stateStore(<integer> stateFile→) Store the state of the object to file.
tfamily virialDensityContrastSphericalCollapseMatterDE

tfamily double precision densityContrast(<double precision> time→,<double precision> expansionFactor→,<logical> collapsing→) Returns the virial density contrast at the given epoch.

tfamily double precision densityContrastRateOfChange(<double precision> time→,<double precision> expansionFactor→,<logical> collapsing→) Returns the rate of change of virial density contrast at the given epoch.

tfamily logical isFinalizable() Return true if this object can be finalized.

tfamily void retabulate(<double> time→) Tabulate spherical collapse virial density contrast.

tfamily void stateRestore(<integer> stateFile→) Restore the state of the object to file.

tfamily void stateStore(<integer> stateFile→) Store the state of the object to file.

tfamily virialDensityContrastSphericalCollapseMatterLambda

tfamily double precision densityContrast(<double precision> time→,<double precision> expansionFactor→,<logical> collapsing→) Returns the virial density contrast at the given epoch.

tfamily double precision densityContrastRateOfChange(<double precision> time→,<double precision> expansionFactor→,<logical> collapsing→) Returns the rate of change of virial density contrast at the given epoch.

tfamily logical isFinalizable() Return true if this object can be finalized.

tfamily void retabulate(<double> time→) Tabulate spherical collapse virial density contrast.

tfamily void stateRestore(<integer> stateFile→) Restore the state of the object to file.

tfamily void stateStore(<integer> stateFile→) Store the state of the object to file.
17. Adding New Methods

17.1. Code Directives

GALACTICUS is designed to be flexible and extensible, allowing you to add new methods and functionality without having to hack the code extensively. To achieve this it makes much use of embedded code directives which, for example, explain to the build system how a particular subroutine or function connects into the GALACTICUS code. Such code directives are indicated by lines beginning with !#, and take the form of short blocks of XML. For example, a typical code directive might look like:

```xml
!# <accretionDisksMethod>
!# <unitName>Accretion_Disks_Shakura_Sunyaev_Initialize</unitName>
!# </accretionDisksMethod>
```

This directive would typically appear just prior to a subroutine which initializes the Shakura-Sunyaev accretion disk module (it could appear anywhere throughout that module, but it makes sense to keep it close to the subroutine that it references). The accretionDisksMethod tag explains to the GALACTICUS build system that this module contains an implementation of black hole accretion disks. The unitName tag specifies the name of a program unit which (in this case) should be called to initialize this accretion disk implementation. The build system will then insert appropriate use and call statements into the GALACTICUS code such that this routine will be called if and when accretion disks are required by GALACTICUS.

17.2. Identifying Components and Mass Types

Many functions can be applied to different components or groups of components and to different types of mass within a node. In general, these functions make use of a set of label defined in the Galactic_Structure_Options module. Components are identified by a componentType label which can take on the following values:

- **componentTypeAll** All components are matched;
- **componentTypeDisk** Only disk components are matched;
- **componentTypeSpheroid** Only spheroid components are matched.
- **componentTypeBlackHole** Only black hole components are matched.
- **componentTypeHotHalo** Only hot halo components are matched.
- **componentTypeDarkHalo** Only dark matter halo components are matched.

Types of mass are identified by a massType which can take one of the following values:

- **massTypeAll** All mass is included;
- **massTypeDark** Only dark matter is included;
massTypeBaryonic Only baryonic mass is included.
massTypeGalactic Only galactic mass is included.
massTypeGaseous Only gaseous mass is included.
massTypeStellar Only stellar mass is included.
massTypeBlackHole Only black hole mass is included.

17.3. Components

This section describes the internal structure of node components, and how a component is implemented.

17.3.1. Component Structure

Each node in the merger tree consists of an arbitrary number of “components”, each of which can actually be an array, allowing multiple components of a given class. Each component represents a specific class of object, which could be a dark matter halo, a galactic disk or a black hole etc. A component of each class may be of one or more different implementations of that component class. Component classes are extensions of the nodeComponent base class, while each implementation is an extension of its component class (or, sometimes, of another implementation of that same class). Each component implementation type consists of a set of data, representing the properties (mass, size etc.) of the component, along with the rates of change (and ODE solver tolerances) for any properties which are evolvable. Additionally, each component contains a large number of methods (functions) which can be used to access its properties, query its interfaces and which are used internally to perform ODE evolution, output etc. The nodeComponent base class and all classes derived from it are built automatically by Galacticus::Build::Components at compile time (take a look in work/build/objects.nodes.components.Inc if you want to see the generated code).

17.3.2. Extending Components

It is possible to create a component which extends an existing component (see the discussion of the extends element in §17.3.3). This capability is intended to allow new properties to be added to a component without having to create a whole new copy of the component. It is not intended to allow changes in the way in which the component is evolved through the halo hierarchy. (With the exception that rules to describe how the newly added properties will evolve through the halo hierarchy can be added of course.)

A simple example of this extension capability can be found in the scaleShape dark matter profile component (§12.13.3), which extends the scale dark matter profile component (§12.13.1). In this case, the scaleShape component adds a new property, shape, and specifies how it is to be initialized, evolved, output, and change by node promotion events. It does not affect how the scale property, inherited from the scale dark matter profile component, is evolved.

\footnote{Data objects in components can be real, integer, boolean or of derived type. For derived types, currently history, abundances, chemicals, and keplerOrbit are supported. Adding additional derived types is possible, providing that the type supports the required methods for output, serialization, etc. Data objects can currently be scalar or rank-1 arrays.}
17.3. Implementing a New Component

Implementing a new component involves writing some modules and functions which contain a definition of the component and, if necessary, handle initialization, creation, evolution, and responses to any events. Frequently, the easiest way to make a new component is to copy a previously existing one and modify it as needed. Details of the various functions that component modules must perform are given below.

By convention, a component’s implementation is split into three or four files, although some components might not need all of these files. These files are named as follows (with `<component>` acting as a placeholder for the name of the component in question):

- `objects.nodes.components.<component>.F90` The primary file which describes the component and its properties, and which contains functions that manipulate the component as it evolves through a merger tree (ODE rates, behavior during mergers, etc.);
- `objects.nodes.components.<component>.bound_functions.F90` Contains functions which will be bound to the component object (i.e. the `nodeComponent<Class><Implementation>` class), and so will be available as type bound procedures. Generally, these functions will include any which get or set values of properties in the component, those which return information about its internal state (such as the density at some position in the component; see §17.4.3), and any other functions which we may want to be overridden by extensions to the component.
- `objects.nodes.components.<component>.data.F90` Contains any data which may need to be shared between the above two files. This might contain parameters which control some property of the component that is the same for all instances (e.g. if spheroids are modelled as Sérsic profiles all with the same value of the Sérsic index, that value might be placed into this file).
- `objects.nodes.components.<component>.structure.F90` Contains any functions which implement the structure (e.g. density, rotation curve) of the component and which cannot be placed in `objects.nodes.components.<component>.bound_functions.Inc` due to dependencies on modules which in turn depend on the `Galacticus_Nodes` module.

In general, `objects.nodes.components.<component>.F90` is the place for the component definition and functions which process the component during tree evolution (including output), while `objects.nodes.components.<component>.bound_functions.Inc` is intended for functions which record or report the internal state of the component.

Component Definition

Component definition itself takes the form of an embedded XML document. The following example illustrates such a document:

```xml
<component>
  <class>disk</class>
  <name>exponential</name>
  <isDefault>yes</isDefault>
  <properties>
    <property>
      <name>isInitialized</name>
      <type>logical</type>
      <rank>0</rank>
      <attributes isSettable="true" isGettable="true" isEvolvable="false" />
    </property>
    <property>
      <name>massStellar</name>
    </property>
  </properties>
</component>
```
17. Adding New Methods

The elements of this document have the following meaning:
class [Required] Specifies the component class of which this is an implementation.

name [Required] Specifies the name of this specific implementation.

extends [Optional] If present, this element must contain class and name elements which specify the type of component which should be extended. The component then automatically inherits all properties and type-bound functions of the extended type.

isDefault [Required] Specifies whether or not this should be the default implementation of this class. Note that only one implementation of each class can be declared to be the default. If no implementation of a given class is declared to be the default then the (automatically generated) null implementation will be made the default.

properties [Optional] Contains an array of property elements which specify the properties of this implementation. Each member property has the following structure:

name [Required] The name of the property.

type [Required] The type (one of real, integer, logical, history, abundances, chemicals, or keplerOrbit at present) of the property.

rank [Required] The rank of this property (currently 0 for a scalar or 1 for a 1-D array).

attributes [Required] Attributes of this property:

isSettable If true then the value of this property can be set directory.

isGettable If true then the value of this property can be got directory.

isEvolvable If true this property evolves as part of the GALACTICUS ODE system.

createIfNeeded If true then any attempt to get, set, or adjust the rate of this property will cause the component to be created if it does not already exist. This is useful if the component should be created in response to mass transfer from some other component for example.

makeGeneric If true then any rate method for this property will have a version created which binds to the base nodeComponent class. This version is suitable for attaching to deferred rate functions of components of another class. For example, the disk gas mass rate function is made generic, and then attached to the deferred cooling rate of the hot halo using:

call hotHalo%hotHaloCoolingMassRateFunction(DiskExponentialMassGasRateGeneric)

isDeferred Contains a “:” separated list which can contain get, set, and rate. The methods present in this list will not have functions bound to them at compile time. Instead a function will be created which allows a function to be bound to these methods at run time. For example:

call myComponent%massFunction (My_Component_Mass_Get_Function)
call myComponent%massSetFunction (My_Component_Mass_Set_Function)
call myComponent%massRateFunction(My_Component_Mass_Rate_Function)

Additionally, a method is created which returns true or false depending on whether the method has been attached to a function yet, e.g.

myComponent%massIsAttached ()
myComponent%massSetIsAttached ()
myComponent%massRateIsAttached()
bindsTo Specifies to which level in the class hierarchy set, get and rate methods should be bound. Normally, these are bound to the component implementation itself. However, it can be useful to specify a binding of “top” to bind to the base nodeComponent class to make these methods interoperable with properties of other classes (see the discussion of the makeGeneric element above).

output [Optional] If present, the property will be included in the GALACTICUS output file. The following attributes control the details of that output:

- unitsInSI The units of the output quantity in the SI system.
- comment A comment to be included with the HDF5 dataset for this property.
- condition A statement which must evaluate to true or false and which will be used to determine if the property will be output. The present output time for is available as time. In the case of an array property the construct “{i}” can be used to pass the index of the element for which the condition should be evaluated.
- modules A comma-separated list of any modules required to perform the output (e.g. modules which contain functions or values that are used).

Additional attributes are required for array properties:

- labels This can be an array, declared as “[L_1,...,L_N]”, specifying the suffix to be added to the property name for each component of the array in the output, or a function which returns the suffix. In the case of a function the construct “{i}” can be used to pass the index of the element for which the suffix is required.
- count A statement which evaluates the number of elements to be output (i.e. the length of the array).

isVirtual [Optional] If present and set to “yes”, this property is a virtual property. A virtual property has no data associated with it and must supply its own functions for getting, setting and adjusting its rate of change (if allowed by the property’s attributes). Virtual properties are used for quantities which are derived from actual properties of the component implementation (for example, a star formation rate could be a virtual property if it is derived from an actual gas mass property) or for adjusting the rates of several actual properties simultaneously.

getFunction [Optional] Specifies the function to be used for getting the value of the property, overriding the default get function. The function must be included in the Galacticus_Nodes module by use of the functions element described below. Note that this function, by virtue of its privileged access to the internal structure of node components, can access the value of the data associated with the property using:

```
myComponent%<property>Data%value
```

setFunction [Optional] The same as getFunction but defines a function to set the value of the property.

classDefault [Optional] Specifies the default value for this property if the component class has not been created (i.e. has no specific implementation yet). The content of this element gives the default value (which can be a scalar, an array, a function, etc.). Additional, optional attributes control the use of this element:

- modules Specifies a comma-separated list of modules which are required to set the default values (e.g. modules which contain the value or function to be used).
- count For array properties whose size is not known at compile-time, it is possible to specify a function which will return the appropriate size of the array at run-time. The scalar default value given in the classDefault element will then be replicated the appropriate number of times.
17.3. Components

bindings [Optional] Contains an array of binding elements which specify functions to bind to this implementation. Each member binding has the following structure:

- **method** The name of the bound method, such that the function can be accessed using
  ```
  myComponent%<method>(...) 
  ```

- **function** The function to which the method should be bound. (This function must be included in the Galacticus_Nodes module by use of the functions element described below.

- **type** The type of function.

  - **bindsTo** Specifies where this method should be bound. “component” specifies binding to the specific implementation of this component class, “componentClass” specifies binding to the component class, while “top” specifies binding to the base nodeComponent class.

functions [Optional] Contains the name of a file which will be included into the Galacticus_Nodes module. This file can contain functions which will be bound to this implementation. By virtue of being included in the Galacticus_Nodes module these functions have privileged access to the internal structure of all node component objects.

Component Initialization

Initialization of a component module (if necessary, for example, to read parameters or allocate workspace) can occur at a number of different points in the execution of GALACTICUS. Providing initialization occurs in advance of any calculations then any point is acceptable. One possibility is simply to call an initialization function at the head of all functions defined in the component module. This initialization function should return immediately if it has already been called (to avoid duplicate initialization). Another option is to use the mergerTreePreTreeConstructionTask event (see §17.4.3) to perform initialization just before merger trees are constructed (the initialization function must again return immediately if it has been previously called).

 Optionally, a component may include a mergerTreeEvolveThreadInitialize directive, which gives the name of a subroutine in its unitName element. The routine specified by mergerTreeEvolveThreadInitialize is called by all threads prior to merger tree evolution, and can therefore be used to perform any “per thread” initialization. Note that this routine will be called many times during a given GALACTICUS run—it is the responsibility of the routine to ensure that it performs any initialization only once.

Component Access, Creation and Destruction

When a node is created, it initially contains no components. A component must therefore create itself on the fly as needed. Typically, a component is first created when an attempt is made to set a property value, or to adjust the rate of change of a property value or in response to some event (e.g. a satellite component may be created in response to a node merging with a larger node). Requests for property values frequently do not require that the component exist, as a zero value can often be returned instead\(^2\).

To access a component from a node, use:

```
myComponent => thisNode%<class>({instance=<N>,autoCreate=create})
```

where **class** is the component class required, the optional **instance** argument requests a specific instance of the component (relevant if the node contains more than one of a particular component, e.g. if it contains two supermassive black holes for example; if no instance is specified the first instance will be returned), and the **autoCreate** option specifies whether or not the component should be automatically created (assuming it does not already exist). **autoCreate=true** should be used to create components initially.

A component of a node can be destroyed using:

\(^2\) Or some other value if a classDefault has been specified (see §17.3.3).
call thisNode%<class>Destroy()

**Component Methods**

Component implementations optionally provide functions to get and set their properties (and to set the rate of change of evolvable properties) so that other components and functions within GALACTICUS can interact with them in a way that is independent of the specific component implementation chosen. To permit this, GALACTICUS creates functions for each property to access it in all permitted ways\(^3\). For example, the exponential implementation of the disk component class has a "massStellar" property defined by:

```
<method>
  <name>massStellar</name>
  <type>real</type>
  <rank>0</rank>
  <attributes isSettable="true" isGettable="true" isEvolvable="true" />
</method>
```

This causes GALACTICUS to define several functions bound to the nodeComponentDisk class:

- **massStellarIsSettable** Returns true if this property is settable;
- **massStellarIsGettable** Returns true if this property is gettable;
- **massStellarSet** Sets the value of this property to the supplied argument;
- **massStellarGet** Gets the value of this property;
- **massStellarRate** Cumulates its argument to the rate of change of this property;
- **massStellarScale** Sets the absolute scale for this property used in ODE error control;

along with several others used internally for output, serialization etc.

**Component Evolution**

All component properties which have an isEvolvable attribute set to true are included in GALACTICUS’s ODE solver as the node is evolved forward in time. As described in §17.3.3, GALACTICUS will create two functions that permit the rate of change of a property adjusted and for the absolute scale used in ODE error control to be set.

A “rate compute” function should be defined to perform any calculations necessary to determine the rate of change of the property and adjust the rate appropriately. Below is an example of the rate compute subroutine for the stellar mass property of the exponential disk component, with only the basic structure shown:

```
!# <rateComputeTask>
!# <unitName>Node_Component_Disk_Exponential_Rate_Compute</unitName>
!# </rateComputeTask>
subroutine Node_Component_Disk_Exponential_Rate_Compute(thisNode , &
   &interrupt , interruptProcedure)
   implicit none
   type (treeNode ) , pointer , intent(inout) :: thisNode
```

\(^3\)Additionally, C wrappers are generated to the get methods for real scalar properties. See §16.4 for a discussion of includeing C code within GALACTICUS.
17.3. Components

logical procedure( ), pointer, intent(inout) :: interrupt
&interruptProcedure
class (nodeComponentDisk ), pointer :: &thisDiskComponent

! Get the disk and check that it is of our class.
thisDiskComponent => thisNode%disk()
select type (thisDiskComponent)
class is (nodeComponentDiskExponential)

    call thisDiskComponent%massStellarRate(stellarMassRate)

end select
return
end subroutine Node_Component_Disk_Exponential_Rate_Comput

Here, we get the disk component and check that it is of the exponential variety. If it is, we compute the rates of change for one or more properties and then adjust their rates appropriately. If multiple instances of a component are used then the rate compute function should loop over all instances and adjust rates appropriately.

When evolving ODEs the ODE solver aims to keep the error on property $i$ below

$$D_i = \epsilon_{abs}s_i + \epsilon_{rel}|y_i|,$$

where $\epsilon_{abs} = \text{[odeToleranceAbsolute]}$, $\epsilon_{rel} = \text{[odeToleranceRelative]}$, $y_i$ is the value of property $i$ and $s_i$ is a scaling factor which controls the absolute tolerance for this property. By default, $s_i = 1$, but this can be changed for a component utilizing the $\text{scaleSetTask}$ directive. This allows a function to be called in which the component sets suitable scale factors for each of its properties prior to any ODE evolution being carried out. This can be very useful, for example, in cases where two components are coupled. Consider a case where a disk is transferring material to a spheroid via a bar instability. If the disk is orders of magnitude more massive that the spheroid then the rate of mass transfer can be very high (i.e. $\dot{y}/y$ for the spheroid will be large). With just a relative tolerance (i.e. the $\epsilon_{rel}|y_i|$ term) this would require very short timesteps for the spheroid. However, in such cases we don’t care about such tiny tolerances for the spheroid (since it will grow to be substantially more massive). Therefore, it may be appropriate to set $s_i$ to be equal to the sum of the disk and spheroid properties for example. The scale set directive and associated subroutine should follow this template:

```fortran
!# <scaleSetTask>
!# <unitName>Node_Component_Disk_Exponential_Scale_Set</unitName>
!# </scaleSetTask>
subroutine Node_Component_Disk_Exponential_Scale_Set(thisNode)
    implicit none
    type (treeNode ), pointer, intent(inout) :: thisNode
class(nodeComponentDisk), pointer :: thisDiskComponent

    ! Get the disk component.
    thisDiskComponent => thisNode%disk()
    ! Check if an exponential disk component exists.
    select type (thisDiskComponent)
class is (nodeComponentDiskExponential)
```

719
17. Adding New Methods

... call thisDiskComponent%massStellarScale(massScale) ...
end select
return
end subroutine Node_Component_Disk_Exponential_Scale_Set

Sensible choices for the $s_i$ factors can significantly speed-up execution of GALACTICUS.

Evolution Interrupts

It is often necessary to interrupt the smooth ODE evolution of a node in GALACTICUS. This can happen if, for example, a galaxy mergers with another galaxy (in which case the merger must be processed prior to further evolution) or if a component must be created before evolution can continue. The rate adjust and rate compute subroutines allow for interrupts to be flagged via their interrupt and interruptProcedure arguments. If an interrupt is required then interrupt should be set to true, while interruptProcedure should be set to point to a procedure which will handle the interrupt. Then, providing no other interrupt occurred earlier, the evolution will be stopped and the interrupt procedure called before evolution is continued.

An interrupt procedure should have the form:

```fortran
subroutine My_Interrupt_Procedure(thisNode)
  implicit none
  type(treeNode), pointer, intent(inout) :: thisNode

  ! Do whatever needs to be done to handle the interrupt.

  return
end subroutine My_Interrupt_Procedure
```

17.4. Existing Method Types

17.4.1. Functions

Functions implement basic calculations (e.g. computing the power spectrum).

Accretion Disk Spectra

Additional implementations for accretion disk spectra are added using the accretionDiskSpectra class. The implementation should be placed in a file containing the directive:

```fortran
!# <accretionDiskSpectra name="accretionDiskSpectraMyImplementation">
!# <description>A short description of the implementation.</description>
!# </accretionDiskSpectra>
```

where MyImplementation is an appropriate name for the implementation. This file should be treated as a regular Fortran module, but without the initial module and final end module lines. That is, it may contain use statements and variable declarations prior to the contains line, and should contain all functions required by the implementation after that line. Function names should begin with accretionDiskSpectraMyImplementation. The file must define a type that extends the accretionDiskSpectraClass class (or extends another type which is itself an extension of the accretionDiskSpectraClass class),
17.4. Existing Method Types

containing any data needed by the implementation along with type-bound functions required by the implementation. The following type-bound functions are required (unless inherited from the parent type):

**spectrum** Returns the spectrum (in units of $L_{\odot}$ Hz$^{-1}$) of the accretion disk at the given wavelength (in units of Å) for node. Must have the following interface:

```fortran
double precision function myImplementationSpectrum(self,node,wavelength)
  class (accretionDiskSpectraClass), intent(inout) :: self
  type (treeNode), intent(inout) :: node
  double precision, intent(in) :: wavelength
end double precision function myImplementationSpectrum
```

**isFinalizable** Return true if this object can be finalized. A default implementation exists. If overridden the following interface must be used:

```fortran
logical function myImplementationIsFinalizable(self)
  class(accretionDiskSpectraClass), intent(inout) :: self
end logical function myImplementationIsFinalizable
```

Existing implementations are:

- **accretionDiskSpectraFile** Accretion disk spectra are interpolated from tables read from file.
- **accretionDiskSpectraHopkins2007** Accretion disk spectra using the model of Hopkins et al. [2007].

**Accretion Onto Halos**

Additional implementations for accretion onto halos are added using the **accretionHalo** class. The implementation should be placed in a file containing the directive:

```
!# <accretionHalo name="accretionHaloMyImplementation">
!# <description>A short description of the implementation.</description>
!# </accretionHalo>
```

where **MyImplementation** is an appropriate name for the implementation. This file should be treated as a regular Fortran module, but without the initial **module** and final **end module** lines. That is, it may contain use statements and variable declarations prior to the contains line, and should contain all functions required by the implementation after that line. Function names should begin with **accretion-HaloMyImplementation**. The file must define a type that extends the **accretionHaloClass** class (or extends another type which is itself an extension of the **accretionHaloClass** class), containing any data needed by the implementation along with type-bound functions required by the implementation. The following type-bound functions are required (unless inherited from the parent type):

**accretedMass** Returns the mass (in units of $M_{\odot}$) of accreted from the IGM onto node in the given accretionMode. Used to initialize nodes. Must have the following interface:

```fortran
double precision function myImplementationAccretedMass(self,node,accretionMode)
  class (accretionHaloClass), intent(inout) :: self
  type (treeNode), intent(inout), pointer :: node
  integer, intent(in) :: accretionMode
end double precision function myImplementationAccretedMass
```

**accretedMassChemicals** Returns the mass of chemicals (in units of $M_{\odot}$) of accreted from the IGM onto node in the given accretionMode. Used to initialize nodes. Must have the following interface:
17. Adding New Methods

type(chemicalAbundances) function myImplementationAccretedMassChemicals(self, node, & accretionMode)
    class (accretionHaloClass), intent(inout) :: self
    type (treeNode  ), intent(inout), pointer :: node
    integer , intent(in ) :: accretionMode
end type(chemicalAbundances) function myImplementationAccretedMassChemicals

accretedMassMetals Returns the mass of metals (in units of $M\odot$) of accreted from the IGM onto node in the given accretionMode. Used to initialize nodes. Must have the following interface:

type(abundances) function myImplementationAccretedMassMetals(self, node, accretionMode)
    class (accretionHaloClass), intent(inout) :: self
    type (treeNode  ), intent(inout), pointer :: node
    integer , intent(in) :: accretionMode
end type(abundances) function myImplementationAccretedMassMetals

accretionRate Returns the rate (in units of $M\odot$ Gyr$^{-1}$) of accretion of mass from the IGM onto node in the given accretionMode. Must have the following interface:

double precision function myImplementationAccretionRate(self, node, accretionMode)
    class (accretionHaloClass), intent(inout) :: self
    type (treeNode  ), intent(inout), pointer :: node
    integer , intent(in) :: accretionMode
end double precision function myImplementationAccretionRate

accretionRateChemicals Returns the rate (in units of $M\odot$ Gyr$^{-1}$) of accretion of chemicals from the IGM onto node in the given accretionMode. Must have the following interface:

type(chemicalAbundances) function myImplementationAccretionRateChemicals(self, node, & accretionMode)
    class (accretionHaloClass), intent(inout) :: self
    type (treeNode  ), intent(inout), pointer :: node
    integer , intent(in) :: accretionMode
end type(chemicalAbundances) function myImplementationAccretionRateChemicals

accretionRateMetals Returns the rate (in units of $M\odot$ Gyr$^{-1}$) of accretion of metals from the IGM onto node in the given accretionMode. Must have the following interface:

type(abundances) function myImplementationAccretionRateMetals(self, node, accretionMode)
    class (accretionHaloClass), intent(inout) :: self
    type (treeNode  ), intent(inout), pointer :: node
    integer , intent(in) :: accretionMode
end type(abundances) function myImplementationAccretionRateMetals

failedAccretedMass Returns the mass (in units of $M\odot$) of that failed to accrete from the IGM onto node in the given accretionMode. Used to initialize nodes. Must have the following interface:

double precision function myImplementationFailedAccretedMass(self, node, accretionMode)
    class (accretionHaloClass), intent(inout) :: self
    type (treeNode  ), intent(inout), pointer :: node
    integer , intent(in) :: accretionMode
end double precision function myImplementationFailedAccretedMass

failedAccretionRate Returns the rate (in units of $M\odot$ Gyr$^{-1}$) of failed accretion of mass from the IGM onto node in the given accretionMode. Must have the following interface:
double precision function myImplementationFailedAccretionRate(self, node, accretionMode)
class (accretionHaloClass), intent(inout) :: self
type (treeNode ), intent(inout), pointer :: node
integer , intent(in ) :: accretionMode
end double precision function myImplementationFailedAccretionRate

isFinalizable Return true if this object can be finalized. A default implementation exists. If overridden
the following interface must be used:

logical function myImplementationIsFinalizable(self)
class(accretionHaloClass), intent(inout) :: self
end logical function myImplementationIsFinalizable

Existing implementations are:

accretionHaloNull Accretion onto halos assuming no accretion.

accretionHaloSimple Accretion onto halos using simple truncation to mimic the effects of reionization.

accretionHaloColdMode Accretion onto halos using simple truncation to mimic the effects of reionization
and accounting for cold mode accretion.

accretionHaloNaozBarkana2007 Accretion onto halos using filtering mass of the IGM calculated from
an equation from Naoz and Barkana [2007].

Cosmology Functions

Additional implementations for cosmology functions are added using the cosmologyFunctions class. The
implementation should be placed in a file containing the directive:

!# <cosmologyFunctions name="cosmologyFunctionsMyImplementation">
!# <description>A short description of the implementation.</description>
!# </cosmologyFunctions>

where MyImplementation is an appropriate name for the implementation. This file should be treated as
a regular Fortran module, but without the initial module and final end module lines. That is, it may
contain use statements and variable declarations prior to the contains line, and should contain all
functions required by the implementation after that line. Function names should begin with cosmology-
FunctionsMyImplementation. The file must define a type that extends the cosmologyFunctionsClass
class (or extends another type which is itself an extension of the cosmologyFunctionsClass class),
containing any data needed by the implementation along with type-bound functions required by the
implementation. The following type-bound functions are required (unless inherited from the parent
type):

comovingVolumeElementRedshift Returns the differential comoving volume element \(dV/dz = r_c^2(t)H^{-1}(t)\)
(where \(r_c\) is the comoving distance to time \(t\) and \(H(t)\) is the Hubble parameter at that time) for
unit solid angle at the specified time. A default implementation exists. If overridden the following
interface must be used:

double precision function myImplementationComovingVolumeElementRedshift(self, time)
class (cosmologyFunctionsClass), intent(inout) :: self
double precision , intent(in ) :: time
end double precision function myImplementationComovingVolumeElementRedshift
17. Adding New Methods

comovingVolumeElementTime Returns the differential comoving volume element $dV/dt = r_c^2(t)a(t)$ (where $r_c$ is the comoving distance to time $t$ and $a(t)$ is the expansion at that time) for unit solid angle at the specified time. A default implementation exists. If overridden the following interface must be used:

```fortran
double precision function myImplementationComovingVolumeElementTime(self,time)
    class (cosmologyFunctionsClass), intent(inout) :: self
    double precision , intent(in ) :: time
end double precision function myImplementationComovingVolumeElementTime
```

cosmicTime Return the cosmological age at the given expansion factor. Must have the following interface:

```fortran
double precision function myImplementationCosmicTime(self,expansionFactor,&
    collapsingPhase)
    class (cosmologyFunctionsClass), intent(inout) :: self
    double precision , intent(in ) :: expansionFactor
    logical , intent(in ), optional :: collapsingPhase
end double precision function myImplementationCosmicTime
```

cosmicTimeIsValid Returns true if the given cosmic time is valid one for this cosmology. Must have the following interface:

```fortran
logical function myImplementationCosmicTimeIsValid(self,time)
    class (cosmologyFunctionsClass), intent(inout) :: self
    double precision , intent(in ) :: time
end logical function myImplementationCosmicTimeIsValid
```

densityScalingEarlyTime Compute the scaling of density with expansion factor at early times in the universe. Must have the following interface:

```fortran
subroutine myImplementationDensityScalingEarlyTime(self,dominateFactor,densityPower , &
    expansionFactorDominant,OmegaDominant)
    class (cosmologyFunctionsClass), intent(inout) :: self
    double precision , intent(in ) :: dominateFactor
    double precision , intent(out) :: densityPower, &
    double precision , intent(out) :: OmegaDominant
    double precision , intent(out), optional :: OmegaDominant
end subroutine myImplementationDensityScalingEarlyTime
```

distanceAngular Return the angular diameter distance to the given cosmic time. Must have the following interface:

```fortran
double precision function myImplementationDistanceAngular(self,time)
    class (cosmologyFunctionsClass), intent(inout) :: self
    double precision , intent(in ) :: time
end double precision function myImplementationDistanceAngular
```

distanceComoving Return the comoving distance to the given cosmic time. Must have the following interface:

```fortran
double precision function myImplementationDistanceComoving(self,time)
    class (cosmologyFunctionsClass), intent(inout) :: self
    double precision , intent(in ) :: time
end double precision function myImplementationDistanceComoving
17.4. Existing Method Types

distanceComovingConvert Convert between different measures of comoving distance. Must have the following interface:

\[
\text{double precision function myImplementationDistanceComovingConvert(self, output, \\
& \text{distanceModulus}, \text{redshift})}
\]

\text{class (cosmologyFunctionsClass), intent(inout) :: self}

\text{integer, intent(in) :: output}

\text{double precision, intent(in), optional :: distanceModulus, \\
& \text{redshift}}

\text{end double precision function myImplementationDistanceComovingConvert}

distanceLuminosity Return the luminosity distance to the given cosmic time. Must have the following interface:

\[
\text{double precision function myImplementationDistanceLuminosity(self, time)}
\]

\text{class (cosmologyFunctionsClass), intent(inout) :: self}

\text{double precision, intent(in) :: time}

\text{end double precision function myImplementationDistanceLuminosity}

dominationEpochMatter Compute the epoch at which matter dominates over other forms of energy by a given factor. Must have the following interface:

\[
\text{double precision function myImplementationDominationEpochMatter(self, dominateFactor)}
\]

\text{class (cosmologyFunctionsClass), intent(inout) :: self}

\text{double precision, intent(in) :: dominateFactor}

\text{end double precision function myImplementationDominationEpochMatter}

ePOCHTIME Convenience function that returns the time corresponding to an epoch specified by time or expansion factor. A default implementation exists. If overridden the following interface must be used:

\[
\text{double precision function myImplementationEpochTime(self, time, \\
& \text{expansionFactor, collapsingPhase})}
\]

\text{class (cosmologyFunctionsClass), intent(inout) :: self}

\text{double precision, intent(in), optional :: time, \\
& \text{expansionFactor}}

\text{logical, intent(in), optional :: collapsingPhase}

\text{end double precision function myImplementationEpochTime}

equalityEpochMatterCurvature Return the epoch of matter-curvature magnitude equality (either expansion factor or cosmic time). Must have the following interface:

\[
\text{double precision function myImplementationEqualityEpochMatterCurvature(self, requestType, \\
& \text{requestType})}
\]

\text{class (cosmologyFunctionsClass), intent(inout) :: self}

\text{integer, intent(in), optional :: requestType}

\text{end double precision function myImplementationEqualityEpochMatterCurvature}

equalityEpochMatterDarkEnergy Return the epoch of matter-dark energy magnitude equality (either expansion factor or cosmic time). Must have the following interface:

\[
\text{double precision function myImplementationEqualityEpochMatterDarkEnergy(self, requestType, \\
& \text{requestType})}
\]

\text{class (cosmologyFunctionsClass), intent(inout) :: self}

\text{integer, intent(in), optional :: requestType}

\text{end double precision function myImplementationEqualityEpochMatterDarkEnergy}
17. Adding New Methods

equationOfStateDarkEnergy  HASH(0x1989a30)  Must have the following interface:

\[
\text{double precision function } \text{myImplementationEquationOfStateDarkEnergy}(\text{self}, \text{time}, \& \text{expansionFactor})
\]

\[
\begin{align*}
\text{class} & \quad \text{(cosmologyFunctionsClass), intent(inout)} : : \text{self} \\
\text{double precision} & \quad \text{(in )}, \text{optional : : time}, \& \\
& \quad \text{& expansionFactor}
\end{align*}
\]

\[
\text{end double precision function } \text{myImplementationEquationOfStateDarkEnergy}
\]

expansionFactor  Returns the expansion factor at cosmological time \( \text{time} \). Must have the following interface:

\[
\text{double precision function } \text{myImplementationExpansionFactor}(\text{self}, \text{time})
\]

\[
\begin{align*}
\text{class} & \quad \text{(cosmologyFunctionsClass), intent(inout)} : : \text{self} \\
\text{double precision} & \quad \text{(in )} : : \text{time}
\end{align*}
\]

\[
\text{end double precision function } \text{myImplementationExpansionFactor}
\]

expansionFactorFromRedshift  Returns expansion factor given a redshift. A default implementation exists. If overridden the following interface must be used:

\[
\text{double precision function } \text{myImplementationExpansionFactorFromRedshift}(\text{self}, \text{redshift})
\]

\[
\begin{align*}
\text{class} & \quad \text{(cosmologyFunctionsClass), intent(inout)} : : \text{self} \\
\text{double precision} & \quad \text{(in )} : : \text{redshift}
\end{align*}
\]

\[
\text{end double precision function } \text{myImplementationExpansionFactorFromRedshift}
\]

expansionFactorIsValid  Returns true if the given expansion factor is valid one for this cosmology. Must have the following interface:

\[
\text{logical function } \text{myImplementationExpansionFactorIsValid}(\text{self}, \text{expansionFactor})
\]

\[
\begin{align*}
\text{class} & \quad \text{(cosmologyFunctionsClass), intent(inout)} : : \text{self} \\
\text{double precision} & \quad \text{(in )} : : \text{expansionFactor}
\end{align*}
\]

\[
\text{end logical function } \text{myImplementationExpansionFactorIsValid}
\]

expansionRate  Returns the cosmological expansion rate, \( \dot{a}/a \) at expansion factor \( \text{expansionFactor} \). Must have the following interface:

\[
\text{double precision function } \text{myImplementationExpansionRate}(\text{self}, \text{expansionFactor})
\]

\[
\begin{align*}
\text{class} & \quad \text{(cosmologyFunctionsClass), intent(inout)} : : \text{self} \\
\text{double precision} & \quad \text{(in )} : : \text{expansionFactor}
\end{align*}
\]

\[
\text{end double precision function } \text{myImplementationExpansionRate}
\]

exponentDarkEnergy  HASH(0x198caa8)  Must have the following interface:

\[
\text{double precision function } \text{myImplementationExponentDarkEnergy}(\text{self}, \text{time}, \text{expansionFactor})
\]

\[
\begin{align*}
\text{class} & \quad \text{(cosmologyFunctionsClass), intent(inout)} : : \text{self} \\
\text{double precision} & \quad \text{(in )}, \text{optional : : time}, \& \\
& \quad \text{& expansionFactor}
\end{align*}
\]

\[
\text{end double precision function } \text{myImplementationExponentDarkEnergy}
\]

hubbleParameterEpochal  Returns the Hubble parameter at the requested cosmological time, \( \text{time} \), or expansion factor, \( \text{expansionFactor} \). Must have the following interface:
17.4. Existing Method Types

double precision function myImplementationHubbleParameterEpochal(self,time,&
& expansionFactor,collapsingPhase)
  class (cosmologyFunctionsClass), intent(inout) :: self
double precision , intent(in ), optional :: time, &
& expansionFactor
logical , intent(in ), optional :: collapsingPhase
end double precision function myImplementationHubbleParameterEpochal

hubbleParameterRateOfChange Returns the rate of change of the Hubble parameter at the requested cosmological time, \( \text{time} \), or expansion factor, \( \text{expansionFactor} \). Must have the following interface:

double precision function myImplementationHubbleParameterRateOfChange(self,time,&
& expansionFactor,collapsingPhase)
  class (cosmologyFunctionsClass), intent(inout) :: self
double precision , intent(in ), optional :: time, &
& expansionFactor
logical , intent(in ), optional :: collapsingPhase
end double precision function myImplementationHubbleParameterRateOfChange

omegaDarkEnergyEpochal Return the dark energy density parameter at expansion factor \( \text{expansionFactor} \). Must have the following interface:

double precision function myImplementationOmegaDarkEnergyEpochal(self,time , &
& expansionFactor,collapsingPhase)
  class (cosmologyFunctionsClass), intent(inout) :: self
double precision , intent(in ), optional :: time, &
& expansionFactor
logical , intent(in ), optional :: collapsingPhase
end double precision function myImplementationOmegaDarkEnergyEpochal

omegaMatterEpochal Return the matter density parameter at expansion factor \( \text{expansionFactor} \). Must have the following interface:

double precision function myImplementationOmegaMatterEpochal(self,time , &
& expansionFactor,collapsingPhase)
  class (cosmologyFunctionsClass), intent(inout) :: self
double precision , intent(in ), optional :: time, &
& expansionFactor
logical , intent(in ), optional :: collapsingPhase
end double precision function myImplementationOmegaMatterEpochal

omegaMatterRateOfChange Return the rate of change of the matter density parameter at expansion factor \( \text{expansionFactor} \). Must have the following interface:

double precision function myImplementationOmegaMatterRateOfChange(self,time , &
& expansionFactor,collapsingPhase)
  class (cosmologyFunctionsClass), intent(inout) :: self
double precision , intent(in ), optional :: time, &
& expansionFactor
logical , intent(in ), optional :: collapsingPhase
end double precision function myImplementationOmegaMatterRateOfChange

redshiftFromExpansionFactor Returns redshift for a given expansion factor. A default implementation exists. If overridden the following interface must be used:
17. Adding New Methods

double precision function myImplementationRedshiftFromExpansionFactor(self, & expansionFactor)
  class (cosmologyFunctionsClass), intent(inout) :: self
double precision , intent(in ) :: expansionFactor
end double precision function myImplementationRedshiftFromExpansionFactor

**temperatureCMBEpochal** Return the temperature of the cosmic microwave background at **expansionFactor**. Must have the following interface:

double precision function myImplementationTemperatureCMBEpochal(self, time , & expansionFactor, collapsingPhase)
  class (cosmologyFunctionsClass), intent(inout) :: self
double precision , intent(in ), optional :: time, & expansionFactor
logical , intent(in ), optional :: collapsingPhase
end double precision function myImplementationTemperatureCMBEpochal

**timeAtDistanceComoving** Return the cosmic time corresponding to the given comovingDistance. Must have the following interface:

double precision function myImplementationTimeAtDistanceComoving(self, comovingDistance)
  class (cosmologyFunctionsClass), intent(inout) :: self
double precision , intent(in ) :: comovingDistance
end double precision function myImplementationTimeAtDistanceComoving

**stateStore** Store the state of the object to file. A default implementation exists. If overridden the following interface must be used:

subroutine myImplementationStateStore(self, stateFile, fgslStateFile)
  class (cosmologyFunctionsClass), intent(inout) :: self
integer , intent(in ) :: stateFile
type (fgsl_file ), intent(in ) :: fgslStateFile
end subroutine myImplementationStateStore

**stateRestore** Restore the state of the object to file. A default implementation exists. If overridden the following interface must be used:

subroutine myImplementationStateRestore(self, stateFile, fgslStateFile)
  class (cosmologyFunctionsClass), intent(inout) :: self
integer , intent(in ) :: stateFile
type (fgsl_file ), intent(in ) :: fgslStateFile
end subroutine myImplementationStateRestore

**isFinalizable** Return true if this object can be finalized. A default implementation exists. If overridden the following interface must be used:

logical function myImplementationIsFinalizable(self)
  class (cosmologyFunctionsClass), intent(inout) :: self
end logical function myImplementationIsFinalizable

Existing implementations are:

cosmologyFunctionsMatterLambda Cosmological relations are computed assuming a universe that contains only matter and a cosmological constant. See §13.2.1.

cosmologyFunctionsMatterDarkEnergy Cosmological relations are computed assuming a universe that contains only matter and dark energy with an equation of state \( w(a) = w_0 + w_1 (1 - a) \). See §13.2.2.
Cosmological Parameters

Additional implementations for cosmological parameters are added using the `cosmologyParameters` class. The implementation should be placed in a file containing the directive:

```fortran
!# <cosmologyParameters name="cosmologyParametersMyImplementation">  
!# <description>A short description of the implementation.</description>  
!# </cosmologyParameters>
```

where `MyImplementation` is an appropriate name for the implementation. This file should be treated as a regular Fortran module, but without the initial `module` and final `end module` lines. That is, it may contain `use` statements and variable declarations prior to the `contains` line, and should contain all functions required by the implementation after that line. Function names should begin with `cosmologyParameters-MyImplementation`. The file must define a type that extends the `cosmologyParametersClass` class (or extends another type which is itself an extension of the `cosmologyParametersClass` class), containing any data needed by the implementation along with type-bound functions required by the implementation. The following type-bound functions are required (unless inherited from the parent type):

**HubbleConstant** Return the Hubble constant at the present day. The optional `units` argument specifies if the return value should be in units of \( \text{km/s/Mpc} \) (`unitsStandard`), \( \text{Gyr}^{-1} \) (`unitsTime`), or 100 \( \text{km/s/Mpc} \) (`unitsLittleH`). Must have the following interface:

```fortran
double precision function myImplementationHubbleConstant(self, units)
    class (cosmologyParametersClass), intent(inout) :: self
    integer , intent(in), optional :: units
end double precision function myImplementationHubbleConstant
```

**OmegaBaryon** Return the cosmological baryon density in units of the critical density at the present day. Must have the following interface:

```fortran
double precision function myImplementationOmegaBaryon(self)
    class (cosmologyParametersClass), intent(inout) :: self
end double precision function myImplementationOmegaBaryon
```

**OmegaCurvature** Return the cosmological curvature density in units of the critical density at the present day. Must have the following interface:

```fortran
double precision function myImplementationOmegaCurvature(self)
    class (cosmologyParametersClass), intent(inout) :: self
end double precision function myImplementationOmegaCurvature
```

**OmegaDarkEnergy** Return the cosmological dark energy density in units of the critical density at the present day. Must have the following interface:

```fortran
double precision function myImplementationOmegaDarkEnergy(self)
    class (cosmologyParametersClass), intent(inout) :: self
end double precision function myImplementationOmegaDarkEnergy
```

**OmegaMatter** Return the cosmological matter density in units of the critical density at the present day. Must have the following interface:

```fortran
double precision function myImplementationOmegaMatter(self)
    class (cosmologyParametersClass), intent(inout) :: self
end double precision function myImplementationOmegaMatter
```
17. Adding New Methods

OmegaRadiation  Return the cosmological radiation density in units of the critical density at the present day. Must have the following interface:

    double precision function myImplementationOmegaRadiation(self)
    class(cosmologyParametersClass), intent(inout) :: self
end double precision function myImplementationOmegaRadiation

densityCritical  Return the critical density at the present day in units of $M_\odot$/Mpc$^3$. Must have the following interface:

    double precision function myImplementationDensityCritical(self)
    class(cosmologyParametersClass), intent(inout) :: self
end double precision function myImplementationDensityCritical

temperatureCMB  Return the temperature of the cosmic microwave background radiation (in units of Kelvin) at the present day. Must have the following interface:

    double precision function myImplementationTemperatureCMB(self)
    class(cosmologyParametersClass), intent(inout) :: self
end double precision function myImplementationTemperatureCMB

isFinalizable  Return true if this object can be finalized. A default implementation exists. If overridden the following interface must be used:

    logical function myImplementationIsFinalizable(self)
    class(cosmologyParametersClass), intent(inout) :: self
end logical function myImplementationIsFinalizable

Existing implementations are:

cosmologyParametersSimple  Provides basic cosmological parameters: ($H_0, \Omega_M, \Omega_\Lambda, \Omega_b, T_{CMB}$). Also provides derived quantities ($\Omega_K, \Omega_r, \rho_{crit}$).

Dark Matter Halo Scales

Additional implementations for dark matter halo scales are added using the darkMatterHaloScale class. The implementation should be placed in a file containing the directive:

    !<darkMatterHaloScale name="darkMatterHaloScaleMyImplementation">
    !<description>A short description of the implementation.</description>
    !</darkMatterHaloScale>

where MyImplementation is an appropriate name for the implementation. This file should be treated as a regular Fortran module, but without the initial module and final end module lines. That is, it may contain use statements and variable declarations prior to the contains line, and should contain all functions required by the implementation after that line. Function names should begin with darkMatterHaloScaleMyImplementation. The file must define a type that extends the darkMatterHaloScaleClass class (or extends another type which is itself an extension of the darkMatterHaloScaleClass class), containing any data needed by the implementation along with type-bound functions required by the implementation. The following type-bound functions are required (unless inherited from the parent type):

dynamicalTimescale  The characteristic dynamical timescale of a dark matter halo. Must have the following interface:
double precision function myImplementationDynamicalTimescale(self,thisNode)
class(darkMatterHaloScaleClass), intent(inout) :: self
type (treeNode ), intent(inout), pointer :: thisNode
end double precision function myImplementationDynamicalTimescale

meanDensity The mean density of a dark matter halo. Must have the following interface:

double precision function myImplementationMeanDensity(self,thisNode)
class(darkMatterHaloScaleClass), intent(inout) :: self
type (treeNode ), intent(inout), pointer :: thisNode
end double precision function myImplementationMeanDensity

meanDensityGrowthRate The growth rate of the mean density of a dark matter halo. Must have the following interface:

double precision function myImplementationMeanDensityGrowthRate(self,thisNode)
class(darkMatterHaloScaleClass), intent(inout) :: self
type (treeNode ), intent(inout), pointer :: thisNode
end double precision function myImplementationMeanDensityGrowthRate

virialRadius The virial radius of a dark matter halo. Must have the following interface:

double precision function myImplementationVirialRadius(self,thisNode)
class(darkMatterHaloScaleClass), intent(inout) :: self
type (treeNode ), intent(inout), pointer :: thisNode
end double precision function myImplementationVirialRadius

virialRadiusGrowthRate The growth rate of the virial radius of a dark matter halo. Must have the following interface:

double precision function myImplementationVirialRadiusGrowthRate(self,thisNode)
class(darkMatterHaloScaleClass), intent(inout) :: self
type (treeNode ), intent(inout), pointer :: thisNode
end double precision function myImplementationVirialRadiusGrowthRate

virialTemperature The virial temperature of a dark matter halo. Must have the following interface:

double precision function myImplementationVirialTemperature(self,thisNode)
class(darkMatterHaloScaleClass), intent(inout) :: self
type (treeNode ), intent(inout), pointer :: thisNode
end double precision function myImplementationVirialTemperature

virialVelocity The virial velocity of a dark matter halo. Must have the following interface:

double precision function myImplementationVirialVelocity(self,thisNode)
class(darkMatterHaloScaleClass), intent(inout) :: self
type (treeNode ), intent(inout), pointer :: thisNode
end double precision function myImplementationVirialVelocity

virialVelocityGrowthRate The growth rate of the virial velocity of a dark matter halo. Must have the following interface:

double precision function myImplementationVirialVelocityGrowthRate(self,thisNode)
class(darkMatterHaloScaleClass), intent(inout) :: self
type (treeNode ), intent(inout), pointer :: thisNode
end double precision function myImplementationVirialVelocityGrowthRate
stateStore Store the state of the object to file. A default implementation exists. If overridden the following interface must be used:

```fortran
subroutine myImplementationStateStore(self, stateFile, fgslStateFile)
  class (darkMatterHaloScaleClass), intent(inout) :: self
  integer , intent(in ) :: stateFile
  type (fgsl_file ), intent(in ) :: fgslStateFile
end subroutine myImplementationStateStore
```

stateRestore Restore the state of the object to file. A default implementation exists. If overridden the following interface must be used:

```fortran
subroutine myImplementationStateRestore(self, stateFile, fgslStateFile)
  class (darkMatterHaloScaleClass), intent(inout) :: self
  integer , intent(in ) :: stateFile
  type (fgsl_file ), intent(in ) :: fgslStateFile
end subroutine myImplementationStateRestore
```

calculationReset Reset the calculation state of the object. A default implementation exists. If overridden the following interface must be used:

```fortran
subroutine myImplementationCalculationReset(self, thisNode)
  class(darkMatterHaloScaleClass), intent(inout) :: self
  type (treeNode ), intent(inout), pointer :: thisNode
end subroutine myImplementationCalculationReset
```

isFinalizable Return true if this object can be finalized. A default implementation exists. If overridden the following interface must be used:

```fortran
logical function myImplementationIsFinalizable(self)
  class(darkMatterHaloScaleClass), intent(inout) :: self
end logical function myImplementationIsFinalizable
```

Existing implementations are:

darkMatterHaloScaleVirialDensityContrastDefinition Dark matter halo scales derived from virial density contrasts.

**Dark Matter Halo Profiles**

Additional implementations for dark matter halo profiles are added using the darkMatterProfile class. The implementation should be placed in a file containing the directive:

```fortran
!# <darkMatterProfile name="darkMatterProfileMyImplementation">
!# <description>A short description of the implementation.</description>
!# </darkMatterProfile>
```

where MyImplementation is an appropriate name for the implementation. This file should be treated as a regular Fortran module, but without the initial module and final end module lines. That is, it may contain use statements and variable declarations prior to the contains line, and should contain all functions required by the implementation after that line. Function names should begin with darkMatterProfileMyImplementation. The file must define a type that extends the darkMatterProfileClass class (or extends another type which is itself an extension of the darkMatterProfileClass class), containing any data needed by the implementation along with type-bound functions required by the implementation. The following type-bound functions are required (unless inherited from the parent type):
circularVelocity Returns the circular velocity (in km/s) in the dark matter profile of node at the given radius (given in units of Mpc). Must have the following interface:

```fortran
double precision function myImplementationCircularVelocity(self,node,radius)
    class (darkMatterProfileClass), intent(inout) :: self
    type (treeNode ), intent(inout), pointer :: node
    double precision , intent(in ) :: radius
end double precision function myImplementationCircularVelocity
```

circularVelocityMaximum Returns the maximum circular velocity (in km/s) in the dark matter profile of node. Must have the following interface:

```fortran
double precision function myImplementationCircularVelocityMaximum(self,node)
    class(darkMatterProfileClass), intent(inout) :: self
    type (treeNode ), intent(inout), pointer :: node
end double precision function myImplementationCircularVelocityMaximum
```

density Returns the density (in $M_\odot \, \text{Mpc}^{-3}$) in the dark matter profile of node at the given radius (given in units of Mpc). Must have the following interface:

```fortran
double precision function myImplementationDensity(self,node,radius)
    class (darkMatterProfileClass), intent(inout) :: self
    type (treeNode ), intent(inout), pointer :: node
    double precision , intent(in ) :: radius
end double precision function myImplementationDensity
```

enclosedMass Returns the enclosed mass (in $M_\odot$) in the dark matter profile of node at the given radius (given in units of Mpc). for the given node. Must have the following interface:

```fortran
double precision function myImplementationEnclosedMass(self,node,radius)
    class (darkMatterProfileClass), intent(inout) :: self
    type (treeNode ), intent(inout), pointer :: node
    double precision , intent(in ) :: radius
end double precision function myImplementationEnclosedMass
```

energy Return the total energy for the given node in units of $M_\odot \, \text{km}^2 \, \text{s}^{-1}$. Must have the following interface:

```fortran
double precision function myImplementationEnergy(self,node)
    class(darkMatterProfileClass), intent(inout) :: self
    type (treeNode ), intent(inout), pointer :: node
end double precision function myImplementationEnergy
```

energyGrowthRate Returns the rate of chance of the total energy of node in units of $M_\odot \, \text{km}^2 \, \text{s}^{-1} \, \text{Gyr}^{-1}$. Must have the following interface:

```fortran
double precision function myImplementationEnergyGrowthRate(self,node)
    class(darkMatterProfileClass), intent(inout) :: self
    type (treeNode ), intent(inout), pointer :: node
end double precision function myImplementationEnergyGrowthRate
```

freeFallRadiusIncreaseRate Returns the rate of increase of the freefall radius (in Mpc/Gyr) corresponding to the given time (in Gyr) in node. Must have the following interface:
17. Adding New Methods

**freefallRadius** Returns the freefall radius (in Mpc) corresponding to the given time (in Gyr) in node. Must have the following interface:

```fortran
double precision function myImplementationFreefallRadius(self,node,time)
  class (darkMatterProfileClass), intent(inout) :: self
type (treeNode ), intent(inout), pointer :: node
double precision , intent(in ) :: time
end double precision function myImplementationFreefallRadius
```

**kSpace** Returns the normalized Fourier space density profile of the dark matter profile of node at the given waveNumber (given in units of Mpc$^{-1}$). Must have the following interface:

```fortran
double precision function myImplementationKSpace(self,node,wavenumber)
  class (darkMatterProfileClass), intent(inout) :: self
type (treeNode ), intent(inout), pointer :: node
double precision , intent(in ) :: wavenumber
end double precision function myImplementationKSpace
```

**potential** Returns the gravitational potential (in $(km/s)^2$) in the dark matter profile of node at the given radius (given in units of Mpc). Must have the following interface:

```fortran
double precision function myImplementationPotential(self,node,radius,status)
  class (darkMatterProfileClass), intent(inout) :: self
type (treeNode ), intent(inout), pointer :: node
double precision , intent(in ) :: radius
integer , intent( out), optional :: status
end double precision function myImplementationPotential
```

**radiusFromSpecificAngularMomentum** Returns the radius (in Mpc) in the dark matter profile of node at which the specific angular momentum of a circular orbit equals specificAngularMomentum (specified in units of km s$^{-1}$ Mpc. Must have the following interface:

```fortran
double precision function myImplementationRadiusFromSpecificAngularMomentum(self,node,& specificAngularMomentum)
  class (darkMatterProfileClass), intent(inout) :: self
type (treeNode ) , intent(inout), pointer :: node
double precision , intent(in ) :: & specificAngularMomentum
end double precision function myImplementationRadiusFromSpecificAngularMomentum
```

**rotationNormalization** Returns the relation between specific angular momentum and rotation velocity (assuming a rotation velocity that is constant in radius) for the given node. Specifically, the normalization, $A$, returned is such that $V_{rot} = AJ/M$. Must have the following interface:

```fortran
double precision function myImplementationRotationNormalization(self,node)
  class (darkMatterProfileClass), intent(inout) :: self
type (treeNode ), intent(inout), pointer :: node
end double precision function myImplementationRotationNormalization
```
17.4. Existing Method Types

**stateStore** Store the state of the object to file. A default implementation exists. If overridden the following interface must be used:

```fortran
subroutine myImplementationStateStore(self, stateFile, fgslStateFile)
  class (darkMatterProfileClass), intent(inout) :: self
  integer, intent(in) :: stateFile
  type (fgsl_file), intent(in) :: fgslStateFile
end subroutine myImplementationStateStore
```

**stateRestore** Restore the state of the object to file. A default implementation exists. If overridden the following interface must be used:

```fortran
subroutine myImplementationStateRestore(self, stateFile, fgslStateFile)
  class (darkMatterProfileClass), intent(inout) :: self
  integer, intent(in) :: stateFile
  type (fgsl_file), intent(in) :: fgslStateFile
end subroutine myImplementationStateRestore
```

**calculationReset** Reset the calculation state of the object. A default implementation exists. If overridden the following interface must be used:

```fortran
subroutine myImplementationCalculationReset(self, thisNode)
  class (darkMatterProfileClass), intent(inout) :: self
  type (treeNode), intent(inout), pointer :: thisNode
end subroutine myImplementationCalculationReset
```

**isFinalizable** Return true if this object can be finalized. A default implementation exists. If overridden the following interface must be used:

```fortran
logical function myImplementationIsFinalizable(self)
  class (darkMatterProfileClass), intent(inout) :: self
end function myImplementationIsFinalizable
```

Existing implementations are:

- **darkMatterProfileIsothermal** Isothermal dark matter halo profiles
- **darkMatterProfileEinasto** “Einasto” dark matter halo profiles
- **darkMatterProfileNFW** Navarro et al. [1997] dark matter halo profiles

**Dark Matter Profile Concentrations**

Additional implementations for dark matter profile concentrations are added using the `darkMatterProfileConcentration` class. The implementation should be placed in a file containing the directive:

```fortran
!# <darkMatterProfileConcentration name="darkMatterProfileConcentrationMyImplementation">
!# <description>A short description of the implementation.</description>
!# </darkMatterProfileConcentration>
```

where `MyImplementation` is an appropriate name for the implementation. This file should be treated as a regular Fortran module, but without the initial `module` and final `end module` lines. That is, it may contain `use` statements and variable declarations prior to the `contains` line, and should contain all functions required by the implementation after that line. Function names should begin with `darkMatterProfileConcentrationMyImplementation`. The file must define a type that extends the
darkMatterProfileConcentrationClass class (or extends another type which is itself an extension of the darkMatterProfileConcentrationClass class), containing any data needed by the implementation along with type-bound functions required by the implementation. The following type-bound functions are required (unless inherited from the parent type):

**concentration** Returns the concentration parameter for the given node. Must have the following interface:

```fortran
double precision function myImplementationConcentration(self,node)
  class(darkMatterProfileConcentrationClass), intent(inout) :: self
  type (treeNode ), intent(inout), pointer :: node
end double precision function myImplementationConcentration
```

darkMatterProfileDefinition Returns a darkMatterProfile object describing the dark matter density profile used to define this concentration. Must have the following interface:

```fortran
class(darkMatterProfileClass) function myImplementationDarkMatterProfileDefinition(self&
  class(darkMatterProfileConcentrationClass), intent(inout) :: self
end class(darkMatterProfileClass) function myImplementationDarkMatterProfileDefinition
```

densityContrastDefinition Returns a virialDensityContrast object describing the virial density contrast used to define this concentration. Must have the following interface:

```fortran
class(virialDensityContrastClass) function myImplementationDensityContrastDefinition(
  class(darkMatterProfileConcentrationClass), intent(inout) :: self
end class(virialDensityContrastClass) function &
& myImplementationDensityContrastDefinition
```

**isFinalizable** Return true if this object can be finalized. A default implementation exists. If overridden the following interface must be used:

```fortran
logical function myImplementationIsFinalizable(self)
  class(darkMatterProfileConcentrationClass), intent(inout) :: self
end logical function myImplementationIsFinalizable
```

Existing implementations are:

darkMatterProfileConcentrationMunozCuartas2011 Dark matter halo concentrations are computed using the algorithm of Muñoz-Cuartas et al. [2011]. See §13.8.3.
darkMatterProfileConcentrationDuttonMaccio2014 Dark matter halo concentrations are computed using the algorithm of Dutton and Macciò [2014]. See §13.8.3.
darkMatterProfileConcentrationNFW1996 Dark matter halo concentrations are computed using the algorithm of Navarro et al. [1996]. See §13.8.3.
darkMatterProfileConcentrationPrada2011 Dark matter halo concentrations are computed using the algorithm of Prada et al. [2011]. See §13.8.3.
darkMatterProfileConcentrationWDM Dark matter halo concentrations are computed using the modifier of Schneider et al. [2012].
17.4. Existing Method Types

darkMatterProfileConcentrationZhao2009 Dark matter halo concentrations are computed using the algorithm of Zhao et al. [2009]. See §13.8.3.

darkMatterProfileConcentrationGao2008 Dark matter halo concentrations are computed using the algorithm of Gao et al. [2008]. See §13.8.3.

Hot Halo Mass Distributions

Additional implementations for hot halo mass distributions are added using the `hotHaloMassDistribution` class. The implementation should be placed in a file containing the directive:

```fortran
!# <hotHaloMassDistribution name="hotHaloMassDistributionMyImplementation">
!# <description>A short description of the implementation.</description>
!# </hotHaloMassDistribution>
```

where `MyImplementation` is an appropriate name for the implementation. This file should be treated as a regular Fortran module, but without the initial `module` and final `end module` lines. That is, it may contain `use` statements and variable declarations prior to the `contains` line, and should contain all functions required by the implementation after that line. Function names should begin with `hotHaloMass-`.

The file must define a type that extends the `hotHaloMassDistributionClass` class (or extends another type which is itself an extension of the `hotHaloMassDistributionClass` class), containing any data needed by the implementation along with type-bound functions required by the implementation. The following type-bound functions are required (unless inherited from the parent type):

- **density** Return the density of the hot halo at the given radius. Must have the following interface:

  ```fortran
  double precision function myImplementationDensity(self,node,radius)
  class (hotHaloMassDistributionClass), intent(inout) :: self
  type (treeNode ), intent(inout), pointer :: node
  double precision , intent(in ) :: radius
  end double precision function myImplementationDensity
  ```

- **densityLogSlope** Return the logarithmic slope of the density of the hot halo at the given radius. Must have the following interface:

  ```fortran
  double precision function myImplementationDensityLogSlope(self,node,radius)
  class (hotHaloMassDistributionClass), intent(inout) :: self
  type (treeNode ), intent(inout), pointer :: node
  double precision , intent(in ) :: radius
  end double precision function myImplementationDensityLogSlope
  ```

- **enclosedMass** Return the mass enclosed in the hot halo at the given radius. Must have the following interface:

  ```fortran
  double precision function myImplementationEnclosedMass(self,node,radius)
  class (hotHaloMassDistributionClass), intent(inout) :: self
  type (treeNode ), intent(inout), pointer :: node
  double precision , intent(in ) :: radius
  end double precision function myImplementationEnclosedMass
  ```

- **radialMoment** Return the density of the hot halo at the given radius. Must have the following interface:

  ```fortran
  double precision function myImplementationRadialMoment(self,node,radius)
  class (hotHaloMassDistributionClass), intent(inout) :: self
  type (treeNode ), intent(inout), pointer :: node
  double precision , intent(in ) :: radius
  end double precision function myImplementationRadialMoment
  ```

737
### Adding New Methods

**double precision function myImplementationRadialMoment(self,node,moment, radius)**

class (hotHaloMassDistributionClass), intent(inout) :: self
type (treeNode ), intent(inout), pointer :: node
double precision , intent(in ) :: moment, &
& radius
end double precision function myImplementationRadialMoment

**rotationNormalization** Returns the relation between specific angular momentum and rotation velocity (assuming a rotation velocity that is constant in radius) for node. Specifically, the normalization, \( A \), returned is such that \( V_{rot} = AJ/M \). Must have the following interface:

**double precision function myImplementationRotationNormalization(self,node)**
class(hotHaloMassDistributionClass), intent(inout) :: self
type (treeNode ), intent(inout), pointer :: node
end double precision function myImplementationRotationNormalization

**isFinalizable** Return true if this object can be finalized. A default implementation exists. If overridden the following interface must be used:

**logical function myImplementationIsFinalizable(self)**
class(hotHaloMassDistributionClass), intent(inout) :: self
end logical function myImplementationIsFinalizable

Existing implementations are:

**hotHaloMassDistributionBetaProfile** Provides a \( \beta \)-profile implementation of the hot halo mass distribution class. See §13.16.1.

**hotHaloMassDistributionNull** Provides a null implementation of the hot halo mass distribution class. See §13.16.3.

**hotHaloMassDistributionRicotti2000** Provides an implementation of the hot halo mass distribution class which uses the model of Ricotti and Shull [2000]. See §13.16.2.

### Hot Halo Mass Distributions Core Radii

Additional implementations for hot halo mass distributions core radii are added using the **hotHaloMassDistributionCoreRadius** class. The implementation should be placed in a file containing the directive:

```
!# <hotHaloMassDistributionCoreRadius name="hotHaloMassDistributionCoreRadiusMyImplementation">
!# <description>A short description of the implementation.</description>
!# </hotHaloMassDistributionCoreRadius>
```

where **MyImplementation** is an appropriate name for the implementation. This file should be treated as a regular Fortran module, but without the initial module and final end module lines. That is, it may contain use statements and variable declarations prior to the contains line, and should contain all functions required by the implementation after that line. Function names should begin with hot-HaloMassDistributionCoreRadiusMyImplementation. The file must define a type that extends the **hotHaloMassDistributionCoreRadiusClass** class (or extends another type which is itself an extension of the **hotHaloMassDistributionCoreRadiusClass** class), containing any data needed by the implementation along with type-bound functions required by the implementation. The following type-bound functions are required (unless inherited from the parent type):

**radius** Return the core radius of the hot halo mass distribution. Must have the following interface:
double precision function myImplementationRadius(self,node)
  class (hotHaloMassDistributionCoreRadiusClass), intent(inout) :: self
  type (treeNode ), intent(inout), pointer :: node
end double precision function myImplementationRadius

stateStore Store the state of the object to file. A default implementation exists. If overridden the following interface must be used:

subroutine myImplementationStateStore(self,stateFile,fgslStateFile)
  class (hotHaloMassDistributionCoreRadiusClass), intent(inout) :: self
  integer , intent(in ) :: stateFile
  type (fgsl_file ), intent(in ) :: fgslStateFile
end subroutine myImplementationStateStore

stateRestore Restore the state of the object to file. A default implementation exists. If overridden the following interface must be used:

subroutine myImplementationStateRestore(self,stateFile,fgslStateFile)
  class (hotHaloMassDistributionCoreRadiusClass), intent(inout) :: self
  integer , intent(in ) :: stateFile
  type (fgsl_file ), intent(in ) :: fgslStateFile
end subroutine myImplementationStateRestore

isFinalizable Return true if this object can be finalized. A default implementation exists. If overridden the following interface must be used:

logical function myImplementationIsFinalizable(self)
  class(hotHaloMassDistributionCoreRadiusClass), intent(inout) :: self
end logical function myImplementationIsFinalizable

Existing implementations are:

hotHaloMassDistributionCoreRadiusVirialFraction Provides an implementation of the hot halo mass distribution core radius class which sets the core radius to a fraction of the virial radius. See §13.17.2.

hotHaloMassDistributionCoreRadiusGrowing Provides an implementation of the hot halo mass distribution core radius class in which the core grows as the hot halo content is depleted. See §13.17.1.

Intergalactic Medium State

Additional implementations for intergalactic medium state are added using the intergalacticMediumState class. The implementation should be placed in a file containing the directive:

!# <intergalacticMediumState name="intergalacticMediumStateMyImplementation">
!# <description>A short description of the implementation.</description>
!# </intergalacticMediumState>

where MyImplementation is an appropriate name for the implementation. This file should be treated as a regular Fortran module, but without the initial module and final end module lines. That is, it may contain use statements and variable declarations prior to the contains line, and should contain all functions required by the implementation after that line. Function names should begin with intergalacticMedium-StateMyImplementation. The file must define a type that extends the intergalacticMediumStateClass class (or extends another type which is itself an extension of the intergalacticMediumStateClass class), containing any data needed by the implementation along with type-bound functions required by the implementation. The following type-bound functions are required (unless inherited from the parent type):

739
doublyIonizedHeliumFraction  Return the doubly-ionized fraction of helium in the IGM at the given time. A default implementation exists. If overridden the following interface must be used:

    double precision function myImplementationDoublyIonizedHeliumFraction(self,time) 
    class (intergalacticMediumStateClass), intent(inout) :: self 
    double precision , intent(in ) :: time 
end double precision function myImplementationDoublyIonizedHeliumFraction

electronFraction  Return the electron fraction (relative to hydrogen) in the IGM at the given time. Must have the following interface:

    double precision function myImplementationElectronFraction(self,time) 
    class (intergalacticMediumStateClass), intent(inout) :: self 
    double precision , intent(in ) :: time 
end double precision function myImplementationElectronFraction

electronScatteringOpticalDepth  Return the electron scattering optical depth from the present day back to the given time in the IGM. A default implementation exists. If overridden the following interface must be used:

    double precision function myImplementationElectronScatteringOpticalDepth(self,time,& & assumeFullyIonized) 
    class (intergalacticMediumStateClass), intent(inout) :: self 
    double precision , intent(in ) :: time 
    logical , intent(in ), optional :: & 
    & assumeFullyIonized 
end double precision function myImplementationElectronScatteringOpticalDepth

electronScatteringTime  Return the cosmological time at which the given electron scattering opticalDepth is reached (integrating from the present day) in the IGM. A default implementation exists. If overridden the following interface must be used:

    double precision function myImplementationElectronScatteringTime(self,opticalDepth,& & assumeFullyIonized) 
    class (intergalacticMediumStateClass), intent(inout) :: self 
    double precision , intent(in ) :: & 
    & opticalDepth 
    logical , intent(in ), optional :: & 
    & assumeFullyIonized 
end double precision function myImplementationElectronScatteringTime

neutralHeliumFraction  Return the neutral fraction of helium in the IGM at the given time. Must have the following interface:

    double precision function myImplementationNeutralHeliumFraction(self,time) 
    class (intergalacticMediumStateClass), intent(inout) :: self 
    double precision , intent(in ) :: time 
end double precision function myImplementationNeutralHeliumFraction

neutralHydrogenFraction  Return the neutral fraction of hydrogen in the IGM at the given time. Must have the following interface:

    double precision function myImplementationNeutralHydrogenFraction(self,time) 
    class (intergalacticMediumStateClass), intent(inout) :: self 
    double precision , intent(in ) :: time 
end double precision function myImplementationNeutralHydrogenFraction
singlyIonizedHeliumFraction Return the singly-ionized fraction of helium in the IGM at the given time. Must have the following interface:

```fortran
double precision function myImplementationSinglyIonizedHeliumFraction(self,time)
  class (intergalacticMediumStateClass), intent(inout) :: self
double precision , intent(in ) :: time
end double precision function myImplementationSinglyIonizedHeliumFraction
```

singlyIonizedHydrogenFraction Return the singly-ionized fraction of hydrogen in the IGM at the given time. A default implementation exists. If overridden the following interface must be used:

```fortran
double precision function myImplementationSinglyIonizedHydrogenFraction(self,time)
  class (intergalacticMediumStateClass), intent(inout) :: self
double precision , intent(in ) :: time
end double precision function myImplementationSinglyIonizedHydrogenFraction
```

temperature Return the temperature (in Kelvin) of the IGM at the given time. Must have the following interface:

```fortran
double precision function myImplementationTemperature(self,time)
  class (intergalacticMediumStateClass), intent(inout) :: self
double precision , intent(in ) :: time
end double precision function myImplementationTemperature
```

isFinalizable Return true if this object can be finalized. A default implementation exists. If overridden the following interface must be used:

```fortran
logical function myImplementationIsFinalizable(self)
  class(intergalacticMediumStateClass), intent(inout) :: self
end logical function myImplementationIsFinalizable
```

Existing implementations are:

intergalacticMediumStateSimple The intergalactic medium is assumed to be instantaneously and fully reionized at a fixed redshift, and heated to a fixed temperature. See §13.23.1.

intergalacticMediumStateInternal The intergalactic medium is assumed to be instantaneously and fully reionized at a fixed redshift, and heated to a fixed temperature.

intergalacticMediumStateFile The intergalactic medium state is read from file. See §13.23.3.

intergalacticMediumStateRecFast The intergalactic medium state is computed using RECFAST. See §13.23.2.

Merger Tree Importer

Additional implementations for merger tree importer are added using the mergerTreeImporter class. The implementation should be placed in a file containing the directive:

```markup
!# <mergerTreeImporter name="mergerTreeImporterMyImplementation">
!# <description>A short description of the implementation.</description>
!# </mergerTreeImporter>
```
where *MyImplementation* is an appropriate name for the implementation. This file should be treated as a regular Fortran module, but without the initial *module* and final *end module* lines. That is, it may contain use statements and variable declarations prior to the *contains* line, and should contain all functions required by the implementation after that line. Function names should begin with *mergerTree-ImporterMyImplementation*. The file *must* define a type that extends the *mergerTreeImporterClass* class (or extends another type which is itself an extension of the *mergerTreeImporterClass* class), containing any data needed by the implementation along with type-bound functions required by the implementation. The following type-bound functions are required (unless inherited from the parent type):

**angularMomenta3DAvailable** Return true if angular momenta (vectors) are available. Must have the following interface:

```fortran
logical function myImplementationAngularMomenta3DAvailable(self)
  class(mergerTreeImporterClass), intent(inout) :: self
end logical function myImplementationAngularMomenta3DAvailable
```

**angularMomentaAvailable** Return true if angular momenta (magnitudes) are available. Must have the following interface:

```fortran
logical function myImplementationAngularMomentaAvailable(self)
  class(mergerTreeImporterClass), intent(inout) :: self
end logical function myImplementationAngularMomentaAvailable
```

**angularMomentaIncludeSubhalos** Returns a Boolean specifying whether halo angular momenta (or spins) include the contribution from their subhalos. Must have the following interface:

```fortran
logical function myImplementationAngularMomentaIncludeSubhalos(self)
  class(mergerTreeImporterClass), intent(inout) :: self
end logical function myImplementationAngularMomentaIncludeSubhalos
```

**close** Closes the file. Must have the following interface:

```fortran
subroutine myImplementationClose(self)
  class(mergerTreeImporterClass), intent(inout) :: self
end subroutine myImplementationClose
```

**cubeLength** Returns the length of the simulation cube. Must have the following interface:

```fortran
double precision function myImplementationCubeLength(self, time, status)
  class (mergerTreeImporterClass), intent(inout) :: self
  double precision , intent(in ) :: time
  integer , intent( out), optional :: status
end double precision function myImplementationCubeLength
```

**import** Imports the *i*\(^{th}\) tree. Must have the following interface:

```fortran
subroutine myImplementationImport(self, i, nodes, requireScaleRadii, requireAngularMomenta&\ & , requireAngularMomenta3D, requireSpin, requireSpin3D, requirePositions, &\ & requireParticleCounts, requireVelocityMaxima, requireVelocityDispersions)
  class (mergerTreeImporterClass) , intent(inout) &
  integer , intent(in ) &
end subroutine myImplementationImport
```

17. Adding New Methods
17.4. Existing Method Types

class (nodeData ), allocatable, dimension(:,), intent( out) 
& :: nodes 
logical , intent(in ), optional & 
& :: requireScaleRadii, requireAngularMomenta, requireAngularMomenta3D, requireSpin, & 
& requireSpin3D, requirePositions, requireParticleCounts, requireVelocityMaxima, & 
& requireVelocityDispersions 
end subroutine myImplementationImport

massesIncludeSubhalos Returns a Boolean specifying whether halo masses include the contribution from their subhalos. Must have the following interface:

logical function myImplementationMassesIncludeSubhalos(self)
class(mergerTreeImporterClass), intent(inout) :: self 
end logical function myImplementationMassesIncludeSubhalos

nodeCount Returns the number of nodes in the $i^{th}$ tree. Must have the following interface:

integer(kind=c_size_t) function myImplementationNodeCount(self,i)
class (mergerTreeImporterClass), intent(inout) :: self 
integer , intent(in ) :: i 
end integer(kind=c_size_t) function myImplementationNodeCount

open Opens the file. Must have the following interface:

subroutine myImplementationOpen(self,fileName)
class(mergerTreeImporterClass), intent(inout) :: self 
type (varying_string ), intent(in ) :: fileName 
end subroutine myImplementationOpen

particleCountAvailable Return true if particle counts are available. Must have the following interface:

logical function myImplementationParticleCountAvailable(self)
class(mergerTreeImporterClass), intent(inout) :: self 
end logical function myImplementationParticleCountAvailable

positionsArePeriodic Returns a Boolean integer specifying whether positions are periodic. Must have the following interface:

integer function myImplementationPositionsArePeriodic(self)
class(mergerTreeImporterClass), intent(inout) :: self 
end integer function myImplementationPositionsArePeriodic

positionsAvailable Return true if positions and/or velocities are available. Must have the following interface:

logical function myImplementationPositionsAvailable(self,positions, velocities)
class (mergerTreeImporterClass), intent(inout) :: self 
logical , intent(in ) :: positions, velocities 
end logical function myImplementationPositionsAvailable

scaleRadiiAvailable Return true if scale radii are available. Must have the following interface:

logical function myImplementationScaleRadiiAvailable(self)
class(mergerTreeImporterClass), intent(inout) :: self 
end logical function myImplementationScaleRadiiAvailable
17. Adding New Methods

**spin3DAvailable** Return true if spin (vectors) are available. Must have the following interface:

```fortran
logical function myImplementationSpin3DAvailable(self)
  class(mergerTreeImporterClass), intent(inout) :: self
end logical function myImplementationSpin3DAvailable
```

**spinAvailable** Return true if spin (magnitudes) are available. Must have the following interface:

```fortran
logical function myImplementationSpinAvailable(self)
  class(mergerTreeImporterClass), intent(inout) :: self
end logical function myImplementationSpinAvailable
```

**subhaloTrace** Supplies epochs, positions, and velocities for traced subhalos. Must have the following interface:

```fortran
subroutine myImplementationSubhaloTrace(self,node,time,position, velocity)
  class (mergerTreeImporterClass) , intent(inout) :: self
  class (nodeData ) , intent(in ) :: node
  double precision , dimension(:) , intent( out) :: time
  double precision , dimension(:,:), intent( out) :: position, &
  & velocity
end subroutine myImplementationSubhaloTrace
```

**subhaloTraceCount** Returns the length of a node’s subhalo trace. Must have the following interface:

```fortran
integer(kind=c_size_t) function myImplementationSubhaloTraceCount(self,node)
  class(mergerTreeImporterClass), intent(inout) :: self
  class(nodeData ), intent(in ) :: node
end integer(kind=c_size_t) function myImplementationSubhaloTraceCount
```

**treeCount** Returns a count of the number of trees available. Must have the following interface:

```fortran
integer(kind=c_size_t) function myImplementationTreeCount(self)
  class(mergerTreeImporterClass), intent(inout) :: self
end integer(kind=c_size_t) function myImplementationTreeCount
```

**treeIndex** Returns the index of the $i^{th}$ tree. Must have the following interface:

```fortran
integer(kind=kind_int8) function myImplementationTreeIndex(self,i)
  class (mergerTreeImporterClass), intent(inout) :: self
  integer , intent(in ) :: i
end integer(kind=kind_int8) function myImplementationTreeIndex
```

**treeWeight** Returns the weight to assign to the $i^{th}$ tree. Must have the following interface:

```fortran
double precision function myImplementationTreeWeight(self,i)
  class (mergerTreeImporterClass), intent(inout) :: self
  integer , intent(in ) :: i
end double precision function myImplementationTreeWeight
```

**treesAreSelfContained** Returns a Boolean integer specifying whether trees are self-contained. Must have the following interface:

```fortran
integer function myImplementationTreesAreSelfContained(self)
  class(mergerTreeImporterClass), intent(inout) :: self
end integer function myImplementationTreesAreSelfContained
```
17.4. Existing Method Types

treesHaveSubhalos Returns a Boolean integer specifying whether or not the trees have subhalos. Must have the following interface:

```
integer function myImplementationTreesHaveSubhalos(self)
class(mergerTreeImporterClass), intent(inout) :: self
end integer function myImplementationTreesHaveSubhalos
```

velocitiesIncludeHubbleFlow Returns a Boolean integer specifying whether velocities include the Hubble flow. Must have the following interface:

```
integer function myImplementationVelocitiesIncludeHubbleFlow(self)
class(mergerTreeImporterClass), intent(inout) :: self
end integer function myImplementationVelocitiesIncludeHubbleFlow
```

velocityDispersionAvailable Return true if halo velocity dispersions are available. Must have the following interface:

```
logical function myImplementationVelocityDispersionAvailable(self)
class(mergerTreeImporterClass), intent(inout) :: self
end logical function myImplementationVelocityDispersionAvailable
```

velocityMaximumAvailable Return true if rotation curve velocity maxima are available. Must have the following interface:

```
logical function myImplementationVelocityMaximumAvailable(self)
class(mergerTreeImporterClass), intent(inout) :: self
end logical function myImplementationVelocityMaximumAvailable
```

isFinalizable Return true if this object can be finalized. A default implementation exists. If overridden the following interface must be used:

```
logical function myImplementationIsFinalizable(self)
class(mergerTreeImporterClass), intent(inout) :: self
end logical function myImplementationIsFinalizable
```

Existing implementations are:

mergerTreeImporterSussing Importer for “Sussing Merger Trees” format merger tree files [Srisawat et al., 2013]. See §13.30.2.

mergerTreeImporterGalacticus Importer for GALACTICUS format merger tree files. See §13.30.1.

Satellite Merging Timescales

Additional implementations for satellite merging timescales are added using the satelliteMergingTimescales class. The implementation should be placed in a file containing the directive:

```
!# <satelliteMergingTimescales name="satelliteMergingTimescalesMyImplementation">
!# <description>A short description of the implementation.</description>
!# </satelliteMergingTimescales>
```

where MyImplementation is an appropriate name for the implementation. This file should be treated as a regular Fortran module, but without the initial module and final end module lines. That is, it may contain use statements and variable declarations prior to the contains line, and should contain all functions
required by the implementation after that line. Function names should begin with \texttt{satelliteMerging-TimescalesMyImplementation}. The file \textit{must} define a type that extends the \texttt{satelliteMergingTimescalesClass} class (or extends another type which is itself an extension of the \texttt{satelliteMergingTimescalesClass} class), containing any data needed by the implementation along with type-bound functions required by the implementation. The following type-bound functions are required (unless inherited from the parent type):

\textbf{stateRestore} Restore the state of the object from file. A default implementation exists. If overridden the following interface must be used:

\begin{verbatim}
    subroutine myImplementationStateRestore(self, stateFile, fgslStateFile)
        class (satelliteMergingTimescalesClass), intent(inout) :: self
        integer , intent(in ) :: stateFile
        type (fgsl_file ), intent(in ) :: fgslStateFile
    end subroutine myImplementationStateRestore
\end{verbatim}

\textbf{stateSnapshot} Stores a snapshot of the object state. A default implementation exists. If overridden the following interface must be used:

\begin{verbatim}
    subroutine myImplementationStateSnapshot(self)
        class(satelliteMergingTimescalesClass), intent(inout) :: self
    end subroutine myImplementationStateSnapshot
\end{verbatim}

\textbf{stateStore} Store the state of the object to file. A default implementation exists. If overridden the following interface must be used:

\begin{verbatim}
    subroutine myImplementationStateStore(self, stateFile, fgslStateFile)
        class (satelliteMergingTimescalesClass), intent(inout) :: self
        integer , intent(in ) :: stateFile
        type (fgsl_file ), intent(in ) :: fgslStateFile
    end subroutine myImplementationStateStore
\end{verbatim}

\textbf{timeUntilMerging} Return the time (in Gyr) until the satellite will merge with its host given the current orbit. Must have the following interface:

\begin{verbatim}
    double precision function myImplementationTimeUntilMerging(self, thisNode, thisOrbit)
        class(satelliteMergingTimescalesClass), intent(inout) :: self
        type (treeNode ), intent(inout), pointer :: thisNode
        type (keplerOrbit ), intent(inout) :: thisOrbit
    end double precision function myImplementationTimeUntilMerging
\end{verbatim}

\textbf{isFinalizable} Return true if this object can be finalized. A default implementation exists. If overridden the following interface must be used:

\begin{verbatim}
    logical function myImplementationIsFinalizable(self)
        class(satelliteMergingTimescalesClass), intent(inout) :: self
    end logical function myImplementationIsFinalizable
\end{verbatim}

Existing implementations are:

\textbf{satelliteMergingTimescalesPreset} This method assumes that merging times have been preset for every node (or, at least, every node which becomes a satellite). It therefore simply returns the preset merging time. See §13.44.1.
17.4. Existing Method Types

satelliteMergingTimescalesVillalobos2013 Computes the merging timescale using the method of Villalobos et al. [2013] to modify another merging timescale method. See §13.44.1.

satelliteMergingTimescalesWetzelWhite2010 Computes the merging timescale using the method of Wetzel and White [2010]. See §13.44.1.

satelliteMergingTimescalesInfinite Returns an infinite timescale for merging. See §13.44.1.

satelliteMergingTimescalesJiang2008 Computes the merging timescale using the method of Jiang et al. [2008]. See §13.44.1.

satelliteMergingTimescalesNull Returns a zero timescale for merging. See §13.44.1.

Spectra Postprocessor

Additional implementations for spectra postprocessor are added using the spectraPostprocessor class. The implementation should be placed in a file containing the directive:

```
#!/ <spectraPostprocessor name="spectraPostprocessorMyImplementation">
#!/ <description>A short description of the implementation.<description>
#!/ </spectraPostprocessor>
```

where MyImplementation is an appropriate name for the implementation. This file should be treated as a regular Fortran module, but without the initial module and final end module lines. That is, it may contain use statements and variable declarations prior to the contains line, and should contain all functions required by the implementation after that line. Function names should begin with spectraPostprocessor-MyImplementation. The file must define a type that extends the spectraPostprocessorClass class (or extends another type which is itself an extension of the spectraPostprocessorClass class), containing any data needed by the implementation along with type-bound functions required by the implementation. The following type-bound functions are required (unless inherited from the parent type):

apply Apply postprocessing to a spectrum. Must have the following interface:

```
subroutine myImplementationApply(self,wavelength, age, redshift,modifier)
   class (spectraPostprocessorClass), intent(inout) :: self
   double precision , intent(in ) :: wavelength, age, &
   redshift
   double precision , intent(inout) :: modifier
end subroutine myImplementationApply
```

isFinalizable Return true if this object can be finalized. A default implementation exists. If overridden the following interface must be used:

```
logical function myImplementationIsFinalizable(self)
   class(spectraPostprocessorClass), intent(inout) :: self
end logical function myImplementationIsFinalizable
```
17. Adding New Methods

Existing implementations are:

**spectraPostprocessorIdentity** Performs an identity postprocessing of spectra. See §13.42.6.

**spectraPostprocessorRecent** Retains only recent stellar populations. See §13.42.5.

**spectraPostprocessorLycSuppress** Suppress the Lyman continuum in stellar populations. See §13.42.4.

**spectraPostprocessorInoue2014** Apply the Inoue et al. [2014] calculation of the attenuation of spectra by the intergalactic medium. See §13.42.1.

**spectraPostprocessorMadau1995** Apply the Madau [1995] calculation of the attenuation of spectra by the intergalactic medium. See §13.42.3.

**spectraPostprocessorMeiksin2006** Apply the Meiksin [2006] calculation of the attenuation of spectra by the intergalactic medium. See §13.42.2.

### Virial Density Contrasts

Additional implementations for virial density contrasts are added using the `virialDensityContrast` class. The implementation should be placed in a file containing the directive:

```fortran
#!/ <virialDensityContrast name="virialDensityContrastMyImplementation">
#!/ <description>A short description of the implementation.</description>
#!/ </virialDensityContrast>
```

where `MyImplementation` is an appropriate name for the implementation. This file should be treated as a regular Fortran module, but without the initial `module` and final `end module` lines. That is, it may contain `use` statements and variable declarations prior to the `contains` line, and should contain all functions required by the implementation after that line. Function names should begin with `virialDensityContrastMyImplementation`. The file must define a type that extends the `virialDensityContrastClass` class (or extends another type which is itself an extension of the `virialDensityContrastClass` class), containing any data needed by the implementation along with type-bound functions required by the implementation. The following type-bound functions are required (unless inherited from the parent type):

**densityContrast** Returns the virial density contrast at the given epoch. Must have the following interface:

```fortran
double precision function myImplementationDensityContrast(self,time , &
& expansionFactor,collapsing)
  class [(virialDensityContrastClass), intent(inout)] :: self
  double precision , intent(in ), optional :: time, &
& expansionFactor
  logical , intent(in ), optional :: collapsing
end double precision function myImplementationDensityContrast
```

**densityContrastRateOfChange** Returns the rate of change of virial density contrast at the given epoch. Must have the following interface:

```fortran
double precision function myImplementationDensityContrastRateOfChange(self,time , &
& expansionFactor,collapsing)
  class [(virialDensityContrastClass), intent(inout)] :: self
  double precision , intent(in ), optional :: time, &
& expansionFactor
  logical , intent(in ), optional :: collapsing
end double precision function myImplementationDensityContrastRateOfChange
```
**17.4. Existing Method Types**

**stateStore** Store the state of the object to file. A default implementation exists. If overridden the following interface must be used:

```fortran
subroutine myImplementationStateStore(self, stateFile, fgslStateFile)
  class (virialDensityContrastClass), intent(inout) :: self
  integer , intent(in ) :: stateFile
  type (fgsl_file ), intent(in ) :: fgslStateFile
end subroutine myImplementationStateStore
```

**stateRestore** Restore the state of the object to file. A default implementation exists. If overridden the following interface must be used:

```fortran
subroutine myImplementationStateRestore(self, stateFile, fgslStateFile)
  class (virialDensityContrastClass), intent(inout) :: self
  integer , intent(in ) :: stateFile
  type (fgsl_file ), intent(in ) :: fgslStateFile
end subroutine myImplementationStateRestore
```

**isFinalizable** Return true if this object can be finalized. A default implementation exists. If overridden the following interface must be used:

```fortran
logical function myImplementationIsFinalizable(self)
  class(virialDensityContrastClass), intent(inout) :: self
end logical function myImplementationIsFinalizable
```

Existing implementations are:

- **virialDensityContrastSphericalCollapseMatterLambda** Dark matter halo virial density contrasts based on the spherical collapse in a matter plus cosmological constant universe.
- **virialDensityContrastFriendsOfFriends** Dark matter halo virial density contrasts based on the friends-of-friends algorithm linking length.
- **virialDensityContrastFixed** Fixed dark matter halo virial density contrasts.
- **virialDensityContrastSphericalCollapseMatterDE** Dark matter halo virial density contrasts based on the spherical collapse in a matter plus dark energy universe.

**Accretion Disks**

Additional methods for accretion disk properties can be added using the `accretionDisksMethod` directive. The directive should contain a single argument, giving the name of a subroutine to be called to initialize the method. For example, the **Shakura-Sunyaev** method is described by a directive:

```
!# <accretionDisksMethod>
!# <unitName>Accretion_Disks_Shakura_Sunyaev_Initialize</unitName>
!# </accretionDisksMethod>
```

Here, **Accretion_Disks_Shakura_Sunyaev_Initialize** is the name of a subroutine which will be called to initialize the method. The initialization subroutine must have the following form:
17. Adding New Methods

implicit none

type(varying_string), intent(in) :: accretionDisksMethod
procedure(), pointer, intent(inout) :: Accretion_Disk_Radiative_Efficiency_Get, Black_Hole_Spin_Up_Rate_Get, Accretion_Disk_Jet_Power_Get

if (accretionDisksMethod == 'myMethod') then
    Accretion_Disk_Radiative_Efficiency_Get => My_Accretion_Disk_Radiative_Efficiency_Get
    Black_Hole_Spin_Up_Rate_Get => My_Black_Hole_Spin_Up_Rate_Get
end if

return
end subroutine Method_Initialize

where myMethod is the name of this method as will be specified by the accretionDisksMethod input parameter. The procedure pointers Accretion_Disk_Radiative_Efficiency_Get, Black_Hole_Spin_Up_Rate_Get and Accretion_Disk_Jet_Power_Get must be set to point to functions which return the radiative efficiency, black hole spin up rate and jet power for the accretion disk respectively as described below. The initialization subroutine should perform any other tasks required to initialize the module (such as reading parameters etc.). The radiative efficiency function must have the form:

double precision function My_Accretion_Disk_Radiative_Efficiency_Get(thisNode, massAccretionRate)

implicit none

type(treeNode), intent(inout), pointer :: thisNode

double precision, intent(in) :: massAccretionRate
.
.
return
end function My_Accretion_Disk_Radiative_Efficiency_Get

The function must return the radiative efficiency for the accretion disk in thisNode. The black hole spin function must have the form:

double precision function My_Black_Hole_Spin_Up_Rate_Get(thisNode, massAccretionRate)

implicit none

type(treeNode), intent(inout), pointer :: thisNode

double precision, intent(in) :: massAccretionRate
.
.
return
end function My_Black_Hole_Spin_Up_Rate_Get

The function must return the spin-up rate for the black hole in thisNode given the massAccretionRate. The jet power function must have the form:

double precision function My_Accretion_Disk_Jet_Power_Get(thisNode, massAccretionRate)

implicit none

type(treeNode), intent(inout), pointer :: thisNode

double precision, intent(in) :: massAccretionRate
.
.
return
end function My_Accretion_Disk_Jet_Power_Get

The function must return the jet power for the accretion disk in thisNode given the massAccretionRate.
17.4. Existing Method Types

The function must return (in units of $M_\odot (\text{km/s})^2 \text{Gyr}^{-1}$) the jet power for the black hole/accretion disk system in thisNode given the massAccretionRate.

Currently defined accretion disk methods are:

**Shakura-Sunyaev** Computes the properties of a thin, radiatively efficiency accretion disk.

**ADAF** Computes the properties of an ADAF using the model of Benson and Babul [2009].

**Switched** Select either Shakura-Sunyaev or ADAF accretion disks based on the accretion rate:

$$\dot{m}_{\text{minimum}} < \dot{M}_{\text{Eddington}} < \dot{m}_{\text{maximum}} \rightarrow \text{Shakura-Sunyaev}$$

otherwise $\rightarrow$ ADAF, \hspace{1cm} (17.2)

where $\dot{m}_{\text{minimum}}$=accretionRateThinDiskMinimum and $\dot{m}_{\text{maximum}}$=accretionRateThinDiskMaximum are input parameters.

**EddingtonLimited** Assumes no specific disk structure, instead setting the radiative efficiency to a fixed number and the jet power to a fixed fraction of the Eddington luminosity.

**Accretion Onto Halos**

Additional methods for accretion of baryons onto halos can be added using the accretionHalosMethod directive. The directive should contain a single argument, giving the name of a subroutine to be called to initialize the method. For example, the **simple** method is described by a directive:

```plaintext
!# <accretionHalosMethod>
!# <unitName>Accretion_Halos_Simple.Initialize</unitName>
!# </accretionHalosMethod>
```

Here, **Accretion_Halos_Simple.Initialize** is the name of a subroutine which will be called to initialize the method. The initialization subroutine must have the following form:

```plaintext
subroutine Method.Initialize(accretionHalosMethod,Halo_Baryonic_Accretion_Rate_Get,Halo_Baryonic_Accreted_Mass_Get, &
Halo_Baryonic_Failed_Accretion_Rate_Get,Halo_Baryonic_Failed_Accreted_Mass_Get, &
Halo_Baryonic_Accretion_Rate_Abundances_Get,Halo_Baryonic_Accreted_Abundances_Get, &
Halo_Baryonic_Accretion_Rate_Chemicals_Get,Halo_Baryonic_Accreted_Chemicals_Get)
```

```
implicit none

type(varying_string), intent(in) :: accretionHalosMethod

procedure(), pointer, intent(inout) :: Halo_Baryonic_Accretion_Rate_Get,Halo_Baryonic_Accreted_Mass_Get, &
Halo_Baryonic_Failed_Accretion_Rate_Get,Halo_Baryonic_Failed_Accreted_Mass_Get, &
Halo_Baryonic_Accretion_Rate_Abundances_Get,Halo_Baryonic_Accreted_Abundances_Get, &
Halo_Baryonic_Accretion_Rate_Chemicals_Get,Halo_Baryonic_Accreted_Chemicals_Get
```

```plaintext
if (accretionHalosMethod == 'myMethod') then
  Halo_Baryonic_Accretion_Rate_Get => My_Accretion_Rate_Get
  Halo_Baryonic_Accreted_Mass_Get => My_Accreted_Mass_Get
  Halo_Baryonic_Failed_Accretion_Rate_Get => My_Failed_Accretion_Rat_Get
  Halo_Baryonic_Failed_Accreted_Mass_Get => My_Failed_Accreted_Mass_Get
```

751
17. Adding New Methods

Halo_Baryonic_Accretion_Rate_Abundances_Get => My_Accretion_Rate_Abundances_Get
Halo_Baryonic_Accreted_Abundances_Get => My_Accreted_Abundances_Get
Halo_Baryonic_Accretion_Rate_Chemicals_Get => My_Accretion_Rate_Chemicals_Get
Halo_Baryonic_Accreted_Chemicals_Get => My_Accreted_Chemicals_Get
end if
return
end subroutine Method_Initialize

where myMethod is the name of this method as will be specified by the accretionHalosMethod input parameter. The procedure pointers Halo_Baryonic_Accretion_Rate_Get, Halo_Baryonic_Accreted_Mass_Get, Halo_Baryonic_Failed_Accretion_Rate_Get and Halo_Baryonic_Failed_Accreted_Mass_Get must be set to point to functions which return accretion rate, total accreted mass (assuming no progenitors), failed accretion rate and total failed accreted mass (assuming no progenitors) respectively as described below. The procedure pointers Halo_Baryonic_Accretion_Rate_Abundances_Get, Halo_Baryonic_Accreted_Abundances_Get, Halo_Baryonic_Accretion_Rate_Chemicals_Get, Halo_Baryonic_Accreted_Chemicals_Get must be set to point to functions which return the accretion rates nad masses (assuming no progenitors) of heavy element abundances and chemicals respectively. The initialization subroutine should perform any other tasks required to initialize the module (such as reading parameters etc.).

The mass functions must have the form:

double precision function My_Accretion_Get(thisNode)
  implicit none
  type(treeNode), intent(inout), pointer :: thisNode
  ...
  return
end function My_Accretion_Get

In the case of the accretion rate functions, the function must return the accretion rate of baryons from the IGM onto thisNode in $M_\odot \text{ Gyr}^{-1}$. For total accreted mass functions, the total mass of baryons (in $M_\odot$) accreted onto thisNode should be returned under the assumption that thisNode formed instataneously with no progenitors. The “failed” accretion refers to mass which would have been accreted onto the halo if it simply traced the growth of overall mass. That is:

$$M_{\text{failed}} = \frac{\Omega_b}{\Omega_M} \dot{M} - \dot{M}_{\text{accreted}}, \quad (17.3)$$

where $\dot{M}$ is the growth rate of total halo mass and $\dot{M}_{\text{accreted}}$ is the accretion rate of baryons onto the halo. If desired, this failed mass can be transferred back into the accreted component once the halo is deemed able to accrete, by simply adjusting the accretion rates returned appropriately.

For abundances and chemicals, the subroutines should have the form:

subroutine My_Abundances_Get(thisNode, accretionAbundances)
  implicit none
  type(treeNode), intent(inout), pointer :: thisNode
  type(abundancesStructure), intent(inout) :: accretionAbundances
  ...
  return
end subroutine My_Abundances_Get

and
subroutine My_Chemicals_Get(thisNode, accretionChemicals)
  implicit none
  type(treeNode), intent(inout), pointer :: thisNode
  type(chemicalAbundancesStructure), intent(inout) :: accretionChemicals

  return
end subroutine My_Chemicals_Get

respectively.

Currently defined accretion disk methods are:

css
t

assumes that halos accrete all available baryons if they have virial velocities above \( \text{reionizationSuppressionVelocity} \) or exist prior to redshift \( \text{reionizationSuppressionRedshift} \). This is a simple model of the effects of reionization on gas accretion. In halos which cannot accrete, accretion is placed into the failed mode. In halos which can accrete, any gas in the failed reservoir is returned to the accreted channel on a timescale of \( \dot{M}/\dot{M} \). Abundances are computed assuming a pristine IGM (i.e. abundances are always zero) and chemicals are computed using the chemical state functions (see §17.4.1).

null

assumes no accretion onto halos.

Analysis

Additional methods for on-the-fly analysis of merger trees can be added using the mergerTreeAnalysisTask directive. The directive should contain a single argument, giving the name of a subroutine to be called to initialize the method. For example, the mass distributions method is described by a directive:

```
! <mergerTreeAnalysisTask>
! <unitName>Galacticus_Output_Analysis_Mass_Dpndnt_Sz_Dstrbtins</unitName>
! </mergerTreeAnalysisTask>
```

Here, \( \text{Galacticus_Output_Analysis_Mass_Dpndnt_Sz_Dstrbtins} \) is the name of a subroutine which will be called to perform the analysis. The analysis subroutine must have the following form:

```
subroutine Tree_Analyze(thisTree, thisNode, iOutput, mergerTreeAnalyses)
  implicit none
  type (mergerTree ), intent(in ) :: thisTree
  type (treeNode ), intent(inout), pointer :: thisNode
  integer , intent(in ) :: iOutput
  type (varying_string), intent(in ), dimension(: ) :: mergerTreeAnalyses

  return
end subroutine Method_Initialize
```

This function will be called once for each node in each tree being output. The function is passed the merger tree object as thisTree, along with a pointer to the node to be analyzed as thisNode. Additionally, the current output number is passed as iOutput. Finally, a list of analyses that were requested (by user input) to be performed is given in the mergerTreeAnalyses array. The function should check if one or more of the entries in mergerTreeAnalyses correspond to analyses that it performs. (Note that this need only be done on the first call to this function—the values of mergerTreeAnalyses will not change between calls.) If an analysis is matched in this way it should be performed. Typically, an analysis
17. Adding New Methods

function might accumulate the results of analysis and then finalize and output them prior to completion of the GALACTICUS model through the use of a hdfPreCloseTask (see §17.4.3).

Currently defined merger tree analysis methods are:

**mass functions** Constructs mass functions for a variety of different surveys. Currently supported analysis names are: sdssStellarMassFunctionZ0.07, alfalfaHiMassFunctionZ0.00, primusStellarMassFunctionZ0.100, primusStellarMassFunctionZ0.250, primusStellarMassFunctionZ0.350, primusStellarMassFunctionZ0.450, primusStellarMassFunctionZ0.575, primusStellarMassFunctionZ0.725, and primusStellarMassFunctionZ0.900. Each such analysis is defined internally to this module through the appropriate redshift, binning, random and systematic errors, and arbitrary mapping of component masses into observed masses. The covariance matrix of the mass function is also computed (see §10.5.3 for details).

**mass-dependent size distributions** Constructs a two-dimensional histogram of galaxy sizes in bins of stellar mass. Currently supported analyses are sdssSizeFunctionZ0.07. Each such analysis is defined internally to this module through the appropriate redshift, binning, random and systematic errors, and arbitrary mapping of component masses/radii into observed masses/radii. The covariance matrix of the size function is also computed (see §10.5.3 for details).

**Atomic Collisional Ionization Rates**

Additional methods for atomic collisional ionization rate calculations can be added using the atomicCollisionalIonizationMethod directive. The directive should contain a single argument, giving the name of a subroutine to be called to initialize the method. For example, the Verner method is described by a directive:

```
!# <atomicCollisionalIonizationMethod>
!#   <unitName>Atomic_Rate_Ionization_Collisional_Verner_Initialize</unitName>
!# </atomicCollisionalIonizationMethod>
```

Here, Atomic_Rate_Ionization_Collisional_Verner_Initialize is the name of a subroutine which will be called to initialize the method. The initialization subroutine must have the following form:

```fortran
subroutine Method_Initialize(atomicCollisionalIonizationMethod, Atomic_Rate_Ionization_Collisional_Get)
  implicit none
  type(varying_string), intent(in) :: atomicCollisionalIonizationMethod
  procedure(), pointer, intent(inout) :: Atomic_Rate_Ionization_Collisional_Get

  if (atomicCollisionalIonizationMethod == 'myMethod') Atomic_Rate_Ionization_Collisional_Get => My_Method_Get_Procedure
  return
end subroutine Method_Initialize
```

where myMethod is the name of this method as will be specified by the atomicCollisionalIonizationMethod input parameter. The procedure pointer Atomic_Rate_Ionization_Collisional_Get must be set to point to a function which returns the rate coefficient of atomic collisional ionization under given physical conditions. The initialization subroutine should perform any other tasks required to initialize the module (such as reading parameters etc.).

The collisional ionization rate function must have the form:

```fortran
double precision function My_Method_Get_Procedure(atomicNumber, ionizationState, temperature)
  implicit none
  integer, intent(in) :: atomicNumber, ionizationState
  double precision, intent(in) :: temperature
```

754
17.4. Existing Method Types

The function must return the collisional ionization rate coefficient (in units of cm$^3$ s$^{-1}$) of ions of the given atomicNumber, ionizationState (where ionization state is the atomic number plus 1 minus the number of electrons) and temperature. Currently defined collisional ionization rate methods are:

**Verner** Computes the rate coefficient of direct collisional ionization by use of the fits from Voronov (1997; Version 2, March 24, 1997).

**Atomic Photoionization Cross-Sections**

Additional methods for atomic photoionization cross-section calculations can be added using the `atomicPhotoIonizationMethod` directive. The directive should contain a single argument, giving the name of a subroutine to be called to initialize the method. For example, the **Verner** method is described by a directive:

```!
<atomicPhotoIonizationMethod>
<unitName>Atomic_Cross_Section_Ionization_Photo_Verner_Initialize</unitName>
</atomicPhotoIonizationMethod>
```

Here, `Atomic_Cross_Section_Ionization_Photo_Verner_Initialize` is the name of a subroutine which will be called to initialize the method. The initialization subroutine must have the following form:

```fortran
subroutine Method_Initialize(atomicPhotoIonizationMethod, Atomic_Cross_Section_Ionization_Photo_Get)
  implicit none
  type(varying_string), intent(in) :: atomicPhotoIonizationMethod
  procedure(), pointer, intent(inout) :: Atomic_Cross_Section_Ionization_Photo_Get

  if (atomicPhotoIonizationMethod == 'myMethod') Atomic_Cross_Section_Ionization_Photo_Get => My_Method_Get_Procedure
  return
end subroutine Method_Initialize
```

where `myMethod` is the name of this method as will be specified by the `atomicPhotoIonizationMethod` input parameter. The procedure pointer `Atomic_Cross_Section_Ionization_Photo_Get` must be set to point to a function which returns the cross-section (in units of cm$^2$) for photoionization. The initialization subroutine should perform any other tasks required to initialize the module (such as reading parameters etc.).

The cross-section function must have the form:

```fortran
double precision function My_Method_Get_Procedure(atomicNumber, ionizationState, shellNumber, wavelength)
  implicit none
  integer, intent(in) :: atomicNumber, ionizationState, shellNumber
  double precision, intent(in) :: wavelength

  .
  .
  return
end function My_Method_Get_Procedure
```

The function must return the cross-section for photoionization (in units of cm$^2$) of electrons in the specified shellNumber for ions of the given atomicNumber and ionizationState (where ionization state
is the atomic number plus 1 minus the number of electrons) at the specified wavelength (given in units of Å).

Currently defined photoionization cross-section methods are:

**Verner** Computes the cross-sections by use of the fits from Verner et al. (1996; Version 2, March 25, 1996).

### Atomic Radiative Recombination Rates

Additional methods for atomic radiative recombination rate calculations can be added using the atomicRadiativeRecombinationMethod directive. The directive should contain a single argument, giving the name of a subroutine to be called to initialize the method. For example, the Verner method is described by a directive:

```
!# <atomicRadiativeRecombinationMethod>
!# <unitName>Atomic_Rate_Recombination_Radiative_Verner.Initialize</unitName>
!# </atomicRadiativeRecombinationMethod>
```

Here, Atomic_Rate_Recombination_Radiative_Verner.Initialize is the name of a subroutine which will be called to initialize the method. The initialization subroutine must have the following form:

```fortran
subroutine Method_Initialize(atomicRadiativeRecombinationMethod, Atomic_Rate_Recombination_Radiative_Get)
    implicit none
    type(varying_string), intent(in) :: atomicRadiativeRecombinationMethod
    procedure(), pointer, intent(inout) :: Atomic_Rate_Recombination_Radiative_Get

    if (atomicRadiativeRecombinationMethod == 'myMethod')
        Atomic_Rate_Recombination_Radiative_Get => My_Method_Get_Procedure
    return
end subroutine Method_Initialize
```

where myMethod is the name of this method as will be specified by the atomicRadiativeRecombinationMethod input parameter. The procedure pointer Atomic_Rate_Recombination_Radiative_Get must be set to point to a function which returns the rate coefficient of atomic radiative recombination under given physical conditions. The initialization subroutine should perform any other tasks required to initialize the module (such as reading parameters etc.).

The radiative recombination rate function must have the form:

```fortran
double precision function My_Method_Get_Procedure(atomicNumber, ionizationState, temperature)
    implicit none
    integer, intent(in) :: atomicNumber, ionizationState
    double precision, intent(in) :: temperature

    return
end function My_Method_Get_Procedure
```

The function must return the radiative recombination rate coefficient (in units of cm$^3$ s$^{-1}$) to ions of the given atomicNumber, ionizationState (where ionization state is the atomic number plus 1 minus the number of electrons) and temperature.

Currently defined radiative recombination rate methods are:

**Verner** Computes the rate coefficient of radiative recombination using the compilation of results from Dima Verner as originally encapsulated in rrfit.f.
Bar Instabilities

Additional methods for bar instabilities in disks can be added using the `barInstabilityMethod` directive. The directive should contain a single argument, giving the name of a subroutine to be called to initialize the method. For example, the ELN method is described by a directive:

```bash
!# <barInstabilityMethod>
!# <unitName>Galactic_Dynamics_Bar_Instabilities_ELN_Initialize</unitName>
!# </barInstabilityMethod>
```

Here, `Galactic_Dynamics_Bar_Instabilities_ELN_Initialize` is the name of a subroutine which will be called to initialize the method. The initialization subroutine must have the following form:

```plaintext
subroutine Method_Initialize(barInstabilityMethod,Bar_Instability_Timescale_Get)
  implicit none
  type(varying_string), intent(in) :: barInstabilityMethod
  procedure(), pointer, intent(inout) :: Bar_Instability_Timescale_Get
  if (barInstabilityMethod == 'myMethod') then
    Bar_Instability_Timescale_Get => My_Bar_Instability_Timescale_Get
  end if
  return
end subroutine Method_Initialize
```

where `myMethod` is the name of this method as will be specified by the `barInstabilityMethod` input parameter. The procedure pointer `Bar_Instability_Timescale_Get` must be set to point to a function which returns the timescale on which the bar instability depletes material from the disk to the pseudo-bulge. The initialization subroutine should perform any other tasks required to initialize the module (such as reading parameters etc.).

The bar instability timescale function must have the form:

```plaintext
subroutine My_Bar_Instability_Timescale(thisNode,barInstabilityTimeScale,barInstabilityExternalDrivingSpecificTorque)
  implicit none
  type (treeNode), intent(inout), pointer :: thisNode
  double precision , intent( out) :: barInstabilityTimeScale,barInstabilityExternalDrivingSpecificTorque
  return
end subroutine My_Bar_Instability_Timescale
```

The function should compute and return, in `barInstabilityTimeScale` the timescale (in Gyr) for the bar instability in the disk in `thisNode` to transfer material from the disk to the pseudo-bulge. If no instability is present, a negative timescale should be returned. Additionally, any specific torque external to the galaxy driving the instability should be returned in `barInstabilityExternalDrivingSpecificTorque`.

Currently defined bar instability methods are:

null A null method in which disks are never bar unstable;

ELN The bar instability is determined using the algorithm of Efstathiou et al. [1982].

ELN+tidal The bar instability is determined using the algorithm of Efstathiou et al. [1982] with an additional term to account for an external tidal field.
17. Adding New Methods

**Black Hole Binaries: Initial Separation**

Additional methods for black hole binary initial separation calculations can be added using the `blackHoleBinaryInitialRadiiMethod` directive. The directive should contain a single argument, giving the name of a subroutine to be called to initialize the method. For example, the `spheroidRadiusFraction` method is described by a directive:

```
!# <blackHoleBinaryInitialRadiiMethod>
!# <unitName>Black_Hole_Binary_Initial_Radii_Spheroid_SizeInitialize</unitName>
!# </blackHoleBinaryInitialRadiiMethod>
```

Here, `Black_Hole_Binary_Initial_Radii_Spheroid_SizeInitialize` is the name of a subroutine which will be called to initialize the method. The initialization subroutine must have the following form:

```fortran
subroutine Method_Initialize(blackHoleBinaryInitialRadiiMethod, Black_Hole_Binary_Initial_Radius_Get)
  implicit none
  type(varying_string), intent(in) :: blackHoleBinaryInitialRadiiMethod
  procedure(), pointer, intent(inout) :: Black_Hole_Binary_Initial_Radius_Get
  if (blackHoleBinaryInitialRadiiMethod == 'myMethod') Black_Hole_Binary_Initial_Radius_Get => My_Method_Get
  return
end subroutine Method_Initialize
```

where `
myMethod
` is the name of this method as will be specified by the `blackHoleBinaryInitialRadiiMethod` input parameter. The procedure pointer `Black_Hole_Binary_Initial_Radius_Get` must be set to point to a function which returns the initial separation of a just-formed black hole binary. The initialization subroutine should perform any other tasks required to initialize the module (such as reading parameters etc.).

The initial separation function must have the form:

```fortran
double precision function My_Method_Get(thisNode, hostNode)
  implicit none
  type(treeNode), intent(inout) :: thisNode, hostNode
  .
  .
  return
end subroutine My_Method_Get
```

The function must return the initial separation (in Mpc) of the active black hole in `thisNode` as it merges into `hostNode`.

Currently defined black hole binary initial separation methods are:

- **spheroidRadiusFraction** Assumes that the initial separation is equal to a fraction of the larger of the spheroid scale radii in `thisNode` and `hostNode`.

- **Volonteri2003** Assumes that the initial separation follows the relationship described in Volonteri et al. [2003] following the black hole masses in `thisNode` and `hostNode`.

- **tidalRadius** Solves the radius at which the satellite galaxy is stripped of its stars, and assume only the central black hole remains, at that specific radius. This uses the masses in `thisNode` and `hostNode`. 

758
Black Hole Binaries: Separation Growth Rate

Additional methods for black hole binary separation growth rate calculations can be added using the `blackHoleBinarySeparationGrowthRateMethod` directive. The directive should contain a single argument, giving the name of a subroutine to be called to initialize the method. For example, the `Volonteri2003` method is described by a directive:

```
!# <blackHoleBinarySeparationGrowthRateMethod>
!# <unitName>Black_Hole_Binary_Separation_Growth_Rate_Standard_Init</unitName>
!# </blackHoleBinarySeparationGrowthRateMethod>
```

Currently defined black hole binary separation growth rate methods are:

- **null** Assures that the initial separation stays constant.
- **standard** Assumes that the separation growth rate follows Volonteri et al. [2003] following the black hole masses in `thisNode`. Although it innovates as it encompasses all three influences: Dynamical Friction, Hardening due to stars, and finally due to Gravitational Wave expulsion. Dynamical friction here occurs until a certain hardening separation is reached, it then is replaced by the (faster) three-body interactions with stars.

Black Hole Binaries: Recoil Velocity

Additional methods for the recoil velocity of a binary black hole can be added using the `blackHoleBinaryRecoilVelocityMethod` directive. The directive should contain a single argument, giving the name of a subroutine to be called to initialize the method. For example, the `Standard` method is described by a directive:

```
!# <blackHoleBinaryRecoilVelocityMethod>
!# <unitName>Black_Hole_Binary_Recoil_Velocity_Standard_Initialize</unitName>
!# </blackHoleBinaryRecoilVelocityMethod>
```

Currently defined black hole binary recoil velocity methods are:

- **null** Assures that there is zero recoil velocity.
- **Campanelli2008** Assures that the recoil velocity follows Campanelli et al. [2007], utilizing the black hole masses and spins in `thisNode`. For now it does not take the direction of the spin into account, and assumes a zero perpendicular velocity.

Black Hole Binaries: Mergers

Additional methods for black hole binary merger calculations can be added using the `blackHoleBinaryMergersMethod` directive. The directive should contain a single argument, giving the name of a subroutine to be called to initialize the method. For example, the `Rezzolla2008` method is described by a directive:

```
!# <blackHoleBinaryMergersMethod>
!# <unitName>Black_Hole_Binary_Merger_Initialize</unitName>
!# </blackHoleBinaryMergersMethod>
```

Here, **Black_Hole_Binary_Merger_Initialize** is the name of a subroutine which will be called to initialize the method. The initialization subroutine must have the following form:
17. Adding New Methods

subroutine Method_Initialize(blackHoleBinaryMergersMethod, Black_Hole_Binary_Merger_Do)
  implicit none
  type(varying_string), intent(in) :: blackHoleBinaryMergersMethod
  procedure(), pointer, intent(inout) :: Black_Hole_Binary_Merger_Do

  if (blackHoleBinaryMergersMethod == 'myMethod') Black_Hole_Binary_Merger_Do => My_Method_Do_Procedure
  return
end subroutine Method_Initialize

where myMethod is the name of this method as will be specified by the blackHoleBinaryMergersMethod input parameter. The procedure pointer Black_Hole_Binary_Merger_Do must be set to point to a function which returns the properties (mass and spin) of the merged black hole as described below. The initialization subroutine should perform any other tasks required to initialize the module (such as reading parameters etc.).

The cooling radius function must have the form:

subroutine My_Method_Do_Procedure(blackHoleMassA, blackHoleMassB, blackHoleSpinA, blackHoleSpinB, blackHoleMassFinal, blackHoleSpinFinal)
  implicit none
  double precision, intent(in) :: blackHoleMassA, blackHoleMassB, blackHoleSpinA, blackHoleSpinB
  double precision, intent(out) :: blackHoleMassFinal, blackHoleSpinFinal
  .
  .
  .
  return
end subroutine My_Method_Do_Procedure

The function must return the mass and spin (in blackHoleMassFinal and blackHoleSpinFinal respectively) of the black hole resulting from the merger of black holes with masses blackHoleMassA and blackHoleMassB and spins blackHoleSpinA and blackHoleSpinB. The subroutine should make no assumptions about the mass ordering of the input black holes (i.e. A could be more massive than B or vice versa).

Currently defined black hole binary merger methods are:

Rezzolla2008 Computes the properties of the merged black hole using the approximations of Rezzolla et al. [2008].

Chemical State

Additional methods for chemical states can be added using the chemicalStateMethod directive. The directive should contain a single argument, giving the name of a subroutine to be called to initialize the method. For example, the atomic_CIE_Cloudy method is described by a directive:

!# <chemicalStateMethod>
!# <unitName>Chemical_State_Atomic_CIE_Cloudy_Initialize</unitName>
!# </chemicalStateMethod>

Here, Chemical_State_Atomic_CIE_Cloudy_Initialize is the name of a subroutine which will be called to initialize the method. The initialization subroutine must have the following form:

  implicit none
  type(varying_string), intent(in) :: chemicalStateMethod
  .
  .
  .
  return
end subroutine Method_Initialize
if (chemicalStateMethod == 'myMethod') then
    Electron_Density_Get => My_Method_Procedure
    Electron_Density_Temperature_Log_Slope_Get => My_Method_Temperature_Log_Slope_Procedure
    Chemical_Densities_Get => My_Method_Chemical_Densities_Procedure
end if
return
end subroutine Method_Initialize

where myMethod is the name of this method as will be specified by the chemicalStateMethod input parameter. The procedure pointer Electron_Density_Get must be set to point to a function which returns the electron density as described below. The other two electron density procedure pointers should point to functions which return the logarithmic gradients of the electron density with respect to temperature and density respectively. The initialization subroutine should perform any other tasks required to initialize the module (such as reading parameters etc.). The Chemical_Densities_Get pointer should be set to point to a subroutine that returns the densities of all “chemicals” active in the chemical subsystem (see §17.5.2).

The electron density function must have the form:

double precision function Electron_Density_Get(temperature,numberDensityHydrogen,abundances,radiation)
    implicit none
    double precision, intent(in) :: temperature,numberDensityHydrogen
    type(abundancesStructure), intent(in) :: abundances
    type(radiationStructure), intent(in) :: radiation

    return
end function Electron_Density_Get

The function must return the electron density (in units of cm$^{-3}$) for gas at the given temperature (in Kelvin), with hydrogen number density numberDensityHydrogen (in cm$^{-3}$), composition as described by the abundances structure and in the presence of a radiation field described by the radiation structure. The logarithmic slope functions should have the same template, but return the appropriate logarithmic slope instead.

The chemical densities subroutine must have the form:

subroutine Chemical_Densities_Get(theseAbundances,temperature,numberDensityHydrogen,abundances,radiation)
    implicit none
    type(chemicalAbundancesStructure), intent(inout) :: theseAbundances
    double precision, intent(in) :: temperature,numberDensityHydrogen
    type(abundancesStructure), intent(in) :: abundances
    type(radiationStructure), intent(in) :: radiation

    return
end subroutine Chemical_Densities_Get

The function must return the density (in units of cm$^{-3}$) of each chemical species for gas at the given temperature (in Kelvin), with hydrogen number density numberDensityHydrogen (in cm$^{-3}$), composi-
tion as described by the \texttt{abundances} structure and in the presence of a radiation field described by the \texttt{radiation} structure.

Currently defined chemical state methods are:

\texttt{CIE\_from\_file} Reads a tabulated CIE chemical state from a file and interpolates in the table to give a result. The XML file containing the table should have the following form:

\begin{verbatim}
<chemicalStates>
  <chemicalState>
    <temperature>
      <datum>10000.0</datum>
      <datum>15000.0</datum>
      ...
    </temperature>
    <electronDensity>
      <datum>1.0e-23</datum>
      <datum>1.7e-23</datum>
      ...
    </electronDensity>
    <hiDensity>
      <datum>0.966495864314214</datum>
      <datum>0.965828463162061</datum>
      ...
    </hiDensity>
    <hiiDensity>
      <datum>0.033504135685786</datum>
      <datum>0.0341715368379391</datum>
      ...
    </hiiDensity>
    <metallicity>-4.0</metallicity>
  </chemicalState>
  ...
</chemicalStates>
\end{verbatim}
Each chemicalState element should contain two lists (inside temperature and electronDensity tags) of datum elements which specify temperature (in Kelvin) and electron density (by number, relative to hydrogen) respectively, and a metallicity element which gives the logarithmic metallicity relative to Solar (a value of -999 or less is taken to imply zero metallicity). Optionally, hiDensity and hiiDensity elements may be added containing lists of H\textsubscript{i} and H\textsubscript{II} densities (by number, relative to hydrogen) respectively. Any number of coolingFunction elements may appear, but they must be in order of increasing metallicity and must all contain the same set of temperatures. The extrapolation element defines how the table is to be extrapolated in the low and high limits of temperature and metallicity. The method elements can take the following values:

**zero** The electron density is set to zero beyond the relevant limit.

**fixed** The electron density is held fixed at the value at the relevant limit.

**power law** The electron density is extrapolated assuming a power-law dependence beyond the relevant limit. This option is only allowed if the electron density is everywhere positive.

If the electron density is everywhere positive the interpolation will be done in the logarithmic of temperature, metallicity\(^4\) and electron density. Otherwise, interpolation is linear in these quantities. The electron density is scaled assuming a linear dependence on hydrogen density.

**atomicCIECloudy** Uses the Cloudy\(^5\) software to compute the chemical state for atomic gas in collisional ionization equilibrium. Cloudy will be downloaded, compiled and run automatically if necessary.

**PIE\textunderscore from\textunderscore file** Reads a tabulated PIE ionization state from a file and interpolates in the table to give a result. The HDF5 file containing the table should have the following form:

```plaintext
GROUP "/" {
    DATASET "neutralHydrogenRatio" {
        DATATYPE H5T_IEEE_F64BE
        DATASPACE SIMPLE { ( <ratioCount>, <redshiftCount>, <temperatureCount>, <densityCount> ) }
    }
}
```

\(^4\)The exception is if the first electron density is tabulated for zero metallicity. In that case, a linear interpolation in metallicity is always used between zero and the first non-zero tabulated metallicity.

\(^5\)Cloudy is used to generate a file which contains a tabulation of the chemical state suitable for reading by the CIE from file method. Generation of the tabulation typically takes several hours, but only needs to be done once as the stored table is simply read back in on later runs.
DATASET "density" {
    DATATYPE H5T_IEEE_F64BE
    DATASPACE SIMPLE { ( <densityCount> ) }
}

DATASET "electronRatio" {
    DATATYPE H5T_IEEE_F64BE
    DATASPACE SIMPLE { ( <ratioCount>, <redshiftCount>, <temperatureCount>, <densityCount> ) }
}

DATASET "heliumToHydrogenRatio" {
    DATATYPE H5T_IEEE_F64BE
    DATASPACE SIMPLE { ( <ratioCount> ) }
    ATTRIBUTE "extrapolationHigh" {
        DATATYPE H5T_STRING {}
        DATASPACE SCALAR
    }
    ATTRIBUTE "extrapolationLow" {
        DATATYPE H5T_STRING {}
        DATASPACE SCALAR
    }
}

DATASET "redshift" {
    DATATYPE H5T_IEEE_F64BE
    DATASPACE SIMPLE { ( <redshiftCount> ) }
    ATTRIBUTE "extrapolationHigh" {
        DATATYPE H5T_STRING {}
        DATASPACE SCALAR
    }
    ATTRIBUTE "extrapolationLow" {
        DATATYPE H5T_STRING {}
        DATASPACE SCALAR
    }
}

DATASET "temperature" {
    DATATYPE H5T_IEEE_F64BE
    DATASPACE SIMPLE { ( <temperatureCount> ) }
    ATTRIBUTE "extrapolationHigh" {
        DATATYPE H5T_STRING {}
        DATASPACE SCALAR
    }
    ATTRIBUTE "extrapolationLow" {
        DATATYPE H5T_STRING {}
        DATASPACE SCALAR
    }
}

The datasets should contain the following information:

**temperature** A list of temperatures (in units of Kelvin) at which cooling functions are tabulated.

If present, the *extrapolationLow* and *extrapolationHigh* attributes specify how the data should be extrapolated to lower and higher temperatures (see below);
redshift A list of redshifts at which cooling functions are tabulated. If present, the extrapolationLow and extrapolationHigh attributes specify how the data should be extrapolated to lower and higher redshifts (see below);

density A list of hydrogen number densities (in units of cm$^{-3}$) at which cooling functions are tabulated. If present, the extrapolationLow and extrapolationHigh attributes specify how the data should be extrapolated to lower and higher densities (see below);

eheliumToHydrogenRatio A list of helium-to-hydrogen number density ratios at which cooling functions are tabulated. If present, the extrapolationLow and extrapolationHigh attributes specify how the data should be extrapolated to lower and higher ratios (see below);

elements A list of the atomic numbers of elements for which cooling functions are tabulated;

neutralHydrogenRatio The neutral hydrogen fraction on the grid of temperature, density, redshift and helium-to-hydrogen number density ratio;

electronRatio The electron to hydrogen number density ratio on the grid of temperature, density, redshift and helium-to-hydrogen number density ratio.

Conditional Mass Functions

Additional methods for empirical conditional mass functions can be added using the conditionalMassFunctionMethod directive. The directive should contain a single argument, giving the name of a subroutine to be called to initialize the method. For example, the Behroozi2010 method is described by a directive:

```plaintext
!# <conditionalMassFunctionMethod>
!# <unitName>Conditional_Mass_Functions_Behroozi2010_Initialize</unitName>
!# </conditionalMassFunctionMethod>
```

Here, Conditional_Mass_Functions_Behroozi2010_Initialize is the name of a subroutine which will be called to initialize the method. The initialization subroutine must have the following form:

```plaintext
subroutine Method_Initialize(conditionalMassFunctionMethod&
   &, Cumulative_Conditional_Mass_Function_Get, Cumulative_Conditional_Mass_Function_Var_Get)
implicit none
   type(varying_string), intent(in) :: conditionalMassFunctionMethod
   procedure(double precision), pointer, intent(inout) :: Cumulative_Conditional_Mass_Function_Get, Cumulative_Conditional_Mass_Function_Var_Get

if (conditionalMassFunctionMethod == 'myMethod') then
   Cumulative_Conditional_Mass_Function_Get => My_Cumulative_Conditional_Mass_Function
   Cumulative_Conditional_Mass_Function_Var_Get => My_Cumulative_Conditional_Mass_Function_Var
   .
   .
end if
return
end subroutine Method_Initialize
```

where myMethod is the name of this method as will be specified by the timePerTreeMethod input parameter. The procedure pointer Galacticus_Time_Per_Tree_Get must be set to point to a function which returns an estimate of the time taken (in seconds) to process a merger tree. The initialization subroutine should perform any other tasks required to initialize the module (such as reading parameters etc.).

The functionw must have the form:
17. Adding New Methods

double precision function My_Cumulative_Conditional_Mass_Function(massHalo,mass)
  implicit none
  double precision, intent(in) :: massHalo,mass

  return
end function My_Cumulative_Conditional_Mass_Function_Var

double precision My_Cumulative_Conditional_Mass_Function_Var(massHalo,massLow,massHigh)
  implicit none
  double precision, intent(in) :: massHalo,massLow,massHigh

  return
end function My_Cumulative_Conditional_Mass_Function_Var

The first function must return the number of galaxies of mass greater than mass in halos of mass massHalo. The second function should return the variance in the number of galaxies in the mass range massLow to massHigh in halos of mass massHalo.

Currently defined tree timing methods are:

Behroozi2010 This method uses the fitting function of Behroozi et al. [2010] to compute the conditional mass function. To compute the variance in the mass function, this method assumes that the number of satellite galaxies follows a Poisson distribution, while central galaxies follow a Bernoulli distribution.

Cooling Rate

Additional methods for the cooling rate from the hot halo can be added using the coolingRateMethod directive. The directive should contain a single argument, giving the name of a subroutine to be called to initialize the method. For example, the White-Frenk1991 method is described by a directive:

!# <coolingRateMethod>
!# <unitName>Cooling_Rate_White_Frenk_Initialize</unitName>
!# </coolingRateMethod>

Here, Cooling_Rate_White_Frenk_Initialize is the name of a subroutine which will be called to initialize the method. The initialization subroutine must have the following form:

subroutine Method_Initialize(coolingRateMethod,Cooling_Rate_Get)
  implicit none
  type(varying_string), intent(in) :: coolingRateMethod
  procedure(), pointer, intent(inout) :: Cooling_Rate_Get

  if (coolingRateMethod == 'myMethod') Cooling_Rate_Get => My_Method_Get
  return
end subroutine Method_Initialize

where myMethod is the name of this method as will be specified by the coolingRateMethod input parameter. The procedure pointer Cooling_Rate_Get must be set to point to a function which returns the
cooling rate from the hot halo. The initialization subroutine should perform any other tasks required to initialize the module (such as reading parameters etc.).

The cooling rate function must have the form:

```fortran
double precision function Cooling_Rate_Get(thisNode)
  implicit none
  type(treeNode), intent(inout), pointer :: thisNode
  .
  .
  return
end function Cooling_Rate_Get
```

The function must return the rate of mass drop-out from the hot halo (in units of $M/\text{Gyr}$) for `thisNode`.

Currently defined cooling rate methods are:

### White-Frenk1991
Implements something similar to that proposed by White and Frenk [1991]. Namely, the cooling rate is set equal to

$$
\dot{M}_{cool} = 4\pi \rho(r_{\text{infall}})^2 r_{\text{infall}}^2 (17.4)
$$

if the infall radius is within the outer radius of the hot halo and

$$
\dot{M}_{cool} = \frac{M_{\text{hot}}}{\tau_{\text{ dynamical, halo}}} (17.5)
$$

otherwise.

### Cole2000
Implements the cooling rate algorithm from Cole et al. [2000].

### simple
Implements a simple algorithm in which the cooling rate is determined from a fixed timescale.

### simpleScaling
Implements a simple algorithm in which the cooling rate is determined from a timescale which is a function of halo mass and redshift.

### Cooling Function

Additional methods for cooling functions can be added using the `coolingFunctionMethods`, `coolingFunctionCompute`, `coolingFunctionDensitySlopeCompute` and `coolingFunctionTemperatureSlopeCompute` directives. Each directive should contain a single argument, giving the name of a subroutine to be called to either initialize the method or compute the relevant quantity. For example, the `atomicCIECloudy` method is initialized by a directive:

```fortran
!# <coolingFunctionMethods>
!# <unitName>Cooling_Function_Atomic_CIE_Cloudy_Initialize</unitName>
!# </coolingFunctionMethods>
```

Here, `Cooling_Function_Atomic_CIE_Cloudy_Initialize` is the name of a subroutine which will be called to initialize the method. The initialization subroutine must have the following form:

```fortran
subroutine Method_Initialize(coolingFunctionMethods,coolingFunctionsMatched)
  implicit none
  type(varying_string), intent(in ) :: coolingFunctionMethods(:)
  integer, intent(inout) :: coolingFunctionsMatched
  .
  return
end subroutine Method_Initialize
```
17. Adding New Methods

```fortran
if (any(coolingFunctionMethods == 'myMethod')) then
  .
  .
end if
return
end subroutine Method_Initialize
```

where `myMethod` is the name of this method as will be specified by the `coolingFunctionMethods` input parameter. The initialization routine should record that whether this cooling function was selected, and perform any other initialization necessary. For each cooling function matched by this method, the value of `coolingFunctionsMatched` should be incremented by one—this permits a check that all cooling functions were matched.

The other directives should specify subroutines with the following template:

```fortran
subroutine Cooling_Function_PropertyCompute(coolingFunctionProperty, temperature, numberDensityHydrogen, &
  abundances, chemicalDensities, radiation)
implicit none
double precision, intent(in) :: temperature, numberDensityHydrogen
  type(abundancesStructure), intent(in) :: abundances
  type(chemicalAbundancesStructure), intent(in) :: chemicalDensities
  type(radiationStructure), intent(in) :: radiation
double precision, intent(out) :: coolingFunctionProperty
  .
  .
return
end subroutine Cooling_Function_PropertyCompute
```

and each should return the relevant quantity in `coolingFunctionProperty`. The `coolingFunctionCompute` subroutine should return the cooling function, the `coolingFunctionDensitySlopeCompute` subroutine should return the partial derivative with respect to hydrogen density and the `coolingFunctionTemperatureSlopeCompute` subroutine should return the partial derivative with respect to temperature.

Currently defined cooling function methods are:

- **CIE_from_file** Reads a tabulated CIE cooling function from a file and interpolates in the table to give a result. The XML file containing the table should have the following form:

```
<coolingFunctions>
  <coolingFunction>
    <temperature>
      <datum>10000.0</datum>
      <datum>15000.0</datum>
      .
      .
    </temperature>
    <coolingRate>
      <datum>1.0e-23</datum>
      <datum>1.7e-23</datum>
    </coolingRate>
  </coolingFunction>
</coolingFunctions>
```
Each coolingFunction element should contain two lists (inside temperature and coolingRate tags) of datum elements which specify temperature (in Kelvin) and cooling function (in ergs cm$^{-3}$ s$^{-1}$ computed for a hydrogen density of 1 cm$^{-3}$) respectively, and a metallicity element which gives the logarithmic metallicity relative to Solar (a value of -999 or less is taken to imply zero metallicity). Any number of coolingFunction elements may appear, but they must be in order of increasing metallicity and must all contain the same set of temperatures. The extrapolation element defines how the table is to be extrapolated in the low and high limits of temperature and metallicity. The method elements can take the following values:

- **zero** The cooling function is set to zero beyond the relevant limit.
- **fixed** The cooling function is held fixed at the value at the relevant limit.
- **power law** The cooling function is extrapolated assuming a power-law dependence beyond the relevant limit. This option is only allowed if the cooling function is everywhere positive.

If the cooling function is everywhere positive the interpolation will be done in the logarithmic of temperature, metallicity and cooling function. Otherwise, interpolation is linear in these quantities.

---

$^6$The exception is if the first cooling function is tabulated for zero metallicity. In that case, a linear interpolation in metallicity is always used between zero and the first non-zero tabulated metallicity.
17. Adding New Methods

Figure 17.1.: Cooling function for atomic gas in collisional ionization equilibrium computed using Cloudy 08.00.

The cooling function is scaled assuming a quadratic dependence on hydrogen density.

atomic_CIE_Cloudy  Uses the CLOUDY software to compute a cooling function for atomic gas in collisional ionization equilibrium. CLOUDY will be downloaded, compiled and run automatically if necessary. Figure 17.1 shows the cooling function from this method.

CMB_Compton  Computes the cooling function due to Compton scattering off of CMB photons.

molecularHydrogenGalliPalla  Implements the molecular hydrogen cooling function from Galli and Palla [1998].

Cloudy is used to generate a file which contains a tabulation of the cooling function suitable for reading by the CIE from file method. Generation of the tabulation typically takes several hours, but only needs to be done once as the stored table is simply read back in on later runs.
17.4. Existing Method Types

Cooling Radius

Additional methods for cooling radius calculations can be added using the `coolingRadiusMethod` directive. The directive should contain a single argument, giving the name of a subroutine to be called to initialize the method. For example, the `simple` method is described by a directive:

```plaintext
!# <coolingRadiusMethod>
!# <unitName>Cooling_Radius_Simple_Initialize</unitName>
!# </coolingRadiusMethod>
```

Here, `Cooling_Radius_Simple_Initialize` is the name of a subroutine which will be called to initialize the method. The initialization subroutine must have the following form:

```plaintext
subroutine Method_Initialize(coolingRadiusMethod,Cooling_Radius_Get,Cooling_Radius_Growth_Rate_Get)
implicit none
  type(varying_string), intent(in) :: coolingRadiusMethod
  procedure(), pointer, intent(inout) :: Cooling_Radius_Get,Cooling_Radius_Growth_Rate_Get

  if (coolingRadiusMethod == 'myMethod') then
    Cooling_Radius_Get => My_Method_Get_Procedure
    Cooling_Radius_Growth_Rate_Get => My_Method_Growth_Rate_Get_Procedure
  end if

end subroutine Method_Initialize
```

where `myMethod` is the name of this method as will be specified by the `coolingRadiusMethod` input parameter. The procedure pointer `Cooling_Radius_Get` must be set to point to a function which returns the cooling function as described below while `Cooling_Radius_Growth_Rate_Get` should be set to point to a function which returns the rate at which the cooling radius is growing. The initialization subroutine should perform any other tasks required to initialize the module (such as reading parameters etc.).

The cooling radius function must have the form:

```plaintext
double precision function Cooling_Radius_Get(thisNode)
implicit none
  type(treeNode), intent(inout), pointer :: thisNode

  return
end function Cooling_Radius_Get
```

The function must return the cooling radius (in units of Mpc) for `thisNode`. The cooling radius growth rate function should have the same template but return the rate at which the cooling radius grows in units of Mpc/Gyr.

Currently defined cooling radius methods are:

- **simple** Computes the cooling radius by seeking the radius at which the time available for cooling equals the cooling time. The growth rate is determined consistently based on the slope of the density profile, the density dependence of the cooling function and the rate at which the time available for cooling is increasing. This method assumes that the cooling time is a monotonic function of radius.

- **isothermal** Computes the cooling radius by assuming that the hot gas density profile is an isothermal profile \( \rho(r) \propto r^{-2} \), and that the cooling rate scales as density squared, \( \dot{E} \propto \rho^2 \), such that the cooling time scales as inverse density, \( t_{cool} \propto \rho^{-1} \). Consequently, the cooling radius grows as the square root of the time available for cooling.
17. Adding New Methods

**Cooling: Freefall Radius**

Additional methods for freefall radius in cooling calculations can be added using the `freefallRadiusMethod` directive. The directive should contain a single argument, giving the name of a subroutine to be called to initialize the method. For example, the `simple` method is described by a directive:

```
!# <freefallRadiusMethod>
!# <unitName>Freefall_Radius_Dark_Matter_Halo_Initialize</unitName>
!# </freefallRadiusMethod>
```

Here, `Freefall_Radius_Dark_Matter_Halo_Initialize` is the name of a subroutine which will be called to initialize the method. The initialization subroutine must have the following form:

```fortran
subroutine Method_Initialize(freefallRadiusMethod,Freefall_Radius_Get,Freefall_Radius_Growth_Rate_Get)
implicit none
    type(varying_string), intent(in) :: freefallRadiusMethod
    procedure(), pointer, intent(inout) :: Freefall_Radius_Get, Freefall_Radius_Growth_Rate_Get

    if (freefallRadiusMethod == 'myMethod') then
        Freefall_Radius_Get => My_Method_Get_Procedure
        Freefall_Radius_Growth_Rate_Get => My_Method_Growth_Rate_Get_Procedure
    end if
end subroutine Method_Initialize
```

where `myMethod` is the name of this method as will be specified by the `freefallRadiusMethod` input parameter. The procedure pointer `Freefall_Radius_Get` must be set to point to a function which returns the freefall radius as described below while `Freefall_Radius_Growth_Rate_Get` should be set to point to a function which returns the rate at which the freefall radius is growing. The initialization subroutine should perform any other tasks required to initialize the module (such as reading parameters etc.).

The freefall radius function must have the form:

```fortran
double precision function Freefall_Radius_Get(thisNode)
    implicit none
    type(treeNode), intent(inout), pointer :: thisNode

    return
end function Freefall_Radius_Get
```

The function must return the freefall radius (in units of Mpc) for `thisNode`. The freefall radius growth rate function should have the same template but return the rate at which the freefall radius grows in units of Mpc/Gyr.

Currently defined freefall radius methods are:

- **darkMatterHalo** Computes the freefall radius by finding the radius in the dark matter halo profile from which a test particle could have free-fallen to zero radius (assuming it began at rest) in the time available for freefall.

**Cooling: Infall Radius**

Additional methods for the infall radius in cooling calculations can be added using the `infallRadiusMethod` directive. The directive should contain a single argument, giving the name of a subroutine to be called to initialize the method. For example, the `coolingRadius` method is described by a directive:
17.4. Existing Method Types

Here, \texttt{Infall\_Radius\_Cooling\_Radius\_Initialize} is the name of a subroutine which will be called to initialize the method. The initialization subroutine must have the following form:

\begin{verbatim}
subroutine Method\_Initialize(infallRadiusMethod,Infall\_Radius\_Get,Infall\_Radius\_Growth\_Rate\_Get)
implicit none
  type(varying\_string), intent(in) :: infallRadiusMethod
  procedure(), pointer, intent(inout) :: Infall\_Radius\_Get, Infall\_Radius\_Growth\_Rate\_Get

  if (infallRadiusMethod == 'myMethod') then
    Infall\_Radius\_Get => My\_Method\_Get\_Procedure
    Infall\_Radius\_Growth\_Rate\_Get => My\_Method\_Growth\_Rate\_Get\_Procedure
  end if

  return
end subroutine Method\_Initialize
\end{verbatim}

where \texttt{myMethod} is the name of this method as will be specified by the \texttt{infallRadiusMethod} input parameter. The procedure pointer \texttt{Infall\_Radius\_Get} must be set to point to a function which returns the infall radius as described below while \texttt{Infall\_Radius\_Growth\_Rate\_Get} should be set to point to a function which returns the rate at which the infall radius is growing. The initialization subroutine should perform any other tasks required to initialize the module (such as reading parameters etc.).

The infall radius function must have the form:

\begin{verbatim}
double precision function Infall\_Radius\_Get(thisNode)
implicit none
  type(treeNode), intent(inout), pointer :: thisNode

  return
end function Infall\_Radius\_Get
\end{verbatim}

The function must return the infall radius (in units of Mpc) for \texttt{thisNode}, i.e. the radius from which gas in the hot halo that is currently accreting onto the galaxy originated. The infall radius growth rate function should have the same template but return the rate at which the infall radius grows in units of \text{Mpc/Gyr}.

Currently defined infall radius methods are:

\begin{itemize}
  \item \texttt{coolingRadius} Assumes that the infall radius equals the cooling radius.
  \item \texttt{cooling and freefall} Assumes that the infall radius is equal to the smaller of the cooling and freefall radii.
\end{itemize}

\textbf{Cooling Specific Angular Momentum}

Additional methods for calculations of the specific angular momentum of cooling gas can be added using the \texttt{coolingSpecificAngularMomentumMethod} directive. The directive should contain a single argument, giving the name of a subroutine to be called to initialize the method. For example, the \texttt{simple} method is described by a directive:
17. Adding New Methods

Here, Cooling_Time_Simple.Initialize is the name of a subroutine which will be called to initialize the method. The initialization subroutine must have the following form:

```fortran
subroutine Method_Initialize(coolingSpecificAngularMomentumMethod, Cooling_Specific_Angular_Momentum_Get)
  implicit none
  type(varying_string), intent(in) :: coolingSpecificAngularMomentumMethod
  procedure(), pointer, intent(inout) :: Cooling_Specific_Angular_Momentum_Get

  if (coolingSpecificAngularMomentumMethod == 'myMethod') then
    Cooling_Specific_Angular_Momentum_Get => My_Method_Get_Procedure
  end if
  return
end subroutine Method_Initialize
```

where myMethod is the name of this method as will be specified by the coolingSpecificAngularMomentumMethod input parameter. The procedure pointer Cooling_Specific_Angular_Momentum_Get must be set to point to a function which returns the specific angular momentum of cooling gas. The initialization subroutine should perform any other tasks required to initialize the module (such as reading parameters etc.).

The specific angular momentum of cooling gas function must have the form:

```fortran
double precision function Cooling_Specific_Angular_Momentum_Get(thisNode)
  implicit none
  type(treeNode), intent(inout), pointer :: thisNode

  return
end function Cooling_Specific_Angular_Momentum_Get
```

The function must return the specific angular momentum (in units of km/s Mpc) of gas that is cooling in thisNode.

Currently defined specific angular momentum of cooling gas methods are:

- **constantRotation** Computes the specific angular momentum of the cooling gas based on the cooling radius, mean specific angular momentum and the assumption of a constant mean rotation speed in the cooling gas as a function of radius.

- **mean** Assumes that the specific angular momentum of the cooling gas always equals the mean specific angular momentum of the hot halo.

**Cooling Time Available**

Additional methods for the time available for cooling can be added using the coolingTimeAvailableMethod directive. The directive should contain a single argument, giving the name of a subroutine to be called to initialize the method. For example, the White-Frenk method is described by a directive:

```fortran
!# <coolingTimeAvailableMethod>
!# <unitName>Cooling_Time_Available_WF_Initialize</unitName>
!# </coolingTimeAvailableMethod>
```
17.4. Existing Method Types

Here, Cool_Time_Available_WF.Initialize is the name of a subroutine which will be called to initialize the method. The initialization subroutine must have the following form:

```fortran
subroutine Method_Initialize(coolingTimeAvailableMethod, Cooling_Time_Available_Get&, Cooling_Time_Available_Increase_Rate_Get)
  implicit none
  type(varying_string), intent(in) :: coolingTimeAvailableMethod
  procedure(), pointer, intent(inout) :: Cooling_Time_Available_Get, Cooling_Time_Available_Increase_Rate_Get

  if (coolingTimeAvailableMethod == 'myMethod') then
    Cooling_Time_Available_Get => My_Method_Get
    Cooling_Time_Available_Increase_Rate_Get => My_Method_Increase_Rate_Get
  end if
  return
end subroutine Method_Initialize
```

where myMethod is the name of this method as will be specified by the coolingTimeAvailableMethod input parameter. The procedure pointers Cooling_Time_Available_Get and Cooling_Time_Available_Increase_Rate_Get must be set to point to functions which return the time available for cooling and the rate of increase of this time respectively. The initialization subroutine should perform any other tasks required to initialize the module (such as reading parameters etc.).

The cooling time available functions must have the form:

```fortran
double precision function Cooling_Time_Available_Get(thisNode)
  implicit none
  type(treeNode), intent(inout), pointer :: thisNode
  .
  .
  .
  return
end function Cooling_Time_Available_Get
```

The first function must return the time available for cooling (in units of Gyr) for thisNode, while the second must return the rate of increase of this time.

Currently defined cooling time available methods are:

- **White-Frenk** The time available is set to a value between the age of the Universe and the dynamical time of the halo, depending on the interpolating parameter [coolingTimeAvailableAgeFactor];
- **haloFormation** The time available for cooling is set equal to the current time minus the formation time of the halo.

**Cooling Time Available For Freefall**

Additional methods for the time available for freefall in cooling calculations can be added using the freeFallTimeAvailableMethod directive. The directive should contain a single argument, giving the name of a subroutine to be called to initialize the method. For example, the haloFormation method is described by a directive:

```plaintext
!# <freeFallTimeAvailableMethod>
!# <unitName>FreeFall_Time_Available_Halo_Formation.Initialize</unitName>
!# </freeFallTimeAvailableMethod>
```
Here, `Freefall_Time_Available_Halo_Formation.Initialize` is the name of a subroutine which will be called to initialize the method. The initialization subroutine must have the following form:

```fortran
subroutine Method_Initialize(freefallTimeAvailableMethod,Freefall_Time_Available_Get&,Freefall_Time_Available_Increase_Rate_Get)
    implicit none
    type(varying_string), intent(in) :: freefallTimeAvailableMethod
    procedure(), pointer, intent(inout) :: Freefall_Time_Available_Get,Freefall_Time_Available_Increase_Rate_Get
    if (freefallTimeAvailableMethod == 'myMethod') then
        Freefall_Time_Available_Get => My_Method_Get
        Freefall_Time_Available_Increase_Rate_Get => My_Method_Increase_Rate_Get
    end if
    return
end subroutine Method_Initialize
```

where `myMethod` is the name of this method as will be specified by the `freefallTimeAvailableMethod` input parameter. The procedure pointers `Freefall_Time_Available_Get` and `Freefall_Time_Available_Increase_Rate_Get` must be set to point to functions which return the time available for freefall in cooling calculations and the rate of increase of this time respectively. The initialization subroutine should perform any other tasks required to initialize the module (such as reading parameters etc.).

The freefall time available functions must have the form:

```fortran
double precision function Freefall_Time_Available_Get(thisNode)
    implicit none
