    type(treeNode), intent(inout), pointer :: thisNode
    
    return
end function Freefall_Time_Available_Get
```

The first function must return the time available for freefall cooling calculations (in units of Gyr) for `thisNode`, while the second must return the rate of increase of this time.

Currently defined freefall time available methods are:

```markdown
**haloFormation**  The time available for cooling is set equal to the current time minus the formation time of the halo.
```

**Cooling Time**

Additional methods for cooling time calculations can be added using the `coolingTimeMethod` directive. The directive should contain a single argument, giving the name of a subroutine to be called to initialize the method. For example, the `simple` method is described by a directive:

```markdown
!# <coolingTimeMethod>
!# <unitName>Cooling_Time_Simple_Initialize</unitName>
!# </coolingTimeMethod>
```

Here, `Cooling_Time_Simple_Initialize` is the name of a subroutine which will be called to initialize the method. The initialization subroutine must have the following form:
subroutine Method_Initialize(coolingTimeMethod,Cooling_Time_Get,Cooling_Time_Density_Log_Slope_Get,Cooling_Time_Temperature_Log_Slope_Get)
  implicit none
  type(varying_string), intent(in) :: coolingTimeMethod
  procedure(), pointer, intent(inout) :: Cooling_Time_Get,Cooling_Time_Density_Log_Slope_Get,Cooling_Time_Temperature_Log_Slope_Get

  if (coolingTimeMethod == 'myMethod') then
    Cooling_Time_Get => My_Method_Get_Procedure
    Cooling_Time_Density_Log_Slope_Get => My_Method_Density_Log_Slope_Procedure
    Cooling_Time_Temperature_Log_Slope_Get => My_Method_Temperature_Log_Slope_Procedure
  end if
  return
end subroutine Method_Initialize

where myMethod is the name of this method as will be specified by the coolingTimeMethod input parameter. The procedure pointer Cooling_Time_Get must be set to point to a function which returns the cooling function as described below while the other two pointers should point to functions which return the appropriate logarithmic slope. The initialization subroutine should perform any other tasks required to initialize the module (such as reading parameters etc.).

The cooling time function must have the form:

double precision function Cooling_Time_Get(temperature,density,abundances,chemicalDensities,radiation)
  implicit none
  double precision, intent(in) :: temperature,density
  type(abundancesStructure), intent(in) :: abundances
  type(chemicalAbundancesStructure), intent(in) :: chemicalDensities
  type(radiationStructure), intent(in) :: radiation

  return
end function Cooling_Time_Get

The function must return the cooling time (in units of Gyr) for at the specified temperature, density and for composition and radiation field as specified by the abundances, chemicalDensities and radiation structures. The logarithmic slope functions should have the same template, but return the logarithmic slope of the cooling time with respect to the appropriate variable instead.

Currently defined cooling time methods are:

**simple** Compute the cooling time as the ratio of the gas thermal energy density to the volume rate of radiative energy loss. The gas is assumed to have an effective number of degrees of freedom specified by the coolingTimeSimpleDegreesOfFreedom parameter.

**Cosmological Mass Root Variance**

Additional methods for computing the cosmological mass root variance, \( \sigma(M) \), can be added using the cosmologicalMassVarianceMethod directive. The directive should contain a single argument, giving the name of a subroutine to be called to initialize the method. For example, the filteredPowerSpectrum method is described by a directive:

```plaintext
!# <cosmologicalMassVarianceMethod>
!# <unitName>Cosmological_Mass_Variance_Filtered_Power_SpectrumInitializer</unitName>
!# </cosmologicalMassVarianceMethod>
```
17. Adding New Methods

Here, Cosmological_Mass_Variance_Filtered_Power_Spectrum.Initialize is the name of a subroutine which will be called to initialize the method. The initialization subroutine must have the following form:

```fortran
subroutine Method_Initialize(cosmologicalMassVarianceMethod, Cosmological_Mass_Variance_Tabulate)
  implicit none
  type (varying_string), intent(in) :: cosmologicalMassVarianceMethod
  procedure( , pointer, intent(inout) :: Cosmological_Mass_Variance_Tabulate

  if (cosmologicalMassVarianceMethod == 'myMethod') then
    Cosmological_Mass_Variance_Tabulate => My_Method_Tabulate
  .

  end if
  return
end subroutine Method_Initialize
```

where myMethod is the name of this method as will be specified by the cosmologicalMassVarianceMethod input parameter. The procedure pointer Cosmological_Mass_Variance_Tabulate must be set to point to a function which populates a table1D object with a tabulation of $\sigma(M)$. The initialization subroutine should perform any other tasks required to initialize the module (such as reading parameters etc.).

The tabulation function must have the form:

```fortran
subroutine Cosmological_Mass_Variance_Filtered_Power_Spectrum(mass, massNormalization, sigmaNormalization, sigmaTable)
  implicit none
  double precision , intent(in) :: mass, massNormalization
  double precision , intent(inout) :: sigmaNormalization
  class (table1D), intent(inout), allocatable :: sigmaTable

  return
end subroutine Cosmological_Mass_Variance_Filtered_Power_Spectrum
```

The function should allocate sigmaTable to a suitable type of table1D object and populate it with a tabulation of $\sigma(M)$ which includes the given mass. On input, the required normalization of $\sigma(M)$ at mass massNormalization is given by sigmaNormalization. The function should divide this value by the unnormalized value of $\sigma(M)$—this is used to normalize the cosmological power spectrum.

Currently defined cosmological mass root variance methods are:

- filteredPowerSpectrum The mass root variance is found by integrating over the transferred linear power spectrum multiplied by the selected window function (see §17.4.1).

Critical Overdensity for Halo Collapse

Additional methods for the critical linear theory overdensity for halo collapse can be added using the criticalOverdensityMethod directive. The directive should contain a single argument, giving the name of a subroutine to be called to initialize the method. For example, the sphericalTopHat method is described by a directive:

```fortran
! # <criticalOverdensityMethod>
! # <unitName>Spherical_Collape_Delta_Critical_Initialize</unitName>
! # </criticalOverdensityMethod>
```
Here, Spherical_Collapse_Delta_CriticalInitialize is the name of a subroutine which will be called to initialize the method. The initialization subroutine must have the following form:

```fortran
subroutine Method_Initialize(criticalOverdensityMethod,Critical_Overdensity_Tabulate)
  implicit none
  type(varying_string), intent(in) :: criticalOverdensityMethod
  procedure(), pointer, intent(inout) :: Critical_Overdensity_Tabulate
  if (criticalOverdensityMethod.eq.'myMethod') then
    Critical_Overdensity_Tabulate => My_Do_Tabulate
  else
  end if
  return
end subroutine Method_Initialize
```

where myMethod is the name of this method as will be specified by the criticalOverdensityMethod input parameter. The procedure pointer Critical_Overdensity_Tabulate must be set to point to a subroutine which tabulates the critical overdensity as described below. The initialization subroutine should perform any other tasks required to initialize the module (such as reading parameters etc.). The tabulation subroutine must have the form:

```fortran
subroutine Critical_Overdensity_Tabulate(time,deltaCritNumberPoints,deltaCritTime,deltaCritDeltaVirial)
  implicit none
  double precision, intent(in) :: time
  integer, intent(out) :: deltaCritNumberPoints
  double precision, intent(inout), allocatable, dimension(:) :: deltaCritTime,deltaCritDeltaVirial
  return
end subroutine Critical_Overdensity_Tabulate
```

The subroutine must tabulate the critical overdensity in array deltaCritDeltaVirial() as a function of wavenumber deltaCritTime() (these arrays must be allocated to the correct size, and may be previously allocated, therefore requiring a deallocation). The number of tabulated points should be returned in deltaCritNumberPoints. The subroutine should ensure that the currently requested time is within the range of the tabulated function (preferably with some buffer).

Currently defined critical overdensity methods are:

- **sphericalTopHat**  The critical overdensity is computed for a Universe containing collisionless matter and a cosmological constant following the spherical top hat collapse model (see, for example, Percival 2005).

- **Kitayama-Suto1996**  The critical overdensity is computed using the fitting formula of Kitayama and Suto [1996], and is therefore valid only for flat cosmological models.

**Critical Overdensity for Halo Collapse: Mass Scaling**

Additional methods for the mass scaling of the critical linear theory overdensity for halo collapse can be added using the criticalOverdensityMassScalingMethod directive. The directive should contain a
17. Adding New Methods

single argument, giving the name of a subroutine to be called to initialize the method. For example, the warm dark matter method is described by a directive:

```plaintext
!# <criticalOverdensityMassScalingMethod>
!# <unitName>Critical_Overdensity_Mass_Scaling_WDM_Initialize</unitName>
!# </criticalOverdensityMassScalingMethod>
```

Here, `Critical_Overdensity_Mass_Scaling_WDM_Initialize` is the name of a subroutine which will be called to initialize the method. The initialization subroutine must have the following form:

```plaintext
subroutine Method_Initialize(criticalOverdensityMassScalingMethod, &
implicit none
  type(varying_string), intent(in) :: criticalOverdensityMassScalingMethod
  procedure(), pointer, intent(inout) :: Critical_Overdensity_Mass_Scaling_Get, &
& Critical_Overdensity_Mass_Scaling_Gradient_Get
if (criticalOverdensityMassScalingMethod == 'myMethod') then
    Critical_Overdensity_Mass_Scaling_Get => My_Do_Tabulate
    Critical_Overdensity_Mass_Scaling_Gradient_Get => My_Do_Gradient_Tabulate
    ...
end if
return
end subroutine Method_Initialize
```

where `myMethod` is the name of this method as will be specified by the `criticalOverdensityMassScalingMethod` input parameter. The procedure pointers `Critical_Overdensity_Mass_Scaling_Get` and `Critical_Overdensity_Mass_Scaling_Gradient_Get` must be set to point to functions which return the critical overdensity mass scaling and its gradient as described below. The initialization subroutine should perform any other tasks required to initialize the module (such as reading parameters etc.).

The mass scaling function must have the form:

```plaintext
double precision function Critical_Overdensity_Mass_Scaling_Get(mass)
implicit none
  double precision, intent(in) :: mass
  ...
return
end function Critical_Overdensity_Mass_Scaling_Get
```

The function should return the factor by which the critical overdensity for collapse at the given mass scale (given in units of $M_\odot$) differs from that for the case $M \to \infty$. The mass scaling gradient function should have the same form, but should return the derivative of the scaling with respect to mass.

Currently defined critical overdensity mass scaling methods are:

- **null** The critical overdensity is assumed to have no scaling with mass;
- **warm dark matter** The mass scaling is computed for warm dark matter using a fitting function to the results of Barkana et al. [2001].
**Dark Matter Density Profile**

Additional methods for the dark matter density profile can be added using the `darkMatterProfileMethod` directive. The directive should contain a single argument, giving the name of a subroutine to be called to initialize the method. For example, the NFW method is described by a directive:

```
!# <darkMatterProfileMethod>
!# <unitName>Dark_Matter_Profile_NFW_Initialize</unitName>
!# </darkMatterProfileMethod>
```

Here, `Dark_Matter_Profile_NFW_Initialize` is the name of a subroutine which will be called to initialize the method. The initialization subroutine must have the following form:

```fortran
subroutine Method_Initialize(darkMatterProfileMethod,Dark_Matter_Profile_Density_Get,Dark_Matter_Profile_Energy_Get,&
& Dark_Matter_Profile_Energy_Growth_Rate_Get,Dark_Matter_Profile_Rotation_Normalization_Get,&
& Dark_Matter_Profile_Radius_from_Specific_Angular_Momentum_Get,Dark_Matter_Profile_Circular_Velocity_Get,&
& Dark_Matter_Profile_Freefall_Radius_Get,Dark_Matter_Profile_Freefall_Radius_Increase_Rate_Get)
implicit none

type(varying_string), intent(in) :: darkMatterProfileMethod
procedure(), pointer, intent(inout) :: Dark_Matter_Profile_Density_Get, Dark_Matter_Profile_Energy_Get,&
& Dark_Matter_Profile_Energy_Growth_Rate_Get, Dark_Matter_Profile_Rotation_Normalization_Get,&
& Dark_Matter_Profile_Radius_from_Specific_Angular_Momentum_Get, Dark_Matter_Profile_Circular_Velocity_Get,&
& Dark_Matter_Profile_Freefall_Radius_Get, Dark_Matter_Profile_Freefall_Radius_Increase_Rate_Get

if (darkMatterProfileMethod == 'myMethod') then
  Dark_Matter_Profile_Density_Get => My_Dark_Matter_Profile_Density
  Dark_Matter_Profile_Energy_Get => My_Dark_Matter_Profile_Energy
  Dark_Matter_Profile_Energy_Growth_Rate_Get => My_Dark_Matter_Profile_Energy_Growth_Rate
  Dark_Matter_Profile_Rotation_Normalization_Get => My_Dark_Matter_Profile_Rotation_Normalization
  Dark_Matter_Profile_Radius_from_Specific_Angular_Momentum_Get => My_Radius_from_Specific_Angular_Momentum
  Dark_Matter_Profile_Circular_Velocity_Get => My_Dark_Matter_Profile_Circular_Velocity
  Dark_Matter_Profile_Potential_Get => My_Dark_Matter_Profile_Potential
  Dark_Matter_Profile_Enclosed_Mass_Get => My_Dark_Matter_Profile_Enclosed_Mass
  Dark_Matter_Profile_kSpace_Get => My_Dark_Matter_Profile_kSpace
  Dark_Matter_Profile_Freefall_Radius_Get => My_Dark_Matter_Profile_Freefall_Radius
  Dark_Matter_Profile_Freefall_Radius_Increase_Rate_Get => My_Dark_Matter_Profile_Freefall_Radius_Increase_Rate
end if
return
end subroutine Method_Initialize
```

where `myMethod` is the name of this method as will be specified by the `darkMatterProfileMethod` input parameter. The procedure pointers must be set to point to functions which return properties of the dark matter density profile as described below. The initialization subroutine should perform any other tasks required to initialize the module (such as reading parameters etc.).

The density, enclosed mass, potential and circular velocity functions must have the form:

```fortran
double precision function My_Dark_Matter_Profile_Property(thisNode,radius)
```

781
17. Adding New Methods

```fortran
implicit none
type(treeNode), intent(inout), pointer :: thisNode
double precision, intent(in) :: radius

return
end function My_Dark_Matter_Profile_Property
```

These functions should compute and return the density (in units of \(M_\odot\) Mpc\(^{-3}\)), enclosed dark matter mass (in units of \(M_\odot\)), gravitational potential (in units of \((\text{km/s})^2\)) and circular velocity (in units of km/s) due to dark matter at the given radius (in units of Mpc) for thisNode respectively.

The freefall radius functions must have the form:

```fortran
double precision function My_Dark_Matter_Profile_Property(thisNode, time)
  implicit none
  type(treeNode), intent(inout), pointer :: thisNode
double precision, intent(in) :: time

  return
end function My_Dark_Matter_Profile_Property
```

These functions should compute and return the freefall radius (in units of Mpc), or its growth rate given a time available for freefall (in Gyr) for thisNode respectively.

The energy, energy growth rate and rotation velocity normalization functions must have the form:

```fortran
double precision function My_Dark_Matter_Profile_Property(thisNode)
  implicit none
  type(treeNode), intent(inout), pointer :: thisNode

  return
end function My_Dark_Matter_Profile_Property
```

The energy functions should compute and return the energy (potential plus kinetic; in units of \(M_\odot\) (km/s)^2) of the dark matter halo out to the virial radius of thisNode and the rate of change of that energy (in units of \(M_\odot\) (km/s)^2 Gyr\(^{-1}\)) respectively. The rotation normalization function should compute and return the normalization between rotation speed and mean specific angular momentum (in units of Mpc\(^{-1}\)) of thisNode assuming that the dark matter halo rotates at the same velocity at all radii.

Finally, the radius from specific angular momentum function must have the form:

```fortran
double precision function My_Dark_Matter_Profile_Radius_From_Specific_Angular_Momentum(thisNode, specificAngularMomentum)
  implicit none
  type(treeNode), intent(inout), pointer :: thisNode
double precision, intent(in) :: specificAngularMomentum

  return
end function My_Dark_Matter_Profile_Radius_From_Specific_Angular_Momentum
```
This function should compute and return the radius (in units of Mpc) in thisNode at which a circular orbit would have the given specificAngularMomentum (in units of km/s Mpc).

The “kSpace” function must have the form:

```fortran
double precision function My_Dark_Matter_Profile_kSpace(thisNode,wavenumber)
    implicit none
    type(treeNode), intent(inout), pointer :: thisNode
    double precision, intent(in) :: wavenumber

    return
end function My_Dark_Matter_Profile_kSpace
```

This function should compute and return the Fourier transform of the dark matter halo density profile (normalized to unity at small wavenumber—as defined in Cooray and Sheth 2002) for thisNode at the given wavenumber (specified in Mpc$^{-1}$).

Currently defined dark matter density profile methods are:

- **Isothermal** The density profile is a singular isothermal sphere;
- **NFW** The density profile proposed by Navarro et al. [1997].
- **Einasto** The Einasto density profile, described, for example, by Cardone et al. [2005].

### Dark Matter Halo Mass Accretion History

Additional methods for dark matter halo mass accretion histories can be added using the `darkMatterAccretionHistoryMethod` directive. The directive should contain a single argument, giving the name of a subroutine to be called to initialize the method. For example, the Zhao2009 method is described by a directive:

```plaintext
!# <darkMatterAccretionHistoryMethod>
!# <unitName>Dark_Matter_Mass_Accretion_Zhao2009_Initialize</unitName>
!# </darkMatterAccretionHistoryMethod>
```

Here, `Dark_Matter_Mass_Accretion_Zhao2009_Initialize` is the name of a subroutine which will be called to initialize the method. The initialization subroutine must have the following form:

```fortran
subroutine Method_Initialize(darkMatterAccretionHistoryMethod,Dark_Matter_Halo_Mass_Accretion_Time_Get)
    implicit none
    type(varying_string), intent(in) :: darkMatterAccretionHistoryMethod
    procedure(), pointer, intent(inout) :: Dark_Matter_Halo_Mass_Accretion_Time_Get

    if (darkMatterAccretionHistoryMethod == 'myMethod') then
        Dark_Matter_Halo_Mass_Accretion_Time_Get => My_Time_Get
    end if
    return
end subroutine Method_Initialize
```
where myMethod is the name of this method as will be specified by the darkMatterAccretionHistoryMethod input parameter. The procedure pointer Dark_Matter_Halo_Mass_Accretion_Time_Get must be set to point to a function which returns the time at which a given mass is reached in the mass accretion history. The initialization subroutine should perform any other tasks required to initialize the module (such as reading parameters etc.).

The time function must have the form:

```fortran
double precision function My_Dark_Matter_Halo_Mass_Accretion_Time(baseNode,nodeMass)  
    implicit none  
    type(treeNode), intent(inout), pointer :: baseNode  
    double precision, intent(in) :: nodeMass  
    .  
    .  
    return  
end function My_Dark_Matter_Halo_Mass_Accretion_Time
```

The function should compute and return the time at which the mass accretion history of baseNode reaches the specified nodeMass.

Currently defined mass accretion history methods are:

- **Wechsler2002**: Uses the fitting function from Wechsler et al. [2002] to compute the mass accretion history. If [accretionHistoryWechslerFormationRedshiftCompute] is set to true then the formation redshift for each history is set using the method of Bullock et al. [2001], otherwise it can be set directly via the [accretionHistoryWechslerFormationRedshift] parameter;

- **Zhao2009**: Uses the algorithm of Zhao et al. [2009] to compute the mass accretion history.

**Dark Matter Density Profile Shape**

Additional methods for the dark matter density profile shape parameter can be added using the darkMatterShapeMethod directive. The directive should contain a single argument, giving the name of a subroutine to be called to initialize the method. For example, the Gao2008 method is described by a directive:

```fortran
!# <darkMatterShapeMethod>
!# <unitName>Dark_Matter_Shapes_Gao20008_Initialize</unitName>
!# </darkMatterShapeMethod>
```

Here, Dark_Matter_Shapes_Gao20008_Initialize is the name of a subroutine which will be called to initialize the method. The initialization subroutine must have the following form:

```fortran
subroutine Method_Initialize(darkMatterShapeMethod,Dark_Matter_Profile_Shape_Get)  
    implicit none  
    type(varying_string), intent(in) :: darkMatterShapeMethod  
    procedure(), pointer, intent(inout) :: Dark_Matter_Profile_Shape_Get  
    if (darkMatterShapeMethod == 'myMethod') then  
        Dark_Matter_Profile_Shape_Get => My_Shape_Get  
    .  
    .  
    end if  
    return  
end subroutine Method_Initialize
```
where \texttt{myMethod} is the name of this method as will be specified by the \texttt{darkMatterShapeMethod} input parameter. The procedure pointer \texttt{Dark\_Matter\_Profile\_Shape\_Get} must be set to point to a function which returns the shape parameter of a node. The initialization subroutine should perform any other tasks required to initialize the module (such as reading parameters etc.).

The shape parameter function must have the form:

\begin{verbatim}
double precision function My_Dark_Matter_Profile_Shape(thisNode)
  implicit none
  type(treeNode), intent(inout), pointer :: thisNode
  .
  .
  .
  return
end function My_Dark_Matter_Profile_Shape
\end{verbatim}

The function should compute and return the shape parameter for \texttt{thisNode}.

Currently defined dark matter profile shape parameter methods are:

\textbf{Gao2008} The shape parameter is computed using a fitting function from Gao et al. [2008] - see §13.8.4 for details.

\textbf{Dark Matter Halo Spin Distribution}

Additional methods for the dark matter density profile concentration can be added using the \texttt{haloSpinDistributionMethod} directive. The directive should contain a single argument, giving the name of a subroutine to be called to initialize the method. For example, the \texttt{Gao2008} method is described by a directive:

\begin{verbatim}
!# <haloSpinDistributionMethod>
!# <unitName>Halo_Spin_Distribution_Bett2007_Initialize</unitName>
!# </haloSpinDistributionMethod>
\end{verbatim}

Here, \texttt{Halo\_Spin\_Distribution\_Bett2007\_Initialize} is the name of a subroutine which will be called to initialize the method. The initialization subroutine must have the following form:

\begin{verbatim}
subroutine Method_Initialize(haloSpinDistributionMethod,Halo_Spin_Sample_Get)
  implicit none
  type(varying_string), intent(in) :: haloSpinDistributionMethod
  procedure(), pointer, intent(inout) :: Halo_Spin_Sample_Get

  if (haloSpinDistributionMethod == 'myMethod') then
    Halo_Spin_Sample_Get => My_Spin_Sample_Get
  .
  .
  .
  end if
  return
end subroutine Method_Initialize
\end{verbatim}

where \texttt{myMethod} is the name of this method as will be specified by the \texttt{haloSpinDistributionMethod} input parameter. The procedure pointer \texttt{Halo\_Spin\_Sample\_Get} must be set to point to a function which returns a spin parameter drawn at random from a distribution. The initialization subroutine should perform any other tasks required to initialize the module (such as reading parameters etc.).

The spin parameter function must have the form:

\begin{verbatim}
subroutine My_Spin_Sample_Get()
  implicit none
  .
  .
  .
  return
end subroutine My_Spin_Sample_Get
\end{verbatim}
17. Adding New Methods

```plaintext
double precision function My_Spin_Distribution_Sample(thisNode)
  implicit none
  type(treeNode), intent(inout), pointer :: thisNode
  .
  .
  return
end function My_Spin_Distribution_Sample
```

The function should compute and return a spin parameter for `thisNode` drawn at random from a distribution.

Currently defined spin distribution methods are:

- **lognormal** The spin is drawn from a lognormal distribution with median `[lognormalSpinDistributionMedian]` and width `[lognormalSpinDistributionSigma]`.
- **Bett2007** The spin is drawn from the distribution found by Bett et al. [2007]. The $\lambda_0$ and $\alpha$ parameter of Bett et al.’s distribution are set by the `[spinDistributionBett2007Lambda0]` and `[spinDistributionBett2007Alpha]` input parameters.
- **deltaFunction** The spin is drawn from a delta function distribution, i.e. a value equal to `[deltaFunctionSpinDistributionSpin]` is always returned.

## Dark Matter Halo Mass Loss Rates

Additional methods for dark matter halo mass loss rates can be added using the `darkMatterHaloMassLossRateMethod` directive. The directive should contain a single argument, giving the name of a subroutine to be called to initialize the method. For example, the `van den Bosch 2005` method is described by a directive:

```plaintext
!# <darkMatterHaloMassLossRateMethod>
!#  <unitName>Dark_Matter_Halos_Mass_Loss_Rate_vanDenBosch_Initialize</unitName>
!# </darkMatterHaloMassLossRateMethod>
```

Here, `Dark_Matter_Halos_Mass_Loss_Rate_vanDenBosch_Initialize` is the name of a subroutine which will be called to initialize the method. The initialization subroutine must have the following form:

```plaintext
subroutine Method_Initialize(darkMatterHaloMassLossRateMethod,Dark_Matter_Halos_Mass_Loss_Rate_Get)
  implicit none
  type(varying_string), intent(in) :: darkMatterHaloMassLossRateMethod
  procedure(), pointer, intent(inout) :: Dark_Matter_Halos_Mass_Loss_Rate_Get
  if (darkMatterHaloMassLossRateMethod == 'myMethod') then
    Dark_Matter_Halos_Mass_Loss_Rate_Get => My_Mass_Loss_Rate_Get
  .
  .
end if
return
end subroutine Method_Initialize
```

where `myMethod` is the name of this method as will be specified by the `darkMatterHaloMassLossRateMethod` input parameter. The procedure pointer `Dark_Matter_Halos_Mass_Loss_Rate_Get` must be set to point to a function which returns a spin parameter drawn at random from a distribution. The initialization
subroutine should perform any other tasks required to initialize the module (such as reading parameters etc.).

The mass loss rate function must have the form:

```fortran
double precision function My_Mass_Loss_Rate(thisNode)
    implicit none
    type(treeNode), intent(inout), pointer :: thisNode
    .
    .
    return
end function My_Mass_Loss_Rate
```

The function should compute and return the mass loss rate from `thisNode` in units of $M_\odot$/Gyr.

Currently defined halo mass loss rate methods are:

- **null** Always returns zero mass loss rate.
- **vanDenBosch2005** Uses the algorithm of van den Bosch et al. [2005] to compute the mass loss rate.

### Excursion Set Barrier

Additional methods for the excursion set barrier can be added using the `excursionSetBarrierMethod` directive. The directive should contain a single argument, giving the name of a subroutine to be called to initialize the method. For example, the `linear` method is described by a directive:

```fortran
!# <excursionSetBarrierMethod>
!# <unitName>Excursion_Sets_Barriers_Linear_Initialize</unitName>
!# </excursionSetBarrierMethod>
```

Here, `Excursion_Sets_Barriers_Linear_Initialize` is the name of a subroutine which will be called to initialize the method. The initialization subroutine must have the following form:

```fortran
subroutine Method_Initialize(excursionSetBarrierMethodExcursion_Sets_Barrier_Get,Excursion_Sets_Barrier_Gradient_Get,barrierName)
    implicit none
    type (varying_string ), intent(in ) :: excursionSetBarrierMethod
    procedure(double precision),pointer, intent(inout) :: Excursion_Sets_Barrier_Get,Excursion_Sets_Barrier_Gradient_Get
    type(varying_string), intent(inout) :: barrierName
    if (excursionSetBarrierMethod == 'myMethod') then
        Excursion_Sets_Barrier_Get => My_Barrier
        Excursion_Sets_Barrier_Gradient_Get => My_Barrier_Gradient
        barrierName=barrierName//":myLabel"
    end if
    return
end subroutine Method_Initialize
```

where `myMethod` is the name of this method as will be specified by the `excursionSetBarrierMethod` input parameter. The procedure pointers `Excursion_Sets_Barrier_Get` and `Excursion_Sets_Barrier_Gradient_Get` must be set to point functions which return the barrier and its gradient respectively, as described below. The initialization subroutine should also append a descriptive label to the `barrierName`.
17. Adding New Methods

The initialization subroutine should perform any other tasks required to initialize the module (such as reading parameters etc.).

The barrier and barrier gradient functions must have the form:

double precision function Excursion_Sets_Barrier(variance, time)
  implicit none
  double precision, intent(in) :: variance, time
  .
  .
  return
end function Excursion_Sets_Barrier

The barrier function must return the barrier at the specified variance and time, while the barrier gradient function should return the derivative with respect to variance of the same barrier.

Currently defined excursion set barrier methods are:

- **linear** A linear (1st-order polynomial) barrier;
- **quadratic** A quadratic (2nd-order polynomial);
- **criticalOverdensity** A barrier equal to the critical overdensity for halo collapse.

**Excursion Set Barrier First Crossing Distribution**

Additional methods for the excursion set barrier first crossing distribution can be added using the `excursionSetFirstCrossingMethod` directive. The directive should contain a single argument, giving the name of a subroutine to be called to initialize the method. For example, the `linearBarrier` method is described by a directive:

```fortran
!# <excursionSetFirstCrossingMethod>
!# <unitName>Excursion_Sets_First_Crossing_Linear_Barrier_Initialize</unitName>
!# </excursionSetFirstCrossingMethod>
```

Here, `Excursion_Sets_First_Crossing_Linear_Barrier_Initialize` is the name of a subroutine which will be called to initialize the method. The initialization subroutine must have the following form:

```fortran
subroutine Method_Initialize(excursionSetFirstCrossingMethod, Excursion_Sets_First_Crossing_Probability_Get, & Excursion_Sets_First_Crossing_Rate_Get, Excursion_Sets_Non_Crossing_Rate_Get)
  implicit none
  type (varying_string), intent(in) :: excursionSetFirstCrossingMethod
  procedure(double precision), pointer, intent(inout) :: Excursion_Sets_First_Crossing_Probability_Get, &
  Excursion_Sets_First_Crossing_Rate_Get, Excursion_Sets_Non_Crossing_Rate_Get
  if (excursionSetFirstCrossingMethod == 'myMethod') then
    Excursion_Sets_First_Crossing_Probability_Get => My_First_Crossing_Probability
    Excursion_Sets_First_Crossing_Rate_Get => My_First_Crossing_Rate
    Excursion_Sets_Non_Crossing_Rate_Get => My_Non_Crossing_Rate
  end if
  return
end subroutine Method_Initialize
```
where myMethod is the name of this method as will be specified by the excursionSetFirstCrossingMethod input parameter. The procedure pointers Excursion_Sets_First_Crossing_Probability_Get, Excursion_Sets_First_Crossing_Rate_Get, and Excursion_Sets_Non_Crossing_Rate_Get must be set to point functions which return the first crossing probability, first crossing probability rate and noncrossing rate as described below. The initialization subroutine should perform any other tasks required to initialize the module (such as reading parameters etc.).

The first crossing probability function must have the form:

```fortran
double precision function Excursion_Sets_First_Crossing_Probability(variance,time)

  implicit none
  double precision, intent(in) :: variance, time

  .

  return

end function Excursion_Sets_First_Crossing_Probability
```

The function must return the first crossing probability per unit variance at the specified variance and time.

The first crossing probability rate function must have the form:

```fortran
double precision function Excursion_Sets_First_Crossing_Rate(variance,varianceProgenitor,time)

  implicit none
  double precision, intent(in) :: variance, varianceProgenitor, time

  .

  return

end function Excursion_Sets_First_Crossing_Rate
```

The function must return the rate of first crossing per unit variance at the specified variance and time for a progenitor of the specified varianceProgenitor.

The non-crossing probability rate function must have the form:

```fortran
double precision function Excursion_Sets_First_Non_Crossing_Rate(variance,time)

  implicit none
  double precision, intent(in) :: variance, time

  .

  return

end function Excursion_Sets_First_Non_Crossing_Rate
```

The function must return the rate of trajectories which never cross the barrier at the specified variance and time.

Currently defined excursion set barrier first crossing methods are:

- **linearBarrier** Assures the solution for a linear barrier;
- **Farahi** Solves the first crossing problem using the methodology of Benson et al. [2012];
- **ZhangHui2006** Solves the first crossing problem using the methodology of Zhang and Hui [2006];
- **ZhangHui2006HighOrder** Solves the first crossing problem using a higher order extension of the methodology of Zhang and Hui [2006].
17. Adding New Methods

**Excursion Set Barrier Remapping**

Additional methods for the excursion set barrier can be added using the `excursionSetBarrierRemapInitialize` directive. The directive should contain a single argument, giving the name of a subroutine to be called to initialize the method. For example, the `scale` method is described by a directive:

```plaintext
!# <excursionSetBarrierRemapInitialize>
!# <unitName>Excursion_Sets_Barriers_Remap_Scale.Initialize</unitName>
!# </excursionSetBarrierRemapInitialize>
```

Here, `Excursion_Sets_Barriers_Remap_Scale.Initialize` is the name of a subroutine which will be called to initialize the method. The initialization subroutine must have the following form:

```plaintext
subroutine Method_Initialize(excursionSetBarrierRemapMethods, barrierName, &
& ratesCalculation, matchedCount)
implicit none
    type(varying_string), intent(in), dimension(:) :: excursionSetBarrierRemapMethods
    type(varying_string), intent(inout) :: barrierName
    logical, intent(in) :: ratesCalculation
    integer, intent(inout) :: matchedCount

    if (any(excursionSetBarrierRemapMethods == 'myMethod')) then
        position = -1
        do i = 1, size(excursionSetBarrierRemapMethods)
            if (excursionSetBarrierRemapMethods(i) == 'myMethod') then
                position = i
                exit
            end if
        end do
        if (ratesCalculation) then
            methodRatesPosition = position
        else
            methodPosition = position
        end if
        matchedCount = matchedCount + 1
        barrierName = barrierName // " :myLabel"
    end if
    return
end subroutine Method_Initialize
```

where `myMethod` is the name of this method as will be specified by the `excursionSetBarrierRemapMethods` input parameter. The initialization subroutine should identify the position of the matched method in the `excursionSetBarrierRemapMethods()` array and record that it is active for standard barrier calculations (`ratesCalculation` = false) or for barriers used in crossing rate calculations (`ratesCalculation` = true). It should also increment the `matchedCount` argument (to allow checking that all specified barriers were matched) and append a descriptive label to the `barrierName` argument. The initialization subroutine should perform any other tasks required to initialize the module (such as reading parameters etc.).

The method must provide a subroutine to compute remapping of the barrier as follows:

```plaintext
!# <excursionSetBarrierRemap>
!# <unitName>Method_Barrier_Remap</unitName>
!# </excursionSetBarrierRemap>
```
subroutine Method_Barrier_Remap(barrier, variance, time, ratesCalculation, iRemap)
  implicit none
  double precision, intent(inout) :: barrier
  double precision, intent(in ) :: variance, time
  logical , intent(in ) :: ratesCalculation
  integer , intent(in ) :: iRemap

  if ((ratesCalculation.and.iRemap == methodRatesPosition).or.(.not.ratesCalculation.and.iRemap == methodPosition)) then
    ! Do remapping.
  .
  .
  end if
return
end subroutine Method_Barrier_Remap

and a subroutine to compute remapping of the barrier gradient as follows:

!# <excursionSetBarrierRemapGradient>
!# <unitName>Method_Barrier_Gradient_Remap</unitName>
!# </excursionSetBarrierRemapGradient>
subroutine Method_Barrier_Gradient_Remap(barrier, barrierGradient, variance, time, ratesCalculation, iRemap)
  implicit none
  double precision, intent(inout) :: barrier, barrierGradient
  double precision, intent(in ) :: variance, time
  logical , intent(in ) :: ratesCalculation
  integer , intent(in ) :: iRemap

  if ((ratesCalculation.and.iRemap == methodRatesPosition).or.(.not.ratesCalculation.and.iRemap == methodPosition)) then
    ! Do remapping.
  .
  .
  end if
return
end subroutine Method_Barrier_Gradient_Remap

Currently defined excursion set barrier remapping methods are:

null A null method which leaves the barrier unchanged;
scale Scales the barrier by a multiplicative factor;
Sheth-Mo-Tormen Remaps the barrier according to the algorithm of Sheth et al. [2001].

Galactic Component Radii Solver

Additional methods for solving for radii of galactic components can be added using the galacticStructureRadiusSolverMethod directive. The directive should contain a single argument, giving the name of a subroutine to be called to initialize the method. For example, the simple method is described by a directive:

!# <galacticStructureRadiusSolverMethod>
!# <unitName>Galactic_Structure_Radii_Simple_Initialize</unitName>
!# </galacticStructureRadiusSolverMethod>
Here, `Galactic_Structure_Radii_Simple_Initialize` is the name of a subroutine which will be called to initialize the method. The initialization subroutine must have the following form:

```fortran
subroutine Method_Initialize(galacticStructureRadiusSolverMethod, Galactic_Structure_Radii_Solve_Do)
  implicit none
  type(varying_string), intent(in) :: galacticStructureRadiusSolverMethod
  procedure(), pointer, intent(inout) :: Galactic_Structure_Radii_Solve_Do

  if (galacticStructureRadiusSolverMethod == 'myMethod') Galactic_Structure_Radii_Solve_Do => My_Method_Do_Procedure
  return
end subroutine Method_Initialize
```

where `myMethod` is the name of this method as will be specified by the `galacticStructureRadiusSolverMethod` input parameter. The procedure pointer `Galactic_Structure_Radii_Solve_Do` must be set to point to a subroutine which solves for the radii of components in a node as described below. The initialization subroutine should perform any other tasks required to initialize the module (such as reading parameters etc.).

The radii solving subroutine must have the form:

```fortran
subroutine Radii_Solver_Do(thisNode)
  implicit none
  type(treeNode), intent(in), pointer :: thisNode

  .
  .
  return
end subroutine Radii_Solver_Do
```

The function must set the radii (and corresponding circular velocities) of all components that have a radius property in `thisNode`.

Currently defined radius solver methods are:

**simple** This solver computes radii assuming that the gravitational potential is dominated by dark matter (i.e. no baryonic self-gravity is included) and that dark matter does not respond to the presence of baryons (i.e. no adiabatic contraction). It uses the “radius solver” (see §17.4.3) task to interact with the node.

**adiabatic** This solver computes radii including the effects of self-gravity of the baryonic component and adiabatic contraction of the dark matter halo using the method of Gnedin et al. [2004]. It uses the “radius solver” (see §17.4.3) task to interact with the node.

**linear** This solver assumes that radii scale linearly with specific angular momentum, equalling the virial radius when the specific angular momentum equals the product of virial radii and velocities. It uses the “radius solver” (see §17.4.3) task to interact with the node.

**fixed** This solver assumes that radii equal the product of virial radius of the halo and its spin parameter (with an adjustable coefficient). It uses the “radius solver” (see §17.4.3) task to interact with the node.

**Galactic Component Radius Solver Initial Radius**

Additional methods for computing the initial radius in the dark matter profile when solving for adiabatic contraction of the halo can be added using the `galacticStructureRadiusSolverInitialRadiusMethod`
17.4. Existing Method Types

directive. The directive should contain a single argument, giving the name of a subroutine to be called to initialize the method. For example, the adiabatic method is described by a directive:

```plaintext
!# <galacticStructureRadiusSolverInitialRadiusMethod>
!# <unitName>Galactic_Structure_Initial_Radii_Adiabatic_Initialize</unitName>
!# </galacticStructureRadiusSolverInitialRadiusMethod>
```

Here, `Galactic_Structure_Initial_Radii_Adiabatic_Initialize` is the name of a subroutine which will be called to initialize the method. The initialization subroutine must have the following form:

```plaintext
subroutine Method_Initialize(galacticStructureRadiusSolverInitialRadiusMethod,Galactic_Structure_Radius_Initial_Get,Galactic_Structure_Radius_Initial_Derivative_Get)
  implicit none
  type(varying_string), intent(in) :: galacticStructureRadiusSolverInitialRadiusMethod
  procedure(), pointer, intent(inout) :: Galactic_Structure_Radius_Initial_Get,Galactic_Structure_Radius_Initial_Derivative_Get
  if (galacticStructureRadiusSolverInitialRadiusMethod == 'myMethod') then
    Galactic_Structure_Radius_Initial_Get => My_Method_Get
    Galactic_Structure_Radius_Initial_Derivative_Get => My_Method_Derivative_Get
  end if
  return
end subroutine Method_Initialize
```

where `myMethod` is the name of this method as will be specified by the `galacticStructureRadiusSolverInitialRadiusMethod` input parameter. The procedure pointers `Galactic_Structure_Radius_Initial_Get` and `Galactic_Structure_Radius_Initial_Derivative_Get` must be set to point to functions which compute the initial radius in the dark matter halo given the final radius, and the derivative of this quantity with respect to the final radius as described below. The initialization subroutine should perform any other tasks required to initialize the module (such as reading parameters etc.).

The initial radius function must have the form:

```plaintext
double precision function Radius_Initial_Get(thisNode,radius)
  implicit none
  type (treeNode), intent(in ), pointer :: thisNode
  double precision , intent(in ) :: radius
  return
end function Radius_Initial_Get
```

The function must return the initial radius in the dark matter halo of `thisNode` corresponding to the final radius after accounting for the effects of adiabatic contraction.

The initial radius derivative function must have the form:

```plaintext
double precision function Radius_Initial_Derivative_Get(thisNode,radius)
  implicit none
  type (treeNode), intent(in ), pointer :: thisNode
  double precision , intent(in ) :: radius
  return
end function Radius_Initial_Derivative_Get
```
The function must return the derivative with respect to the final radius of initial radius in the dark matter halo of thisNode corresponding to the final radius after accounting for the effects of adiabatic contraction.

Currently defined initial radius methods are:

**static** This method assumes a static dark matter halo, and so the initial radius always equals the final radius.

**adiabatic** This method assumes adiabatic contraction follows the model of Gnedin et al. [2004].

**Hot Halo Ram Pressure Force**

Additional methods for the ram pressure stripping force due to hot halos can be added using the `hotHaloRamPressureForceMethod` directive. The directive should contain a single argument, giving the name of a subroutine to be called to initialize the method. For example, the `Font2008` method is described by a directive:

```
!# <hotHaloRamPressureForceMethod>
!# <unitName>Hot_Halo_Ram_Pressure_Force_Font2008_Initialize</unitName>
!# </hotHaloRamPressureForceMethod>
```

Here, `Hot_Halo_Ram_Pressure_Force_Font2008_Initialize` is the name of a subroutine which will be called to initialize the method. The initialization subroutine must have the following form:

```
subroutine Method_Initialize(hotHaloRamPressureForceMethod,Hot_Halo_Ram_Pressure_Force_Get)
  implicit none
  type(varying_string), intent(in) :: hotHaloRamPressureForceMethod
  procedure(), pointer, intent(inout) :: Hot_Halo_Ram_Pressure_Force_Get

  if (hotHaloRamPressureForceMethod == 'myMethod') Hot_Halo_Ram_Pressure_Force_Get => My_Hot_Halo_Ram_Pressure_Force_Get
  return
end subroutine Method_Initialize
```

where `myMethod` is the name of this method as will be specified by the `hotHaloRamPressureForceMethod` input parameter. The procedure pointer `Hot_Halo_Ram_Pressure_Force_Get` must be set to point to a function which returns ram pressure force due to the hot halo. The initialization subroutine should perform any other tasks required to initialize the module (such as reading parameters etc.).

The ram pressure force function must have the form:

```
double precision function Hot_Halo_Ram_Pressure_Force_Get(thisNode)
  implicit none
  type(treeNode), intent(inout), pointer :: thisNode

  .
  .
  .
  return
end function Hot_Halo_Ram_Pressure_Force_Get
```

The function must return the ram pressure force acting on thisNode due to the hot halo of its host node (in units of $M_\odot \text{km}^2 \text{s}^{-1} \text{Mpc}^{-3}$).

Currently defined hot halo ram pressure force methods are:

**null** Returns a zero ram pressure force.

**Font2008** Computes the ram pressure stripping radius using the algorithm of Font et al. [2008].
17.4. Existing Method Types

**Hot Halo Ram Pressure Stripping Radius**

Additional methods for the ram pressure stripping radius in hot halos can be added using the `hotHaloRamPressureStrippingMethod` directive. The directive should contain a single argument, giving the name of a subroutine to be called to initialize the method. For example, the `virialRadius` method is described by a directive:

```plaintext
!# <hotHaloRamPressureStrippingMethod>
!# <unitName>Hot_Halo_Ram_Pressure_Stripping_Virial_Radii.Initialize</unitName>
!# </hotHaloRamPressureStrippingMethod>
```

Here, `Hot_Halo_Ram_Pressure_Stripping_Virial_Radii.Initialize` is the name of a subroutine which will be called to initialize the method. The initialization subroutine must have the following form:

```plaintext
subroutine Method_Initialize(hotHaloRamPressureStrippingMethod, Hot_Halo_Ram_Pressure_Stripping_Get)
  implicit none
  type(varying_string), intent(in) :: hotHaloRamPressureStrippingMethod
  procedure(), pointer, intent(inout) :: Hot_Halo_Ram_Pressure_Stripping_Get

  if (hotHaloRamPressureStrippingMethod == 'myMethod') Hot_Halo_Ram_Pressure_Stripping_Get => My_Hot_Halo_Ram_Pressure_Stripping_Get
  return
end subroutine Method_Initialize
```

where `myMethod` is the name of this method as will be specified by the `hotHaloRamPressureStrippingMethod` input parameter. The procedure pointer `Hot_Halo_Ram_Pressure_Stripping_Get` must be set to point to a function which returns the radius to which the hot halo is stripped by ram pressure forces. The initialization subroutine should perform any other tasks required to initialize the module (such as reading parameters etc.).

The ram pressure stripping radius function must have the form:

```plaintext
double precision function Hot_Halo_Ram_Pressure_Stripping_Get(thisNode)
  implicit none
  type(treeNode), intent(inout), pointer :: thisNode
  .
  .
  return
end function Hot_Halo_Ram_Pressure_Stripping_Get
```

The function must return the radius (in units of Mpc) to which the hot halo of `thisNode` is stripped by ram pressure forces.

Currently defined hot halo ram pressure stripping radii methods are:

- **virialRadius** Sets the ram pressure stripping radius equal to the virial radius always—effectively resulting in no ram pressure stripping.

- **Font2008** Computes the ram pressure stripping radius using the algorithm of Font et al. [2008].

**Hot Halo Ram Pressure Stripping Timescale**

Additional methods for the ram pressure stripping timescale in hot halos can be added using the `hotHaloRamPressureStrippingTimescaleMethod` directive. The directive should contain a single argument, giving the name of a subroutine to be called to initialize the method. For example, the `virialRadius` method is described by a directive:
17. Adding New Methods

Here, \texttt{Hot\_Halo\_Ram\_Pressure\_Timescales\_Halo\_DynTime\_Initialize} is the name of a subroutine which will be called to initialize the method. The initialization subroutine must have the following form:

```fortran
subroutine Method\_Initialize(hotHaloRamPressureStrippingTimescaleMethod,Hot\_Halo\_Ram\_Pressure\_Stripping\_Get)
    implicit none
    type(varying\_string), intent(in) :: hotHaloRamPressureStrippingTimescaleMethod
    procedure(), pointer, intent(inout) :: Hot\_Halo\_Ram\_Pressure\_Timescale\_Get

    if (hotHaloRamPressureStrippingTimescaleMethod == 'myMethod') Hot\_Halo\_Ram\_Pressure\_Timescale\_Get => My\_Hot\_Halo\_Ram\_Pressure\_Timescale\_Get
    return
end subroutine Method\_Initialize
```

where \texttt{myMethod} is the name of this method as will be specified by the \texttt{hotHaloRamPressureStrippingTimescaleMethod} input parameter. The procedure pointer \texttt{Hot\_Halo\_Ram\_Pressure\_Timescale\_Get} must be set to point to a function which returns the timescale on which material is removed from the hot halo due to ram pressure forces. The initialization subroutine should perform any other tasks required to initialize the module (such as reading parameters etc.).

The ram pressure stripping timescale function must have the form:

```fortran
double precision function Hot\_Halo\_Ram\_Pressure\_Timescale\_Get(thisNode)
    implicit none
    type(tree\_Node), intent(inout), pointer :: thisNode

    return
end function Hot\_Halo\_Ram\_Pressure\_Timescale\_Get
```

The function must return the timescale (in units of Gyr) on which the hot halo of \texttt{thisNode} is being stripped by ram pressure forces.

Currently defined hot halo ram pressure stripping timescale methods are:

- \texttt{haloDynamicalTime} Sets the ram pressure stripping timescale equal to the dynamical time of the node’s dark matter halo
- \texttt{ramPressureAcceleration} Computes the timescale from the ram pressure acceleration following Roediger and Brácašggen [2007].

### Hot Halo Temperature Profile

Additional methods for the hot halo temperature profile can be added using the \texttt{hotHaloTemperatureMethod} directive. The directive should contain a single argument, giving the name of a subroutine to be called to initialize the method. For example, the \texttt{virial} method is described by a directive:

```fortran
!# <hotHaloTemperatureMethod>
!# <unitName>Hot\_Halo\_Temperature\_Virial</unitName>
!# </hotHaloTemperatureMethod>
```

Here, \texttt{Hot\_Halo\_Temperature\_Virial} is the name of a subroutine which will be called to initialize the method. The initialization subroutine must have the following form:
17.4. Existing Method Types

```
subroutine Method_Initialize(hotHaloTemperatureMethod, Hot_Halo_Temperature_Get, Hot_Halo_Temperature_Logarithmic_Slope_Get)
  implicit none
  type(varying_string), intent(in) :: hotHaloTemperatureMethod
  procedure(), pointer, intent(inout) :: Hot_Halo_Temperature_Get, Hot_Halo_Temperature_Logarithmic_Slope_Get
  if (hotHaloTemperatureMethod == 'myMethod') then
    Hot_Halo_Temperature_Get => My_Method_Get
    Hot_Halo_Temperature_Logarithmic_Slope_Get => My_Method_Logarithmic_Slope_Get
  end if
  return
end subroutine Method_Initialize
```

where `myMethod` is the name of this method as will be specified by the `hotHaloTemperatureMethod` input parameter. The procedure pointer `Hot_Halo_Temperature_Get` must be set to point to a function which returns the hot halo density as described below while `Hot_Halo_Temperature_Logarithmic_Slope_Get` must point to a function which returns the logarithmic slope of the temperature profile. The initialization subroutine should perform any other tasks required to initialize the module (such as reading parameters etc.).

The temperature function must have the form:

```
double precision function Hot_Halo_Temperature_Get(thisNode, radius)
  implicit none
  type(treeNode), intent(inout), pointer :: thisNode
  double precision, intent(in) :: radius
  .
  .
  return
end function Hot_Halo_Temperature_Get
```

The function must return the temperature (in Kelvin) of the hot halo at the specified radius (given in Mpc) for `thisNode`. The logarithmic slope function should have the same template, but return $d \ln T / d \ln r$.

Currently defined hot halo density profile methods are:

- **virial** Implements an isothermal profile with temperature equal to the virial temperature.

**Halo Bias**

Additional methods for the halo bias (i.e. the linear theory bias) can be added using the `darkMatterHaloBiasMethod` directive. The directive should contain a single argument, giving the name of a subroutine to be called to initialize the method. For example, the Press-Schechter method is described by a directive:

```
! # <darkMatterHaloBiasMethod>
! # <unitName>Dark_Matter_Halo_Bias_Press_Schechter_Initialize</unitName>
! # </darkMatterHaloBiasMethod>
```

Here, `Dark_Matter_Halo_Bias_Press_Schechter_Initialize` is the name of a subroutine which will be called to initialize the method. The initialization subroutine must have the following form:

```
subroutine Method_Initialize(darkMatterHaloBiasMethod, Dark_Matter_Halo_Bias_Node_Get, Dark_Matter_Halo_Bias_Get)
  implicit none
  type(varying_string), intent(in) :: darkMatterHaloBiasMethod
  procedure(), pointer, intent(inout) :: Dark_Matter_Halo_Bias_Get
```
17. Adding New Methods

if (darkMatterHaloBiasMethod == 'myMethod') then
    Dark_Matter_Halo_Bias_Node_Get => My_Method_Node_Get
    Dark_Matter_Halo_Bias_Get => My_Method_Get
end if
return
end subroutine Method_Initialize

where myMethod is the name of this method as will be specified by the darkMatterHaloBiasMethod input parameter. The procedure pointers Dark_Matter_Halo_Bias_Node_Get and Dark_Matter_Halo_Bias_Get must be set to point to functions which return the bias of the specified halo. The initialization subroutine should perform any other tasks required to initialize the module (such as reading parameters etc.).

The halo bias functions must have the following forms.

double precision function Dark_Matter_Halo_Bias_Node(thisNode)
    implicit none
    type(treeNode), intent(inout), pointer :: thisNode
    .
    .
    .
    return
end function Dark_Matter_Halo_Bias_Node

The function should return the linear theory bias for thisNode.

double precision function Dark_Matter_Halo_Bias(mass,time)
    implicit none
    double precision, intent(in) :: mass, time
    .
    .
    .
    return
end function Dark_Matter_Halo_Bias

The function should return the linear theory bias for the given mass and time. Two versions of these functions are provided because a common assumption is that the bias depends only on mass and time, while in reality it may depend on other properties of the halo (environment, formation time etc.). The first version of the function allows for arbitrary dependence on properties of the node.

Currently defined halo bias methods are:

SMT Implements the Sheth-Tormen [Sheth et al., 2001] bias.

Tinker2010 Implements the bias described by Tinker et al. [2010].

Halo Mass Functions

Additional methods for the halo mass function can be added using the haloMassFunctionMethod directive. The directive should contain a single argument, giving the name of a subroutine to be called to initialize the method. For example, the Press-Schechter method is described by a directive:
17.4. Existing Method Types

Here, Halo_Mass_Function_Press_Schechter_Initialize is the name of a subroutine which will be called to initialize the method. The initialization subroutine must have the following form:

```fortran
    implicit none
    type(varying_string), intent(in) :: haloMassFunctionMethod
    procedure(), pointer, intent(inout) :: Halo_Mass_Function_Tabulate

    return
end subroutine Method_Initialize
```

where myMethod is the name of this method as will be specified by the haloMassFunctionMethod input parameter. The procedure pointer Halo_Mass_Function_Differential_Get must be set to point to a subroutine which returns the differential form of the halo mass function. The initialization subroutine should perform any other tasks required to initialize the module (such as reading parameters etc.).

The halo mass function function must have the form:

```fortran
double precision function Halo_Mass_Function_Differential_Get(time, mass)
    implicit none
    double precision, intent(in ) :: time, mass

    return
end function Halo_Mass_Function_Differential_Get
```

The function should return the halo mass function, $dn/dM$ (in units of $Mpc^{-3}M_\odot^{-1}$) at mass $mass$ and time $time$.

Currently defined halo mass function methods are:

- **Sheth-Tormen** Implements the Sheth-Tormen [Sheth et al., 2001] mass function.
- **Tinker2008** Implements the mass function described by Tinker et al. [2008].

### Halo Mass Sampling Density Functions

Additional methods for halo mass sampling density functions can be added using the haloMassFunctionSamplingMethod directive. The directive should contain a single argument, giving the name of a subroutine to be called to initialize the method. For example, the powerLaw method is described by a directive:

```fortran
!# <haloMassFunctionSamplingMethod>
!# <unitName>Merger_Trees_Mass_Function_Sampling_Power_Law_Initialize</unitName>
!# </haloMassFunctionSamplingMethod>
```

Here, Merger_Trees_Mass_Function_Sampling_Power_Law_Initialize is the name of a subroutine which will be called to initialize the method. The initialization subroutine must have the following form:
17. Adding New Methods

```fortran
subroutine Method_Initialize(haloMassFunctionSamplingMethod, Merger_Tree_Construct_Mass_Function_Sampling_Get)
    implicit none
    type(varying_string), intent(in) :: haloMassFunctionSamplingMethod
    procedure(), pointer, intent(inout) :: Merger_Tree_Construct_Mass_Function_Sampling_Get

    if (haloMassFunctionSamplingMethod == 'myMethod') Merger_Tree_Construct_Mass_Function_Sampling_Get => My_Mass_Function_Sampling
    return
end subroutine Method_Initialize
```

where **myMethod** is the name of this method as will be specified by the **haloMassFunctionSamplingMethod** input parameter. The procedure pointer **Merger_Tree_Construct_Mass_Function_Sampling_Get** must be set to point to a function which returns the sampling rate per unit decade of halo mass.

The halo mass sampling density function must have the form:

```fortran
double precision function My_Mass_Function_Sampling(mass, time, massMinimum, massMaximum)
    implicit none
    double precision, intent(in) :: mass, time, massMinimum, massMaximum
    .
    .
    return
end function My_Mass_Function_Sampling
```

The function should return the halo mass sampling density function (the relative number of halos per decade of halo mass to sample) for halos of the given **mass**. Halos are defined at the given **time** and will be sampled in the mass range **massMinimum** to **massMaximum**.

Currently defined halo mass sampling density function methods are:

- **powerLaw** The distribution of halo masses is such that the mass of the i<sup>th</sup> halo is
  \[ M_{\text{halo},i} = \exp \left[ \ln(M_{\text{halo, min}}) + \ln \left( \frac{M_{\text{halo, max}}}{M_{\text{halo, min}}} \right) x_i \right]^{1+\alpha} \].
  (17.6)

  Here, \( x_i \) is a number between 0 and 1 and \( \alpha = \text{mergerTreeBuildTreesHaloMassExponent} \) is an input parameter that controls the relative number of low and high mass tree produced.

- **haloMassFunction** The sampling density is set equal to the dark matter halo mass function, defined per decade of halo mass.

- **stellarMassFunction** The sampling density is chosen to give optimally minimal errors on the model stellar mass function (see §10.4.1 for full details).

**Halo Spin Distribution**

Additional methods for the halo spin distribution can be added using the **haloSpinDistributionMethod** directive. The directive should contain a single argument, giving the name of a subroutine to be called to initialize the method. For example, the **lognormal** method is described by a directive:

```
!# <haloSpinDistributionMethod>
!# <unitName>Halo_Spin_Distribution_Lognormal_Initialize</unitName>
!# </haloSpinDistributionMethod>
```

Here, **Halo_Spin_Distribution_Lognormal_Initialize** is the name of a subroutine which will be called to initialize the method. The initialization subroutine must have the following form:
subroutine Method_Initialize(haloSpinDistributionMethod,Halo_Spin_Sample_Get)
  implicit none
  type(varying_string), intent(in) :: haloSpinDistributionMethod
  procedure(), pointer, intent(inout) :: Halo_Spin_Sample_Get

  if (haloSpinDistributionMethod == 'myMethod') Halo_Spin_Sample_Get => My_Method_Get
  return
end subroutine Method_Initialize

where myMethod is the name of this method as will be specified by the haloSpinDistributionMethod input parameter. The procedure pointer Halo_Spin_Sample_Get must be set to point to a function which returns a halo spin drawn at random from the distribution. The initialization subroutine should perform any other tasks required to initialize the module (such as reading parameters etc.).

The halo spin sampling function must have the form:

double precision function Halo_Spin_Sample_Get(thisNode)
  implicit none
  type(treeNode), intent(inout), pointer :: thisNode
  .
  .
  .
  return
end function Halo_Spin_Sample_Get

The function must return a halo spin drawn at random for the distribution appropriate to thisNode.

Currently defined halo spin distribution methods are:

lognormal  Implements a lognormal distribution with median lognormalSpinDistributionMedian and dispersion in ln λ of lognormalSpinDistributionSigma, both of which are input parameters to GALACTICUS.

Bett2007  Implements distribution from Bett et al. [2007] with parameter λ₀ = [spinDistributionBett2007Lambda0] and α = [spinDistributionBett2007Alpha], both of which are input parameters to GALACTICUS.

Initial Mass Function Functions

Each registered IMF must provide multiple functions, specified by the following directives:

!# <imfRecycledInstantaneous>
!# <unitName>Star_Formation_IMF_Recycled_Instantaneous_My_IMF</unitName>
!# </imfRecycledInstantaneous>

!# <imfYieldInstantaneous>
!# <unitName>Star_Formation_IMF_Yield_Instantaneous_My_IMF</unitName>
!# </imfYieldInstantaneous>

!# <imfTabulate>
!# <unitName>Star_Formation_IMF_Tabulate_My_IMF</unitName>
!# </imfTabulate>

!# <imfMinimumMass>
!# <unitName>Star_Formation_IMF_Minimum_Mass_My_IMF</unitName>

801
17. Adding New Methods

These functions/subroutines should have the following forms:

```fortran
subroutine Star_Formation_IMF_Recycled_Instantaneous_My_IMF(imfSelected, imfMatched, recycledFraction)
  integer, intent(in) :: imfSelected
  logical, intent(inout) :: imfMatched
  double precision, intent(out) :: recycledFraction

  if (imfSelected == imfIndex) then
    imfMatched=.true.
  end if
  return
end subroutine Star_Formation_IMF_Recycled_Instantaneous_My_IMF

subroutine Star_Formation_IMF_Yield_Instantaneous_My_IMF(imfSelected, imfMatched, yield)
  integer, intent(in) :: imfSelected
  logical, intent(inout) :: imfMatched
  double precision, intent(out) :: yield

  if (imfSelected == imfIndex) then
    imfMatched=.true.
  end if
  return
end subroutine Star_Formation_IMF_Yield_Instantaneous_My_IMF

subroutine Star_Formation_IMF_Tabulate_My_IMF(imfSelected, imfMatched, imfMass, imfPhi)
  integer, intent(in) :: imfSelected
  logical, intent(inout) :: imfMatched
  double precision, intent(inout), allocatable, dimension(:) :: imfMass, imfPhi

  if (imfSelected == imfIndex) then
    imfMatched=.true.
  end if
```

802
return
end subroutine Star_Formation_IMF_Tabulate_My_IMF

subroutine Star_Formation_IMF_Minimum_Mass_My_IMF(imfSelected,imfMatched,minimumMass)
implicit none
integer, intent(in) :: imfSelected
logical, intent(inout) :: imfMatched
double precision, intent(out) :: minimumMass

if (imfSelected == imfIndex) then
    .
    .
    .
    imfMatched=.true.
end if
return
end subroutine Star_Formation_IMF_Minimum_Mass_My_IMF

subroutine Star_Formation_IMF_Maximum_Mass_My_IMF(imfSelected,imfMatched,minimumMass)
implicit none
integer, intent(in) :: imfSelected
logical, intent(inout) :: imfMatched
double precision, intent(out) :: maximumMass

if (imfSelected == imfIndex) then
    .
    .
    .
    imfMatched=.true.
end if
return
end subroutine Star_Formation_IMF_Maximum_Mass_My_IMF

subroutine Star_Formation_IMF_Phi_My_IMF(imfSelected,imfMatched,imfMass,imfPhi)
integer, intent(in) :: imfSelected:: imfSelected
logical, intent(inout) :: imfMatched:: imfMatched
double precision, intent(inout) :: imfMass:: imfMass
double precision, intent(out) :: imfPhi:: imfPhi

if (imfSelected == imfIndex) then
    .
    .
    .
    imfMatched=.true.
end if
return
end subroutine Star_Formation_IMF_Phi_My_IMF

In each case the procedure should check if the supplied imfSelected index matches the index which this IMF was given when it was registered. If it is, then imfMatched should be set to true. The procedures
should then perform as follows:

*Star* Formation_\text{IMF} Yield\_Instantaneous\_My\_IMF* Return a suitable metal yield in \textit{yield} for this IMF in the instantaneous recycling approximation.

*Star* Formation_\text{IMF} Recycled\_Instantaneous\_My\_IMF* Return a suitable recycled fraction in \textit{recycledFraction} for this IMF in the instantaneous recycling approximation.

*Star* Formation_\text{IMF} Tabulate\_My\_IMF* Allocate the \textit{imfMass()} and \textit{imfPhi()} arrays and fill them with a tabulation of the IMF. The routine can choose the size of the tabulation and should ensure that it is sufficient to resolve any features in the IMF.

*Star* Formation_\text{IMF} Minimum\_Mass\_My\_IMF* Return the lowest mass for which the IMF is non-zero.

*Star* Formation_\text{IMF} Maximum\_Mass\_My\_IMF* Return the largest mass for which the IMF is non-zero.

*Star* Formation_\text{IMF} Phi\_My\_IMF* Return the IMF for the specified \textit{imfMass} initial stellar mass.

Currently defined IMFs are described in §13.22.2.

**Initial Mass Function Selection**

Additional methods for selection of initial mass functions can be added using the \texttt{imfSelectionMethod} directive. The directive should contain a single argument, giving the name of a subroutine to be called to initialize the method. For example, the \texttt{fixed} method is described by a directive:

```bash
!# <imfSelectionMethod>
!# <unitName>IMF_Select_Fixed.Initialize</unitName>
!# </imfSelectionMethod>
```

Here, \texttt{IMF_Select\_Fixed\_Initialize} is the name of a subroutine which will be called to initialize the method. The initialization subroutine must have the following form:

```fortran
subroutine Method\_Initialize(imfSelectionMethod,IMF\_Select,imfNames)
  implicit none
  type(varying_string), intent(in) :: imfSelectionMethod,imfNames(:)
  procedure(), pointer, intent(inout) :: IMF\_Select

  if (imfSelectionMethod == 'myMethod') then
    IMF\_Select\_Fixed => My\_Selection\_Procedure
  end if
  return
end subroutine Method\_Initialize
```

where \texttt{myMethod} is the name of this method as will be specified by the \texttt{imfSelectionMethod} input parameter. The procedure pointer \texttt{IMF\_Select} must be set to point to a function which returns the index of the selected IMF as described below. The initialization subroutine should perform any other tasks required to initialize the module (such as reading parameters etc.). The input array \texttt{imfNames()} contains a list of all available IMF names and can be used for index determination.

The selection function must have the form:
integer function IMF_Select(starFormationRate, fuelAbundances, component)
  double precision, intent(in) :: starFormationRate
  type(abundancesStructure), intent(in) :: fuelAbundances
  integer, intent(in) :: component
  
  return
end function IMF_Select

The function must return the index of the IMF appropriate for the given starFormationRate (in $M_\odot$ Gyr$^{-1}$), fuelAbundances and component (using the component labels provided by the Galactic_Structure_Options module).

Currently defined IMF selection methods are:

- **fixed**: A fixed IMF is used irrespective of physical conditions. The IMF is specified by the input parameter imfSelectionFixed.

- **diskSpheroid**: Uses different IMFs for star formation in disks and in spheroids irrespective of other physical conditions. The IMFs are specified by the input parameters imfSelectionDisk and imfSelectionSpheroid.

### Linear Growth Function

Additional methods for the linear growth factor can be added using the linearGrowthMethod directive. The directive should contain a single argument, giving the name of a subroutine to be called to initialize the method. For example, the simple method is described by a directive:

```fortran
!# <linearGrowthMethod>
!# <unitName>Growth_Factor_Simple_Initialize</unitName>
!# </linearGrowthMethod>
```

Here, `Growth_Factor_Simple_Initialize` is the name of a subroutine which will be called to initialize the method. The initialization subroutine must have the following form:

```fortran
subroutine Method_Initialize(linearGrowthMethod, Linear_Growth_Tabulate)
  implicit none
  type(varying_string), intent(in) :: linearGrowthMethod
  procedure(), pointer, intent(inout) :: Linear_Growth_Tabulate

  if (linearGrowthMethod.eq.'myMethod') then
    Linear_Growth_Tabulate => My_Do_Tabulate
  
  end if
  
  return
end subroutine Method_Initialize
```

where `myMethod` is the name of this method as will be specified by the linearGrowthMethod input parameter. The procedure pointer `Linear_Growth_Tabulate` must be set to point to a subroutine which tabulates the linear growth factor as described below. The initialization subroutine should perform any other tasks required to initialize the module (such as reading parameters etc.).

The tabulation subroutine must have the form:
subroutine Linear_Growth_Tabulate(time, growthTableNumberPoints, growthTableTime, growthTableWavenumber, & growthTableGrowthFactor, normalizationMatterDominated)
    implicit none
    double precision, intent(in) :: time
    integer, intent(out) :: growthTableNumberPoints
    double precision, intent(inout), allocatable, dimension(:) :: growthTableTime, growthTableWavenumber
    double precision, intent(inout), allocatable, dimension(:, :) :: growthTableGrowthFactor
    double precision, intent(out), dimension(3) :: normalizationMatterDominated
    return
end subroutine Linear_Growth_Tabulate

The subroutine must tabulate the linear growth factor in array growthTableGrowthFactor() for dark matter, baryons and radiation (entries 1, 2 and 3 of the first dimension respectively) as a function of time growthTableTime() (second dimension) and wavenumber growthTableWavenumber() (third dimension). These arrays must be allocated to the correct size, and may be previously allocated, therefore requiring a deallocation. The number of tabulated points in the time dimension should be returned in growthTableNumberPoints. It is permissible to tabulate for just a single wavenumber if the growth function is independent of wavenumber. The subroutine should ensure that the currently requested time is within the range of the tabulated function (preferably with some buffer). The linear growth factors must be normalized to unity at $a = 1$. Additionally, normalizationMatterDominated should be set to the factor by which the tabulated growth factor (for the smallest wavenumber tabulated) must be multiplied such that it scales as $(9\Omega_M/4\theta_0)_{1/3}(H_0t)^{2/3}$ during the matter dominated regime.

Currently defined linear growth factor methods are:

**simple** The linear growth factor is computed for a Universe containing collisionless matter and a cosmological constant.

**Merger Tree Branching**

Additional methods for merger tree branching can be added using the treeBranchingMethod directive. The directive should contain a single argument, giving the name of a subroutine to be called to initialize the method. For example, the modifiedPress-Schechter method is described by a directive:

```
!# <treeBranchingMethod>
!# <unitName>Modified_Press_Schechter_Branching.Initialize</unitName>
!# </treeBranchingMethod>
```

Here, Modified_Press_Schechter_Branching.Initialize is the name of a subroutine which will be called to initialize the method. The initialization subroutine must have the following form:

```subroutine Method.Initialize(treeBranchingMethod, TreeBranchingProbability, TreeSubresolutionFraction, TreeBranch_Mass, TreeMaximumStep)
    type(varying_string), intent(in) :: treeBranchingMethod
    procedure(), pointer, intent(inout) :: TreeBranchingProbability, TreeSubresolutionFraction, TreeBranch_Mass, TreeMaximumStep
    if (treeBranchingMethod == 'myMethod') then
        TreeBranchingProbability => My_Branching_Probability
        TreeSubresolutionFraction => My_Subresolution_Fraction
        TreeMaximumStep => My_Maximum_Step
        TreeBranch_Mass => My_Branch_Mass
    .
```

806
17.4. Existing Method Types

where method is the name of this method as will be specified by the treeBranchingMethod input parameter. The procedure pointers must be set to point to routines which perform various functions as described below. The initialization subroutine should perform any other tasks required to initialize the module (such as reading parameters etc.).

The procedure pointers must point to functions with the following templates:

```fortran
double precision function My_Branch_Mass(haloMass,deltaCritical,massResolution,probability)
    double precision, intent(in) :: haloMass,deltaCritical,massResolution,probability
    .
    .
    return
end function My_Branch_Mass
```

```fortran
double precision function My_Branching_Maximum_Step(haloMass,deltaCritical,massResolution)
    double precision, intent(in) :: haloMass,deltaCritical,massResolution
    .
    .
    return
end function My_Branching_Maximum_Step
```

```fortran
double precision function My_Branching_Probability(haloMass,deltaCritical,massResolution)
    double precision, intent(in) :: haloMass,deltaCritical,massResolution
    .
    .
    return
end function My_Branching_Probability
```

```fortran
double precision function My_Subresolution_Fraction(haloMass,deltaCritical,massResolution)
    double precision, intent(in) :: haloMass,deltaCritical,massResolution
    .
    .
    return
end function My_Subresolution_Fraction
```

Tree_Branching_Probability must point to a function which returns the probability per unit change in \( \delta_{\text{crit}} \) that a halo of mass haloMass at time deltaCritical will undergo a branching to progenitors with mass greater than massResolution. Tree_Subresolution_Fraction must point to a function which returns the fraction of mass accreted in subresolution halos, i.e. those below massResolution, per unit change in \( \delta_{\text{crit}} \) for a halo of mass haloMass at time deltaCritical, or a negative value if the halo is so close to the resolution limit that this number cannot be determined accurately. Tree_Maximum_Step must point to a function which returns the maximum allowed step in \( \delta_{\text{crit}} \) that a halo of mass haloMass
17. Adding New Methods

At time $\Delta_{\text{critical}}$ should be allowed to take. $\text{Tree\_Branch\_Mass}$ must point to a function which returns the mass of one of the halos to which the given halo branches, given the branching probability, probability.

Currently defined merger tree branching methods are:

- **modifiedPress-Schechter** Branching probabilities are computed using the method of Parkinson et al. [2008]. Progenitor mass functions generated using GALACTICUS’s implementation of this algorithm (and the Cole et al. [2000] merger tree building algorithm) are shown in Fig. 17.2.

- **generalizedPress-Schechter** Branching probabilities are computed using excursion set barrier first crossing rates (computed using the selected $\text{excursionSetFirstCrossingMethod}$; see §17.4.1), modified by the selected $\text{treeBranchingModifierMethod}$ (see §17.4.1).

### Merger Tree Branching Modifiers

Additional methods for merger tree branching probability modifiers can be added using the $\text{treeBranchingModifierMethod}$ directive. The directive should contain a single argument, giving the name of a subroutine to be called to initialize the method. For example, the null method is described by a directive:

```verbatim
#!/ <treeBranchingModifierMethod>
#!/ <unitName>Merger_Tree_Branching_Modifiers_Null_Initialize</unitName>
#!/ </treeBranchingModifierMethod>
```

Here, $\text{Merger\_Tree\_Branching\_Modifiers\_Null\_Initialize}$ is the name of a subroutine which will be called to initialize the method. The initialization subroutine must have the following form:

```fortran
subroutine Method_Initialize(treeBranchingModifierMethod, Merger_Tree_Branching_Modifier_Get)
  type (varying_string), intent(in) :: treeBranchingModifierMethod
  procedure(double precision), pointer, intent(inout) :: Merger_Tree_Branching_Modifier_Get

  if (treeBranchingModifierMethod == 'myMethod') then
    Merger_Tree_Branching_Modifier_Get => My_Get
  end if
  return
end subroutine Method_Initialize
```

where $\text{myMethod}$ is the name of this method as will be specified by the $\text{treeBranchingModifierMethod}$ input parameter. The procedure pointer $\text{Merger\_Tree\_Branching\_Modifier\_Get}$ must build and return the modifier to the branching probability as described below. The initialization subroutine should perform any other tasks required to initialize the module (such as reading parameters etc.).

The branching probability modifier function should have the interface:

```fortran
subroutine Merger_Tree_Branching_Modifier_Get(parentDelta, childSigma, parentSigma)
  double precision, intent(in) :: parentDelta, childSigma, parentSigma

  return
end subroutine Merger_Tree_Branching_Modifier_Get
```
Figure 17.2.: Progenitor mass functions at redshifts $z = 0.5, 1, 2$ and $4$ (bottom to top) for halos of mass $10^{12\pm0.151}, 10^{13.5\pm0.151}$ and $10^{15\pm0.151} h^{-1} M_\odot$ (left to right) are shown. Green lines are measured from the Millennium Simulation, while red lines are computed using GALACTICUS’s merger tree building routines (with the Parkinson et al. [2008] branching algorithm and the Cole et al. [2000] tree building algorithm).
and should return the multiplicative modifier to the branching probability for the given parentDelta, childSigma and parentSigma.

Currently defined merger tree branching probability modifier methods are:

null Makes no modification;

Parkinson-Cole-Helly2008 Modifies branching rates according to the algorithm of Parkinson et al. [2008].

Merger Tree Building

Additional methods for merger tree building can be added using the mergerTreeBuildMethod directive. The directive should contain a single argument, giving the name of a subroutine to be called to initialize the method. For example, the Cole2000 method is described by a directive:

```mergerTreeBuildMethod
<unitName>Merger_Tree_Build_Cole2000_Initialize</unitName>
</mergerTreeBuildMethod>
```

Here, Merger_Tree_Build_Cole2000_Initialize is the name of a subroutine which will be called to initialize the method. The initialization subroutine must have the following form:

```fortran
subroutine Method_Initialize(mergerTreeBuildMethod,Merger_Tree_Build)
  type(varying_string), intent(in) :: mergerTreeBuildMethod
  procedure(), pointer, intent(inout) :: Merger_Tree_Build
  if (mergerTreeBuildMethod == 'myMethod') then
    Merger_Tree_Build => My_Do_Tabulate
  .
  .
  end if
  return
end subroutine Method_Initialize
```

where myMethod is the name of this method as will be specified by the mergerTreeBuildMethod input parameter. The procedure pointer Merger_Tree_Build must build and return a merger tree given the a base node as described below. The initialization subroutine should perform any other tasks required to initialize the module (such as reading parameters etc.).

```fortran
subroutine Merger_Tree_Build_Do(thisTree)
  type(mergerTree), intent(inout) :: thisTree
  .
  .
  return
end subroutine Merger_Tree_Build_Do
```

and should return a full merger tree in thisTree built from the base node which will already be set in thisTree. The tree must have at least masses, times and parent/child/sibling links created. Other properties (e.g. spins) can be optionally included also.

Currently defined merger tree building methods are:

17.4. Existing Method Types

**Merger Tree Building Mass Resolution**

Additional methods for the mass resolution to use when building merger trees can be added using the `mergerTreesBuildMassResolution` directive. The directive should contain a single argument, giving the name of a subroutine to be called to initialize the method. For example, the `fixed` method is described by a directive:

```plaintext
!# <mergerTreesBuildMassResolution>
!# <unitName>Merger_Trees_Build_Mass_Resolution_Fixed_Initialize</unitName>
!# </mergerTreesBuildMassResolution>
```

Here, `Merger_Trees_Build_Mass_Resolution_Fixed_Initialize` is the name of a subroutine which will be called to initialize the method. The initialization subroutine must have the following form:

```plaintext
subroutine Method_Initialize(mergerTreesBuildMassResolutionMetod,Merger_Tree_Build_Mass_Resolution_Get)
  type(varying_string), intent(in) :: mergerTreesBuildMassResolutionMetod
  procedure(), pointer, intent(inout) :: Merger_Tree_Build_Mass_Resolution_Get
  if (mergerTreesBuildMassResolutionMetod == 'myMethod') then
    Merger_Tree_Build_Mass_Resolution_Get => My_Merger_Tree_Build_Mass_Resolution
  .
  .
  end if
  return
end subroutine Method_Initialize
```

where `myMethod` is the name of this method as will be specified by the `mergerTreesBuildMassResolutionMetod` input parameter. The procedure pointer `Merger_Tree_Build_Mass_Resolution_Get` must be set to point to a function which returns the mass resolution to use for a given tree as described below. The initialization subroutine should perform any other tasks required to initialize the module (such as reading parameters etc.).

The mass resolution function should have the form:

```plaintext
double precision function Merger_Tree_Build_Mass_Resolution(thisTree)
  type(mergerTree), intent(in ) :: thisTree
  .
  .
  return
end function Merger_Tree_Build_Mass_Resolution
```

and should return the mass resolution to use when building `thisTree`. Note that the base node in `thisTree` will already be set.

Currently defined merger tree building mass resolution methods are:

- **fixed** Uses a fixed mass resolution for all trees.
- **scaled** The resolution is set to a fraction of the tree base node mass (or a defined minimum, whichever is larger).
17. Adding New Methods

Merger Tree Construction

Additional methods for merger tree construction can be added using the `mergerTreeConstructMethod` directive. The directive should contain a single argument, giving the name of a subroutine to be called to initialize the method. For example, the `build` method is described by a directive:

```mergerTreeConstructMethod
!# <mergerTreeConstructMethod>
!# <unitName>Merger_Tree_Build.Initialize</unitName>
!# </mergerTreeConstructMethod>
```

Here, `Merger_Tree_Build.Initialize` is the name of a subroutine which will be called to initialize the method. The initialization subroutine must have the following form:

```fortran
subroutine Method_Initialize(mergerTreeConstructMethod,Merger_Tree_Construct)
  type(varying_string), intent(in) :: mergerTreeConstructMethod
  procedure(), pointer, intent(inout) :: Merger_Tree_Construct
  if (mergerTreeConstructMethod == 'myMethod') then
    Merger_Tree_Construct => My_Do_Tabulate
    ...
  end if
  return
end subroutine Method_Initialize
```

where `myMethod` is the name of this method as will be specified by the `mergerTreeConstructMethod` input parameter. The procedure pointer `Merger_Tree_Construct` must be set to point to a function which returns a fully constructed merger tree as described below. The initialization subroutine should perform any other tasks required to initialize the module (such as reading parameters etc.).

The construction subroutine should have the following form:

```fortran
subroutine Merger_Tree_Construct_Do(thisTree,skipTree)
  type(mergerTree), intent(inout) :: thisTree
  logical, intent(in) :: skipTree
  return
end subroutine Merger_Tree_Construct_Do
```

and should return a full merger tree in `thisTree`, unless `skipTree` is true, in which case this tree will be skipped (i.e. not evolved or output) and so it suffices to merely allocate the base node—there is no need to create the entire tree (although it is permissible to do so)—and update any internal data (e.g. a count of trees constructed) as required. The tree must have at least masses, times and parent/child/sibling links created. Other properties (e.g. spins) can be optionally included also. By default, the tree is assumed to be “uninitialized”, such that the merger tree initialization function will be called prior to the tree being evolve. If the tree construction method returns a fully initialized tree it should set `thisTree%initialized=.true.`.

Currently defined merger tree construction methods are:

- **build** Generates a set of halo masses distributed between `mergerTreeBuildHaloMassMinimum` and `mergerTreeBuildHaloMassMaximum` (with `mergerTreeBuildTreesPerDecade` halos per decade of mass) at redshift `mergerTreeBuildTreesBaseRedshift`. 
or with masses read from a file, and then uses the selected merger tree build method (see §17.4.1) to build trees from these base nodes;

**read**  Reads merger tree data from an HDF5 file (see §6.2). The file to read is specified by the [mergerTreeReadFileName] parameter.

**smoothAccretion** Constructs a branchless merger tree with a smooth accretion history using the selected mass accretion history method (see §17.4.1). See §13.25.4 for details.

**stateRestore** Intended primarily for debugging purposes, this method will restore a tree whose complete internal state was written to file. See §13.25.5 for details of how to use this method.

**fullySpecified** Intended primarily for constructing test cases, this method allows the full state of the merger tree (and all components of nodes) to be specified via an XML document. See §13.25.3 for details of how to use this method.

### Non-linear Matter Power Spectrum

Additional methods for the non-linear matter power spectrum can be added using the `powerSpectrumNonlinearMethod` directive. The directive should contain a single argument, giving the name of a subroutine to be called to initialize the method. For example, the Peacock-Dodds1996 method is described by a directive:

```
!# <powerSpectrumNonlinearMethod>
!# <unitName>Nonlinear_Power_Spectrum_Power_Law.Initialize</unitName>
!# </powerSpectrumNonlinearMethod>
```

Here, `Power_Spectrum_Nonlinear_PeacockDodds1996.Initialize` is the name of a subroutine which will be called to initialize the method. The initialization subroutine must have the following form:

```fortran
subroutine Method_Initialize(powerSpectrumNonlinearMethod,Power_Spectrum_Nonlinear_Get)
  implicit none
  type (varying_string ), intent(in ) :: powerSpectrumNonlinearMethod
  procedure(double precision), pointer, intent(inout) :: Power_Spectrum_Nonlinear_Get

  if (powerSpectrumNonlinearMethod == 'myMethod') then
    Power_Spectrum_Nonlinear_Get => My_Get
  .
  .
  end if
  return
end subroutine Method_Initialize
```

where **myMethod** is the name of this method as will be specified by the `powerSpectrumNonlinearMethod` input parameter. The procedure pointer `Power_Spectrum_Nonlinear_Get` must be set to point to a subroutine which computes the non-linear matter power spectrum as described below. The initialization subroutine should perform any other tasks required to initialize the module (such as reading parameters etc.).

The non-linear matter power spectrum function must have the form:

```fortran
double precision function Nonlinear_Power_Spectrum(wavenumber,time)
  implicit none
  double precision, intent(in ) :: wavenumber,time
```

813
17. Adding New Methods

The function must return the non-linear matter power spectrum, \( P_n(k) \), at the requested wavenumber (in units of Mpc\(^{-1}\)) and time (in units of Gyr).

Currently defined non-linear matter power spectrum methods are:

- **linear** Simply returns the linear matter power spectrum. Intended primarily for testing purposes.
- **Peacock-Dodds1996** Uses the fitting function of Peacock and Dodds [1996] to compute the non-linear matter power spectrum.
- **CosmicEmu** Utilizes the cosmic emulator (“CosmicEmu”) code of Lawrence et al. [2010] to compute the non-linear matter power spectrum.

### Chemical Reaction Rates

Additional methods for chemical species reaction rates can be added using the `chemicalReactionRatesMethods` directive. Note that more than one method can be specified in which cases rates are cumulative over all selected methods. The directive should contain a single argument, giving the name of a subroutine to be called to initialize the method. For example, the `hydrogenNetwork` method is described by a directive:

```plaintext
!# <chemicalReactionRatesMethods>
!# <unitName>Chemical_Hydrogen_Rates_Initialize</unitName>
!# </chemicalReactionRatesMethods>
```

Here, `Chemical_Hydrogen_Rates_Initialize` is the name of a subroutine which will be called to initialize the method. The initialization subroutine must have the following form:

```plaintext
subroutine Method_Initialize(chemicalReactionRatesMethods)
    implicit none
    type(varying_string), intent(in) :: chemicalReactionRatesMethods
    if (chemicalReactionRatesMethods == 'myMethod') then
        ratesSelected = .true.
    .
    .
    end if
    return
end subroutine Method_Initialize
```

where `myMethod` is the name of this method as will be specified by the `chemicalReactionRatesMethods` input parameter. The `ratesSelected` variable is set to true if the method is active and will be checked on all subsequent calls to the module such that rates are computed only if `ratesSelected` is true. The initialization subroutine should perform any other tasks required to initialize the module (such as reading parameters etc.).

The method must provide a subroutine to compute the chemical reaction rates. This subroutine is specified by the `chemicalRatesCompute` directive. The directive should contain a single argument, giving the name of a subroutine to be called to compute rates. For example, the `hydrogenNetwork` method uses:
Here, *Chemical_Hydrogen_Rates_Compute* is the name of a subroutine which will be called to compute the rates. The rates subroutine must have the following form:

```fortran
subroutine Compute_Rates(temperature, chemicalDensity, radiation, chemicalRates)
  implicit none
  type(chemicalAbundancesStructure), intent(in) :: chemicalDensity
  double precision, intent(in) :: temperature
  type(radiationStructure), intent(in) :: radiation
  type(chemicalAbundancesStructure), intent(inout) :: chemicalRates

  ! Exit immediately if this method is not active.
  if (.not.ratesSelected) return

  ! Compute rates for all species present.
  .
  .
  .
  return
end subroutine Compute_Rates
```

Here, *temperature* is the temperature of the gas, *chemicalDensity* provides the densities (in cm\(^{-3}\)) of all chemicals, the radiation field is described by the *radiation* object and any reaction rates should be added to the *chemicalRates* object in units of cm\(^{-3}\) s\(^{-1}\).

Currently defined chemical reaction rate methods are:

- **null** A null method which does not affect any rates.
- **hydrogenNetwork** Computes rates using the network of reactions and fitting functions from Abel et al. [1997] and Tegmark et al. [1997].

**Population III Supernovae**

Additional methods for Population III supernovae can be added using the *supernovaePopIIIMethod* directive. The directive should contain a single argument, giving the name of a subroutine to be called to initialize the method. For example, the *Heger-Woosley2002* method is described by a directive:

```fortran
! <supernovaePopIIIMethod>
! <unitName>Supernovae_Population_III_HegerWoosley_Initialize</unitName>
! </supernovaePopIIIMethod>
```

Here, *Supernovae_Population_III_HegerWoosley_Initialize* is the name of a subroutine which will be called to initialize the method. The initialization subroutine must have the following form:

```fortran
subroutine Method_Initialize(supernovaePopIIIMethod, SNePopIII_Cumulative_Energy_Get)
  implicit none
  type(varying_string), intent(in) :: supernovaePopIIIMethod
  procedure(), pointer, intent(inout) :: SNePopIII_Cumulative_Energy_Get

  if (supernovaePopIIIMethod == 'myMethod') then
```
17. Adding New Methods

```fortran
SNePopIII_Cumulative_Energy_Get => My_SNePopIII_Cumulative_Energy_Get

end if
return
end subroutine Method_Initialize
```

where `myMethod` is the name of this method as will be specified by the `supernovaePopIIIMethod` input parameter. The procedure pointer `SNePopIII_Cumulative_Energy_Get` must be set to point to a function which returns the cumulative energy input from Population III supernovae as described below. The initialization subroutine should perform any other tasks required to initialize the module (such as reading parameters etc.).

The functions must have the form:

```fortran
double precision function PopIII_Cumulative_Energy(initialMass, age, metallicity)
imPLICIT none
  double precision, intent(in) :: initialMass, age, metallicity
.
.
return
end function PopIII_Cumulative_Energy
```

This function must return the cumulative energy (in $M_\odot (\text{km/s})^2$) from Population III supernovae resulting from a star with given `initialMass` and `metallicity` after a time `age`.

Currently defined population III supernovae methods are:

**Heger-Woosley2002** Computes the energy input from the pair-instability results of Heger and Woosley [2002].

**Power Spectrum Variance Window Function**

Additional methods for the window function used to compute variance from the power spectrum can be added using the `powerSpectrumWindowFunctionMethod` directive. The directive should contain a single argument, giving the name of a subroutine to be called to initialize the method. For example, the `topHat` method is described by a directive:

```fortran
! # <powerSpectrumWindowFunctionMethod>
! # <unitName>Power_Spectrum_Window_Functions_Top_Hat_Initialize</unitName>
! # </powerSpectrumWindowFunctionMethod>
```

Here, `Power_Spectrum_Window_Functions_Top_Hat_Initialize` is the name of a subroutine which will be called to initialize the method. The initialization subroutine must have the following form:

```fortran
subroutine Method_Initialize(powerSpectrumWindowFunctionMethod, Power_Spectrum_Window_Function_Get)
imPLICIT none
  type (varying_string ), intent(in ) :: powerSpectrumWindowFunctionMethod
  procedure(double precision), pointer, intent(inout) :: Power_Spectrum_Window_Function_Get
  procedure(double precision), pointer, intent(inout) :: Power_Spectrum_Window_Function_Wavenumber_Maximum_Get
if (powerSpectrumWindowFunctionMethod == 'myMethod') then
  Power_Spectrum_Window_Function_Get => My_Window_Function
end if
return
end subroutine Method_Initialize
```

Heger-Woosley2002 Computes the energy input from the pair-instability results of Heger and Woosley [2002].
17.4. Existing Method Types

Power_Spectrum_Window_Function_Wavenumber_Maximum_Get => My_Window_Function_Maximum_Wavelength

where myMethod is the name of this method as will be specified by the powerSpectrumWindowFunctionMethod input parameter. The procedure pointers Power_Spectrum_Window_Function_Get, and Power_Spectrum_Window_Function_Wavenumber_Maximum_Get must be set to point to functions which return the window function for a given wavenumber and mass, and the maximum wavenumber for which that window function is non-zero respectively. The initialization subroutine should perform any other tasks required to initialize the module (such as reading parameters etc.).

The window function function must have the form:

subroutine Power_Spectrum_Window_Function(wavenumber,smoothingMass)
  implicit none
  double precision, intent(in ) :: wavenumber,smoothingMass
.
.
return
end subroutine Power_Spectrum_Window_Function

The function should return the window function for the specified wavenumber (given in Mpc$^{-1}$) and the given smoothingMass (given in $M_\odot$).

The window function maximum wavenumber function must have the form:

subroutine Power_Spectrum_Window_Function_Wavenumber_Maximum(smoothingMass)
  implicit none
  double precision, intent(in ) :: smoothingMass
.
.
return
end subroutine Power_Spectrum_Window_Function_Wavenumber_Maximum

The function should return the largest wavenumber for which the window function is non-zero for the given smoothingMass (given in $M_\odot$). If the window function is non-zero as $k \to \infty$ then a suitably large value (e.g. $10^{30}\text{Mpc}^{-1}$) should be returned.

Currently defined power spectrum variance window function methods are:

topHat The window function is a top-hat in real-space.

kSpaceSharp The window function is a top-hat in $k$-space.

topHatKSpaceSharpHybrid A convolution of top-hat in real space and top-hat in $k$-space window functions.
### Primordial Power Spectrum

Additional methods for the primordial power spectrum can be added using the `powerSpectrumMethod` directive. The directive should contain a single argument, giving the name of a subroutine to be called to initialize the method. For example, the `powerLaw` method is described by a directive:

```plaintext
!# <powerSpectrumMethod>
!# <unitName>CDM_Primordial_Power_Spectrum_Power_Law_Initialize</unitName>
!# </powerSpectrumMethod>
```

Here, `CDM_Primordial_Power_Spectrum_Power_Law_Initialize` is the name of a subroutine which will be called to initialize the method. The initialization subroutine must have the following form:

```fortran
subroutine Method_Initialize(powerSpectrumMethod, Power_Spectrum_Tabulate)
  implicit none
  type(varying_string), intent(in) :: powerSpectrumMethod
  procedure(), pointer, intent(inout) :: Power_Spectrum_Tabulate

  if (powerSpectrumMethod.eq.'myMethod') then
    Power_Spectrum_Tabulate => My_Do_Tabulate
  end if
  return
end subroutine Method_Initialize
```

where `myMethod` is the name of this method as will be specified by the `powerSpectrumMethod` input parameter. The procedure pointer `Power_Spectrum_Tabulate` must be set to point to a subroutine which tabulates the power spectrum as described below. The initialization subroutine should perform any other tasks required to initialize the module (such as reading parameters etc.).

The tabulation subroutine must have the form:

```fortran
subroutine Power_Spectrum_Tabulate(wavenumber, powerSpectrumNumberPoints, powerSpectrumLogWavenumber, powerSpectrumLogP)
  implicit none
  double precision, intent(in) :: wavenumber
  double precision, allocatable, dimension(:), intent(inout) :: powerSpectrumLogWavenumber, powerSpectrumLogP
  integer, intent(out) :: powerSpectrumNumberPoints

  return
end subroutine Power_Spectrum_Tabulate
```

The subroutine must tabulate the natural log of the power spectrum in array `powerSpectrumLogP()` as a function of the natural log of wavenumber `powerSpectrumLogWavenumber()` (these arrays must be allocated to the correct size, and may be previously allocated, therefore requiring a deallocation). The number of tabulated points should be returned in `powerSpectrumNumberPoints`. The subroutine should ensure that the currently requested `wavenumber` is within the range of the tabulated function (preferably with some buffer).

Currently defined power spectrum methods are:
17.4. Existing Method Types

powerLaw The power spectrum is assumed to be a power law, possibly with a running index. It is defined by

\[ P(k) \propto k^{n_s + \ln(k/k_{ref})/dn/d\ln k}, \]

where the parameters are specified by input parameters \( n_s \equiv \text{power Spectrum Index}, k_{ref} \equiv \text{power Spectrum Reference Wavenumber} \) and \( dn/d\ln k \equiv \text{power Spectrum Running} \).

Radiation Components

Radiation components (i.e. types of radiation field that may be added to any radiation object; see §17.5.3) are defined using a combination of several directives: \texttt{radiationLabel, radiationSet, radiationTemperature} and \texttt{radiationFlux}. For example, the cosmic microwave background radiation component is defined by the following set of directives:

```plaintext
!# <radiationLabel>
!# <label>CMB</label>
!# </radiationLabel>

!# <radiationSet>
!# <unitName>Radiation_Set_CMB</unitName>
!# <label>CMB</label>
!# </radiationSet>

!# <radiationTemperature>
!# <unitName>Radiation_Temperature_CMB</unitName>
!# <label>CMB</label>
!# </radiationTemperature>

!# <radiationFlux>
!# <unitName>Radiation_Flux_CMB</unitName>
!# <label>CMB</label>
!# </radiationFlux>
```

The first of these, \texttt{radiationLabel}, should contain a single element, \texttt{label}, which gives a label that will be used to identify this component, both in other directives and also in the internal parameters used to select this radiation component (e.g. in this case, a parameter \texttt{radiationTypeCMB} will be available within GALACTICUS to select the cosmic microwave background component). The other directives must all specify the same \texttt{label} element and additional give, in a \texttt{unitName} element, the name of a function/subroutine to be called to perform the relevant calculation.

The \texttt{radiationSet} directive must specify a subroutine with the following template:

```plaintext
subroutine Radiation_Set(componentMatched,thisNode,radiationProperties)
    implicit none
    logical, intent(in) :: componentMatched
    type(treeNode), intent(inout), pointer :: thisNode
    double precision, intent(inout), allocatable, dimension(:) :: radiationProperties
    if (.not.componentMatched) return
    .
    .
    return
```
If `componentMatched` is true, then the subroutine should set the radiation component, otherwise it should exit immediately. If the radiation component is to be set, then the routine can allocate the `radiationProperties` array as necessary to store any data needed to specify the radiation field. These data should then be set using, if necessary, any relevant information from `thisNode`.

The `radiationTemperature` directive should specify a subroutine with the following template:

```fortran
subroutine Radiation_Temperature(requestedType,ourType,radiationProperties,radiationTemperature,radiationType)
    implicit none
    integer, intent(in) :: requestedType,ourType
    double precision, intent(in), dimension(:) :: radiationProperties
    double precision, intent(inout) :: radiationTemperature
    integer, intent(in), optional, dimension(:) :: radiationType

    if (requestedType /= ourType) return
    if (present(radiationType)) then
        if (all(radiationType /= ourType)) return
    end if

    return
end subroutine Radiation_Temperature
```

The tests in the above should always be included so that the subroutine exits immediately if the component type is not active or not requested. Once these tests have been made, the subroutine should set the temperature (in units of Kelvin) of the radiation field (if applicable).

The `radiationFlux` directive should specify a subroutine with the following template:

```fortran
subroutine Radiation_Flux(requestedType,ourType,radiationProperties,wavelength,radiationFlux,radiationType)
    implicit none
    integer, intent(in) :: requestedType,ourType
    double precision, intent(in) :: wavelength
    double precision, intent(in), dimension(:) :: radiationProperties
    double precision, intent(inout) :: radiationFlux
    integer, intent(in), optional, dimension(:) :: radiationType

    if (requestedType /= ourType) return
    if (present(radiationType)) then
        if (all(radiationType /= ourType)) return
    end if

    return
end subroutine Radiation_Flux
```

The tests in the above should always be included so that the subroutine exits immediately if the component type is not active or not requested. Once these tests have been made, the subroutine should add the flux (in units of ergs cm$^2$ s$^{-1}$ Hz$^{-1}$ ster$^{-1}$) at the specified `wavelength` (in units of Å) of the radiation field to that in `radiationFlux`. 
Currently defined radiation component types are:

null A null component with no radiation.

CMB The cosmic microwave background, assumed to be a perfect blackbody spectrum with a temperature equal to \( T_{\text{CMB}}(1 + z) \).

IGB The intergalactic background light, set using the method selected by \( \text{radiationIntergalacticBackgroundMethod} \); see §17.4.1.

### Radiation Components: Intergalactic Background

Additional methods for the intergalactic background radiation component can be added using the \( \text{radiationIntergalacticBackgroundMethod} \) directive. The directive should contain a single argument, giving the name of a subroutine to be called to initialize the method. For example, the file method is described by a directive:

```bash
!# <radiationIntergalacticBackgroundMethod>
!# <unitName>Radiation_IGB_File_Initialize</unitName>
!# </radiationIntergalacticBackgroundMethod>
```

Here, \( \text{Radiation_IGB_File_Initialize} \) is the name of a subroutine which will be called to initialize the method. The initialization subroutine must have the following form:

```bash
subroutine Method_Initialize(radiationIntergalacticBackgroundMethod,Radiation_Set_Intergalactic_Background_Do,Radiation_Flux_Intergalactic_Background_Do)
implicit none
  type(varying_string), intent(in) :: radiationIntergalacticBackgroundMethod
  procedure(), pointer, intent(inout) :: Radiation_Set_Intergalactic_Background_Do,Radiation_Flux_Intergalactic_Background_Do

  if (radiationIntergalacticBackgroundMethod == 'myMethod') then
    Radiation_Set_Intergalactic_Background_Do => My_Method_Set
    Radiation_Flux_Intergalactic_Background_Do => My_Method_Flux
  end if
  return
end subroutine Method_Initialize
```

where \( \text{myMethod} \) is the name of this method as will be specified by the \( \text{radiationIntergalacticBackgroundMethod} \) input parameter. The procedure pointers \( \text{Radiation_Set_Intergalactic_Background_Do} \) and \( \text{Radiation_Flux_Intergalactic_Background_Do} \) must be set to point to subroutines which set the radiation field and return its flux as described below. The initialization subroutine should perform any other tasks required to initialize the module (such as reading parameters etc.).

The set subroutine must have the form:

```bash
subroutine My_Method_Set(thisNode,radiationProperties)
implicit none
  type(treeNode), intent(inout), pointer :: thisNode
  double precision, intent(inout), allocatable, dimension(1:) :: radiationProperties

  return
end subroutine My_Method_Set
```

and should set the radiation component as described in §17.4.1. The flux subroutine must have the form:
subroutine My_Method_Flux(radiationProperties, wavelength, radiationFlux)
    implicit none
    double precision, intent(in) :: wavelength
    double precision, intent(in), dimension(:) :: radiationProperties
    double precision, intent(inout) :: radiationFlux

    return
end subroutine My_Method_Flux

and should increment radiationFlux as described in §17.4.1.

Currently defined intergalactic background radiation methods are:

file The intergalactic background radiation field, specified as a function of cosmic time, is read from a
file. The flux is determined by linearly interpolating to the required time and wavelength. The XML
file to read is specified by [radiationIGBFileName]. An example of the required file structure is:

    <spectrum>
      <URL>http://adsabs.harvard.edu/abs/1996ApJ...461...20H</URL>
      <description>Cosmic background radiation spectrum from quasars alone.</description>
      <source>Francesco Haardt on Aug 6 2005, via Cloudy 08.00</source>
      <wavelengths>
        <datum>0.0002481</datum>
        <datum>0.001489</datum>
        ...
        <units>Å</units>
      </wavelengths>
      <spectra>
        <datum>7.039E-49</datum>
        <datum>8.379E-48</datum>
        <datum>1.875E-39</datum>
        <datum>7.583E-38</datum>
        ...
        <redshift>0</redshift>
        <units>erg cm⁻² s⁻¹ Hz⁻¹ sr⁻¹</units>
      </spectra>
    </spectrum>

The optional URL, description, reference and source elements can be used to give the provenance of
the data. The wavelengths element should contain a set of datum elements each containing a wavelength
(in increasing order) at which the spectrum will be tabulated. Wavelengths must be given in Angstroms.
Multiple spectra elements can be given, each specifying the spectrum at a redshift as given in the
redshift element. Each spectra element must contain an array of datum elements that gives the
spectrum at each wavelength listed in the wavelength element. Spectra must be in units of erg cm⁻²
s⁻¹ Hz⁻¹ sr⁻¹.
17.4. Existing Method Types

Ram Pressure Mass Loss Rates in Disks/Spheroids

Additional methods for computing ram pressure induced mass loss rates in disks/spheroids can be added using the \texttt{ramPressureStrippingMassLossRate(Disks|Spheroids)}Method directive. The directive should contain a single argument, giving the name of a subroutine to be called to initialize the method. For example, the \texttt{simple} method for disks is described by a directive:

\begin{verbatim}
!# <ramPressureStrippingMassLossRateDisksMethod>
!#    <unitName>Ram_Pressure_Stripping_Mass_Loss_Rate_Disks_Simple_Init</unitName>
!# </ramPressureStrippingMassLossRateDisksMethod>
\end{verbatim}

Here, \texttt{Ram_Pressure_Stripping_Mass_Loss_Rate_Disks_Simple_Init} is the name of a subroutine which will be called to initialize the method. The initialization subroutine must have the following form:

\begin{verbatim}
subroutine Method_Initialize(ramPressureStrippingMassLossRateDisksMethod,Ram_Pressure_Stripping_Mass_Loss_Rate_Disk_Get)
implicit none
type(varying_string), intent(in) :: starFormationTimescaleDisksMethod
procedure(), pointer, intent(inout) :: Ram_Pressure_Stripping_Mass_Loss_Rate_Disk_Get
if (ramPressureStrippingMassLossRateDisksMethod == 'myMethod') Ram_Pressure_Stripping_Mass_Loss_Rate_Disk_Get => My_Ram_Pressure_Stripping_Mass_Loss_Rate_Disk_Get
return
end subroutine Method_Initialize
\end{verbatim}

where \texttt{myMethod} is the name of this method as will be specified by the \texttt{ramPressureStrippingMassLossRate(Disks|Spheroids)} input parameter. The procedure pointer \texttt{Ram_Pressure_Stripping_Mass_Loss_Rate(Disks|Spheroids)} must be set to point to a function which returns mass loss rate due to ram pressure as described below. The initialization subroutine should perform any other tasks required to initialize the module (such as reading parameters etc.).

The mass loss rate function must have the form:

\begin{verbatim}
double precision function Ram_Pressure_Stripping_Mass_Loss_Rate_Disk_Get(thisNode)
implicit none
type(treeNode), intent(in) :: thisNode
. .
return
end function Ram_Pressure_Stripping_Mass_Loss_Rate_Disk_Get
\end{verbatim}

The function must return the mass loss rate induced by ram pressure forces (in units of $M_\odot$/Gyr) for the disk/spheroid in \texttt{thisNode}.

Currently defined ram pressure mass loss rate methods are:

\texttt{simple} The mass loss rate scales in proportion to the ratio of ram pressure and gravitational restoring forces;

\texttt{null} The mass loss rate is assumed to be always zero.

Satellite Merging Mass Movements

Additional methods for the satellite merging mass movements can be added using the \texttt{satelliteMergingMassMovementsMethod} directive. The directive should contain a single argument, giving the name of a subroutine to be called to initialize the method. For example, the \texttt{simple} method is described by a directive:
17. Adding New Methods

!# <satelliteMergingMassMovementsMethod>
!# <unitName>Satellite_Merging_Mass_Movements_Simple.Initialize</unitName>
!# </satelliteMergingMassMovementsMethod>

Here, Satellite_Merging_Mass_Movements_Simple.Initialize is the name of a subroutine which will be called to initialize the method. The initialization subroutine must have the following form:

  implicit none
  type(varying_string), intent(in) :: satelliteMergingMassMovementsMethod
  procedure(), pointer, intent(inout) :: Satellite_Merging_Mass_Movement_Get

  if (satelliteMergingMassMovementsMethod == 'simple') Satellite_Merging_Mass_Movement_Get => My_Method_Get
  return
end subroutine Method.Initialize

where myMethod is the name of this method as will be specified by the satelliteMergingMassMovementsMethod input parameter. The procedure pointer Satellite_Merging_Mass_Movement_Get must be set to point to a function which sets the mass movement descriptors as described below. The initialization subroutine should perform any other tasks required to initialize the module (such as reading parameters etc.).

The mass movement subroutine must have the form:

subroutine My_Method_Get(thisNode,gasMovesTo,starsMoveTo,hostGasMovesTo,hostStarsMoveTo,mergerIsMajor)
  implicit none
  type(treeNode), intent(inout), pointer :: thisNode
  integer, intent(out) :: gasMovesTo,starsMoveTo,hostGasMovesTo,hostStarsMoveTo
  logical, intent(out) :: mergerIsMajor

 H H H
 return
end subroutine My_Method_Get

The subroutine must return values for each of the "MoveTo" descriptors to specify where stars and gas from thisNode and thisNode's host node should move to in the host. Allowed values are:

movesToDisk The material in question moves to the disk of the host node;
movesToSpheroid The material in question moves to the spheroid of the host node;
doesNotMove The material in question does not move (allowed only for host node descriptors).

Additionally, the mergerIsMajor flag should be set to indicate whether this merger is deemed to be "major" (typically defined as one which redistributes mass from a disk into a spheroidal component).

Currently defined satellite merger mass movement methods are:

verySimple In this case, the satellite is always added to the disk of the host, while material in the host does not move.
simple If the baryonic mass of the satellite exceeds a fraction majorMergerMassRatio of the baryonic mass of the host then all material is moved to the spheroid of the host. Otherwise, satellite gas moves to the component given by minorMergerGasMovesTo, satellite stars move to the host spheroid and host material does not move.
17.4. Existing Method Types

Baugh2005 If the baryonic mass of the satellite exceeds a fraction $\text{majorMergerMassRatio}$ of the baryonic mass of the host then all material is moved to the spheroid of the host. Otherwise, if the baryonic mass of the satellite exceeds a fraction $\text{burstMassRatio}$ of the baryonic mass of the host and the gas fraction in the host exceeds $\text{burstCriticalGasFraction}$ then all gas is moved to the host spheroid, while the host stellar disk remains in place. For mergers failing both criteria, satellite gas moves to the component given by $\text{minorMergerGasMovesTo}$, satellite stars move to the host spheroid and host material does not move.

Satellite Merging Remnant Sizes

Additional methods for the satellite merging remnant sizes can be added using the $\text{satelliteMergingRemnantSizeMethod}$ directive. The directive should contain a single argument, giving the name of a subroutine to be called to initialize the method. For example, the Cole2000 method is described by a directive:

```plaintext
!# <satelliteMergingRemnantSizeMethod>
!#   <unitName>Satellite_Merging_Remnant_Sizes_Cole2000_Initialize</unitName>
!# </satelliteMergingRemnantSizeMethod>
```

Here, $\text{Satellite_Merging_Remnant_Sizes_Cole2000_Initialize}$ is the name of a subroutine which will be called to initialize the method. The initialization subroutine must have the following form:

```plaintext
subroutine Method_Initialize(satelliteMergingRemnantSizeMethod,Satellite_Merging_Remnant_Size_Do)
  implicit none
  type(varying_string), intent(in) :: satelliteMergingRemnantSizeMethod
  procedure(), pointer, intent(inout) :: Satellite_Merging_Remnant_Size_Do

  if (satelliteMergingRemnantSizeMethod == 'myMethod') Satellite_Merging_Remnant_Size_Do => My_Method_Do
  return
end subroutine Method_Initialize
```

where $\text{myMethod}$ is the name of this method as will be specified by the $\text{satelliteMergingRemnantSizeMethod}$ input parameter. The procedure pointer $\text{Satellite_Merging_Remnant_Size_Do}$ must be set to point to a function which computes the size of the merger remnant and stores the properties (e.g. radius, circular velocity and specific angular momentum at the half-mass radius) of the host node. The initialization subroutine should perform any other tasks required to initialize the module (such as reading parameters etc.).

The remnant size subroutine must have the form:

```plaintext
subroutine My_Method_Do(thisNode)
  implicit none
  type(treeNode), intent(inout), pointer :: thisNode

  .
  .
  .
  return
end subroutine My_Method_Do
```

The subroutine must compute the properties of the merger remnant. Typically these are stored in the $\text{Satellite_Merging_Remnant_Sizes_Properties}$ module for later retrieval by the appropriate component.

Currently defined satellite merger remnant size methods are:
null  This is a null method which does nothing. It is useful for runs where no baryonic components are included (e.g. for studying dark matter only).

Cole2000  Implements the algorithm of Cole et al. [2000] to compute the remnant size. The orbital energy assumed can be adjusted using the mergerRemnantSizeOrbitalEnergy parameter, which is equivalent to the $f_{\text{orbit}}$ parameter of Cole et al. [2000].

Covington2008  Implements the algorithm of Covington et al. [2008] to compute the remnant size. The orbital energy assumed can be adjusted using the mergerRemnantSizeOrbitalEnergy parameter, which is equivalent to the $f_{\text{orbit}}$ parameter of Cole et al. [2000].

**Satellite Merging Remnants: Progenitor Properties**

Additional methods for satellite merging remnant progenitor properties can be added using the satelliteMergingRemnantProgenitorPropertiesMethod directive. The directive should contain a single argument, giving the name of a subroutine to be called to initialize the method. For example, the standard method is described by a directive:

```plaintext
!# <satelliteMergingRemnantProgenitorPropertiesMethod>
!# <unitName> Satellite_Merging_Remnant_Progenitor_Properties_Standard_Init</unitName>
!# </satelliteMergingRemnantProgenitorPropertiesMethod>
```

Here, Satellite_Merging_Remnant_Progenitor_Properties_Standard_Init is the name of a subroutine which will be called to initialize the method. The initialization subroutine must have the following form:

```plaintext
implicit none
    type(varying_string), intent(in) :: satelliteMergingRemnantProgenitorPropertiesMethod
    procedure(), pointer, intent(inout) :: Satellite_Merging_Remnant_Progenitor_Properties_Get

    return
end subroutine Method_Initialize
```

where myMethod is the name of this method as will be specified by the satelliteMergingRemnantProgenitorPropertiesMethod input parameter. The procedure pointer Satellite_Merging_Remnant_Progenitor_Properties_Get must be set to point to a subroutine which computes various properties of the progenitor galaxies involved in the merger, as described below. The initialization subroutine should perform any other tasks required to initialize the module (such as reading parameters etc.).

The progenitor properties subroutine must have the form:

```plaintext
subroutine My_Method_Get(satelliteNode,hostNode,satelliteMass,hostMass,satelliteSpheroidMass &
    & ,hostSpheroidMass,hostSpheroidMassPreMerger,satelliteRadius,hostRadius &
    & ,angularMomentumFactor,remnantSpheroidMass,remnantSpheroidGasMass)
implicit none
    type(treeNode), intent(inout), pointer :: satelliteNode,hostNode
    double precision, intent(out) :: satelliteMass,hostMass,satelliteSpheroidMass, &
    & hostSpheroidMass,hostSpheroidMassPreMerger,satelliteRadius,hostRadius, &
    & angularMomentumFactor,remnantSpheroidMass,remnantSpheroidGasMass

    .
    .

    return
end subroutine My_Method_Do
```
17.4. Existing Method Types

The subroutine must compute properties of the merger progenitor galaxies in \texttt{satelliteNode} and \texttt{hostNode}: \texttt{satelliteMass} and \texttt{hostMass} are the total masses of the two galaxies; \texttt{satelliteSpheroidMass} and \texttt{hostSpheroidMass} are the masses of each galaxy that will end up in the spheroid of the merger remnant; \texttt{hostSpheroidMassPreMerger} is the mass of the host spheroid prior to the merger; \texttt{satelliteRadius} and \texttt{hostRadius} are radii of the two galaxies for use in merger remnant size calculations (and so should typically refer to the radius of material that will end up in the merger remnant spheroid); \texttt{remnantSpheroidMass} is the mass of the spheroid in the remnant; \texttt{remnantSpheroidGasMass} is the mass of gas in the spheroid of the remnant; and \texttt{angularMomentumFactor} gives the pseudo-specific angular momentum of the remnant in units of \((G \text{remnant.spheroid} \times \text{remnant.spheroid})^{1/2}\) where \(M_{\text{remnant.spheroid}}\) is the mass of the remnant spheroid and \(r_{\text{remnant.spheroid}}\) is the radius of the remnant spheroid.

Currently defined satellite merger progenitor properties methods are:

- **Cole2000** Implements the algorithm of Cole et al. [2000] to compute the remnant properties. Masses of host and spheroid are set equal to their stellar plus cold gas masses utilizing, while radii are the half-mass radii of each galaxy, including only those components which end up in the remnant spheroid. The angular momentum factor is set to a mass-weighted average of the corresponding factor for each component which will end up in the merger remnant spheroid.

- **standard** Masses of host and spheroid are set equal to their stellar plus cold gas masses utilizing, while radii are a mass-weighted average of the half-mass radii of the components which end up in the merger remnant spheroid. The angular momentum factor is similarly set to a mass-weighted average of the corresponding factor for each component which will end up in the merger remnant spheroid.

**Satellite Tidal Fields**

Additional methods for the satellite tidal fields can be added using the \texttt{satellitesTidalFieldMethod} directive. The directive should contain a single argument, giving the name of a subroutine to be called to initialize the method. For example, the \texttt{sphericalSymmetry} method is described by a directive:

```fortran
!# <satellitesTidalFieldMethod>
!# <unitName></unitName>
!# </satellitesTidalFieldMethod>
```

Here, \texttt{Satellites_Tidal_Fields_Spherical_Symmetry_Initialize} is the name of a subroutine which will be called to initialize the method. The initialization subroutine must have the following form:

```fortran
subroutine Method_Initialize(satellitesTidalFieldMethod,Satellites_Tidal_Field_Get)
  implicit none
  type (varying_string ) , intent(in ) :: satellitesTidalFieldMethod
  procedure(My_Method_Procedure), pointer, intent(inout) :: Satellites_Tidal_Field_Get

  if (satellitesTidalFieldMethod == 'myMethod') Satellites_Tidal_Field_Get => My_Method_Procedure
  return
end subroutine Method_Initialize
```

where \texttt{myMethod} is the name of this method as will be specified by the \texttt{satellitesTidalFieldMethod} input parameter. The procedure pointer \texttt{Satellites_Tidal_Field_Get} must be set to point to a function which returns the time until merging as described below. The initialization subroutine should perform any other tasks required to initialize the module (such as reading parameters etc.).

The satellite tidal field function must have the form:

```fortran
double precision function Satellites_Tidal_Fields(thisNode)
  implicit none
```

827
17. Adding New Methods

type(treeNode), pointer, intent(inout) :: thisNode

return
end function Satellites_Tidal_Fields

The function must return the magnitude of the tidal field for thisNode in units of (km/s)² Mpc⁻². Currently defined satellite tidal field methods are:

null Assumes a zero tidal field.
sphericalSymmetry Computes the tidal field assuming a spherically-symmetric host halo.

Satellite Virial Orbits

Additional methods for the satellite virial orbits (i.e. orbital parameters at virial radius crossing) can be added using the virialOrbitsMethod directive. The directive should contain a single argument, giving the name of a subroutine to be called to initialize the method. For example, the Benson2005 method is described by a directive:

!# <virialOrbitsMethod>
!# <unitName>Virial_Orbital_Parameters_Benson2005_Initialize</unitName>
!# </virialOrbitsMethod>

Here, Virial_Orbital_Parameters_Benson2005_Initialize is the name of a subroutine which will be called to initialize the method. The initialization subroutine must have the following form:

subroutine Method_Initialize(virialOrbitsMethod,Virial_Orbital_Parameters_Get)
  implicit none
  type(varying_string), intent(in) :: virialOrbitsMethod
  procedure(), pointer, intent(inout) :: Virial_Orbital_Parameters_Get

  if (virialOrbitsMethod.eq.'myMethod') Virial_Orbital_Parameters_Get => My_Method_Procedure
  return
end subroutine Method_Initialize

where myMethod is the name of this method as will be specified by the virialOrbitsMethod input parameter. The procedure pointer Virial_Orbital_Parameters_Get must be set to point to a subroutine which returns orbital parameters as described below. The initialization subroutine should perform any other tasks required to initialize the module (such as reading parameters etc.).

The orbital parameter subroutine must have the form:

function Virial_Orbital_Parameters(thisNode,hostNode,acceptUnboundOrbits) result (thisOrbit)
  implicit none
  type(keplerOrbit) :: thisOrbit
  type(treeNode), intent(inout), pointer :: thisNode,hostNode
  logical, intent(in) :: acceptUnboundOrbits

  return
end subroutine Virial_Orbital_Parameters
17.4. Existing Method Types

The subroutine must return a fully-defined Kepler orbit object (i.e. the orbit must have at least three parameters defined in addition to the node masses) initialized to the orbital parameters for thisNode orbitting in hostNode at the point of virial radius crossing. If acceptUnboundOrbits is true, then unbound orbits may be returned, otherwise, the routine must ensure that the returned orbit is bound. Velocities should be returned in units of km/s, lengthscales in units of Mpc and masses in $M_\odot$. Note that the usual conventions of the keplerOrbit object should be followed, namely the that orbitting bodies are treated as point masses, with the host being stationary and the usual reduced mass used.

Currently defined satellite virial orbit methods are:

- **Benson2005** The orbital parameters are select from the distribution found by Benson [2005].
- **Wetzel2010** The orbital parameters are select from the distribution found by Wetzel [2010].
- **fixed** The orbital parameters are set to fixed values, with $v_r = [\text{virialOrbitsFixedRadialVelocity}] V_{\text{virial}}$ and $v_\phi = [\text{virialOrbitsFixedTangentialVelocity}] V_{\text{virial}}$.

**Star Formation Feedback in Disks/Spheroids**

Additional methods for computing feedback from star formation in disks/spheroids can be added using the starFormationFeedback[Disks|Spheroids]Method directive. The directive should contain a single argument, giving the name of a subroutine to be called to initialize the method. For example, the powerLaw method is described by a directive:

```
!# <starFormationFeedbackSpheroidsMethod>
!# <unitName>Star_Formation_Feedback_Spheroids_Power_Law.Initialize</unitName>
!# </starFormationFeedbackSpheroidsMethod>
```

Here, Star_Formation_Feedback_Spheroids_Power_Law.Initialize is the name of a subroutine which will be called to initialize the method. The initialization subroutine must have the following form:

```fortran
subroutine Method_Initialize(starFormationFeedbackDisksMethod, Star_Formation_Feedback_Disk_Outflow_Rate_Get)
implicit none
type(varying_string), intent(in) :: starFormationFeedbackDisksMethod
procedure(), pointer, intent(inout) :: Star_Formation_Feedback_Disk_Outflow_Rate_Get

if (starFormationFeedbackDisksMethod == 'myMethod') Star_Formation_Feedback_Disk_Outflow_Rate_Get => My_Star_Formation_Feedback_Disk_Outflow_Rate_Get
return
end subroutine Method_Initialize
```

where myMethod is the name of this method as will be specified by the starFormationFeedback[Disks|Spheroids]Method input parameter. The procedure pointer Star_Formation_Feedback_Disk_Outflow_Rate_Get (or Star_Formation_Feedback_Spheroid_Outflow_Rate_Get for the spheroid case) must be set to point to a function which returns the mass outflow rate due to star formation as described below. The initialization subroutine should perform any other tasks required to initialize the module (such as reading parameters etc.).

The outflow rate function must have the form:

```fortran
double precision function Star_Formation_Feedback_Outflow_Rate_Get(thisNode, starFormationRate, energyInputRate)
implicit none
type(treeNode), intent(inout), pointer :: thisNode
double precision, intent(in) :: starFormationRate, energyInputRate
```

...
17. Adding New Methods

```
return
end function Star_Formation_Feedback_Outflow_Rate_Get
```

The function must return the mass outflow rate (in \( M_\odot \text{ Gyr}^{-1} \)) for `thisNode`.

Currently defined star formation feedback methods are:

**fixed** The outflow rate is a fixed multiple of the the star formation rate.

**powerLaw** The outflow rate is given by

\[
\dot{M}_{\text{outflow}} = \left( \frac{V_{\text{outflow}}}{V} \right)^{\alpha_{\text{outflow}}} \frac{\dot{E}}{E_{\text{canonical}}},
\]

(17.8)

where \( V_{\text{outflow}} = [\text{disk|spheroid}]\text{OutflowVelocity} \) (in km/s) and \( \alpha_{\text{outflow}} = [\text{disk|spheroid}]\text{OutflowVelocity} \) are input parameters, \( V \) is the characteristic velocity of the component, \( \dot{E} \) is the rate of energy input from stellar populations and \( E_{\text{canonical}} \) is the total energy input by a canonical stellar population normalized to \( 1M_\odot \) after infinite time.

**Creasey2012** The outflow rate computed using the model of Creasey et al. [2012].

**(Expulsive) Star Formation Feedback in Disks/Spheroids**

Additional methods for computing expulsive feedback\(^8\) from star formation in disks/spheroids can be added using the `starFormationExpulsiveFeedback[Disks|Spheroids]Method` directive. The directive should contain a single argument, giving the name of a subroutine to be called to initialize the method.

For example, the `powerLaw` method is described by a directive:

```
!# <starFormationExpulsiveFeedbackSpheroidsMethod>
!#  <unitName>Star_Formation_Expulsive_Feedback_Spheroids_Power_Law_Initialize</unitName>
!# </starFormationExpulsiveFeedbackSpheroidsMethod>
```

Here, `Star_Formation_Expulsive_Feedback_Spheroids_Power_Law_Initialize` is the name of a subroutine which will be called to initialize the method. The initialization subroutine must have the following form:

```
subroutine Method_Initialize(starFormationExpulsiveFeedbackDisksMethod, Star_Formation_Expulsive_Feedback_Disk_Outflow_Rate_Get)
implicit none
type(varying_string), intent(in) :: starFormationFeedbackDisksMethod
procedure(), pointer, intent(inout) :: Star_Formation_Expulsive_Feedback_Disk_Outflow_Rate_Get

if (starFormationExpulsiveFeedbackDisksMethod == 'myMethod') Star_Formation_Expulsive_Feedback_Disk_Outflow_Rate_Get => My_Star_Formation_Expulsive_Feedback_Disk_Outflow_Rate_Get
return
end subroutine Method_Initialize
```

where `myMethod` is the name of this method as will be specified by the `starFormationExpulsiveFeedback[Disks|Spheroids]` input parameter. The procedure pointer `Star_Formation_Expulsive_Feedback_Disk_Outflow_Rate_Get` (or `Star_Formation_Expulsive_Feedback_Spheroid_Outflow_Rate_Get` for the spheroid case) must be set to point to a function which returns the expulsive mass outflow rate due to star formation as described below. The initialization subroutine should perform any other tasks required to initialize the module (such as reading parameters etc.).

The outflow rate function must have the form:

\(^8\)“Expulsive” feedback implies outflows in which gas is driven not only out of a galaxy but also out of its host dark matter halo.
double precision function Star_Formation_Expulsive_Feedback_Outflow_Rate_Get(thisNode, starFormationRate, energyInputRate)
  implicit none
  type(treeNode), intent(inout), pointer :: thisNode
  double precision, intent(in) :: starFormationRate, energyInputRate
  .
  .
  return
end function Star_Formation_Expulsive_Feedback_Outflow_Rate_Get

The function must return the expulsive mass outflow rate (in $M_\odot$ Gyr$^{-1}$) for thisNode.

Currently defined star formation expulsive feedback methods are:

null Assumes a zero outflow rate.

superwind The outflow rate is given by

$$\dot{M}_{\text{outflow}} = \beta_{\text{superwind}} \frac{\dot{E}}{E_{\text{canonical}}} \begin{cases} \left(\frac{V_{\text{superwind}}}{V}\right)^2 & \text{if } V > V_{\text{superwind}} \\ 1 & \text{otherwise,} \end{cases}$$ \hfill (17.9)

where $V_{\text{superwind}} = \left[\text{disk|spheroid}\right]$ SuperwindVelocity (in km/s) and $\beta_{\text{superwind}} = \left[\text{disk|spheroid}\right]$ SuperwindMassLoading are input parameters, $V$ is the characteristic velocity of the component, $\dot{E}$ is the rate of energy input from stellar populations and $E_{\text{canonical}}$ is the total energy input by a canonical stellar population normalized to $1M_\odot$ after infinite time.

Star Formation Rate Surface Density in Disks

Additional methods for computing the surface density of star formation rate in disks can be added using the starFormationRateSurfaceDensityDisksMethod directive. The directive should contain a single argument, giving the name of a subroutine to be called to initialize the method. For example, the Blitz-Rosolowsky2006 method is described by a directive:

```
!# <starFormationRateSurfaceDensityDisksMethod>
!# <unitName>Star_Formation_Rate_Surface_Density_Disks_BR_Initialize</unitName>
!# </starFormationRateSurfaceDensityDisksMethod>
```

Here, Star_Formation_Rate_Surface_Density_DISKS_BR_Initialize is the name of a subroutine which will be called to initialize the method. The initialization subroutine must have the following form:

```subroutine Method_Initialize(starFormationRateSurfaceDensityDisksMethod, Star_Formation_Rate_Surface_Density_Disk_Get)
  implicit none
  type(varying_string), intent(in) :: starFormationRateSurfaceDensityDisksMethod
  procedure(), pointer, intent(inout) :: Star_Formation_Rate_Surface_Density_Disk_Get

  if (starFormationRateSurfaceDensityDisksMethod == 'myMethod') Star_Formation_Rate_Surface_Density_Disk_Get => My_Method_Get

  return
end subroutine Method_Initialize
```

where myMethod is the name of this method as will be specified by the starFormationRateSurfaceDensityDisksMethod input parameter. The procedure pointer Star_Formation_Rate_Surface_Density_Disk_Get must be set to point to a function which returns the surface density of star formation rate at a specified radius as described below. The initialization subroutine should perform any other tasks required to initialize the module (such as reading parameters etc.).

The star formation rate surface density function must have the form:
double precision function Star_Formation_Rate_Surface_Density_Get(thisNode, radius)
  implicit none
  type (treeNode), intent(inout), pointer :: thisNode
  double precision, intent(in) :: radius
  return
end function Star_Formation_Rate_Surface_Density_Get

The function must return the surface density of star formation rate (in units of $M_\odot$ Gyr$^{-1}$ Mpc$^{-2}$) for thisNode.

Currently defined star formation rate surface density methods are:

**Kennicutt-Schmidt** The rate is given by the Kennicutt-Schmidt law (Schmidt 1959, Kennicutt 1998; see §13.38.1).

**extendedSchmidt** The rate is given by the extended Schmidt law (Shi et al. 2011; see §13.38.2).

**Blitz-Rosolowsky2006** The rate is given by the Blitz-Rosolowsky rule (Blitz and Rosolowsky 2006; see §13.38.3).

**KMT09** The rate is given by the Krumholz-McKee-Tumlinson (Krumholz et al. 2009; see §13.38.4);

### Star Formation Timescale in Disks/Spheroids

Additional methods for computing star formation timescales in disks/spheroids can be added using the `starFormationTimescale[Disks|Spheroids]Method` directive. The directive should contain a single argument, giving the name of a subroutine to be called to initialize the method. For example, the `dynamicalTime` method is described by a directive:

```
!# <starFormationTimescaleDisksMethod>
!# <unitName>Star_Formation_Timescale_Disks_Dynamical_Time_Initialize</unitName>
!# </starFormationTimescaleDisksMethod>
```

Here, `Star_Formation_Timescale_Disks_Dynamical_Time_Initialize` is the name of a subroutine which will be called to initialize the method. The initialization subroutine must have the following form:

```
subroutine Method_Initialize(starFormationTimescaleDisksMethod, Star_Formation_Timescale_Disk_Get)
  implicit none
  type(varying_string), intent(in) :: starFormationTimescaleDisksMethod
  procedure(), pointer, intent(inout) :: Star_Formation_Timescale_Disk_Get

  if (starFormationTimescaleDisksMethod == 'myMethod') Star_Formation_Timescale_Disk_Get => My_Method_Get_Procedure
return
end subroutine Method_Initialize
```

where `myMethod` is the name of this method as will be specified by the `starFormationTimescale[Disks|Spheroids]Method` input parameter. The procedure pointer `Star_Formation_Timescale_Disk_Get` (or `Star_Formation_Timescale_Spheroid_Get` for the spheroid case) must be set to point to a function which returns the timescale for star formation as described below. The initialization subroutine should perform any other tasks required to initialize the module (such as reading parameters etc.).

The star formation timescale function must have the form:
double precision function Star_Formation_Timescale_Get(thisNode)
  implicit none
  type(treeNode), intent(in) :: thisNode
  .
  .
  .
  return
end function Star_Formation_Timescale_Get

The function must return the star formation timescale (in units of Gyr) for thisNode.

Currently defined star formation timescale methods are:

haloScaling  The timescale scales with halo virial velocity and redshift;

fixed  The timescale is a fixed quantity;

dynamicalTime  The timescale is given by

\[ \tau_\star = \epsilon_\star^{-1} \tau_{\text{dynamical}, \text{disk|spheroid}} \left( \frac{V_{\text{disk|spheroid}}}{200 \text{ km/s}} \right)^{\alpha_\star}, \]  

(17.10)

where \( \epsilon_\star = \text{starFormation[Disk|Spheroid]Efficiency} \) is a star formation efficiency and \( \alpha_\star = \text{starFormation[Disk|Spheroid]VelocityExponent} \) controls the scaling with velocity. Note that \( \tau_{\text{dynamical}, \text{disk|spheroid}} = R_{\text{disk|spheroid}} / V_{\text{disk|spheroid}} \) where the radius and velocity are whatever characteristic values returned by the disk/spheroid method. This scaling is functionally similar to that adopted by Cole et al. [2000], but they specifically used the half-mass radius and circular velocity at that radius.

Baugh2005]  The timescale is given by \( \tau_0 (V_{\text{disk}} / 200 \text{ km/s})^{\alpha_a \beta} \).

integratedSurfaceDensity]  The timescale is given by \( \tau_\star = M_{\text{cold}} / \int_0^\infty 2\pi r \dot{\Sigma}_\star (r) dr \) where \( \dot{\Sigma}_\star (r) \) is the surface density of star formation rate (see §13.38)

Stellar Astrophysics

Additional methods for stellar astrophysical properties can be added using the stellarAstrophysicsMethod directive. The directive should contain a single argument, giving the name of a subroutine to be called to initialize the method. For example, the file method is described by a directive:

!# <stellarAstrophysicsMethod>
!#   <unitName>Stellar_Astrophysics_File_Initialize</unitName>
!# </stellarAstrophysicsMethod>

Here, Stellar_Astrophysics_File_Initialize is the name of a subroutine which will be called to initialize the method. The initialization subroutine must have the following form:

  implicit none
  type(varying_string), intent(in) :: stellarAstrophysicsMethod

  if (stellarAstrophysicsMethod == 'myMethod') then
    Star_Ejected_Mass_Get => My_Star_Ejected_Mass
    Star_Initial_Mass_Get => My_Star_Initial_Mass
    Star_Metal_Yield_Mass_Get => My_Star_Metal_Yield_Mass
    Star_Lifetime_Get => My_Star_Lifetime
  else
    ! # myMethod subroutine
  end if
end subroutine Method_Initialize

833
17. Adding New Methods

    Star_Lifetime_Get => My_Star_Lifetime
end if
return
end subroutine Method_Initialize

where myMethod is the name of this method as will be specified by the stellarAstrophysicsMethod input parameter. The procedure pointers must be set to point to functions which return stellar properties as described below. The initialization subroutine should perform any other tasks required to initialize the module (such as reading parameters etc.).

The ejected mass and lifetime functions must have the form:

    double precision function Star_Property(initialMass,metallicity)
        implicit none
        double precision, intent(in) :: initialMass,metallicity
        .
        .
        .
        return
    end function Star_Property

These functions must return the total ejected mass (in $M_\odot$), total metal yield (in $M_\odot$) and lifetime (in Gyr) for a star of the specified initialMass and metallicity.

The metal yield function must have the form:

    double precision function Star_Metal_Yield(initialMass,metallicity,atomIndex)
        implicit none
        double precision, intent(in) :: initialMass,metallicity
        integer, intent(in), optional :: atomIndex
        .
        .
        .
        return
    end function Star_Property

This function must return the yield (in $M_\odot$) of the element identified by atomIndex (as returned by the Atom_Lookup() function from the Atomic_Data module) if present, or total metal yield otherwise for a star of the specified initialMass and metallicity.

The initial mass function must have the form:

    double precision function Star_Initial_Mass(lifetime,metallicity)
        implicit none
        double precision, intent(in) :: lifetime,metallicity
        .
        .
        .
        return
    end function Star_Initial_Mass

and should return the initial mass (in $M_\odot$) of a star of given lifetime (specified in Gyr) and metallicity.

Currently defined stellar astrophysics methods are:

file Stellar properties are read from an XML file and interpolated. The structure of the XML file is described in §13.43.1.
Stellar Population Properties

Additional methods for computing properties of stellar populations can be added using the `stellarPopulationPropertiesMethod` directive. The directive should contain a single argument, giving the name of a subroutine to be called to initialize the method. For example, the `instantaneous` method is described by a directive:

```plaintext
!# <stellarPopulationPropertiesMethod>
!# <unitName>Stellar_Population_Properties_Instantaneous_Initialize</unitName>
!# </stellarPopulationPropertiesMethod>
```

Here, `Stellar_Population_Properties_Instantaneous_Initialize` is the name of a subroutine which will be called to initialize the method. The initialization subroutine must have the following form:

```plaintext
  implicit none
  type(varying_string), intent(in) :: stellarPopulationPropertiesMethod
  if (stellarPopulationPropertiesMethod == 'myMethod') then
    Stellar_Population_Properties_History_Create_Do => My_Method_History_Create_Procedure
  end if
  return
end subroutine Method_Initialize
```

where `myMethod` is the name of this method as will be specified by the `stellarPopulationPropertiesMethod` input parameter. The procedure pointers `Stellar_Population_Properties_Rates_Get` and `Stellar_Population_Properties_Scales_Get` must be set to point to subroutines which return properties of a stellar population and set scaling factors for ODE error control as described below, while the `Stellar_Population_Properties_History_Count_Get` and `Stellar_Population_Properties_History_Create_Do` procedure pointers must be set to point to functions which return the number of histories that will be required by this method and create a suitable history object respectively. The initialization subroutine should perform any other tasks required to initialize the module (such as reading parameters etc.).

The stellar populations properties subroutine must have the form:

```plaintext
subroutine Stellar_Population_Properties_Rates(starFormationRate,fuelAbundances,component,thisNode,thisHistory,stellarMassRate&,stellarAbundancesRates,stellarLuminositiesRates,fuelMassRate,fuelAbundancesRates,energyInputRate)
  implicit none
  implicit none
  double precision, intent(out) :: stellarMassRate,fuelMassRate,energyInputRate
  type(abundancesStructure), intent(out) :: stellarAbundancesRates,fuelAbundancesRates
  integer, intent(in) :: component
  double precision, dimension(:) :: stellarLuminositiesRates
  double precision, intent(in) :: starFormationRate
  type(abundancesStructure), intent(in) :: fuelAbundances
  type(treeNode), intent(inout), pointer :: thisNode
```
17. Adding New Methods

```plaintext
type(history), intent(inout) :: thisHistory
.
.
.
return
end subroutine Stellar_Population_Properties_Rates
```

The subroutine is given the starFormationRate (in $M_\odot$ Gyr$^{-1}$) in thisNode. Any history information required by this method must be passed in via the history argument. Stars are forming from fuel material with composition specified by fuelAbundances and occurring in the specified galactic component (using the labels provided by the Galactic_Structure_Options module). The subroutine must return the rates of change of stellar and fuel mass (in $M_\odot$ Gyr$^{-1}$) in stellarMassRate and fuelMassRate respectively, and the corresponding rates (also in $M_\odot$ Gyr$^{-1}$) of abundance change in stellarAbundancesRates and fuelAbundancesRates respectively. Finally, it should return rates of change (in $L_{AB}$ Gyr$^{-1}$) of stellar luminosities for all requested output bands in stellarLuminositiesRates. Additionally, the rate of energy input from stellar populations must be returned in energyInputRate.

The scales procedure should have the form:

```plaintext
subroutine Stellar_Population_Properties_Scales_Noninstantaneous(thisHistory,stellarMass,stellarAbundances)
    implicit none
double precision, intent(in) :: stellarMass
type(abundancesStructure), intent(in) :: stellarAbundances
type(history), intent(inout) :: thisHistory
.
.
return
end subroutine Stellar_Population_Properties_Scales_Noninstantaneous
```

and should set scale factors for ODE error control (see §17.3.3) in the stellar population properties history thisHistory. The stellarMass and stellarAbundances (both in $M_\odot$) are provided as input as they are often useful in choosing appropriate scale factors.

The history count function must have the form

```plaintext
integer function Stellar_Population_Properties_History_Count()
    implicit none
.
.
return
end function Stellar_Population_Properties_History_Count
```

and should return the number of histories that will be required by this method. The history create function must have the form

```plaintext
subroutine Stellar_Population_Properties_History_Create(thisNode,thisHistory)
type(treeNode), intent(inout), pointer :: thisNode
type(history), intent(inout) :: thisHistory
.
.
return
end subroutine Stellar_Population_Properties_History_Create
```
and should create thisHistory with a suitable set of time steps for thisNode.

Currently defined stellar population properties methods are:

**instantaneous** Computes stellar population properties using an instantaneous recyclying approxima-

**Stellar Population Spectra**

Additional methods for computing spectra of stellar populations can be added using the `stellarPopulationSpectraMethod` directive. The directive should contain a single argument, giving the name of a subroutine to be called to initialize the method. For example, the Conroy-White-Gunn2009 method is described by a directive:

```plaintext
!# <stellarPopulationSpectraMethod>
!# <unitName>Stellar_Population_Spectra_Conroy_Initialize</unitName>
!# </stellarPopulationSpectraMethod>
```

Here, `Stellar_Population_Spectra_Conroy_Initialize` is the name of a subroutine which will be called to initialize the method. The initialization subroutine must have the following form:

```plaintext
implicit none
  type(varying_string), intent(in) :: stellarPopulationSpectraMethod
  procedure(), pointer, intent(inout) :: Stellar_Population_Spectra_Get,Stellar_Population_Spectrum_Tabulation_Get
  if (stellarPopulationSpectraMethod == 'myMethod') then
    Stellar_Population_Spectra_Get => My_Method_Spectra_Get
  end if
return
end subroutine Method_Initialize
```

where `myMethod` is the name of this method as will be specified by the `stellarPopulationSpectraMethod` input parameter. The procedure pointer `Stellar_Population_Spectra_Get` must be set to point to a function which returns the spectrum of a stellar population as described below while the `Stellar_Population_Spectrum_Tabulation_Get` pointer must be set to point to a subroutine which returns a tabulation of ages and metallicities on which stellar spectra should be tabulated. The initialization subroutine should perform any other tasks required to initialize the module (such as reading parameters etc.).

The stellar spectra function must have the form:

```plaintext
double precision function Stellar_Population_Spectra_Get(abundances,age,wavelength,imfIndex)
imPLICIT none
  type(abundancesStructure), intent(in) :: abundances
  double precision, intent(in) :: age,wavelength
  integer, intent(in) :: imfIndex
  .
  .
return
end function Stellar_Population_Spectra_Get
```

The function is given the `abundances`, `age` (in Gyr), and `imfIndex` of the stellar population and the `wavelength` (in Å) at which the spectrum should be computed. The spectrum should be returned in units of $L_\odot$ Hz$^{-1}$.
The tabulation subroutine must have the form:

```fortran
subroutine Stellar_Population_Spectrum_Tabulation(imfIndex, agesCount, metallicitiesCount, age, metallicity)
  implicit none
  integer, intent(in) :: imfIndex
  integer, intent(out) :: agesCount, metallicitiesCount
  double precision, intent(out), allocatable, dimension(:) :: age, metallicity
  
  return
end subroutine Stellar_Population_Spectrum_Tabulation
```

and should return the number of ages and metallicities at which stellar population spectra should be tabulated for the specified IMF, and should allocate the `age` and `metallicity` arrays appropriately and should fill them with the ages and metallicities at which to tabulate.

Currently defined stellar population properties methods are:

- **Conroy-White-Gunn2009**

  Uses the FSPS code of Conroy et al. [2009] to compute stellar spectra. If necessary, the FSPS code will be downloaded, patched and compiled and run to generate spectra. These tabulations are then stored to file for later retrieval.

- **File**

  Stellar spectra for a given IMF are read from the file specified by the `stellarPopulationSpectraForXXXXIMF` where `XXXX` is the name of the IMF. This should specify an HDF5 file with the following structure:

  - `ages` Dataset `{ageCount}`
  - `metallicities` Dataset `{metallicityCount}`
  - `spectra` Dataset `{metallicityCount, ageCount, metallicityCount}`
  - `wavelengths` Dataset `{wavelengthCount}`

  where the datasets contain the tabulated ages (in Gyr), metallicities (logarithmic, relative to Solar), wavelengths (in Å) and spectra (in $L_\odot \text{Hz}^{-1}$).

Currently, the following pre-computed stellar spectra files are available as a separate download from [http://users.obs.carnegiescience.edu/abenson/galacticus/data/Galacticus_SSP_Data.tar.bz2](http://users.obs.carnegiescience.edu/abenson/galacticus/data/Galacticus_SSP_Data.tar.bz2):

- data/stellarPopulations/SSP_Spectra_Conroy-et-al_v2.0_imfSalpeter.hdf5 corresponds to a Salpeter IMF computed using v2.0 of the FSPS code;
- data/stellarPopulations/SSP_Spectra_Conroy-et-al_v2.1_imfSalpeter.hdf5 corresponds to a Salpeter IMF computed using v2.1 of the FSPS code;
- data/stellarPopulations/SSP_Spectra_Conroy-et-al_v2.1_imfChabrier.hdf5 corresponds to a Chabrier IMF computed using v2.1 of the FSPS code;
- data/stellarPopulations/SSP_Spectra_Conroy-et-al_v2.2_imfChabrier.hdf5 corresponds to a Chabrier IMF computed using v2.2 of the FSPS code;
- data/stellarPopulations/SSP_Spectra_Conroy-et-al_v2.2_imfKennicutt.hdf5 corresponds to a Kennicutt IMF computed using v2.2 of the FSPS code;
- data/stellarPopulations/SSP_Spectra_Conroy-et-al_v2.2_imfBaugh2005TopHeavy.hdf5 corresponds to the top-heavy IMF of Baugh et al. [2005] computed using v2.2 of the FSPS code;
17.4. Existing Method Types

data/stellarPopulations/SSP_Spectra_Maraston_hbMorphologyRed_imfKroupa.hdf5  The spectra from Maraston [2005] for a Kroupa IMF and a red horizontal branch morphology;

data/stellarPopulations/SSP_Spectra_Maraston_hbMorphologyRed_imfSalpeter.hdf5  The spectra from Maraston [2005] for a Salpeter IMF and a red horizontal branch morphology;

data/stellarPopulations/SSP_Spectra_BC2003_highResolution_imfSalpeter.hdf5  The (high resolution) spectra from Bruzual and Charlot [2003] for a Salpeter IMF, using Padova 1994 tracks;

data/stellarPopulations/SSP_Spectra_Grasil_gkn15rd_ken.hdf5  The spectra used by GRASIL for a Kennicutt IMF;

data/stellarPopulations/SSP_Spectra_Grasil_gkn1rd_ken.hdf5  The spectra used by GRASIL for a Kennicutt IMF;

data/stellarPopulations/SSP_Spectra_Grasil_gsrdk0b_sal.hdf5  The spectra used by GRASIL for a Salpeter IMF;

data/stellarPopulations/SSP_Spectra_Grasil_imf27_kro.hdf5  Spectra used by GRASIL.

Note that the high resolution spectra from Bruzual and Charlot [2003] may require you to adjust the [stellarPopulationLuminosityIntegrationToleranceRelative] parameter to a larger value. The sharp features in these high resolution spectra can be difficult to integrate. Scripts to convert the data provided by Maraston [2005] and Bruzual and Charlot [2003] into GALACTICUS’s format are provided in the scripts/ssps folder. Spectra for other initial mass functions will be computed automatically when using the Conroy et al. [2009] population synthesis models.

Stellar Feedback

Additional methods for stellar feedback can be added using the stellarFeedbackMethod directive. The directive should contain a single argument, giving the name of a subroutine to be called to initialize the method. For example, the standard method is described by a directive:

    !# <stellarFeedbackMethod>
    !# <unitName>Stellar_Feedback_Standard_Initialize</unitName>
    !# </stellarFeedbackMethod>

Here, Stellar_Feedback_Standard_Initialize is the name of a subroutine which will be called to initialize the method. The initialization subroutine must have the following form:

    subroutine Method_Initialize(stellarFeedbackMethod,Stellar_Feedback_Cumulative_Energy_Input_Get)
    implicit none
    type(varying_string), intent(in) :: stellarFeedbackMethod
    procedure(), pointer, intent(inout) :: Stellar_Feedback_Cumulative_Energy_Input_Get

    if (stellarFeedbackMethod == 'myMethod') then

839
17. Adding New Methods

. .
end if
return
end subroutine Method_Initialize

where myMethod is the name of this method as will be specified by the stellarFeedbackMethod input parameter. The procedure pointer Stellar_Feedback_Cumulative_Energy_Input_Get must be set to point to a function which returns the cumulative energy input from stars as described below. The initialization subroutine should perform any other tasks required to initialize the module (such as reading parameters etc.).

The function must have the form:

```plaintext
double precision function Stellar_Feedback_Cumulative_Energy_Input(initialMass,age,metallicity)
  implicit none
  double precision, intent(in) :: initialMass,age,metallicity
  . .
  return
end function Stellar_Feedback_Cumulative_Energy_Input
```

The function must return the cumulative energy input (in \(M_\odot (\text{km/s})^2\)) from stars of given initialMass and metallicity after a time age. Currently defined stellar feedback methods are:

**standard** This method assumes that the energy input has contributions from stellar winds, Type Ia, Type II and Population III supernovae. The minimum mass required for a star to produce a Type II supernova is specified via initialMassForSupernovaeTypeII (in \(M_\odot\)), while the energy per Type II or Ia supernova is specified via supernovaEnergy (in ergs).

**Stellar Tracks**

Additional methods for stellar tracks can be added using the stellarTracksMethod directive. The directive should contain a single argument, giving the name of a subroutine to be called to initialize the method. For example, the file method is described by a directive:

```plaintext
!# <stellarTracksMethod>
!# <unitName>Stellar_Tracks_Initialize_File</unitName>
!# </stellarTracksMethod>
```

Here, Stellar_Tracks_Initialize_File is the name of a subroutine which will be called to initialize the method. The initialization subroutine must have the following form:

```plaintext
subroutine Method_Initialize(stellarTracksMethod,Stellar_Luminosity_Get,Stellar_Effective_Temperature_Get)
  implicit none
  type(varying_string), intent(in) :: stellarTracksMethod
  procedure(), pointer, intent(inout) :: Stellar_Luminosity_Get,Stellar_Effective_Temperature_Get

  if (stellarTracksMethod == 'myMethod') then
    Stellar_Luminosity_Get => My_Stellar_Luminosity_Get
  .
end subroutine Method_Initialize
```
17.4. Existing Method Types

Stellar_Effective_Temperature_Get => My_Stellar_Effective_Temperature_Get

end if
return
end subroutine Method_Initialize

where myMethod is the name of this method as will be specified by the stellarTracksMethod input parameter. The procedure pointers Stellar_Luminosity_Get and Stellar_Effective_Temperature_Get must be set to point to functions which return the luminosity and effective temperatures of stars as described below. The initialization subroutine should perform any other tasks required to initialize the module (such as reading parameters etc.).

The functions must have the form:

\[
\text{double precision function Stellar_Tracks_Function(initialMass,age,metallicity) }
\]

\[
\text{implicit none}
\]

\[
\text{double precision, intent(in)} :: \text{initialMass,age,metallicity}
\]

return
end function Stellar_Tracks_Function

The luminosity function must return the bolometric luminosity (in \(L_\odot\)) of a star of given initialMass and metallicity after a time age. The effective temperature function should give the effective temperature (in Kelvin) for the same star.

Currently defined stellar tracks methods are:

**file** Stellar tracks are read from an HDF5 file and interpolated in. The structure of the HDF5 is described in §13.43.3.

**Stellar Winds**

Additional methods for stellar winds can be added using the stellarWindsMethod directive. The directive should contain a single argument, giving the name of a subroutine to be called to initialize the method. For example, the Leitherer1992 method is described by a directive:

\[
!\# <\text{stellarWindsMethod}>
!\# <\text{unitName}>Stellar_Winds_Leitherer1992_Initialize</\text{unitName}>
!\# </\text{stellarWindsMethod}>
\]

Here, Stellar_Winds_Leitherer1992_Initialize is the name of a subroutine which will be called to initialize the method. The initialization subroutine must have the following form:

subroutine Method_Initialize(stellarWindsMethod,Stellar_Winds_Mass_Loss_Rate_Get,Stellar_Winds_Terminal_Velocity_Get)
implicit none
type(varying_string), intent(in) :: stellarWindsMethod
procedure(), pointer, intent(inout) :: Stellar_Winds_Mass_Loss_Rate_Get,Stellar_Winds_Terminal_Velocity_Get
if (stellarWindsMethod == 'myMethod') then
    Stellar_Winds_Mass_Loss_Rate_Get => My_Stellar_Winds_Mass_Loss_Rate_Get
    Stellar_Winds_Terminal_Velocity_Get => My_Stellar_Winds_Terminal_Velocity_Get
end if
return
end subroutine Method_Initialize
17. Adding New Methods

. .

end if
return
end subroutine Method_Initialize

where myMethod is the name of this method as will be specified by the stellarWindsMethod input parameter. The procedure pointers Stellar_Winds_Mass_Loss_Rate_Get and Stellar_Winds_Terminal_Velocity_Get must be set to point to functions which return the mass loss rate and terminal velocity of winds as described below. The initialization subroutine should perform any other tasks required to initialize the module (such as reading parameters etc.).

The functions must have the form:

double precision function Stellar_Wind_Function(initialMass, age, metallicity)
   implicit none
   double precision, intent(in) :: initialMass, age, metallicity
   .
   return
end function Stellar_Wind_Function

The mass loss function must return the rate of mass loss (in $M_\odot$/Gyr) from stars of given initialMass and metallicity after a time age. The terminal velocity function should give the velocity (in km/s) at infinity of the wind for the same stars.

Currently defined stellar winds methods are:

Leitherer1992 Computes wind properties using the fitting functions of Leitherer et al. [1992] and GALACTICUS stellar tracks.

Supernovae Type Ia

Additional methods for Type Ia supernovae can be added using the supernovaeIaMethod directive. The directive should contain a single argument, giving the name of a subroutine to be called to initialize the method. For example, the Nagashima method is described by a directive:

!# <supernovaeIaMethod>
!# <unitName>Supernovae_Type_Ia_Nagashima_Initialize</unitName>
!# </supernovaeIaMethod>

Here, Supernovae_Type_Ia_Nagashima_Initialize is the name of a subroutine which will be called to initialize the method. The initialization subroutine must have the following form:

subroutine Method_Initialize(supernovaeIaMethod, SNeIa_Cumulative_Number_Get, SNeIa_Cumulative_Yield_Get)
   implicit none
   type(varying_string), intent(in) :: supernovaeIaMethod
   procedure(), pointer, intent(inout) :: SNeIa_Cumulative_Number_Get, SNeIa_Cumulative_Yield_Get
   .
   if (supernovaeIaMethod == 'myMethod') then
      SNeIa_Cumulative_Number_Get => My_SNeIa_Cumulative_Number_Get
      SNeIa_Cumulative_Yield_Get  => My_SNeIa_Cumulative_Yield_Get
   .
where `myMethod` is the name of this method as will be specified by the `supernovaeIaMethod` input parameter. The procedure pointers `SNeIa_Cumulative_Number_Get` and `SNeIa_Cumulative_Yield_Get` must be set to point to functions which return the cumulative number of and cumulative yield from Type Ia supernovae as described below. The initialization subroutine should perform any other tasks required to initialize the module (such as reading parameters etc.).

The cumulative number function must have the form:

```fortran
double precision function SNeIa_Cumulative_Number(initialMass,age,metallicity)
  implicit none
  double precision, intent(in) :: initialMass,age,metallicity
  .
  .
  .
  return
end function SNeIa_Cumulative_Number
```

and must return the number of Type Ia supernovae resulting per $M_\odot$ of stars formed with given `initialMass` and `metallicity` after a time `age`. (Since Type Ia's form in binary systems this function should specifically return the number such that when integrated over the IMF it gives the correct total number of Type Ia supernovae formed from a single stellar population.)

The cumulative yield function must have the form:

```fortran
double precision function SNeIa_Cumulative_Yield(initialMass,age,metallicity,atomIndex)
  implicit none
  double precision, intent(in) :: initialMass,age,metallicity
  integer, intent(in), optional :: atomIndex
  .
  .
  .
  return
end function SNeIa_Cumulative_Yield
```

and should return the yield of the element identified by `atomIndex` (as returned by the `Atom.Lookup()` function from the `Atomic_Data` module) if present, or total metal yield otherwise from Type Ia's resulting from stars defined in the same way as for the cumulative number function.

Currently defined type Ia supernovae methods are:

**Nagashima** Computes Type Ia properties using the methods described by Nagashima et al. [2005].

**Tidal Mass Loss Rates in Disks/Spheroids**

Additional methods for computing tidal induced mass loss rates in disks/spheroids can be added using the `tidalStrippingMassLossRate(Disks|Spheroids)Method` directive. The directive should contain a single argument, giving the name of a subroutine to be called to initialize the method. For example, the `simple` method for disks is described by a directive:
Here, Tidal_Stripping_Mass_Loss_Rate_Disks_Simple_Init is the name of a subroutine which will be called to initialize the method. The initialization subroutine must have the following form:

```fortran
subroutine Method_Initialize(tidalStrippingMassLossRateDisksMethod,Tidal_Stripping_Mass_Loss_Rate_Disk_Get)
  implicit none
  type(varying_string), intent(in) :: starFormationTimescaleDisksMethod
  procedure(), pointer, intent(inout) :: Tidal_Stripping_Mass_Loss_Rate_Disk_Get

  if (tidalStrippingMassLossRateDisksMethod == 'myMethod') Tidal_Stripping_Mass_Loss_Rate_Disk_Get => My_Tidal_Stripping_Mass_Loss_Rate_Disk_Get
  return
end subroutine Method_Initialize
```

where myMethod is the name of this method as will be specified by the tidalStrippingMassLossRate(Disks|Spheroids)Method input parameter. The procedure pointer Tidal_Stripping_Mass_Loss_Rate_(Disk|Spheroid)_Get must be set to point to a function which returns mass loss rate due to tidal forces as described below. The initialization subroutine should perform any other tasks required to initialize the module (such as reading parameters etc.).

The mass loss rate function must have the form:

```fortran
double precision function Tidal_Stripping_Mass_Loss_Rate_Disk_Get(thisNode)
  implicit none
  type(treeNode), intent(in) :: thisNode
  
  return
end function Tidal_Stripping_Mass_Loss_Rate_Disk_Get
```

The function must return the mass loss rate induced by tidal forces (in units of $M_\odot$/Gyr) for the disk/spheroid in thisNode.

Currently defined ram pressure mass loss rate methods are:

- **simple** The mass loss rate scales in proportion to the ratio of tidal and gravitational restoring forces;
- **null** The mass loss rate is assumed to be always zero.

### Survey Geometry

Additional methods for survey geometries can be added using the `surveyGeometryMethod` directive. The directive should contain a single argument, giving the name of a subroutine to be called to initialize the method. For example, the Martin-2010-ALFALFA method is described by a directive:

```fortran
!# <surveyGeometryMethod>
!# <unitName>Geometry_Surveys_MARTIN_2010_ALFALFA_Initialize</unitName>
!# </surveyGeometryMethod>
```

Here, Geometry_Surveys_MARTIN_2010_ALFALFA_Initialize is the name of a subroutine which will be called to initialize the method. The initialization subroutine must have the following form:
17.4. Existing Method Types

subroutine Method_Initialize(surveyGeometryMethod, ,Geometry_Survey_Distance_Maximum_Get & &Geometry_Survey_Solid_Angle_Get ,Geometry_Survey_Volume_Maximum_Get, Geometry_Survey_Window_Functions_Get)
    implicit none
    type (varying_string ), intent(in ) :: surveyGeometryMethod
    procedure(double precision), pointer, intent(inout) :: Geometry_Survey_Distance_Maximum_Get, Geometry_Survey_Solid_Angle_Get & &Geometry_Survey_Volume_Maximum_Get
    procedure( ), pointer, intent(inout) :: Geometry_Survey_Window_Functions_Get
    if (surveyGeometryMethod == 'myMethod') then
        Geometry_Survey_Distance_Maximum_Get => My_Geometry_Survey_Distance_Maximum
        Geometry_Survey_Solid_Angle_Get => My_Geometry_Survey_Solid_Angle
        Geometry_Survey_Volume_Maximum_Get => My_Geometry_Survey_Volume_Maximum
        Geometry_Survey_Window_Functions_Get => My_Geometry_Survey_Window_Functions
    .
    .
    end if
    return
end subroutine Method_Initialize

where myMethod is the name of this method as will be specified by the surveyGeometryMethod input parameter. The procedure pointers must be set to point to functions which return properties of the survey as described below. The initialization subroutine should perform any other tasks required to initialize the module (such as reading parameters etc.).

The maximum distance function must have the form:

    double precision function Geometry_Survey_Distance_Maximum(mass)
    implicit none
    double precision, intent(in ) :: mass
    .
    .
    return
end function Geometry_Survey_Distance_Maximum

and must return the maximum distance (in Mpc) at which a galaxy of the given mass would be included in the survey.

The solid angle function must have the form:

    double precision function Geometry_Survey_Solid_Angle()
    implicit none
    .
    .
    return
end function Geometry_Survey_Solid_Angle

and should return the solid angle (in steradians) of the survey angular mask.

The maximum volume function must have the form:

    double precision function Geometry_Survey_Volume_Maximum(mass)
    implicit none
17. Adding New Methods

```fortran
double precision, intent(in) :: mass

return
end function Geometry_Survey_Volume_Maximum
```

and should return the maximum volume (in Mpc$^3$) within which a galaxy of the given mass could be found in the survey.

The window function function must have the form:

```fortran
double precision function Geometry_Survey_Window_Functions(mass1,mass2,boxLength,gridCount,windowFunction1,windowFunction2)
implicit none
double precision , intent(in) :: mass1,mass2
integer , intent(in) :: gridCount
double precision , intent(out) :: boxLength
complex(c_double_complex), intent(out), dimension(gridCount,gridCount,gridCount) :: windowFunction1,windowFunction2

return
end function Geometry_Survey_Window_Functions
```

and should compute the Fourier space window functions corresponding to the survey volume within which galaxies of masses mass1 and mass2 could be found. The window functions should be computed on a Cartesian grid, containing gridCount elements in each dimension. The chosen length of the box within which the survey geometry was embedded should be returned in the boxLength variable.

Currently defined type Ia supernovae methods are:

- Martin-2010-ALFALFA Computes the survey geometry of the survey of Martin et al. [2010].
- Li-White-2009-SDSS Computes the survey geometry of the survey of Li and White [2009].

**Tree Timing**

Additional methods for tree timing (i.e. the time taken to process a given merger tree) can be added using the `timePerTreeMethod` directive. The directive should contain a single argument, giving the name of a subroutine to be called to initialize the method. For example, the file method is described by a directive:

```fortran
!# <timePerTreeMethod>
!# <unitName>Galacticus_Time_Per_Tree_File_Initialize</unitName>
!# </timePerTreeMethod>
```

Here, `Galacticus_Time_Per_Tree_File_Initialize` is the name of a subroutine which will be called to initialize the method. The initialization subroutine must have the following form:

```fortran
subroutine Method_Initialize(timePerTreeMethod,Galacticus_Time_Per_Tree_Get)
imPLICIT none
type(varying_string), intent(in) :: timePerTreeMethod
procedure(), pointer, intent(inout) :: Galacticus_Time_Per_Tree_Get

if (timePerTreeMethod == 'myMethod') then
```

846
17.4. Existing Method Types

Galacticus_Time_Per_Tree_Get => My_Time_Per_Tree_Get

end if
return
end subroutine Method_Initialize

where myMethod is the name of this method as will be specified by the timePerTreeMethod input parameter. The procedure pointer Galacticus_Time_Per_Tree_Get must be set to point to a function which returns an estimate of the time taken (in seconds) to process a merger tree. The initialization subroutine should perform any other tasks required to initialize the module (such as reading parameters etc.).

The function must have the form:

    double precision function Time_Per_Tree(treeRootMass)
       implicit none
       double precision, intent(in) :: treeRootMass
    .
    .
    .
    return
    end function Time_Per_Tree

The function must return an estimate of the time taken (in seconds) to process a merger tree with the given treeRootMass.

Currently defined tree timing methods are:

file This method reads coefficients of a simple fitting formula for the processing time from a file, specified via the [timePerTreeFitFileName] parameter (see §18.2).

Transfer Function

Additional methods for transfer function can be added using the transferFunctionMethod directive. The directive should contain a single argument, giving the name of a subroutine to be called to initialize the method. For example, the file method is described by a directive:

!# <transferFunctionMethod>
!# <unitName>Transfer_Function_File_Initialize</unitName>
!# </transferFunctionMethod>

Here, Transfer_Function_File_Initialize is the name of a subroutine which will be called to initialize the method. The initialization subroutine must have the following form:

    subroutine Method_Initialize(transferFunctionMethod,Transfer_Function_Tabulate)
       implicit none
       type  (varying_string),  intent(in ) :: transferFunctionMethod
       procedure(      ), pointer, intent(inout) :: Transfer_Function_Tabulate
       procedure(      ), pointer, intent(inout) :: Transfer_Function_Half_Mode_Mass
    if (transferFunctionMethod == 'myMethod') then
       Transfer_Function_Tabulate => My_Do_Tabulate
       Transfer_Function_Half_Mode_Mass => My_Do_Half_Mode_Mass
    .
17. Adding New Methods

.

end if
return
end subroutine Method_Initialize

where myMethod is the name of this method as will be specified by the transferFunctionMethod input parameter. The procedure pointer transferFunction_Tabulate must be set to point to a subroutine which tabulates the transfer function as described below. The initialization subroutine should perform any other tasks required to initialize the module (such as reading parameters etc.).

The tabulation subroutine must have the form:

subroutine Transfer_Function_Tabulate(wavenumber,transferFunctionNumberPoints,transferFunctionWavenumber,transferFunctionT)
implicit none
double precision, intent(in) :: wavenumber
double precision, allocatable, dimension(:), intent(inout) :: transferFunctionLogWavenumber,transferFunctionLogT
integer, intent(out) :: transferFunctionNumberPoints
.
.
return
end subroutine Transfer_Function_Tabulate

The subroutine must tabulate the natural log of the transfer function in array transferFunctionLogT() as a function of the natural log of wavenumber transferFunctionLogWavenumber() (these arrays must be allocated to the correct size, and may be previously allocated, therefore requiring a deallocation). The number of tabulated points should be returned in transferFunctionNumberPoints. The subroutine should ensure that the currently requested wavenumber is within the range of the tabulated function (preferably with some buffer).

The half-mode mass function must have the form:

double precision function Transfer_Function_Half_Mode_Mass()
implicit none
.
.
return
end function Transfer_Function_Half_Mode_Mass

The function should return the mass, \( M_{hm} = \left(4\pi/3\right)(\Pi/k_{hm})^3 \), (in units of \( M_{\odot} \)) corresponding to the wavenumber, \( k_{hm} \), at which the transfer function is reduced by a factor 2 relative to the CDM case by small-scale dark matter particle physics.

Currently defined transfer function methods are:

null \( T(k) = 1 \).

file The transfer function is read from an XML file specified by input parameter transferFunctionFile.

CAMB The transfer function is generated by CAMB using the specified cosmological parameters. The transfer function is written out to a file in the data/ directory and will be re-read later if needed.

BBKS The transfer function is computed using the fitting formula of Bardeen et al. [1986].
Eisenstein-Hu1999 The transfer function is computed using the fitting formula of Eisenstein and Hu [1999]. The effective number of neutrino species and the summed mass (in electron volts) of all neutrino species are specified via the `effectiveNumberNeutrinos` and `summedNeutrinoMasses` parameters respectively.

The XML file format for transfer functions looks like:

```
<data>
  <column>k [Mpc^-1] - wavenumber</column>
  <column>T(k) - transfer function</column>
  <datum>1.111614e-05 0.218866E+08</datum>
  <datum>1.228521e-05 0.218866E+08</datum>
  <datum>1.357727e-05 0.218866E+08</datum>
  <datum>1.50052e-05 0.218866E+08</datum>
  <datum>1.658335e-05 0.218866E+08</datum>
  <datum>1.83274e-05 0.218865E+08</datum>
  ...
  ...
  ...
  <description>Cold dark matter power spectrum created by CAMB.</description>
  <fileFormat>1</fileFormat>
  <parameter>
    <name>Omega_b</name>
    <value>0.0450</value>
  </parameter>
  <parameter>
    <name>Omega_Matter</name>
    <value>0.250</value>
  </parameter>
  <parameter>
    <name>Omega_DE</name>
    <value>0.750</value>
  </parameter>
  <parameter>
    <name>H_0</name>
    <value>70.0</value>
  </parameter>
  <parameter>
    <name>T_CMB</name>
    <value>2.780</value>
  </parameter>
  <parameter>
    <name>Y_He</name>
    <value>0.24</value>
  </parameter>
  <extrapolation>
    <wavenumber>
      <limit>low</limit>
      <method>power law</method>
    </wavenumber>
  </extrapolation>
</data>
```
17. Adding New Methods

The `datum` elements give wavenumber (in Mpc$^{-1}$) and transfer function pairs. The `extrapolation` element defines how the tabulated function should be extrapolated to lower and higher wavenumbers. The two options for the `method` are “fixed”, in which case the transfer function is extrapolated assuming that it remains constant, and “power law” in which case the extrapolation is performed assuming a fixed power-law relation between transfer function and wavenumber. The `column`, `description` and `parameter` elements are optional, but are encouraged to make the file easier to understand. Finally, the `fileFormat` element should currently always contain the value 1—this may change in future if the format of this file is modified.

17.4.2. Events

Events are triggered during merger tree evolution. Examples are when a node needs to be promoted to its parent node, or when a minor node merges with its parent.

Node Merger Events

Additional methods for the node merging (i.e. when a non-primary progenitor merges with its parent) can be added using the `nodeMergersMethod` directive. The directive should contain a single argument, giving the name of a subroutine to be called to initialize the method. For example, the `singleLevelHierarchy` method is described by a directive:

```
!# <nodeMergersMethod>
!# <unitName>Events_Node_Merger.Initialize_SLH</unitName>
!# </nodeMergersMethod>
```

Here, `Satellite_Time_Until_Merging_Lacey_Cole_Initialize` is the name of a subroutine which will be called to initialize the method. The initialization subroutine must have the following form:

```fortran
subroutine Events_Node_Merger_Initialize(nodeMergersMethod,Events_Node_Merger_Do)
    implicit none
    type(varying_string), intent(in) :: nodeMergersMethod
    procedure(), pointer, intent(inout) :: Events_Node_Merger_Do

    if (nodeMergersMethod.eq.'myMethod') Events_Node_Merger_Do => My_Method_Procedure

    return
end subroutine Events_Node_Merger_Initialize
```

where `myMethod` is the name of this method as will be specified by the `nodeMergersMethod` input parameter. The procedure pointer `Events_Node_Merger_Do` must be set to point to a subroutine which handles the merging event as described below. The initialization subroutine should perform any other tasks required to initialize the module (such as reading parameters etc.).

The node merging subroutine must have the form:

```fortran
subroutine Events_Node_Merger_Do(thisNode)
    implicit none
```
17.4. Existing Method Types

The function must perform any processing required for the merger, and move `thisNode` to the linked list of satellite nodes in `thisNode%parentNode`.

Currently defined node merger event methods are:

**singleLevelHierarchy**  The node merger is handled by placing the merging node into the linked list of satellites of the parent node. Any satellites in the merging node are also promoted to be satellites in the new node, thereby maintaining just a single hierarchy level of substructure.

### Node Promotion Events

Additional methods for node promotion (i.e. when a primary progenitor reaches its parent halo) can be added using the `nodePromotionTask` directive. The directive should contain a single argument, giving the name of a subroutine to be called to initialize the method. For example, the `basic` tree node method uses this directive as follows:

```plaintext
!# <nodePromotionTask>
!# <unitName>Tree_Node_Basic_Promote</unitName>
!# </nodePromotionTask>
```

Here, `Tree_Node_Basic_Promote` is the name of a subroutine which will be called to perform whatever tasks are required prior to the promotion. The subroutine must have the following form:

```plaintext
subroutine Node_Promotion_Task(thisNode)
  implicit none
  type(treeNode), pointer, intent(inout) :: thisNode
  .
  .
  return
end subroutine Node_Promotion_Task
```

where `thisNode` is the node about to be promoted.

### 17.4.3. Tasks

Tasks are any processing which must be performed on a node as a result of some specific event (such as a merger).

### Calculation Reset Tasks

Additional methods for calculation reset tasks (i.e. flagging that the properties of a node may have changed so that any calculations must be performed anew) can be added using the `calculationResetTask` directive. The directive should contain a single argument, giving the name of a subroutine to be called to perform the task. For example, the standard hot halo component adds a task as follows:
17. Adding New Methods

Here, **Tree_Node_Hot_Halo_Reset_Standard** is the name of a subroutine which will be called to perform whatever tasks are required. The subroutine must have the following form:

```fortran
subroutine Reset_Task(thisNode)
  implicit none
  type(treeNode), pointer, intent(inout) :: thisNode
  .
  .
  return
end subroutine Prederivative_Task
```

where `thisNode` is the node for which derivatives will be computed. Tasks typically involve precomputing quantities that will be used in finding the derivatives or resetting the state so that stored quantities will be recomputed as needed.

**Cooling Rate Modifiers**

Additional methods for modifying the cooling rate from the hot halo can be added using the `coolingRateModifierMethod` directive. The directive should contain a single argument, giving the name of a subroutine to be called to modify the cooling rate. For example, the “cut-off” modifier is described by a directive:

```fortran
!# <coolingRateModifierMethod>
!# <unitName>Cooling_Rate_Modifier_Cut_Off</unitName>
!# </coolingRateModifierMethod>
```

Here, **Cooling_Rate_Modifier_Cut_Off** is the name of the subroutine which will be called modify the cooling rate. The modification subroutine must have the following form:

```fortran
subroutine Modify_Rate(thisNode,coolingRate)
  implicit none
  type(treeNode) , intent(inout), pointer :: thisNode
  double precision, intent(inout) :: coolingRate

  return
end subroutine Modify_Rate
```

The subroutine should modify the `coolingRate` as necessary. Currently defined cooling rate modifier tasks are:

- **“cut-off”**  The cooling rate is set to zero in halos with virial velocities below `[coolingCutOffVelocity]` at redshifts below/above `[coolingCutOffRedshift]` for `[coolingCutOffWhen]=after/before. In other halos the cooling rate is not modified.

**Decode Property Identifier Tasks**

Additional property identifier decoding tasks (i.e. determining the name of a property from a set of integer identifiers) can be added using the `decodePropertyIdentifiersTask` directive. The directive should contain a single argument, giving the name of a subroutine to be called to perform the task. For example, the Hernquist spheroid component adds a task as follows:
17.4. Existing Method Types

Here, Hernquist_Spheroid_Property_Identifiers_Decode is the name of a subroutine which will be called to perform the decoding task. The subroutine must have the following form:

```fortran
subroutine Property_Identifier_Decode_Task(propertyComponent,propertyObject,propertyIndex,matchedProperty,propertyName)
  implicit none
  integer, intent(in) :: propertyComponent,propertyObject,propertyIndex
  logical, intent(inout) :: matchedProperty
  type(varying_string), intent(inout) :: propertyName

return
end subroutine Property_Identifier_Decode_Task
```

The task should check whether propertyComponent matches its stored componentIndex value. If it does, it should set propertyName to a suitable name (e.g. hernquistSpheroid::stellarMass) and set matchedProperty = true. The value of propertyObject will be either objectTypeProperty indicating that the object in question is a standard property, or objectTypeHistory indicating that it is a history. The value of propertyIndex then gives the position of the object in question in the array of properties or histories.

**Evolution Timestep Tasks**

Merger tree nodes are evolved over some fixed timestep before evolution is stopped and other processing is allowed. The timestep is always sufficiently small such that the node does not evolve past the time of its parent node, nor does it evolve past the time of any of its satellite nodes. An arbitrary number of other criteria can be used to adjust the timestep. Such a criterion can be added using the timeStepsTask directive. For example, the simple timestep task adds itself using

```fortran
!# <timeStepsTask>
!# <unitName>Merger_Tree_Timestep_Simple</unitName>
!# </timeStepsTask>
```

Here, unitName gives the name of the subroutine to be called to (possibly) adjust the timestep. It should have the following form:

```fortran
subroutine My_Timestep(thisNode,timeStep,End_Of_Timestep_Task,report,lockNode,lockType)
  implicit none
  type (treeNode ), intent(inout), pointer :: thisNode
  procedure( ), intent(inout), pointer :: End_Of_Timestep_Task
  double precision , intent(inout) :: timeStep
  logical , intent(in ) :: report
  type (treeNode ), intent(inout), pointer, optional :: lockNode
  type (varying_string), intent(inout), optional :: lockType

return
end subroutine My_Timestep
```
17. Adding New Methods

This subroutine should compute a suitable timestep for thisNode and, if it is less than the currently defined value of timeStep should set timeStep to that value. Optionally, the procedure pointer End_Of_Timestep_Task can be set to point to a subroutine which will be called after the node is evolved to the end of the timestep. It is acceptable for this pointer to be null. Note that the End_Of_Timestep_Task will only be called for the task which provided the shortest timestep—other tasks can always request to be called again when the next timestep is determined. The subroutine to be called at the end of the timestep must have the form:

```
subroutine My_End_Of_Timestep_Task(thisTree,thisNode,deadlockStatus)
  implicit none
  type(mergerTree), intent(in) :: thisTree
  type(treeNode), intent(inout), pointer :: thisNode
  integer, intent(inout) :: deadlockStatus
  .
  return
end subroutine My_End_Of_Timestep_Task
```

The deadlockStatus argument should be set to isNotDeadlocked (provided by the Merger_Trees-Evolve_Deadlock_Status module) if, and only if, the end of timestep task makes some change to the state of the tree (e.g. merging a node), to indicate that the tree was not deadlocked in this pass (i.e. something actually changed in the tree).

If the report argument is true then the function should report the value of timestep prior to exiting. (This is used in reporting on timestepping criteri in deadlocked trees.) It is recommended that the report be made using the Evolve_To_Time_Report() function. Additionally, if the optional lockNode and lockType arguments are present then additional information can be supplied to aid in diagnosing deadlock conditions. If the current task is limiting the timestep then the lockNode pointer should be set to point to whichever node is causing the limit (which may be thisNode or some other node, e.g. a satellite of thisNode, etc.), and lockType should be set to a short description label identifying the type of limit.

Galactic Component Density

The function Galactic_Structure_Density() computes the density of material at a given position within a node. To have their density counted, each component must register a task using:

```
!# <densityTask>
!# <unitName>Density_Procedure</unitName>
!# </densityTask>
```

where Density_Procedure is the name of a function with the following template

```
double precision function Density_Procedure(thisNode,position,coordinateSystem,componentType,massType,weightBy,weightIndex,haloLoaded)
  type(treeNode), intent(inout), pointer :: thisNode
  integer, intent(in) :: massType,coordinateSystem,componentType,weightBy,weightIndex
  double precision, intent(in) :: radius
  logical , intent(in), optional :: haloLoaded
  .
  return
end function Density_Procedure
```
17.4. Existing Method Types

If \texttt{componentType} is a match to the component then the function should return the density of the component matching type \texttt{massType} at position for \texttt{thisNode}. \texttt{componentType} and \texttt{massType} can take one of the values described in §17.2. In the above “density” can actually refer to different quantities depending on the values of \texttt{weightBy} (and \texttt{weightIndex}): 

\texttt{weightByMass} The actual mass should be returned (the value of \texttt{weightIndex} is irrelevant); 

\texttt{weightByLuminosity} The \texttt{weightIndex}th luminosity should be returned.

If \texttt{haloLoaded=\text{true}} (which should be the default if this option is not present), then the effects of baryonic loading on the halo profile should be taken into account where necessary. Otherwise, the effects of baryonic loading should be ignored.

**Galactic Component Enclosed Mass**

The function \texttt{Galactic\_Structure\_Enclosed\_Mass()} computes the mass within a specified radius in a node. To have their mass counted, each component must register a task using:

\begin{verbatim}
!# <enclosedMassTask>
!#   <unitName>Enclosed_Mass_Procedure</unitName>
!# </enclosedMassTask>
\end{verbatim}

where \texttt{Enclosed\_Mass\_Procedure} is the name of a function with the following template

\begin{verbatim}
double precision function Enclosed\_Mass\_Procedure(thisNode,radius,componentType,massType,weightBy,weightIndex,haloLoaded)
    type(treeNode), intent(inout), pointer :: thisNode
    integer, intent(in) :: massType,componentType,weightBy,weightIndex
    double precision, intent(in) :: radius
    logical, intent(in), optional :: haloLoaded
    .
    .
    return
end function Enclosed\_Mass\_Procedure
\end{verbatim}

If \texttt{componentType} is a match to the component then the function should return the “mass” of the component matching type \texttt{massType} within \texttt{radius} for \texttt{thisNode}. \texttt{componentType} and \texttt{massType} can take one of the values described in §17.2. If \texttt{radius} is equal to or greater than \texttt{radiusLarge} the routine should return the total “mass” (i.e. “mass” within infinite radius). In the above “mass” can actually refer to different quantities depending on the values of \texttt{weightBy} (and \texttt{weightIndex}): 

\texttt{weightByMass} The actual mass should be returned (the value of \texttt{weightIndex} is irrelevant); 

\texttt{weightByLuminosity} The \texttt{weightIndex}th luminosity should be returned.

If \texttt{haloLoaded=\text{true}} (which should be the default if this option is not present), then the effects of baryonic loading on the halo profile should be taken into account where necessary. Otherwise, the effects of baryonic loading should be ignored.

**Galactic Component Rotation Curve**

The function \texttt{Galactic\_Structure\_Rotation\_Curve()} computes the rotation curve at a specified radius in a node. To have their contribution counted, each component must register a task using:
17. Adding New Methods

```fortran
!# <rotationCurveTask>
!# <unitName>Rotation_Curve_Procedure</unitName>
!# </rotationCurveTask>

where Rotation_Curve_Procedure is the name of a function with the following template

double precision function Rotation_Curve_Procedure(thisNode, radius, componentType, massType, haloLoaded)
  type(treeNode), intent(inout), pointer :: thisNode
  integer, intent(in) :: massType, componentType
  double precision, intent(in) :: radius
  logical , intent(in), optional :: haloLoaded
  .
  .
  .
  return
end function Rotation_Curve_Procedure

If componentType is a match to the component then the procedure should return the contribution to the rotation curve due to the component matching type massType within radius for thisNode.

Galactic Component Rotation Curve Gradient

The function Galactic_Structure_Rotation_Curve_Gradient() computes the gradient of the rotation curve at a specified radius in a node. To have their contribution counted, each component must register a task using:

```fortran
!# <rotationCurveGradientTask>
!# <unitName>Rotation_Curve_Gradient_Procedure</unitName>
!# </rotationCurveGradientTask>

where Rotation_Curve_Gradient_Procedure is the name of a function with the following template

double precision function Rotation_Curve_Gradient_Procedure(thisNode, radius, componentType, massType, haloLoaded)
  type(treeNode), intent(inout), pointer :: thisNode
  integer, intent(in) :: massType, componentType
  double precision, intent(in) :: radius
  logical , intent(in), optional :: haloLoaded
  .
  .
  .
  return
end function Rotation_Curve_Gradient_Procedure

If componentType is a match to the component then the function should return the contribution to the gradient of $V^2(r)$ due to the component matching type massType within radius for thisNode. Note that this is the gradient of the square of the rotation curve to permit gradients to be directly summed. componentType and massType can take one of the values described in §17.2. If haloLoaded=true (which should be the default if this option is not present), then the effects of baryonic loading on the halo profile should be taken into account where necessary. Otherwise, the effects of baryonic loading should be ignored.
Galactic Component Potential

The function `Galactic_Structure_Potential()` computes the potential at a specified radius in a node. To have their contribution counted, each component must register a task using:

```fortran
!# <potentialTask>
!# <unitName>Potential_Task</unitName>
!# </potentialTask>
```

where `Potential_Task` is the name of a function with the following template

```fortran
double precision function Potential_Procedure(thisNode, radius, componentType, massType, haloLoaded)
  type(treeNode), intent(inout), pointer :: thisNode
  integer, intent(in), optional :: componentType
  double precision, intent(in) :: radius
  logical , intent(in), optional :: haloLoaded
.
  return
end function Potential_Procedure
```

If `componentType` is a match to the component then the procedure should return the contribution to the rotation curve due to the component matching type `massType` within radius for `thisNode`. `componentType` and `massType` can take one of the values described in §17.2. If `haloLoaded`=true (which should be the default if this option is not present), then the effects of baryonic loading on the halo profile should be taken into account where necessary. Otherwise, the effects of baryonic loading should be ignored.

Galactic Component Surface Density

The function `Galactic_Structure_Surface_Density()` computes the surface density of material at a given position within a node. Note that while a 3-D position is specified the routine should return the surface density corresponding to integrating the component density through the minor axis (typically the z-axis). To have their surface density counted, each component must register a task using:

```fortran
!# <surfaceDensityTask>
!# <unitName>Surface_Density_Procedure</unitName>
!# </surfaceDensityTask>
```

where `Surface_Density_Procedure` is the name of a function with the following template

```fortran
double precision function Surface_Density_Procedure(thisNode, position, coordinateSystem, componentType, massType)
  type(treeNode), intent(inout), pointer :: thisNode
  integer, intent(in) :: massType, coordinateSystem, componentType
  double precision, dimension(3):: position
  logical , intent(in), optional :: haloLoaded
.
  return
end function Surface_Density_Procedure
```
17. Adding New Methods

If `componentType` is a match to the component then the function should return the surface density of the component matching type `massType` at `position` for `thisNode`. `componentType` and `massType` can take one of the values described in §17.2. The coordinate system in which `position` is specified is given by `coordinateSystem` which can take on the following values:

- `coordinateSystemCartesian` Cartesian \((x, y, z)\);
- `coordinateSystemSpherical` Spherical \((r, \theta, \phi)\);
- `coordinateSystemCylindrical` Cylindrical \((R, \phi, z)\).

If `haloLoaded` = `true` (which should be the default if this option is not present), then the effects of baryonic loading on the halo profile should be taken into account where necessary. Otherwise, the effects of baryonic loading should be ignored.

### Halo Formation Events

Tasks to be performed when a halo is deemed to have “formed” (or reformed) can be registered using the `haloFormationTask` directive. For example, the `Tree_Node_Methods_Hot_Halo` module registers a task using

```
!# <haloFormationTask>
!# <unitName>Hot_Halo_Formation_Task</unitName>
!# </haloFormationTask>
```

The contents of `<unitName>` should give the name of the subroutine to be called on halo formation. The subroutine should have a single argument, `thisNode`, which is the node that has (re)formed.

### HDF5 File Close

Tasks to be performed just prior to closing the GALACTICUS output HDF5 file (typically involving writing accumulated data to that file) can be registered using the `hdfPreCloseTask` directive. For example, the `Merger_Tree_Timesteps_History` module registers a task using

```
!# <hdfPreCloseTask>
!# <unitName>Merger_Tree_History_Write</unitName>
!# </hdfPreCloseTask>
```

The contents of `<unitName>` should give the name of the subroutine to be called prior to HDF5 file closure. The subroutine should have no arguments.

### Initial Mass Functions

New IMF s can be added using the `imfRegister` and `imfRegisterName` task directives. For example, the Salpeter IMF is registered using the directives:

```
!# <imfRegister>
!# <unitName>Star_Formation_IMF_Register_Salpeter</unitName>
!# </imfRegister>
```

and

```
!# <imfRegisterName>
!# <unitName>Star_Formation_IMF_Register_Name_Salpeter</unitName>
!# </imfRegisterName>
```
17.4. Existing Method Types

The `unitName` tags specify subroutines that are called to register the IMF. These subroutines should have the following forms:

```fortran
subroutine Star_Formation_IMF_Register_My_IMF(imfAvailableCount)
    integer, intent(inout) :: imfAvailableCount

    imfAvailableCount=imfAvailableCount+1
    myImfIndex       =imfAvailableCount

    return
end subroutine Star_Formation_IMF_Register_My_IMF

subroutine Star_Formation_IMF_Register_Name_My_IMF(imfNames,imfDescriptors)
    type(varying_string), intent(inout), dimension(:) :: imfNames,imfDescriptors

    imfNames (myImfIndex)="Salpeter"
    imfDescriptors(myImfIndex)="Salpeter"

    return
end subroutine Star_Formation_IMF_Register_Name_My_IMF
```

The first routine should increment the `imfAvailableCount` counter by 1 and keep a record of the resulting index—this will be the index by which the IMF is referred to. The second routine should store the name and descriptor of the IMF in the appropriate position in the supplied `imfNames()` and `imfDescriptors()` arrays. The “name” is the label used to identify the IMF in input parameters for example. The “descriptor” should be a label sufficient to uniquely identify the IMF, and is used, for example, in constructing file names when storing IMF related data. Often, the name and descriptor are identical. However, if the IMF has user-definable parameters then those parameters should be encoded into the descriptor.

Each registered IMF should supply a set of functions as described in §17.4.1.

### Merger Tree Extra Output Tasks

Extra outputs for merger trees (i.e. those which do not involve output of a fixed number of properties for every node—examples might be star formation histories for a subset of galaxies) can be added using the directive: `mergerTreeExtraOutputTask`. The directive should give the name of the subroutine to be called to perform the task. A template for this task is:

```fortran
!# <mergerTreeExtraOutputTask>
!# <unitName>Galacticus_Extra_Output_Example</unitName>
!# </mergerTreeExtraOutputTask>
subroutine Galacticus_Extra_Output_Example(thisNode,iOutput,treeIndex,nodePassesFilter)
    implicit none
    type(treeNode), intent(inout), pointer :: thisNode
    integer, intent(in) :: iOutput
    integer(kind=kind_int8), intent(in) :: treeIndex
    logical, intent(in) :: nodePassesFilter

    .
    .
    return
end subroutine Galacticus_Extra_Output_Example
```

The subroutine will be called for each node in each merger tree at each output, and should perform whatever extra output related to `thisNode`. The index of the output and tree are provided as `iOutput`
and `treeIndex` for reference, and may be used in organizing output. The `nodePassesFilter` flag will be set to `true` if `thisNode` passed all active output filters (see §17.4.3). If it is `false` then typically no output should occur (although other tasks may still be undertaken).

**Merger Tree Output Tasks**

Additional outputs for merger trees can be added using three directives: `mergerTreeOutputPropertyCount`, `mergerTreeOutputNames` and `mergerTreeOutputTask`. Each directive should give the name of the subroutine to be called to perform the task and, additionally, a name for sorting (this should be the same for all three directives and ensures that output tasks are always called in the correct order). Templates for these tasks are:

```
!# <mergerTreeOutputNames>
!# <unitName>Galacticus_Output_Tree_Example_Names</unitName>
!# <sortName>Galacticus_Output_Tree_Example</sortName>
!# </mergerTreeOutputNames>
subroutine Galacticus_Output_Tree_Example_Names(integerProperty,integerPropertyNames,integerPropertyComments,integerPropertyUnitsSI &
   &,doubleProperty,doublePropertyNames,doublePropertyComments,doublePropertyUnitsSI,time)
   implicit none
   double precision, intent(in) :: time
   integer, intent(inout) :: integerProperty,doubleProperty
   character(len=*) , intent(inout), dimension(:) :: integerPropertyNames,integerPropertyComments,doublePropertyNames &
   & ,doublePropertyComments
   double precision, intent(inout), dimension(:) :: integerPropertyUnitsSI,doublePropertyUnitsSI
   .
   .
   return
end subroutine Galacticus_Output_Tree_Example_Names

!# <mergerTreeOutputPropertyCount>
!# <unitName>Galacticus_Output_Tree_Example_Property_Count</unitName>
!# <sortName>Galacticus_Output_Tree_Example</sortName>
!# </mergerTreeOutputPropertyCount>
subroutine Galacticus_Output_Tree_Example_Property_Count(integerPropertyCount,doublePropertyCount)
   implicit none
   integer, intent(inout) :: integerPropertyCount,doublePropertyCount
   .
   .
   return
end subroutine Galacticus_Output_Tree_Example_Property_Count

!# <mergerTreeOutputTask>
!# <unitName>Galacticus_Output_Tree_Example</unitName>
!# <sortName>Galacticus_Output_Tree_Example</sortName>
!# </mergerTreeOutputTask>
subroutine Galacticus_Output_Tree_Example(thisNode,integerProperty,integerBufferCount,integerBuffer,doubleProperty &
   &,doubleBufferCount,doubleBuffer)
   implicit none
17.4. Existing Method Types

```fortran
  type(treeNode), intent(inout), pointer :: thisNode
  integer, intent(inout) :: integerProperty, integerBufferCount, doubleProperty, doubleBufferCount
  integer(kind=kind_int8), intent(inout) :: integerBuffer(:,:)
  double precision, intent(inout) :: doubleBuffer(:,:)

  !
  !
  !
  return
end subroutine Galacticus_Output_Tree_Example
```

The `mergerTreeOutputPropertyCount` subroutine must simply increment `integerPropertyCount` and `doublePropertyCount` by the number of integer and double precision properties that will be output respectively. The `mergerTreeOutputNames` subroutine must store the dataset names, comments and units in the SI system\(^9\) for each integer and double precision property in the supplied arrays. The value of `integerProperty` and `doubleProperty` should be incremented by 1 before each property name/comment is set—these then supply the position within the input arrays in which to store the name. The `mergerTreeOutputTask` subroutine must similarly place the desired property values for `thisNode` into the supplied arrays. The value of `integerProperty` and `doubleProperty` should be incremented by 1 before each property value is set. The value can then be stored in, for example, `integerBuffer(integerBufferCount,integerProperty)`.

### Merger Tree Pre-Construction Tasks

Additional tasks to be performed prior to the construction of each merger tree can be added using the `mergerTreePreTreeConstructionTask` directive. For example, the tree timing task uses this directive as follows:

```fortran
!# <mergerTreePreTreeConstructionTask>
!# <unitName>Meta_Tree_Timing_Pre_Construction</unitName>
!# </mergerTreePreTreeConstructionTask>
```

Here, `Meta_Tree_Timing_Pre_Construction` is the name of a subroutine which will be called to perform whatever tasks are required. The subroutine must have the following form:

```fortran
subroutine Merger_Tree_PreConstruction_Task()
  implicit none
  .
  .
  return
end subroutine Merger_Tree_PreConstruction_Task
```

The subroutine will be called once for each tree, before the tree has been constructed.

### Merger Tree Post-Evolution Tasks

Additional tasks to be performed after the evolution (and subsequent destruction) of each merger tree can be added using the `mergerTreePostEvolveTasker` directive. For example, the tree timing task uses this directive as follows:

```fortran
!# <mergerTreePostEvolveTasker>
!# <unitName>Meta_Tree_Timing_Post_Evolve</unitName>
!# </mergerTreePostEvolveTasker>
```

For dimensionless quantities, the units may be set to zero. In such cases, the `unitsInSI` attribute for the dataset will not be written to the `Galacticus` output file.

\(^9\)For dimensionless quantities, the units may be set to zero. In such cases, the `unitsInSI` attribute for the dataset will not be written to the `Galacticus` output file.
17. Adding New Methods

Here, Meta_Tree_Timing_Post_Evolve is the name of a subroutine which will be called to perform whatever tasks are required. The subroutine must have the following form:

```
subroutine Merger_Tree_PostEvolution_Task()
    implicit none
    .
    .
    return
end subroutine Merger_Tree_PostEvolution_Task
```

The subroutine will be called once for each tree, after the tree has been evolved and destroyed.

**Merger Tree Pre-Evolution Tasks**

Additional tasks to be performed on merger trees prior to their evolution can be added using the `mergerTreePreEvolveTask` directive. For example, the mass accretion history task uses this directive as follows:

```
!# <mergerTreePreEvolveTask>
!# <unitName>Merger_Tree_Mass_Accretion_History_Output</unitName>
!# </mergerTreePreEvolveTask>
```

Here, Merger_Tree_Mass_Accretion_History_Output is the name of a subroutine which will be called to perform whatever tasks are required. The subroutine must have the following form:

```
subroutine Merger_Tree_PreEvolution_Task(thisTree)
    implicit none
    type(mergerTree), intent(in) :: thisTree
    .
    .
    return
end subroutine Merger_Tree_PreEvolution_Task
```

where thisTree is the tree to be processed. The function will be called once for each tree, prior to the tree being evolved. Note that thisTree may link to other trees via its nextTree pointer. The function may want to process each tree in this linked list.

**Merger Tree Initialization Tasks**

Additional tasks to be performed during merger tree initialization can be added using the `mergerTreeInitializeTask` directive. The directive should contain a single argument, giving the name of a subroutine to be called to initialize the method. For example, the standard basic component method uses this directive as follows:

```
!# <satelliteMergerTask>
!# <unitName>Halo_Mass_Accretion_Rate</unitName>
!# </satelliteMergerTask>
```
Here, \texttt{Halo\_Mass\_Accretion\_Rate} is the name of a subroutine which will be called to perform whatever tasks are required as a result of the merger. The subroutine must have the following form:

```fortran
subroutine Merger\_Tree\_Initialize\_Task(thisNode)
    implicit none
    type(tree\_Node), pointer, intent(inout) :: thisNode
    .
    .
    return
end subroutine Merger\_Tree\_Initialize\_Task
```

where \texttt{thisNode} is the node to be initialized. The subroutine will be called once for each node in the tree.

**Merger Tree Structure Output Tasks**

Additional outputs for merger tree structure output can be added using the \texttt{mergerTreeStructureOutputTask}. The directive should give the name of the subroutine to be called to perform the task. The templates for this tasks is:

```fortran
!# <mergerTreeStructureOutputTask>
!# <unitName>Structure\_Output\_Task</unitName>
!# </mergerTreeStructureOutputTask>
subroutine Structure\_Output\_Task(baseNode,nodeProperty,treeGroup)
    implicit none
    type(tree\_Node), intent(in), pointer :: baseNode
double precision, intent(inout), dimension(:) :: nodeProperty
type(hdf5\_Object), intent(inout) :: treeGroup
    .
    .
    return
end subroutine Structure\_Output\_Task
```

The subroutine must walk the merger tree beginning from the given \texttt{baseNode} and store each property to output in the given \texttt{nodeProperty} array. Once populated, this array can be written to the appropriate HDF5 group, given by \texttt{treeGroup}, in the \texttt{GALACTICUS} output file.

**Node Dump**

The function \texttt{Node\_Dump(thisNode)} writes out all properties of a node to the display. To have their properties listed, each component must register a task using:

```fortran
!# <nodeDumpTask>
!# <unitName>Node\_Dump\_Procedure</unitName>
!# </nodeDumpTask>
```

where \texttt{Node\_Dump\_Procedure} is the name of a subroutine with the following template

```fortran
subroutine Node\_Dump\_Procedure(thisNode)
    type(tree\_Node), intent(inout), pointer :: thisNode
    .
```

863
17. Adding New Methods

return
end subroutine Node_Dump_Procedure

If the node contains an active component, this subroutine should display all relevant properties of the
component. If not, it can display a short message indicating that fact.

Output Filter Tasks

Extra filters for controlling which galaxies are output can be added using the directives \texttt{mergerTreeOutputFilterInitialize}
and \texttt{mergerTreeOutputFilter}. Each directive should give the name of the function to be called to ini-
tialize or apply the filter respectively. A template for these tasks is:

\begin{verbatim}
!# <mergerTreeOutputFilterInitialize>
!# <unitName>Galacticus_Merger_Tree_Output_Filter_Initialize_Example</unitName>
!# </mergerTreeOutputFilterInitialize>
subroutine Galacticus_Merger_Tree_Output_Filter_Initialize_Example(filterNames)
  implicit none
  type(varying_string), intent(in), dimension(:) :: filterNames
  .
  .
  return
end subroutine Galacticus_Merger_Tree_Output_Filter_Initialize_Example

!# <mergerTreeOutputFilter>
!# <unitName>Galacticus_Merger_Tree_Output_Filter_Example</unitName>
!# </mergerTreeOutputFilter>
logical function Galacticus_Merger_Tree_Output.Filter_Example(thisNode,doOutput)
  implicit none
  type(treeNode), intent(inout), pointer :: thisNode
  logical, intent(inout) :: doOutput
  .
  .
  return
end function Galacticus_Merger_Tree_Output_Filter_Example
\end{verbatim}

The initialization subroutine will be called prior to any use of the filter function. The \texttt{filterNames}
arrays contains a list of all filters which were requested to be applied. The function should check if its
filter is listed in this array and activate itself if necessary. The filter function will be called for each node,
\texttt{thisNode}, which is being considered for output. If the filter is activate, it should determine whether
\texttt{thisNode} passes its criteria for output. If it does not, \texttt{doOutput} should be set to false. If the output
criteria are met, then \texttt{doOutput should not be changed} (as it may already have been set false by some
other filter).

Currently available filters, selected using the [mergerTreeOutputFilters] input parameter, are:

\begin{itemize}
\item \texttt{lightcone} Restricts output to those galaxies which fall within a specified lightcone geometry. See §14.8 for
  further details;
\item \texttt{stellarMass} Restricts output to those galaxies with a total stellar mass equal to or greater than [stellarMassFilterThreshold];
\end{itemize}
17.4. Existing Method Types

luminosity  Restricts output to those galaxies with a total absolute AB magnitude less than or equal to \[^{10}\] \([\text{luminosityFilterAbsoluteMagnitudeThresholds}]\). This input parameter should be an array, with one entry for each luminosity being computed. The filter will be applied only for those luminosities that are being output at the current time.

### Output Group Output Tasks

Extra outputs for output groups (i.e. the groups which hold all merger tree data for a given output time) can be added using the directive: `outputGroupOutputTask`. The directive should give the name of the subroutine to be called to perform the task. A template for this task is:

```markdown
!# <outputGroupOutputTask>
!# <unitName>Galacticus_Output_Group_Output_Example</unitName>
!# </outputGroupOutputTask>

subroutine Galacticus_Output_Group_Output_Example(outputGroup,time)
  implicit none
  type(hdf5Object), intent(inout) :: outputGroup
  double precision, intent(in) :: time
  .
  .
  return
end subroutine Galacticus_Output_Group_Output_Example
```

The subroutine will be called for each output group created, and should perform whatever extra output it requires. The `outputGroup` object and the corresponding output `time` are provided as input parameters.

### Pre-derivative Tasks

Additional methods for pre-derivative tasks (i.e. things that should be done just prior to the computation of derivatives or properties for a node) can be added using the `preDerivativeTask` directive. The directive should contain a single argument, giving the name of a subroutine to be called to perform the task. For example, the standard hot halo component adds a task as follows:

```markdown
!# <preDerivativeTask>
!# <unitName>Tree_Node_Hot_Halo_Prederivative_Standard</unitName>
!# </preDerivativeTask>
```

Here, `Tree_Node_Hot_Halo_Prederivative_Standard` is the name of a subroutine which will be called to perform whatever tasks are required. The subroutine must have the following form:

```markdown
subroutine Prederivative_Task(thisNode)
  implicit none
  type(treeNode), pointer, intent(inout) :: thisNode
  .
  .
  return
end subroutine Prederivative_Task
```

where `thisNode` is the node for which derivatives will be computed. Tasks typically involve precomputing quantities that will be used in finding the derivatives.

[^10]: That is, galaxies which are at least as luminous as the specified threshold.
17. Adding New Methods

**Radius Solver Tasks**

Galactic radii solver functions (see §17.4.1) need to be able to interact with the components of a tree node to

1. Determine which components want a radius to be solved for;
2. Get and set the properties of those components.

The `radiusSolverPlausibility` and `radiusSolverTask` directives facilitate this. A component which has a radius to be solved for should include directives of the form:

```
!# <radiusSolverTask>
!# <unitName>Component_Radius_Solver_Plausibility</unitName>
!# </radiusSolverTask>
```

and

```
!# <radiusSolverTask>
!# <unitName>Component_Radius_Solver</unitName>
!# </radiusSolverTask>
```

where `Component_Radius_Solver_Plausibility` is the name of a subroutine which will specify whether or not the component is physically plausible for radius solving (e.g. has non-negative mass) and should have the following form:

```plaintext
subroutine Component_Radius_Solver_Plausibility(thisNode,galaxyIsPhysicallyPlausible)
  implicit none
  type(treeNode), pointer, intent(inout) :: thisNode
  logical,     intent(inout) :: galaxyIsPhysicallyPlausible
  .
  .
  .
  return
end subroutine Component_Radius_Solver_Plausibility
```

which should set `galaxyIsPhysicallyPlausible` to false if the component is not physically plausible, but should otherwise leave `galaxyIsPhysicallyPlausible` unchanged. Additionally, `Component_Radius_Solver` is the name of a subroutine which will supply the necessary information about the node, and which should have the following form:

```plaintext
subroutine Component_Radius_Solver(thisNode,componentActive,specificAngularMomentum,Radius_Get,Radius_Set,Velocity_Get,Velocity_Set)
  implicit none
  type(treeNode), pointer, intent(inout) :: thisNode
  logical,     intent(out) :: componentActive
  double precision,     intent(out) :: specificAngularMomentum
  procedure(),       pointer, intent(out) :: Radius_Get,Velocity_Get
  procedure(),       pointer, intent(out) :: Radius_Set,Velocity_Set
  .
  .
  return
end subroutine Component_Radius_Solver
```
When called, the subroutine should set `componentActive` to indicate whether or not this node contains an active component of the type. If it does, it should also set `specificAngularMomentum` to reflect the specific angular momentum (in km s\(^{-1}\) Mpc) of the component (at whatever point in its profile the radius is required) and should point the four procedure pointers to routines which get and set the radius and circular velocity properties of the component (which should have the standard form for component get and set methods). It is acceptable for the set procedures to point to dummy routines.

The galactic structure radii solver routines will use this information to determine (and set) the radius and circular velocity of the component. An advantage of this approach is that different radii solver methods can all use this same system, ensuring that just a single interface is needed in each component.

**Satellite Host Change Tasks**

Additional methods for satellite host change events (i.e. when a satellite node moves to a new host) can be added using the `satelliteHostChangeTask` directive. The directive should contain a single argument, giving the name of a subroutine to be called to initialize the method. For example, the `simple` satellite orbits components uses this directive as follows:

```plaintext
! # <satelliteHostChangeTask>
! # <unitName>Satellite_Orbit_New_Host</unitName>
! # </satelliteHostChangeTask>
```

Here, `Satellite_Orbit_New_Host` is the name of a subroutine which will be called to perform whatever tasks are required as a result of the host change. The subroutine must have the following form:

```plaintext
subroutine New_Host_Task(thisNode)
  implicit none
  type(treeNode), pointer, intent(inout) :: thisNode
  .
  .
  return
end subroutine New_Host_Task
```

where `thisNode` is the node which has changed host (the new host halo is `thisNode%parentNode`).

**Satellite Merger Tasks**

Additional methods for satellite merger tasks can be added using the `satelliteMergerTask` directive. The directive should contain a single argument, giving the name of a subroutine to be called to initialize the method. For example, the `simple` satellite orbits components uses this directive as follows:

```plaintext
! # <satelliteMergerTask>
! # <unitName>Satellite_Merger_Task</unitName>
! # </satelliteMergerTask>
```

Here, `Satellite_Merger_Task` is the name of a subroutine which will be called to perform whatever tasks are required as a result of the merger. The subroutine must have the following form:

```plaintext
subroutine Satellite_Merger_Task(thisNode)
  implicit none
  type(treeNode), pointer, intent(inout) :: thisNode
  .
  .
```
17. Adding New Methods

. return  
end subroutine Satellite_Merger_Task  

where thisNode is the node about to merge with thisNode%parentNode.

Star Formation History Tasks

Additional methods for star formation history tracking can be added using the starFormationHistoriesMethod directive. The directive should contain a single argument, giving the name of a subroutine to be called to initialize the method. For example, the metallicitySplit method uses this directive as follows:

!# <starFormationHistoriesMethod>  
!# <unitName>Star_Formation_Histories_Metallicity_Split_Initialize</unitName>  
!# </starFormationHistoriesMethod>

Here, Star_Formation_Histories_Metallicity_Split_Initialize is the name of a subroutine which will be called to initialize the method. The subroutine must have the following form:

```fortran
subroutine Method_Initialize( starFormationHistoriesMethod &,  
                           Star_Formation_History_Create_Do &,  
                           Star_Formation_History_Scales_Do &,  
                           Star_Formation_History_Record_Do &,  
                           Star_Formation_History_Output_Do & )  
implicit none  
type(varying_string), intent(in) :: starFormationHistoriesMethod  
procedure(), pointer, intent(inout) :: Star_Formation_History_Create_Do &,  
                                      Star_Formation_History_Scales_Do &,  
                                      Star_Formation_History_Record_Do &,  
                                      Star_Formation_History_Output_Do &  

if (starFormationHistoriesMethod == 'myMethod') then  
   Star_Formation_History_Create_Do => My_Create  
   Star_Formation_History_Scales_Do => My_Scales  
   Star_Formation_History_Record_Do => My_Record  
   Star_Formation_History_Output_Do => My_Output  
end if  
return  
end subroutine Method_Initialize
```

where myMethod is the name of this method as will be specified by the starFormationHistoriesMethod input parameter. The procedure pointers must be set to point to subroutines which perform the functions described below. The initialization subroutine should perform any other tasks required to initialize the module (such as reading parameters etc.).

The Star_Formation_History_Create_Do subroutine must have the form:

```fortran
subroutine My_Create(thisNode,thisHistory)  
implicit none  
type(treeNode), intent(inout), pointer :: thisNode  
type(history), intent(inout) :: thisHistory  
return  
end subroutine My_Create
```
17.4. Existing Method Types

and should return a history object in \texttt{thisHistory} suitable for holding a star formation history for \texttt{thisNode}.

The \texttt{Star\_Formation\_History\_Scales\_Do} subroutine must have the form:

```fortran
subroutine My_Scales(thisHistory, stellarMass, stellarAbundances)
  implicit none
  double precision, intent(in) :: stellarMass
  type(abundancesStructure), intent(in) :: stellarAbundances
  type(history), intent(inout) :: thisHistory
  return
end subroutine My_Scales
```

and should set the ODE solver error tolerance scales in \texttt{thisHistory}, using the provided information on \texttt{stellarMass} and \texttt{stellarAbundances} if required.

The \texttt{Star\_Formation\_History\_Record\_Do} subroutine must have the form:

```fortran
subroutine My_Record(thisNode, thisHistory, fuelAbundances, starFormationRate)
  implicit none
  type(treeNode), intent(inout), pointer :: thisNode
  type(history), intent(inout) :: thisHistory
  type(abundancesStructure), intent(in) :: fuelAbundances
  double precision, intent(in) :: starFormationRate
  return
end subroutine My_Record
```

and should record the contribution to the star formation history in \texttt{thisHistory} for \texttt{thisNode} given the current \texttt{starFormationRate} and star formation \texttt{fuelAbundances}. That is, the subroutine should adjust the rates in \texttt{thisHistory} appropriately.

The \texttt{Star\_Formation\_History\_Output\_Do} subroutine must have the form:

```fortran
subroutine My_Output(thisNode, thisHistory, iOutput, treeIndex, componentLabel)
  implicit none
  type(treeNode), intent(inout), pointer :: thisNode
  type(history), intent(inout) :: thisHistory
  integer, intent(in) :: iOutput
  integer(kind=kind_int8), intent(in) :: treeIndex
  character(len=*) :: componentLabel
  return
end subroutine My_Output
```

and should write the star formation history, \texttt{thisHistory}, for \texttt{thisNode} to the output file. The output number and tree index are provided as \texttt{iOutput} and \texttt{treeIndex} for reference, and \texttt{componentLabel} provides a suitable label for the component to which the history belongs (and so should be used in the name of the datasets to which the history is written for example).

Conventionally, star formation histories are output as follows:

```hdf5
"galacticus.hdf5" {
  GROUP "starFormationHistories" {
    COMMENT "Star formation history data."
    GROUP "Output1" {
      COMMENT "Star formation histories for all trees at each out"
      GROUP "mergerTree1" {
```

869
17. Adding New Methods

where \( \text{nodeID} \) is the index of the relevant node. The specifics of each dataset will depend on the selected star formation history method.

Currently defined star formation history methods are:

**metallicitySplit** The star formation history is tabulated on a grid of time and metallicity. The binning in time is chosen such that bins are at most of size \([\text{starFormationHistoryTimeStep}]\) between the time at which each galaxy formed and the final output time, and at most of size \([\text{starFormationHistoryFineTimeStep}]\) in the period \([\text{starFormationHistoryFineTime}]\) prior to each output time (all times specified in Gyr). The allows fine binning of recent star formation just prior to each output. The metallicity binning is arranged logarithmically in metallicity with \([\text{starFormationHistoryMetallicityCount}]\) bins between \([\text{starFormationHistoryMetallicityMinimum}]\) and \([\text{starFormationHistoryMetallicityMaximum}]\) (specified in Solar units). Note that the metallicity associated with each bin is the minimum metallicity for that bin (the maximum being the metallicity value associated with the next bin, except for the final bin which extends to infinite metallicity). If \([\text{starFormationHistoryMetallicityCount}] = 0\) is set, then the star formation
history is not split by metallicity (i.e. a single metallicity bin encompassing all metallicities from zero to infinity is used). Output follows the conventional format, with 2D star formation history datasets to represent the history as a function of time and metallicity. An additional `metallicities` dataset is added to the `starFormationHistories` output group to record the metallicity binning as follows:

```
DATASET "metallicities" {
    COMMENT "Metallicities at which star formation histories are tabulated"
    DATATYPE H5T_IEEE_F64LE
    DATASPACE SIMPLE { ( [starFormationHistoryMetallicityCount] ) / ( [starFormationHistoryMetallicityCount] ) }
}
```

### 17.5. Subsystems

This section describes some of the subsystems within GALACTICUS that support various physical entities or processes.

#### 17.5.1. Kepler Orbits

The `keplerOrbit` object (provided by the `Kepler_Orbits_Structure` module) stores the parameters of a single Keplerian orbit. It internally handles computation of additional/alternate orbital parameters once an orbit has been fully defined. Currently, the orientation of orbits (i.e. the unit vector normal to the orbital plane and the argument of periapsis) is not tracked. As such, orbits are fully defined by three parameters (in addition to the masses of the orbitting bodies). The following limitations presently apply to the `keplerOrbit` object:

- If an orbit is overdefined (i.e. if more than three parameters are set manually) no checking is performed to ensure that the parameters are consistent with a Keplerian orbit;
- Not all interconversions between parameters are supported\(^\text{11}\). If a conversion cannot be performed, an error message will be given.

A `keplerOrbit` object can be reset by calling the `reset()` method, and its defined/undefined status can be tested with the `isDefined()` method or asserted with the `assertIsDefined()` method. The following orbital parameters are supported, each method returning the value of the parameter and a corresponding method suffixed with `Set` can be used to set the parameter: `radius`, `velocityRadial`, `velocityTengential`, `energy`, `angularMomentum`, `eccentricity`, `semiMajorAxis`, `radiusPericenter`, `radiusApocenter`. Additionally, the masses of the orbitting bodies are provided by the `hostMass()` and `reducedMassSpecific()` = \( M_{\text{host}} / (M_{\text{host}} + M_{\text{satellite}}) \) methods. Finally, the `velocityScale()` method returns \( G M_{\text{host}} / r \) where \( r \) is the radius of the orbit.

#### 17.5.2. Chemicals

The chemicals subsystem provides both a interface to a database of known chemicals (allowing their physical properties to be queried) and a structure to store abundances/masses/etc. of the set of chemicals being tracked in GALACTICUS. The name “chemicals” is used to denote any chemical species that might be involved in reactions, including molecules, atoms, atomic and molecular ions and electrons.

\(^{11}\) The `keplerOrbit` object works by trying to convert to the combination radius, radial and tangential velocities. Once these are defined, all other parameters can be computed. However, for orbits defined in terms of other parameters, the `keplerOrbit` object does not know how to convert from every such combination of parameters.
Chemical Database

The file data/Chemical_Database.cml contains a database of chemicals that can currently be used by GALACTICUS. It uses a simplified version of the Chemical Markup Language to describe chemicals. An excerpt from the database is shown below:

```xml
<list>
  <chemical>
    <id>MolecularHydrogenAnion</id>
    <formalCharge>-1</formalCharge>
    <atomArray>
      <atom>
        <id>1</id>
        <elementType>H</elementType>
      </atom>
      <atom>
        <id>2</id>
        <elementType>H</elementType>
      </atom>
    </atomArray>
    <bondArray>
      <bond>
        <atomRefs2>1 2</atomRefs2>
        <order>1</order>
      </bond>
    </bondArray>
  </chemical>
</list>
```

The database contains a list of chemicals, each contained within a chemical element. The id element provides a label for the chemical (usually a descriptive name with no white space). The formalCharge element gives the charge of the chemical in units of the elementary charge. The chemical is then describe by a list of atoms and bonds inside atomArray and bondArray elements respectively. The atomArray can contain any number of atom elements, which should describe each atom in the chemical giving it a unique id number and an elementType, which is the short one or two letter label for the element (e.g. H, Ni, etc.). The bondArray should contain a bond entry for each atomic bond, which itself contains a atomRefs2 element giving the IDs of the two atoms participating in the bond and an order element which gives the order of the bond (e.g. “1” for a single bond).

Chemical Structure

Within GALACTICUS a chemical is represented using the chemicalStructure type which is provided by the Chemical_Structures module. A chemicalStructure object can be assigned a particular chemical by retrieving that chemical from the database using:

```python
call myChemical%retrieve("chemicalID")
```

where chemicalID is the ID of the chemical in the database. Any chemical can be exported to a CML file using
call myChemical%export(fileName)

where fileName gives the name of the file to which to export.

Once assigned a chemical, basic properties such as mass and charge (in atomic units) can be accessed using myChemical%mass and myChemical%charge respectively. The mass is computed from the known atomic masses of the constituent atoms of the chemical.

**Chemical Abundances**

Within GALACTICUS a set of abundances (or masses, or densities...) for all chemicals being tracked, as specified by the [chemicalsToTrack] input parameter, is stored within a chemicalAbundancesStructure type, as provided by the Chemical_Abundances_Structure module. The structure provides interfaces for setting and retrieving the abundance of a given chemical species, to pack/unpack all chemicals to/from an array, to convert from mass-weighted to number-weighted quantities and to multiply and divide the chemicals abundances by a given amount. Additionally, the Chemical_Abundances_Structure module provides functions which provide a count of the number of chemicals tracked, to look up the index of a chemical array representation from its name, and to retrieve the name of a given chemical.

**17.5.3. Radiation**

This subsystem handles radiation fields, providing convenient means to communicate radiation fields from one part of the GALACTICUS code to another. A radiation object can hold multiple different types of radiation field (e.g. it could contain both the cosmic microwave background and an interstellar radiation field localized to a specific galaxy).

**Radiation Structure**

Within GALACTICUS radiation fields are represented by the radiationStructure type which is provided by the Radiation_Structures module. A radiationStructure object must first be defined using:

    call myRadiation%define([radiationType1,radiationType2])

where the list of radiationTypes specifies what radiation components will be present in this radiation object. Currently defined radiation types are:

- **CMB** The cosmic microwave background;
- **Null** A null (zero radiation) component.

For example,

    call myRadiation%define([radiationTypeCMB])

will define the myRadiation object to contain just the cosmic microwave background.

Once defined, the specific radiation field can be set using:

    call myRadiation%set(thisNode)

This will cause all components to set their radiation fields using (if necessary) the properties of thisNode. Radiation objects can be queried using the following methods:

- **temperature(radiationTypes)** Returns the temperature (in Kelvin) of the radiation object. The optional radiationTypes array specifies which radiation types are to be queried.

- **flux(wavelength,radiationTypes)** Returns the flux (in ergs cm$^2$ s$^{-1}$ Hz$^{-1}$ ster$^{-1}$) of the radiation object at the given wavelength (specified in units of Å). The optional radiationTypes array specifies which radiation types are to be queried.
17.5.4. Mass Distributions

The `massDistribution` class, provided by the `Mass_Distributions` module, provides an object describing a distribution of mass in space, together with methods to query for the density, enclosed mass etc. of that mass distribution. Mass distribution objects make use of the `coordinates` subsystem (see §17.5.5) for specifying positions within mass distributions.

The base class provides the following methods:

- `symmetry` Returns one of the following labels to indicate the symmetry of the mass distribution:
  - `massDistributionSymmetryNone` Indicates that the mass distribution has no particular symmetry;
  - `massDistributionSymmetryCylindrical` Indicates that the mass distribution has cylindrical symmetry (conventionally around the \(z\)-axis);
  - `massDistributionSymmetrySpherical` Indicates that the mass distribution has spherical symmetry.

- `isDimensionless` Returns a Boolean indicating whether this is a dimensionless or dimensionful mass distribution;

- `density` Returns the density of the mass distribution at the supplied coordinates;

- `densityRadialMoment` Returns the \(n\)th moment of the integral of the density over radius, \(\int_0^\infty \rho(x)|x|^n \, dx\);

- `massEnclosedBySphere` Returns the mass enclosed by a sphere of given radius (centered on the origin);

- `potential` Returns the gravitational potential at the specified coordinates.

The `massDistributionSpherical` class extends the `massDistribution` base class with an additional method:

- `halfMassRadius` Returns the radius enclosing half of the mass of the density distribution.

Mass distributions are created using:

```
myMassDistribution => Mass_Distribution_Create(type)
```

where `type` is the name of the mass distribution (see below). After creation, the parameters of the profile must usually be initialized using:

```
call myMassDistribution%initialize(....)
```

Arguments for initialization vary for each mass distribution (see below).

Currently implemented mass distributions include:

- **nfw** An NFW [Navarro et al., 1997] density profile. Initialization is by

  ```
call myNfwProfile%initialize(scaleLength,concentration,densityNormalization,mass, &
& virialRadius,isDimensionless)
```

  All arguments are optional, but the combination given must be sufficient to allow the scale length and density normalization to be determined. The profile will be assumed to be dimensionful unless the `isDimensionless` argument specifies otherwise.

- **betaProfile** A \(\beta\)-profile, \(\rho(r) = \rho_0/[1 + (r/r_{core})^2]^{3\beta/2}\). Initialization is by
call myBetaProfile%initialize(beta,coreRadius,densityNormalization,mass, &
  outerRadius,isDimensionless)

beta = \beta and coreRadius = r_{core} must always be specified. The density normalization must be specified either by the densityNormalization argument, or by supplying both mass and outerRadius. The profile will be assumed to be dimensionful unless the isDimensionless argument specifies otherwise.

hernquist The Hernquist [Hernquist, 1990] profile. Initialization is by

call myHernquistProfile%initialize(scaleLength,densityNormalization,mass, &
  isDimensionless)

All arguments are optional, but the combination given must be sufficient to allow the scale length and density normalization to be determined unless the profile is dimensionless (in which case scale length and total mass are set to unity). The profile will be assumed to be dimensionful unless the isDimensionless argument specifies otherwise.

sersic The Sérsic [Sérsic, 1963] profile. Initialization is by

call mySersicProfile%initialize(index,halfMassRadius,densityNormalization,mass, &
  isDimensionless)

The Sérsic index must be specified. All other arguments are optional, but the combination given must be sufficient to allow the scale length and density normalization to be determined unless the profile is dimensionless (in which case scale length and total mass are set to unity). The profile will be assumed to be dimensionful unless the isDimensionless argument specifies otherwise.

17.5.5. Coordinates

The coordinate class, provided by the Coordinates module provides an object describing a position in three-dimensional space. Each extension of this class (currently, coordinateCartesian, coordinateCylindrical, and coordinateSpherical) supply methods to convert to and from Cartesian coordinates. The assignment operator (=) is overloaded such that coordinate objects of any class can be assigned to any other class and conversion to the appropriate coordinate system will happen automatically. A function accepting a class(coordinate) object can therefore convert it to, for example, spherical coordinates simply using

class(coordinate ), intent(in) :: coordinates
type (coordinateSpherical) :: coordinatesSpherical
coordinatesSpherical=coordinates

and thereby allow a position to be passed to it in any coordinate system.

Each extension of the base class also provides methods to get and set the values of each component of the relevant coordinate system (see §16.5.2 for complete details).
18. Auxilliary Methods

18.1. Conditional Stellar Mass Function

Empirical conditional stellar mass functions are used by GALACTICUS in calculations of halo mass function sampling. GALACTICUS implements the following calculations of tree processing times, which can be selected via the \([\text{conditionalStellarMassFunctionMethod}]\) input parameter.

Currently the only option, and selected using \([\text{conditionalStellarMassFunctionMethod}] = \text{Behroozi2010}\), this method adopts the fitting function of Behroozi et al. [2010]:

\[
\langle N_c(M_\star | M) \rangle \equiv \int_{M_\star}^{\infty} \phi_c(M'_\star) d \ln M'_\star = \frac{1}{2} \left[ 1 - \text{erf} \left( \frac{\log_{10} M_\star - \log_{10} f_{\text{SHMR}}(M)}{\sqrt{2} \sigma_{\log M_\star}} \right) \right]. \tag{18.1}
\]

Here, the function \(f_{\text{SHMR}}(M)\) is the solution of

\[
\log_{10} M = \log_{10} M_1 + \beta \log_{10} \left( \frac{M_\star}{M_{\star,0}} \right) + \frac{(M_\star/M_{\star,0})^\delta}{1 + (M_\star/M_{\star,0})^{-\gamma}} - 1/2. \tag{18.2}
\]

For satellites,

\[
\langle N_s(M_\star | M) \rangle \equiv \int_{M_\star}^{\infty} \phi_s(M'_\star) d \ln M'_\star = \langle N_c(M_\star | M) \rangle \frac{f_{\text{SHMR}}^{-1}(M_\star)}{M_{\text{sat}}} \alpha_{\text{sat}} \exp \left( -\frac{M_{\text{cut}}}{f_{\text{SHMR}}^{-1}(M_\star)} \right), \tag{18.3}
\]

where

\[
\frac{M_{\text{sat}}}{10^{12} M_\odot} = B_{\text{sat}} \left( \frac{f_{\text{SHMR}}^{-1}(M_\star)}{10^{12} M_\odot} \right)^{\beta_{\text{sat}}}, \tag{18.4}
\]

and

\[
\frac{M_{\text{cut}}}{10^{12} M_\odot} = B_{\text{cut}} \left( \frac{f_{\text{SHMR}}^{-1}(M_\star)}{10^{12} M_\odot} \right)^{\beta_{\text{cut}}}. \tag{18.5}
\]

By default, parameter values are taken from the fit of Leauthaud et al. [2011], specifically their \text{SIG\_MOD1} method for their \(z_1\) sample. These default values, and the GALACTICUS input parameters which can be used to adjust them are shown in Table 18.1. This method assumes that \(P_s(N|M_\star, M; \delta \ln M_\star)\) is a Poisson distribution while \(P_c(N|M_\star, M; \delta \ln M_\star)\) has a Bernoulli distribution, with each distribution’s free parameter fixed by requiring

\[
\phi(M_\star; M) \delta \ln M_\star = \sum_{N=0}^{\infty} NP(N|M_\star, M; \delta \ln M_\star) \tag{18.6}
\]
18. Auxiliary Methods

18.2. Tree Timing

Estimates of the time taken to process a merger tree are used in some halo sampling rate functions and may in future be used in load balancing algorithms. GALACTICUS implements the following calculations of tree processing times, which can be selected via the [timePerTreeMethod] input parameter.

18.2.1. File Method

Currently the only option, and selected using [timePerTreeMethod]=file, this method assumes that the time taken to process a tree is given by

$$\log_{10}[\tau_{\text{tree}}(M)] = \sum_{i=0}^{2} C_i (\log_{10} M)^i,$$

(18.7)

where $M$ is the root mass of the tree and the coefficients $C_i$ are read from a file, the name of which is specified via the [timePerTreeFitFileName] parameter. This file should be an XML document with the structure:

```xml
<timing>
  <fit>
    <coefficient>-0.73</coefficient>
    <coefficient>-0.20</coefficient>
    <coefficient>0.03</coefficient>
  </fit>
</timing>
```

where the array of coefficients give the values $C_0$, $C_1$ and $C_2$.

Note that, if GALACTICUS is run with [metaCollectTimingData]=true, then it will output measures of tree processing time to the output file (see §5.6.1). The analysis script scripts/analysis/treeTiming.pl can be used to extract tree timing data from such an output file and output fitting coefficients in the above format. It is used as follows:

```
treeTiming.pl <modelFile> [options.....]
```
where `<modelFile>` is the name of the GALACTICUS output file to analyze. The following options can be specified:

**accumulate** If present, this argument will cause new timing data from the `<modelFile>` to be accumulated with any timing data already present in the output file (which must be specified in this case). The fit is recomputed from the totality of the accumulated data;

**outputFile** If present, the timing data for individual trees together with the fitting coefficients will be output to the specified file;

**maxPoints** When accumulating trees to the output file, this parameter, if present, will limit the number of trees stored in the file to the given value. The oldest trees added to the file will be dropped first;

**plotFile** If present, a plot of the tree timing as a function of halo mass, together with the fitting function, will be output to the specified file.

Note that the output file will contain both the fitting coefficients in the format described above and, additionally, a list of tree root masses and processing times (necessary if you later want to append trees from another run to this file).

**Description:** Computes the baryonic accretion rate onto node.

**Code lines:** 38

**Contained by:** module accretion_halos

**Modules used:** cosmology_parameters galacticus_nodes

**function: simpleaccretionratechemicals**

**Description:** Computes the rate of mass of chemicals accretion (in $M_\odot$/Gyr) onto node from the intergalactic medium. Assumes a primordial mixture of hydrogen and helium and that accreted material is in collisional ionization equilibrium at the virial temperature.

**Code lines:** 26

**Contained by:** module accretion_halos

**Modules used:** chemical_abundances_structure galacticus_nodes

**function: simpleaccretionratemetals**

**Description:** Computes the rate of mass of abundance accretion (in $M_\odot$/Gyr) onto node from the intergalactic medium.

**Code lines:** 12

**Contained by:** module accretion_halos

**Modules used:** galacticus_nodes

**function: simpleaccretionratetotal**
19.1. Program units

**Description:** Returns the total accretion rate from the IGM onto a halo (including dark matter).

**Code lines:** 11

**Contained by:** module accretion_halos

**Modules used:** galacticus_nodes

**function: simplechemicalmasses**

**Description:** Compute the masses of chemicals accreted (in $M_\odot$) onto node from the intergalactic medium.

**Code lines:** 39

**Contained by:** module accretion_halos

**Modules used:** chemical_abundances_structure, chemical_reaction_rates_utilities, chemical_states, cosmology_parameters, dark_matter_halo_scales, galacticus_nodes, numerical_constants_astronomical

**function: simpleconstructor**

**Description:** Default constructor for the simple halo accretion class.

**Code lines:** 32

**Contained by:** module accretion_halos

**Modules used:** atomic_data, chemical_abundances_structure, galacticus_error, galacticus_nodes, input_parameters

**function: simpledefaultconstructor**

**Description:** Default constructor for the simple halo accretion class.

**Code lines:** 85

**Contained by:** module accretion_halos

**Modules used:** cosmology_functions, galacticus_error, input_parameters, intergalactic_medium_state

**function: simplefailedaccretedmass**

**Description:** Computes the mass of baryons accreted into node.

**Code lines:** 23

**Contained by:** module accretion_halos

**Modules used:** cosmology_parameters, dark_matter_halo_scales, galacticus_nodes

**function: simplefailedaccretionrate**

**Description:** Computes the baryonic accretion rate onto node.

**Code lines:** 37

**Contained by:** module accretion_halos

**Modules used:** cosmology_parameters, dark_matter_halo_scales, galacticus_nodes

**function: simplefailedfraction**

**Description:** Returns the fraction of potential accretion onto a halo from the IGM which fails.

**Code lines:** 15

**Contained by:** module accretion_halos

**Modules used:** galacticus_nodes
19. Source Code Documentation

function: simplemasstotal
Description: Returns the total node mass.
Code lines: 11
Contained by: module accretion_halos
Modules used: galacticus_nodes

function: simplevelocityscale
Description: Returns the velocity scale to use for node. Use the virial velocity.
Code lines: 12
Contained by: module accretion_halos
Modules used: dark_matter_halo_scales galacticus_nodes

Description: An implementation of accretion from the IGM onto halos using filtering mass of the IGM calculated from an equation from Naoz and Barkana [2007].
Code lines: 106

interface: accretionhalonaozbarkana2007
Description: Constructors for the naozBarkana2007 halo accretion class.
Code lines: 4

interface: assignment(=)
Code lines: 2

function: naozbarkana2007constructor
Description: Default constructor for the naozBarkana2007 halo accretion class.

*Used by:* subroutine accretion_disks_initialize
module accretion_disks_switched

**subroutine: accretion_disk_adaf_tabulate**
19.1. Program units

**Description:** Tabulate jet power and spin-up efficiency for an ADAF.

**Code lines:** 45

**Contained by:** module **accretion_disks_adaf**

**Modules used:**
- black_hole_fundamentals
- numerical_constants_physical

**function: accretion_disk_jet_power_adaf**

**Description:** Computes the jet power for an ADAF in units of $M_\odot \ (\text{km/s})^2 \ \text{Gyr}^{-1}$.

**Code lines:** 25

**Contained by:** module **accretion_disks_adaf**

**Modules used:**
- galacticus_nodes

**function: accretion_disk_radiative_efficiency_adaf**

**Description:** Computes the radiative efficiency for an ADAF.

**Code lines:** 18

**Contained by:** module **accretion_disks_adaf**

**Modules used:**
- accretion_disks_shakura_sunyaev
- galacticus_nodes

**subroutine: accretion_disks_adaf_get_parameters**

**Description:** Initialize the module by reading in parameter values.

**Code lines:** 147

**Contained by:** module **accretion_disks_adaf**

**Modules used:**
- galacticus_error
- input_parameters

**subroutine: accretion_disks_adaf_initialize**

**Description:** Test if this method is to be used and set procedure pointer appropriately.

**Code lines:** 15

**Contained by:** module **accretion_disks_adaf**

**function: adaf_alpha**

**Description:** Returns the effective value of $\alpha$ for an ADAF.

**Code lines:** 28

**Contained by:** module **accretion_disks_adaf**

**function: adaf_angular_momentum**

**Description:** Returns the specific angular momentum of accreted material in the ADAF.

**Code lines:** 15

**Contained by:** module **accretion_disks_adaf**

**function: adaf_bh_jet_power**

**Description:** Returns the power of the black hole-launched jet from an ADAF.

**Code lines:** 28

**Contained by:** module **accretion_disks_adaf**

**Modules used:**
- black_hole_fundamentals

**function: adaf_disk_jet_power**

**Description:** Returns the power of the disk-launched jet from an ADAF.

**Code lines:** 23

**Contained by:** module **accretion_disks_adaf**

**Modules used:**
- black_hole_fundamentals
function: adaf_disk_jet_power_from_black_hole
Description: Returns the power extracted from the black hole by the disk-launched jet from an ADAF.
Code lines: 15
Contained by: module accretion_disks_adaf

function: adaf_enthalpy
Description: Returns the relativistic enthalpy of the ADAF.
Code lines: 15
Contained by: module accretion_disks_adaf

function: adaf_enthalpy-angular_momentum_product
Description: Return the product of enthalpy and angular momentum for the ADAF.
Code lines: 30
Contained by: module accretion_disks_adaf
Modules used: black_hole_fundamentals

function: adaf_field_enhancement
Description: Returns the field enhancement factor, \( g \), in the ADAF.
Code lines: 26
Contained by: module accretion_disks_adaf
Modules used: black_hole_fundamentals

function: adaf_fluid-angular_velocity
Description: Returns the angular velocity of the rotating fluid with respect to the local inertial observer (ZAMO).
Code lines: 16
Contained by: module accretion_disks_adaf
Modules used: black_hole_fundamentals

function: adaf_gamma
Description: Returns the net relativistic boost factor from the fluid frame of an ADAF to an observer at rest at infinity. The input quantities are in natural units.
Code lines: 16
Contained by: module accretion_disks_adaf

function: adaf_gamma_phi
Description: Returns the \( \phi \) component relativistic boost factor from the fluid frame of an ADAF to an observer at rest at infinity. The input quantities are in natural units.
Code lines: 17
Contained by: module accretion_disks_adaf
Modules used: black_hole_fundamentals

function: adaf_gamma_r
Description: Returns the \( r \) component relativistic boost factor from the fluid frame of an ADAF to an observer at rest at infinity. The input quantities are in natural units.
Code lines: 16
Contained by: module accretion_disks_adaf

function: adaf_height
Description: Return the (dimensionless) height in an ADAF at given radius, for a black hole of given blackHoleSpin and a flow with viscosity parameter adafViscosityAlpha.

Code lines: 21
Contained by: module accretion_disks_adaf
Modules used: black_hole_fundamentals

function: adaf_temperature

Description: Return the (dimensionless) velocity in an ADAF at given radius, for a black hole of given blackHoleSpin and a flow with viscosity parameter adafViscosityAlpha.

Code lines: 28
Contained by: module accretion_disks_adaf
Modules used: black_hole_fundamentals

function: adaf_v

Description: Computes the spin up rate of the black hole in thisBlackHole due to accretion from an ADAF disk.

Code lines: 31
Contained by: module accretion_disks_adaf
Modules used: black_hole_fundamentals

file: accretion_disks.Eddington_limited.F90

Description: Contains a module which implements calculations of properties of accretion disks which ignore the details of accretion physics and assume that black hole jets have a power that is a fixed fraction of the Eddington luminosity.

Code lines: 112

module: accretion_disks_eddington

Description: Implements calculations of properties of accretion disks which ignore the details of accretion physics and assume that black hole jets have a power that is a fixed fraction of the Eddington luminosity.

Code lines: 91
Contained by: file accretion_disks.Eddington_limited.F90
Used by: subroutine accretion_disks_initialize

function: accretion_disk_jet_power_eddington

Description: Computes the jet power for an Eddington-limited accretion disk.

Code lines: 11
Contained by: module accretion_disks_eddington
Modules used: black_hole_fundamentals galacticus_nodes numerical_constants_physical

function: accretion_disk_radiative_efficiency_eddington

Description: Computes the radiative efficiency for an Eddington-limited accretion disk.

Code lines: 9
19. Source Code Documentation

**module** accretion_disks_eddington

**included by:** module galacticus_nodes

**subroutine:** accretion_disks_eddington_initialize

function: file default constructor
Description: Default constructor for the file accretion disk spectra class.
Code lines: 26
Contained by: file accretion_disks.spectra.file.F90
Modules used: input_parameters

subroutine: file destructor
Description: Default destructor for the file accretion disk spectra class.
Code lines: 13
Contained by: file accretion_disks.spectra.file.F90
Modules used: memory_management numerical_interpolation

subroutine: file load file
```
19.1. Program units

Description: Load a file of AGN spectra.
Code lines: 22
Contained by: file accretion_disks.spectra.file.F90
Modules used: galacticus_error io_hdf5

function: filespectrum
Description: Return the accretion disk spectrum for tabulated spectra.
Code lines: 38
Contained by: file accretion_disks.spectra.file.F90
Modules used: iso_c_binding numerical_constants_astronomical numerical_constants_physical numerical_interpolation

file: accretion_disks.switched.F90
Description: Contains a module which implements calculations of properties of accretion disks which switch between thin and ADAF depending on the accretion rate.
Code lines: 247

module: accretion_disks_switched
Description: Implements calculations of properties of accretion disks which switch between thin and ADAF depending on the accretion rate.
Code lines: 226
Contained by: file accretion_disks.switched.F90
Modules used: accretion_disks_adaf accretion_disks_shakura_sunyaev
Used by: subroutine accretion_disks_initialize

function: accretion_disk_jet_power_switched
Description: Computes the jet power for a switching accretion disk.
Code lines: 11
Contained by: module accretion_disks_switched
Modules used: galacticus_nodes

function: accretion_disk_radiative_efficiency_switched
Description: Computes the radiative efficiency for a switching accretion disk.
Code lines: 14
Contained by: module accretion_disks_switched
Modules used: galacticus_nodes

function: accretion_disk_switched_adaf_fraction
Description: Decide which type of accretion disk to use.
Code lines: 40
Contained by: module accretion_disks_switched
Modules used: black_hole_fundamentals galacticus_nodes

function: accretion_disk_switched_adaf_radiative_efficiency_scaling
Description: Determine the scaling of radiative efficiency of the ADAF component in a switched accretion disk.
Code lines: 34
Contained by: module accretion_disks_switched
Modules used: black_hole_fundamentals galacticus_nodes
**subroutine:** accretion_disks_switched_initialize  
*Description:* Test if this method is to be used and set procedure pointer appropriately.  
*Code lines:* 75  
*Contained by:* module accretion_disks_switched  
*Modules used:*  
  - input_parameters  
  - iso_varying_string

**function:** black_hole_spin_up_rate_switched  
*Description:* Computes the spin up rate of the black hole in *thisBlackHole* due to accretion from a switching accretion disk.  
*Code lines:* 14  
*Contained by:* module accretion_disks_switched  
*Modules used:* galacticus_nodes

**file:** atomic.cross_sections.Compton.F90  
*Description:* Contains a module which implements calculation of the Compton cross-section.  
*Code lines:* 43  

**module:** atomic_cross_sections_compton  
*Description:* Implements calculation of the Compton cross-section.  
*Code lines:* 23  
*Contained by:* file atomic.cross_sections.Compton.F90  
*Used by:* program xray_absorption_ism_wilms2000

**function:** atomic_cross_section_compton  
*Description:* Returns the Compton cross section (in cm$^2$) for the specified photonEnergy (in keV) from Klein and Nishina [1929].  
*Code lines:* 13  
*Contained by:* module atomic_cross_sections_compton  
*Modules used:*  
  - numerical_constants_physical  
  - numerical_constants_prefixes  
  - numerical_constants_units

**file:** atomic.cross_sections.ionization.photo.F90  
*Description:* Contains a module that implements calculations of atomic photo-ionization cross-sections.  
*Code lines:* 115  

**module:** atomic_cross_sections_ionization_photo  
*Description:* Implements calculations of atomic photo-ionization cross-sections.  
*Code lines:* 95  
*Contained by:* file atomic.cross_sections.ionization.photo.F90  
*Used by:*  
  - function cross_section_h_gamma_to_hplus_electron  
  - function intergalactic_medium_state_internal_odes  
  - subroutine radiation_intergalactic_background_internal_initialize

**function:** atomic_cross_section_ionization_photo  
*Description:* Return the cross-section (in units of cm$^2$) for a given atom in a given ionization state at the specified wavelength (given in units of Å).  
*Code lines:* 14
19.1. Program units

**Contained by:** module `atomic_cross_sections_ionization_photo`

**subroutine:** `atomic_cross_section_ionization_photo_initialize`

*Description:* Initialize the atomic photo ionization cross-section module.

*Code lines:* 53

**Contained by:** module `atomic_cross_sections_ionization_photo`

**Modules used:**
- `atomic_cross_sections_ionization_photo_verner`
- `galacticus_error`
- `input_parameters`

**file:** `atomic.cross_sections.ionization.photo.Verner.F90`

*Description:* Contains a module which computes cross sections for photo-ionization for all ionization stages of all atoms from H to Zn.

*Code lines:* 2032

**module:** `atomic_cross_sections_ionization_photo_verner`

*Description:* Computes cross sections for photo-ionization for all ionization stages of all atoms from H to Zn ($Z = 30$) by use of the following fit parameters:

- Outer shells of the Opacity Project (OP) elements: Verner et al. [1996]
- Inner shells of all elements, and outer shells of the non-OP elements: Verner and Yakovlev [1995]

Original version (`phfit2.f`) written by D. A. Verner (Version 2. March 25, 1996). Inner-shell ionization energies of some low-ionized species are slightly improved to fit smoothly the experimental inner-shell ionization energies of neutral atoms.

*Code lines:* 2012

**Contained by:** file `atomic.cross_sections.ionization.photo.Verner.F90`

**Used by:**
- subroutine `atomic_cross_section_ionization_photo_initialize`

**function:** `atomic_cross_section_ionization_photo_verner`

*Description:* Computes the cross section for photo-ionization (in units of cm$^2$) at the specified wavelength for all ionization stages of all atoms from H to Zn ($Z = 30$) by use of the following fit parameters:

- Outer shells of the Opacity Project (OP) elements: Verner et al. [1996]
- Inner shells of all elements, and outer shells of the non-OP elements: Verner and Yakovlev [1995]

Original version (`phfit2.f`) written by D. A. Verner (Version 2. March 25, 1996). Inner-shell ionization energies of some low-ionized species are slightly improved to fit smoothly the experimental inner-shell ionization energies of neutral atoms.

*Code lines:* 83

**Contained by:** module `atomic_cross_sections_ionization_photo_verner`

**Modules used:**
- `numerical_constants_physical`
- `numerical_constants_units`

**subroutine:** `atomic_cross_section_ionization_photo_verner_initialize`

*Description:* Initializes the “Verner” atomic photo-ionization cross section module.
19. Source Code Documentation

Code lines: 11
Contained by: module atomic_cross_sections_ionization_photo_verner
Modules used: iso_varying_string

file: atomic.data.F90
Description: Contains a module which provides various atomic data.
Code lines: 347

module: atomic_data
Description: Provides various atomic data.

**Module:** `gaunt_factors_sutherland1998`  
**Description:** Contains a function which computes Gaunt factors for Bremsstrahlung emission from ions using the fitting functions of Sutherland [1998].
19.1. Program units

function: gaunt_factor_sutherland1998
Description: Compute energy averaged Gaunt factors for thermal electron distributions using the tabulations and fits of Sutherland [1998].

subroutine: gaunt_factor_sutherland1998_initialize
Description: Initializes the “Sutherland1998” Gaunt Factor module.

file: atomic.rates.excitation.collisional.F90
Description: Contains a module that implements calculations of collisional excitation rates.

module: atomic_rates_excitation_collisional
Description: Implements calculations of collisional excitation rates.

function: collisional_excitation_cooling_rate
Description: Return the collisional excitation cooling rate, in units of J/m^3/s, for ion of given atomicNumber and electronNumber at temperature T (in Kelvin).

subroutine: collisional_excitation_rate_initialize
Description: Initialize the collisional excitation rate module.

file: atomic.rates.excitation.collisional.ScholzWalters91.F90
Description: Contains a module which computes cooling rates due to collisional excitation using the fitting functions of Scholz and Walters [1991].
module: atomic_rates_excitation_collisional_scholzwalters91
Description: Contains a function which computes cooling rates due to collisional excitation using the fitting functions of Scholz and Walters [1991].
Code lines: 69
Contained by: file atomic.rates.excitation.collisional.ScholzWalters91.F90
Used by: subroutine collisional_excitation_cooling_rate

function: collisional_excitation_cooling_rate
Description: Return collisional excitation cooling rates, in units of J/m^3/s, for ion Ion at temperature T (in Kelvin) using the fitting functions of Scholz and Walters [1991].
Code lines: 44
Contained by: module atomic_rates_excitation_collisional_scholzwalters91
Modules used: galacticus_error

subroutine: collisional_excitation_cooling_rate_scholzwalters91_initialize
Description: Initializes the "ScholzWalters91" collisional excitation rate module.
Code lines: 10

Code lines: 53
Contained by: module atomic_rates_ionization_collisional
Modules used: atomic_rates_ionization_collisional__verner

file: atomic.rates.ionization.collisional.Verner.F90
Description: Contains a module which computes rates of atomic direct collisional ionization using the fitting function of Voronov (1997; Version 2, March 24, 1997). Based on the code originally written by Dima Verner.
Code lines: 497
module: atomic_rates_ionization_collisional_verner
Description: Computes rates of atomic direct collisional ionization using the fitting function of Voronov (1997; Version 2, March 24, 1997). Based on the code originally written by Dima Verner.
Code lines: 475
Contained by: file atomic.rates.ionization.collisional.Verner.F90
Used by: subroutine atomic_rate_ionization_collisional_initialize

function: atomic_rate_ionization_collisional_verner
Description: Computes the rate coefficient of direct collisional ionization (in units of cm$^3$s$^{-1}$) at the specified temperature for all ions of atoms with $Z < 28$ by use of the fits from Voronov (1997; Version 2, March 24, 1997). Based on the code originally written by Dima Verner. The ionization state passed to this function should be that of the atom/ion prior to ionization.
Code lines: 35
Contained by: module atomic_rates_ionization_collisional_verner
Modules used: numerical_constants_physical numerical_constants_units

subroutine: atomic_rate_ionization_collisional_verner_initialize
Description: Initializes the “Verner” atomic collisional ionization rate module.
Code lines: 11
Contained by: module atomic_rates_ionization_collisional_verner
Modules used: iso_varying_string

file: atomic.rates.recombination.dielectronic.Arnaud85.F90
Description: Contains a module which computes rates of dielectronic recombination.
Code lines: 246

module: atomic_rates_recombination_dielectronic_arnaud1985
Description: Contains a function which computes rates of dielectronic recombination.
Code lines: 224
Contained by: file atomic.rates.recombination.dielectronic.Arnaud85.F90
Used by: subroutine dielectronic_recombination_rate_arnaud1985_initialize

subroutine: dielectronic_recom_arnaud1985_initialize
Description: Initializes the “Arnaud1985” dielectronic recombination rate module.
Code lines: 10
Contained by: module atomic_rates_recombination_dielectronic_arnaud1985
Modules used: iso_varying_string

function: dielectronic_recombination_rate_arnaud1985
Description: This function calculates rates of dielectric recombination for all ionization stages of all elements from H to Ni ($Z = 28$) by use of the fits from Aldrovandi and Pequignot [1973], Shull and van Steenberg [1982] and Arnaud and Rothenflug [1985]. Input parameters: 
- atomicNumber: atomic number;
- electronNumber: number of electrons;
- temperature: temperature [K].

Output parameter: rate coefficient [cm$^3$ s$^{-1}$].

Code lines: 22

Contained by: module atomic_rates_recombination_dielectronic_arnaud1985

Modules used: galacticus_error

subroutine: set_coefficients
19.1. Program units

Description: Populate the array of fitting function coefficients for the Arnaud1985 dielectronic recombination rates.

Code lines: 172

Contained by: module atomic_rates_recombination_dielectronic_arnaud1985

file: atomic.rates.recombination.dielectronic.F90
Description: Contains a module that implements calculations of dielectronic recombination rates.
Code lines: 114

module: atomic_rates_recombination_dielectronic
Description: Implements calculations of dielectronic recombination rates.

**Code lines:** 655

**module:** `atomic_rates_recombination_radiative_verner`  
**Description:** Computes rates of atomic radiative recombination using a compilation of fitting functions. Based on the code originally written by Dima Verner.  
**Code lines:** 634  
**Contained by:** file `atomic.rates.recombination.radiative.Verner.F90`  
**Used by:** subroutine `atomic_rate_recombination_radiative_initialize`  

**function:** `atomic_rate_recombination_radiative_verner`  
**Description:** Computes the rate coefficient of radiative recombination (in units of cm$^3$ s$^{-1}$) at the specified temperature for all ions of all elements from H through Zn (selected by the atomicNumber and the ionizationState of the recombined ion) use of the following fits:  
- H-like, He-like, Li-like, Na-like: [Verner and Ferland, 1996];  
- Other ions of C, N, O, Ne: [Pequignot et al., 1991], refitted by Verner & Ferland formula to ensure correct asymptotes;  
- Fe XVII-XXIII: [Arnaud and Raymond, 1992];  
- Fe I-XV: refitted by Verner & Ferland formula to ensure correct asymptotes;  
- Other ions of Mg, Si, S, Ar, Ca, Fe, Ni: [Shull and van Steenberg, 1982];  
- Other ions of Na, Al: [Landini and Fossi, 1990];  
- Other ions of F, P, Cl, K, Ti, Cr, Mn, Co (excluding Ti I-II, Cr I-IV, Mn I-V, Co I): [Landini and Fossi, 1991];  
- All other species: interpolations of the power-law fits.  

Based on the code originally written by Dima Verner. The ionization state passed to this function should be that of the atom/ion post recombination.

Code lines: 3
Contained by: module black_hole_fundamentals

function: black_hole_horizon_radius_node
Description: Return the radius of the horizon for a Kerr metric with dimensionless angular momentum j. The radius is in units of the gravitational radius.
Code lines: 30
Contained by: module black_hole_fundamentals
Modules used: galacticus_error

function: black_hole_horizon_radius_spin
Description: Return the radius of the horizon for a Kerr metric with dimensionless angular momentum j. The radius is in units of the gravitational radius.
Code lines: 8
Contained by: module black_hole_fundamentals

interface: black_hole_isco_radius
Code lines: 3
Contained by: module black_hole_fundamentals

function: black_hole_isco_radius_node
Description: Returns the radius (in physical or gravitational units and for a prograde or retorgrade orbit) of the innermost stable circular orbit for the black hole in thisBlackHole.
Code lines: 32
Contained by: module black_hole_fundamentals

function: black_hole_isco_radius_spin
Description: Returns the radius (in gravitational units and for a prograde or retorgrade orbit) of the innermost stable circular orbit for a black hole with spin blackHoleSpin.
Code lines: 41
Contained by: module black_hole_fundamentals
Modules used: galacticus_error

function: black_hole_isco_specific_angular_momentum
19.1. Program units

*Description:* Returns the specific angular momentum (in physical or gravitational units and for a prograde or retorgrade orbit) of the innermost stable circular orbit for the black hole in `thisBlackHole`.

*Code lines:* 42

*Contained by:* module `black_hole_fundamentals`

*Modules used:* `numerical_constants_physical`

**interface: black_hole_isco_specific_energy**

*Code lines:* 3

*Contained by:* module `black_hole_fundamentals`

**function: black_hole_isco_specific_energy_node**

*Description:* Returns the specific energy (in physical or gravitational units and for a prograde or retorgrade orbit) of the innermost stable circular orbit for the black hole in `thisNode`.

*Code lines:* 26

*Contained by:* module `black_hole_fundamentals`

*Modules used:* `numerical_constants_physical`

**function: black_hole_isco_specific_energy_spin**

*Description:* Returns the specific energy (in physical or gravitational units and for a prograde or retorgrade orbit) of the innermost stable circular orbit for a black hole of given `blackHoleSpin`.

*Code lines:* 23

*Contained by:* module `black_hole_fundamentals`

**interface: black_hole_metric_a_factor**

*Code lines:* 3

*Contained by:* module `black_hole_fundamentals`

**function: black_hole_metric_a_factor_node**

*Description:* Returns the \( A \) factor appearing in the Kerr metric for `thisBlackHole`.

*Code lines:* 32

*Contained by:* module `black_hole_fundamentals`

*Modules used:* `galacticus_error`

**function: black_hole_metric_a_factor_spin**

*Description:* Returns the \( A \) factor appearing in the Kerr metric for spin `blackHoleSpin`.

*Code lines:* 7

*Contained by:* module `black_hole_fundamentals`

**interface: black_hole_metric_d_factor**

*Code lines:* 3

*Contained by:* module `black_hole_fundamentals`

**function: black_hole_metric_d_factor_node**

*Description:* Returns the \( D \) factor appearing in the Kerr metric for `thisBlackHole`.

*Code lines:* 32

*Contained by:* module `black_hole_fundamentals`

*Modules used:* `galacticus_error`
function: black_hole_metric_d_factor_spin
Description: Returns the $D$ factor appearing in the Kerr metric for spin `blackHoleSpin`.
Code lines: 7
Contained by: module `black_hole_fundamentals`

interface: black_hole_rotational_energy_spin_down
Code lines: 3
Contained by: module `black_hole_fundamentals`

function: black_hole_rotational_energy_spin_down_node
Description: Wrapper function for `Black_Hole_Rotational_Energy_Spin_Down_Node` which takes a tree node as input.
Code lines: 13
Contained by: module `black_hole_fundamentals`

function: black_hole_rotational_energy_spin_down_spin
Description: Computes the spin down rate of a black hole due to extraction of rotational energy. Specifically, it returns the factor $S$ in the relation:

$$s = -S \frac{P_{\text{rotation}}}{M_{\bullet} c^2},$$

(19.1)

where $P_{\text{rotation}}$ is the power of rotational energy extraction and

$$S = \frac{\left(1 + \sqrt{1 - j^2} \right)^2 + j^2}{j},$$

(19.2)

for black hole spin $j$.
Code lines: 30
Contained by: module `black_hole_fundamentals`

interface: black_hole_static_radius
Code lines: 3
Contained by: module `black_hole_fundamentals`

function: black_hole_static_radius_node
Description: Return the radius of the static limit for a Kerr metric for the black hole in `thisBlackHole` and angle `theta`.
Code lines: 33
Contained by: module `black_hole_fundamentals`
Modules used: `galacticus_error`

function: black_hole_static_radius_spin
Description: Return the radius of the static limit for a Kerr metric for a black hole of given `blackHoleSpin` and angle `theta`.
Code lines: 18
Contained by: module `black_hole_fundamentals`
Modules used: `numerical_constants_math`
19.1. Program units

**file:** chemical.reaction_rates.F90
Description: Contains a module that implements calculations of chemical reaction rates.

**module:** chemical.reaction_rates
Description: Implements calculations of chemical reaction rates.

**subroutine:** chemical_reaction_rate
Description: Return chemical reaction rates at the given temperature for the specified set of chemical densities (in cm$^{-3}$) and radiation field. Units of the returned rates are cm$^{-3}$ s$^{-1}$.

**subroutine:** chemical_reaction_rates_initialize
Description: Initialize the chemical reaction rates module.

**file:** chemical.reaction_rates.hydrogen.F90
Description: Contains a module which implements calculations of chemical reaction rates for hydrogen using the fits from Abel et al. [1997] and Tegmark et al. [1997].

- `numerical_constants_physical`
- `numerical_constants_units`

---

**function:** `cross_section_h_gamma_to_hplus_electron`

**Description:** Compute the cross-section (in units of cm\(^2\)) for the reaction \(H_2 + \gamma \rightarrow 2H^+\) as given by Abel et al. [1997].

**Code lines:** 11

**Contained by:** module `chemical_hydrogen_rates`

**Modules used:**
- `atomic_cross_sections_ionization_photo`

---

**function:** `cross_section_hminus_gamma_to_h_electron`

---
Description: Compute the cross-section (in units of cm$^2$) for the reaction $\text{H}^- + \gamma \rightarrow \text{H} + e^-$ using the fitting function given by Shapiro and Kang [1987], renormalized\(^a\) to match the results of Nascimento and Goddard [1977].

\(^a\)It seems unclear what units were used in Shapiro and Kang [1987], hence the recalibration.

module:  cooling_functions_atomic_cie_cloudy
Description:  Generates a tabulated atomic collisional ionization equilibrium cooling function using CLOUDY.
Code lines:  213
Contained by:  file  cooling.cooling_function.atomic_CIE_Cloudy.F90
Modules used:  iso_varying_string

subroutine:  cooling_function_atomic_cie_cloudy
Description:  Return the cooling function assuming atomic CIE as computed by CLOUDY.
Code lines:  30
Contained by:  module  cooling_functions_atomic_cie_cloudy
Modules used:  abundances_structure

subroutine:  cooling_function_atomic_cie_cloudy_create
Description:  Create the cooling function.
Code lines:  54
Contained by:  module  cooling_functions_atomic_cie_cloudy
Modules used:  abundances_structure
19. Source Code Documentation

subroutine: cooling_function_atomic_cie_cloudy_initialize
Description: Initializes the “atomic CIE cooling function from CLOUDY” module.
Code lines: 13
Contained by: module cooling_functions_atomic_cie_cloudy

subroutine: cooling_function_density_slope_atomic_cie_cloudy
Description: Return the gradient with respect to density of cooling function assuming atomic CIE as computed by CLOUDY.
Code lines: 30
Contained by: module cooling_functions_atomic_cie_cloudy
Modules used: abundances_structure chemical_abundances_structure radiation_structure

subroutine: cooling_function_temperature_slope_atomic_cie_cloudy
Description: Return the cooling function assuming atomic CIE as computed by CLOUDY.
Code lines: 34
Contained by: module cooling_functions_atomic_cie_cloudy
Modules used: abundances_structure chemical_abundances_structure cooling_functions_cie_file radiation_structure

file: cooling.cooling_function.molecular_hydrogen_Galli_Palla.F90
Description: Contains a module which computes the contribution to the cooling function from molecular hydrogen using the cooling function of Galli and Palla [1998].
Code lines: 381

module: cooling_functions_molecular_hydrogen_galli_palla
Description: Computes the contribution to the cooling function from molecular hydrogen using the cooling function of
Code lines: 360
Contained by: file cooling.cooling_function.molecular_hydrogen_Galli_Palla.F90
Modules used: iso_varying_string
Used by: function cooling_function function cooling_function_density_log_slope
function cooling_function_temperature_log_slope
subroutine cooling_function_initialize

subroutine: cooling_function_density_slope_molecular_hydrogen_gp
Description: Return the gradient with respect to density of the cooling function due to molecular hydrogen using the cooling function of Galli and Palla [1998].
Code lines: 42
Contained by: module cooling_functions_molecular_hydrogen_galli_palla
Modules used: abundances_structure chemical_abundances_structure radiation_structure

function: cooling_function_gp_h2plus_electron
Description: Compute the cooling function due to H^+_2−e^− interactions.
Code lines: 28
19.1. Program units

function: cooling_function_gp_h_h2
Description: Compute the cooling function due to H–H\textsubscript{2} interactions.
Code lines: 23

function: cooling_function_gp_h_h2plus
Description: Compute the cooling function due to H–H\textsubscript{2}\textsuperscript{+} interactions.
Code lines: 28

subroutine: cooling_function_molecular_hydrogen_gp
Description: Return the cooling function due to molecular hydrogen using the cooling function of Galli and Palla [1998] (which refers to the local thermodynamic equilibrium cooling function of Hollenbach and McKee [1979]). Cooling functions involving H\textsubscript{2}\textsuperscript{+} are computed using polynomial fits to the results of Suchkov and Shchekinov [1978] found by Andrew Benson by measuring curves from the original paper.
Code lines: 35

subroutine: cooling_function_molecular_hydrogen_gp_initialize
Description: Initializes the “molecular hydrogen Galli & Palla” cooling function module.
Code lines: 21

subroutine: cooling_function_temperature_slope_molecular_hydrogen_gp
Description: Return the gradient with respect to temperature of the cooling function due to molecular hydrogen using the cooling function of Galli and Palla [1998].
Code lines: 78

subroutine: number_density_critical_over_number_density_hydrogen
Description: Compute the ratio of critical number density to the hydrogen number density for use in molecular hydrogen cooling functions.
Code lines: 38

file: cooling.cooling_radius.F90
Description: Contains a module that implements calculations of the cooling radius.
module: cooling_radii
Description: Implements calculations of the cooling radius.
Code lines: 222
Contained by: file cooling.cooling_radius.F90
Modules used: 

galacticus_nodes
cooling_radii_isothermal
iso_varying_string

Used by:
function infall_radius_cooling_freefall
function infall_radius_cooling_radius

function infall_radius_cooling_freefall
description: Return the cooling radius for thisNode (in units of Mpc).
Code lines: 12
Contained by: module cooling_radii

function: cooling_radius_growth_rate
description: Return the rate at which the cooling radius grows for thisNode (in units of Mpc/Gyr).
Code lines: 12
Contained by: module cooling_radii

subroutine: cooling_radius_hot_halo_output
description: Store hot halo properties in the GALACTICUS output file buffers.
Code lines: 18
Contained by: module cooling_radii
Modules used: kind_numbers

subroutine: cooling_radius_hot_halo_output_count
description: Account for the number of hot halo cooling properties to be written to the GALACTICUS output file.
Code lines: 13
Contained by: module cooling_radii

subroutine: cooling_radius_hot_halo_output_names
description: Set names of hot halo properties to be written to the GALACTICUS output file.
Code lines: 29

Contained by: module cooling_radii
19.1. Program units

**Modules used:** galacticus_error

**subroutine:** cooling_radius_output_initialize

*Description:* Initialize output in the cooling radius module.

*Code lines:* 27

*Contained by:* module cooling_radii

*Modules used:* input_parameters

**file:** cooling.cooling_radius.isothermal_profile.F90

*Description:* Contains a module which implements a calculation of cooling radius appropriate for an isothermal halo, assuming collisional ionization equilibrium such that cooling time scales as inverse density.

*Code lines:* 209

**module:** cooling_radii_isothermal

*Description:* Implements calculation of cooling radius appropriate for an isothermal halo, assuming collisional ionization equilibrium such that cooling time scales as inverse density.

*Code lines:* 187

*Contained by:* file cooling.cooling_radius.isothermal_profile.F90

*Modules used:* abundances_structure chemical_abundances_structure
galacticus_nodes kind_numbers
radiation_structure

*Used by:* module cooling_radii subroutine galacticus_calculations_reset

**function:** cooling_radius_growth_rate_isothermal

*Description:* Return the growth rate of the cooling radius in the “isothermal” model in Mpc/Gyr.

*Code lines:* 42

*Contained by:* module cooling_radii_isothermal

*Modules used:* cooling_times_available dark_matter_halo_scales

**function:** cooling_radius_isothermal

*Description:* Return the cooling radius in the isothermal model.

*Code lines:* 69

*Contained by:* module cooling_radii_isothermal

*Modules used:* chemical_reaction_rates_utilities cooling_times
cooling_times_available dark_matter_halo_scales
hot_halo_mass_distributions hot_halo_temperature_profile

**subroutine:** cooling_radius_isothermal_initialize

*Description:* Initializes the “isothermal” cooling radius module.

*Code lines:* 16

*Contained by:* module cooling_radii_isothermal

*Modules used:* iso_varying_string

**subroutine:** cooling_radius_isothermal_reset

*Description:* Reset the cooling radius calculation.

*Code lines:* 12

*Contained by:* module cooling_radii_isothermal
file: `cooling.cooling_radius.simple.F90`

*Description:* Contains a module which implements a simple cooling radius calculation (finds the radius at which the time available for cooling equals the cooling time).

*Code lines:* 292

**module: cooling_radii_simple**

*Description:* Implements a simple cooling radius calculation (finds the radius at which the time available for cooling equals the cooling time).

*Code lines:* 271

*Contained by:* file `cooling.cooling_radius.simple.F90`

*Modules used:*
- abundances_structure
- chemical_abundances_structure
- galacticus_nodes
- hot_halo_mass_distributions
- kind_numbers
- radiation_structure

*Used by:* module `cooling_radii` subroutine `galacticus_calculations_reset`

**function: cooling_radius_growth_rate_simple**

*Description:* Return the growth rate of the cooling radius in the “simple” model in Mpc/Gyr.

*Code lines:* 64

*Contained by:* module `cooling_radii_simple`

*Modules used:*
- cooling_times
- cooling_times_available
- hot_halo_temperature_profile

**function: cooling_radius_root**

*Description:* Root function which evaluates the difference between the cooling time at radius and the time available for cooling.

*Code lines:* 16

*Contained by:* module `cooling_radii_simple`

*Modules used:*
- cooling_times
- hot_halo_temperature_profile

**function: cooling_radius_simple**

*Description:* Return the cooling radius in the simple model.

*Code lines:* 61

*Contained by:* module `cooling_radii_simple`

*Modules used:*
- cooling_times_available
- root_finder

**subroutine: cooling_radius_simple_initialize**

*Description:* Initializes the “simple” cooling radius module.

*Code lines:* 21

*Contained by:* module `cooling_radii_simple`

*Modules used:*
- array_utilities
- galacticus_error
- iso_varying_string
- string_handling

**subroutine: cooling_radius_simple_reset**

*Description:* Reset the cooling radius calculation.

*Code lines:* 12

*Contained by:* module `cooling_radii_simple`
subroutine: cooling_radius_solver_initialize
Description: Initialize the abundances, chemical properties and radiation field for thisNode for use in cooling radius calculations.
Code lines: 36
Contained by: module cooling_radii_simple
Modules used: chemical_reaction_rates_utilities

Description: Contains a module which implements a Cole et al. [2000] cooling rate calculation.
Code lines: 89

module: cooling_rates_cole2000
Description: Implements a Cole et al. [2000] cooling rate calculation.
Code lines: 69
Used by: subroutine cooling_rate_initialize

function: cooling_rate_cole2000
Description: Computes the mass cooling rate in a hot gas halo utilizing the Cole et al. [2000] method. This is based on the properties of the halo at formation time, and gives a zero cooling rate when the cooling radius exceeds the virial radius.
Code lines: 44
Contained by: module cooling_rates_cole2000
Modules used: cooling_infall_radii galacticus_nodes hot_halo_mass_distributions numerical_constants_math

subroutine: cooling_rate_cole2000_initialize
Description: Initializes the “Cole et al. (2000)” cooling rate module.
Code lines: 10
Contained by: module cooling_rates_cole2000
Modules used: iso_varying_string

file: cooling.cooling_rate.F90
Description: Contains a module that implements calculations of the cooling rate.
Code lines: 256

module: cooling_rates
Description: Implements calculations of the cooling rate.

input_parameters

subroutine: cooling_rate_output_initialize
Description: Initialize output in the cooling rate module.
Code lines: 26
Contained by: module cooling_rates
Modules used: input_parameters

file: cooling.cooling_rate.White-Frenk.F90
Description: Contains a module which implements a White and Frenk [1991] cooling rate calculation.
Code lines: 113

module: cooling_rates_white_frenk
Description: Implements a White and Frenk [1991] cooling rate calculation.
Code lines: 93
Contained by: file cooling.cooling_rate.White-Frenk.F90
19.1. Program units

**Modules used:** galacticus_nodes
**Used by:** subroutine cooling_rate_initialize

**function:** cooling_rate_white_frenk
**Description:** Computes the mass cooling rate in a hot gas halo utilizing the White and Frenk [1991] method.
**Code lines:** 44
**Contained by:** module cooling_rates_white_frenk
**Modules used:** cooling_infall_radii, dark_matter_halo_scales, hot_halo_mass_distributions, numerical_constants_math

**subroutine:** cooling_rate_white_frenk_initialize
**Description:** Initializes the “White-Frenk1991” cooling rate module.
**Code lines:** 30
**Contained by:** module cooling_rates_white_frenk
**Modules used:** array_utilities, galacticus_error, input_parameters, iso_varying_string

**file:** cooling.cooling_rate.modifier.cut_off.F90
**Description:** Contains a module which implements a cut off in the cooling rate at given redshift and virial velocity.
**Code lines:** 137

**module:** cooling_rates_modifier_cut_off
**Description:** Implements a cut off in the cooling rate at given redshift and virial velocity.
**Code lines:** 117
**Contained by:** file cooling.cooling_rate.modifier.cut_off.F90
**Used by:** function cooling_rate

**subroutine:** cooling_rate_modifier_cut_off
**Description:** Modify cooling rates by truncating them to zero below a given redshift and virial velocity.
**Code lines:** 94
**Contained by:** module cooling_rates_modifier_cut_off
**Modules used:** cosmology_functions, dark_matter_halo_scales, galacticus_error, galacticus_nodes, input_parameters, iso_varying_string

**file:** cooling.cooling_rate.simple.F90
**Description:** Contains a module which implements a simple cooling rate calculation in which the cooling rate equals the mass of hot gas divided by a fixed timescale.
**Code lines:** 78

**module:** cooling_rates_simple
**Description:** Implements a simple cooling rate calculation in which the cooling rate equals the mass of hot gas divided by a fixed timescale.
**Code lines:** 57
**Contained by:** file cooling.cooling_rate.simple.F90
**Modules used:** galacticus_nodes
**Used by:** subroutine cooling_rate_initialize
function: cooling_rate_simple
Description: Computes the mass cooling rate in a hot gas halo assuming a fixed timescale for cooling.
Code lines: 9
contained by: module cooling_rates_simple

subroutine: cooling_rate_simple_initialize
Description: Initializes the "simple" cooling rate module.
Code lines: 28
Contained by: module cooling_rates_simple
Modules used: galacticus_error input_parameters iso_varying_string

file: cooling.cooling_rate.simple_scaling.F90
Description: Contains a module which implements a simple cooling rate calculation in which the cooling rate equals the mass of hot gas divided by a timescale which is a function of halo mass and redshift.
Code lines: 141

module: cooling_rates_simple_scaling
Description: Implements a simple cooling rate calculation in which the cooling rate equals the mass of hot gas divided by a timescale which is a function of halo mass and redshift.
Code lines: 120
Contained by: file cooling.cooling_rate.simple_scaling.F90
Modules used: galacticus_nodes
Used by: subroutine cooling_rate_initialize

function: cooling_rate_simple_scaling
Description: Computes the mass cooling rate in a hot gas halo assuming a fixed timescale for cooling.
Code lines: 25
Contained by: module cooling_rates_simple_scaling
Modules used: cosmology_functions

subroutine: cooling_rate_simple_scaling_initialize
Description: Initializes the "simple scaling" cooling rate module.
Code lines: 75
Contained by: module cooling_rates_simple_scaling
Modules used: array_utilities galacticus_error input_parameters iso_varying_string

file: cooling.cooling_rate.zero.F90
Description: Contains a module which implements a zero cooling rate calculation.
Code lines: 52

module: cooling_rates_zero
Description: Implements zero cooling rate calculation.
Code lines: 32
Contained by: file cooling.cooling_rate.zero.F90
Used by: subroutine cooling_rate_initialize
function: cooling_rate_zero
  Description: Returns a zero mass cooling rate in a hot gas halos.
  Code lines: 8
  Contained by: module cooling_rates_zero
  Modules used: galacticus_nodes

subroutine: cooling_rate_zero_initialize
  Description: Initializes the “zero” cooling rate module.
  Code lines: 9
  Contained by: module cooling_rates_zero
  Modules used: iso_varying_string

file: cooling.cooling_time.F90
  Description: Contains a module that implements calculations of the cooling time.
  Code lines: 158

module: cooling_times
  Description: Implements calculations of the cooling function.

Description: Implements an infall radius calculation in which the infall radius is the smaller of the cooling and freefall radii.
Code lines: 90
Contained by: file cooling.infall_radius.cooling_and_freefall.F90
Used by: module cooling_infall_radii

function: infall_radius_cooling_freefall
Description: Return the infall radius in the “cooling and freefall” model in Mpc/Gyr.
Code lines: 30
Contained by: module infall_radii_cooling_freefall
Modules used: cooling_radii dark_matter_halo_scales freefall_radii galacticus_nodes

subroutine: infall_radius_cooling_freefall_initialize
Description: Initializes the “cooling and freefall” infall radius module.
Code lines: 13
Contained by: module infall_radii_cooling_freefall
Modules used: iso_varying_string

function: infall_radius_growth_rate_cooling_freefall
Description: Return the growth rate of the infall radius in the “cooling and freefall” model in Mpc/Gyr.
Code lines: 30
Contained by: module infall_radii_cooling_freefall
Modules used: cooling_radii dark_matter_halo_scales freefall_radii galacticus_nodes
file: cooling.infall_radius.cooling_radius.F90
Description: Contains a module which implements a simple infall radius calculation, simply assuming that the infall radius equals the cooling radius.
Code lines: 68

module: infall_radii_cooling_radius
Description: Implements a simple infall radius calculation, simply assuming that the infall radius equals the cooling radius.
Code lines: 48
Contained by: file cooling.infall_radius.cooling_radius.F90
Used by: module cooling_infall_radii

function: infall_radius_cooling_radius
Description: Return the growth rate of the infall radius in the “cooling radius” model in Mpc/Gyr.
Code lines: 9
Contained by: module infall_radii_cooling_radius
Modules used: cooling_radii galacticus_nodes

subroutine: infall_radius_cooling_radius_initialize
Description: Initializes the “cooling radius” infall radius module.
Code lines: 13
Contained by: module infall_radii_cooling_radius
Modules used: iso_varying_string

function: infall_radius_growth_rate_cooling_radius
Description: Return the growth rate of the infall radius in the “cooling radius” model in Mpc/Gyr.
Code lines: 9
Contained by: module infall_radii_cooling_radius
Modules used: cooling_radii galacticus_nodes

file: cooling.specific_angular_momentum.F90
Description: Contains a module that implements calculations of the specific angular momentum of cooling gas.
Code lines: 110

module: cooling_specific_angular_momenta
Description: Implements calculations of the specific angular momentum of cooling gas.
Code lines: 90
Contained by: file cooling.specific_angular_momentum.F90
Modules used: cooling_specific_angular_momenta_- cooling_specific_angular_momenta_mean constant_rotation galacticus_nodes iso_varying_string
Used by: subroutine node_component_hot_halo_- subroutine node_component_hot_halo_- cold_mode_push_to_cooling_pipes standard_push_to_cooling_pipes

function: cooling_specific_angular_momentum
Description: Return the specific angular momentum (in units of km/s Mpc) of cooling gas in thisNode.
Code lines: 13
19. Source Code Documentation

Contained by: module `cooling_specific-angular-momenta`

**subroutine:** `cooling_specific-angular-momentum_initialize`
*Description:* Initialize the specific angular momentum of cooling gas module.

**Modules used:** *cooling_time_available_white_frenk cooling_times_available_halo-formation galacticus_nodes iso_varying_string*

**Used by:** function *cooling_radius_growth_rate-isothermal cooling_radius_simple*

**Function:** *cooling_time_available*

*Description:* Return the time available for cooling in *thisNode*.

*Code lines:* 12

**Contained by:** module *cooling_times_available*

**Interface:** *cooling_time_available_get_template*

*Code lines:* 5

**Contained by:** module *cooling_times_available*

**Function:** *cooling_time_available_get_template*

*Code lines:* 3

**Contained by:** interface *cooling_time_available_get_template*

**Function:** *cooling_time_available_increase_rate*

*Description:* Return the rate at which the time available for cooling increases in *thisNode*.

*Code lines:* 12

**Contained by:** module *cooling_times_available*
subroutine: cooling_time_available_initialize
  Description: Initializes the cooling time available module.
  Code lines: 42
  Contained by: module cooling_times_available
  Modules used: galacticus_error  input_parameters

file: cooling.time_available.White-Frenk.F90
  Description: Contains a module which implements the White and Frenk [1991] method for computing the time available for cooling in hot halos.
  Code lines: 105

module: cooling_time_available_white_frenk
  Description: Implements the White and Frenk [1991] method for computing the time available for cooling in hot halos.
  Code lines: 84
  Contained by: file cooling.time_available.White-Frenk.F90
  Used by: module cooling_times_available
  Modules used: galacticus_nodes

function: cooling_time_available_increase_rate_wf
  Description: Compute the rate of increase of the time available for cooling using the White and Frenk [1991] method. We return a rate of 1, even though technically it can depend on halo properties.
  Code lines: 10
  Contained by: module cooling_time_available_white_frenk
  Modules used: galacticus_nodes

function: cooling_time_available_wf
  Description: Compute the time available for cooling using the White and Frenk [1991] method. This is assumed to be equal to the dynamical timescale of the halo.
  Code lines: 26
  Contained by: module cooling_time_available_white_frenk
  Modules used: dark_matter_halo_scales  galacticus_nodes

subroutine: cooling_time_available_wf_initialize
  Description: Initialize the White and Frenk [1991] cooling time available module.
  Code lines: 28
  Contained by: module cooling_time_available_white_frenk
  Modules used: galacticus_error  input_parameters  iso_varying_string

file: cooling.time_available.halo_formation.F90
  Description: Contains a module which implements the Cole et al. [2000] method for computing the time available for cooling in hot halos.
  Code lines: 78

module: cooling_times_available_halo_formation
  Description: Implements the Cole et al. [2000] method for computing the time available for cooling in hot halos.
  Code lines: 57
19.1. Program units

*Contained by:* file `cooling.time_available.halo_formation.F90`

*Modules used:* `galacticus_nodes`

*Used by:* module `cooling_times_available`

**function:** `cooling_time_available_halo_formation`

*Description:* Compute the time available for cooling using the Cole et al. [2000] method. Specifically, the time available is assumed to be the time since the halo formation event.

*Code lines:* 13

*Contained by:* module `cooling_times_available_halo_formation`

**subroutine:** `cooling_time_available_halo_formation_initialize`

*Description:* Initialize the Cole et al. [2000] cooling time available module.

*Code lines:* 17

*Contained by:* module `cooling_times_available_halo_formation`

*Modules used:* `galacticus_error` `iso_varying_string`

**function:** `cooling_time_available_increase_rate_halo_formation`

*Description:* Compute the rate of increase of the time available for cooling using the Cole et al. [2000] method. We return a rate of 1.

*Code lines:* 9

*Contained by:* module `cooling_times_available_halo_formation`

**file:** `cosmology.functions.F90`

*Description:* Contains a module which provides an object that implements cosmological functions.

*Code lines:* 2648

**module:** `cosmology_functions`
Description: Provides an object that implements cosmological functions. An implementation of the cosmological functions class for cosmologies consisting of collisionless matter plus a cosmological constant. An implementation of the cosmological functions class for cosmologies consisting of collisionless matter and dark energy with an equation of state of the form: $P = \rho^w$ with $w(a) = w_0 + w_1(a - 1)$.

Modules used: `galacticus_error`

**function:** `matterdarkenergyexponentdarkenergyderivative`
Description: Return the derivative of the dark energy exponent with respect to expansion factor.
Code lines: 22
Contained by: module `cosmology_functions`
Modules used: `galacticus_error`

**function:** `matterdarkenergyhubbleparameterepochal`
Description: Returns the Hubble parameter at the request cosmological time, time, or expansion factor, expansionFactor.
Code lines: 37
Contained by: module `cosmology_functions`
Modules used: `galacticus_error`

**function:** `matterdarkenergyhubbleparameterrateofchange`
Description: Returns the rate of change of the Hubble parameter at the requested cosmological time, time, or expansion factor, expansionFactor.
Code lines: 26
Contained by: module `cosmology_functions`
Modules used: `galacticus_error`

**subroutine:** `matterdarkenergymakeexpansionfactortable`
Description: Builds a table of expansion factor vs. time for dark energy universes.
Code lines: 127
Contained by: module `cosmology_functions`
Modules used: `cosmology_parameters iso_c_binding memory_management numerical_interpolation numerical_ranges`

**function:** `matterdarkenergyomegadarkenergyepochal`
Description: Return the dark energy density parameter at expansion factor expansionFactor.
Code lines: 25
Contained by: module `cosmology_functions`
Modules used: `galacticus_error`

**subroutine:** `matterdarkenergytargetself`
Description: Set a module-scope pointer to the current dark energy cosmology functions object.
Code lines: 7
Contained by: module `cosmology_functions`

**function:** `matterdarkenergytimeatdistancecomoving`
Description: Returns the cosmological time corresponding to given comovingDistance.
Code lines: 9
Contained by: module `cosmology_functions`
Modules used: `galacticus_error`
function: matterlambdaagetableodes
Description: System of differential equations to solve for expansion factor vs. age.
Code lines: 11
Contained by: module cosmology_functions
Modules used: iso_c_binding

function: matterlambdacollapseodes
Description: System of differential equations to solve for age vs. expansion factor.
Code lines: 13
Contained by: module cosmology_functions
Modules used: iso_c_binding

function: matterlambdacomovingdistanceintegrand
Description: Integrand function used in computing the comoving distance.
Code lines: 12
Contained by: module cosmology_functions
Modules used: iso_c_binding numerical_constants_astronomical numerical_constants_physical

function: matterlambdaconstructor
Description: Constructor for the matter plus cosmological constant cosmological functions class.
Code lines: 84
Contained by: module cosmology_functions
Modules used: cosmology_parameters iso_c_binding iso_varying_string numerical_comparison ode_solver

function: matterlambdacosmictime
Description: Return the cosmological matter density in units of the critical density at the present day.
Code lines: 42
Contained by: module cosmology_functions
Modules used: galacticus_error numerical_interpolation

function: matterlambdacosmictimeisvalid
Description: Checks that the time falls within allowed ranges.
Code lines: 8
Contained by: module cosmology_functions

function: matterlambdadefaultconstructor
Description: Default constructor for the matter plus cosmological constant cosmological functions class.
Code lines: 12
Contained by: module cosmology_functions
Modules used: cosmology_parameters

subroutine: matterlambdadensityscalingearlytime
Code lines: 15
Contained by: module cosmology_functions
Modules used: cosmology_parameters
**subroutine: matterlambdadestructor**
*Description:* Default constructor for the matter plus cosmological constant cosmological functions class.
*Code lines:* 16
*Contained by:* module cosmology_functions
*Modules used:* numerical_interpolation

**function: matterlambdadistanceangular**
*Description:* Returns the angular diameter distance to cosmological time \( t \).
*Code lines:* 11
*Contained by:* module cosmology_functions
*Modules used:* galacticus_error numerical_interpolation

**function: matterlambdadistancecomoving**
*Description:* Returns the comoving distance to cosmological time \( t \).
*Code lines:* 24
*Contained by:* module cosmology_functions
*Modules used:* galacticus_error numerical_interpolation

**function: matterlambdadistancecomovingconvert**
*Description:* Convert between different measures of distance.
*Code lines:* 37
*Contained by:* module cosmology_functions
*Modules used:* cosmology_functions_options galacticus_error numerical_interpolation

**function: matterlambdadistanceluminosity**
*Description:* Returns the luminosity distance to cosmological time \( t \).
*Code lines:* 11
*Contained by:* module cosmology_functions
*Modules used:* galacticus_error numerical_interpolation

**function: matterlambdaordinationepochmatter**
*Code lines:* 29
*Contained by:* module cosmology_functions
*Modules used:* cosmology_functions_parameters cosmology_parameters

**function: matterlambdadequalityepochmattercurvature**
*Description:* Return the epoch of matter-curvature magnitude equality (either expansion factor or cosmic time).
*Code lines:* 18
*Contained by:* module cosmology_functions
*Modules used:* cosmology_functions_parameters cosmology_parameters

**function: matterlambdadequalityepochmatterdarkenergy**
*Description:* Return the epoch of matter-dark energy magnitude equality (either expansion factor or cosmic time).
*Code lines:* 17
*Contained by:* module cosmology_functions
*Modules used:* cosmology_functions_parameters cosmology_parameters
function: matterlambdaequationofstatedarkenergy
Description: Return the dark energy equation of state.
Code lines: 8
Contained by: module cosmology_functions

function: matterlambdaexpansionfactor
Description: Returns the expansion factor at cosmological time time.
Code lines: 39
Contained by: module cosmology_functions
Modules used: galacticus_error numerical_interpolation

function: matterlambdaexpansionfactorisvalid
Description: Checks that the expansion factor falls within allowed ranges.
Code lines: 8
Contained by: module cosmology_functions

function: matterlambdaexpansionrate
Description: Returns the cosmological expansion rate, $\dot{a}/a$ at expansion factor expansionFactor.
Code lines: 10
Contained by: module cosmology_functions
Modules used: cosmology_parameters

function: matterlambdaexponentdarkenergy
Description: Return the dark energy equation of state.
Code lines: 8
Contained by: module cosmology_functions

function: matterlambdahubbleparameterepochal
Description: Returns the Hubble parameter at the request cosmological time, time, or expansion factor, expansionFactor.
Code lines: 38
Contained by: module cosmology_functions
Modules used: cosmology_parameters galacticus_error

function: matterlambdahubbleparameterrateofchange
Description: Returns the rate of change of the Hubble parameter at the request cosmological time, time, or expansion factor, expansionFactor.
Code lines: 26
Contained by: module cosmology_functions
Modules used: cosmology_parameters galacticus_error

subroutine: matterlambdamadeakedistancetable
Description: Builds a table of distance vs. time.
Code lines: 54
Contained by: module cosmology_functions
Modules used: iso_c_binding memory_management numerical_integration numerical_interpolation
numerical_ranges

subroutine: matterlambdamakeexpansionfactortable
Description: Builds a table of expansion factor vs. time.
Code lines: 104
Contained by: module cosmology_functions
Modules used: cosmology_parameters
iso_c_binding
numerical_interpolation
ode_solver

function: matterlambdaomegadarkenergyepochal
Description: Return the dark energy density parameter at expansion factor expansionFactor.
Code lines: 25
Contained by: module cosmology_functions
Modules used: galacticus_error

function: matterlambdaomegammatterepochal
Description: Return the matter density parameter at expansion factor expansionFactor.
Code lines: 27
Contained by: module cosmology_functions
Modules used: galacticus_error

function: matterlambdaomegammatterrateofchange
Description: Return the rate of change of the matter density parameter at expansion factor expansionFactor.
Code lines: 18
Contained by: module cosmology_functions
Modules used: galacticus_error

subroutine: matterlambdastaterestore
Description: Retrieve the tabulation state from the file.
Code lines: 29
Contained by: module cosmology_functions
Modules used: memory_management

subroutine: matterlambdastatestore
Description: Write the tablulation state to file.
Code lines: 14
Contained by: module cosmology_functions

function: matterlambdatemperaturecmbepochal
Description: Return the temperature of the CMB at expansion factor expansionFactor.
Code lines: 25
Contained by: module cosmology_functions
Modules used: galacticus_error

function: matterlambdatimeatdistancecomoving
Description: Returns the cosmological time corresponding to given comovingDistance.
19.1. Program units

Code lines: 28

```
19. Source Code Documentation

**Description:** Implements calculations of dark matter halo formation times.

**Code lines:** 44

**Contained by:** file `dark_matter_halos.formation_times.F90`

**Used by:**
- function `zhao2009concentration`
- subroutine `node_component_mass_flow_statistics_standard_merger_tree_init`
- subroutine `node_component_merging_statistics_standard_merger_tree_init_set`

**function: dark_matter_halo_formation_time**

**Description:** Returns the time at which the main branch progenitor of `thisNode` first had a mass equal to `formationMassFraction` of the current mass.

**Code lines:** 34

**Contained by:** module `dark_matter_halo_formation_times`

**Modules used:**
- `dark_matter_halo_mass_accretion_histories`

**file: dark_matter_halos.mass_accretion_history.F90**

**Description:** Contains a module which implements calculations of dark matter halo mass accretion histories.

**Code lines:** 117

**module: dark_matter_halo_mass_accretion_histories**

**Description:** Implements calculations of dark matter halo mass accretion histories.

**Code lines:** 97

**Contained by:** file `dark_matter_halos.mass_accretion_history.F90`

**Modules used:**
- `galacticus_nodes`
- `iso_varying_string`

**Used by:**
- function `dark_matter_halo_formation_time`
- subroutine `merger_tree_smooth_accretion_do`
- program `test_zhao2009_flat`
- program `test_zhao2009_dark_energy`
- program `test_zhao2009_open`

**function: dark_matter_halo_mass_accretion_time**

**Description:** Returns the time for `thisNode` in `thisTree` according to the mass accretion history.

**Code lines:** 13

**Contained by:** module `dark_matter_halo_mass_accretion_histories`

**subroutine: dark_matter_mass_accretion_initialize**

**Description:** Initialize the dark matter mass accretion history module.

**Code lines:** 54

**Contained by:** module `dark_matter_halo_mass_accretion_histories`

**Modules used:**
- `dark_matter_halo_mass_accretion_histories_wechsler2002`
- `dark_matter_halo_mass_accretion_histories_zhao2009`
- `galacticus_error`
- `input_parameters`

**Description:** Contains a module which implements the Wechsler et al. [2002] halo mass accretion algorithm.

**Code lines:** 143

**module: dark_matter_halo_mass_accretion_histories_wechsler2002**
19.1. Program units

Description: Implements the Wechsler et al. [2002] halo mass accretion algorithm.
Code lines: 123

Modules used: galacticus_nodes

Used by: subroutine dark_matter_mass_accretion_initialize

function: dark_matter_halo_mass_accretion_time_wechsler2002
Description: Compute the time corresponding to nodeMass in the mass accretion history of thisNode using the algorithm of Wechsler et al. [2002].
Code lines: 33

Contained by: module dark_matter_halo_mass_accretion_histories_wechsler2002

Modules used: cosmology_functions

subroutine: dark_matter_mass_accretion_wechsler2002_initialize
Description: Initializes the “Wechsler2002” mass accretion history module.
Code lines: 41

Contained by: module dark_matter_halo_mass_accretion_histories_wechsler2002

Modules used: input_parameters iso_varying_string

function: expansion_factor_at_formation
Description: Computes the expansion factor at formation using the simple model of Bullock et al. [2001].
Code lines: 27

Contained by: module dark_matter_halo_mass_accretion_histories_wechsler2002

Modules used: cosmology_functions critical_overdensity power_spectra

file: dark_matter_halos.mass_accretion_history.Zhao2009.F90
Description: Contains a module which implements the Zhao et al. [2009] halo mass accretion algorithm.
Code lines: 158

module: dark_matter_halo_mass_accretion_histories_zhao2009
Description: Implements the Zhao et al. [2009] halo mass accretion algorithm.
Code lines: 138

Contained by: file dark_matter_halos.mass_accretion_history.Zhao2009.F90

Modules used: fgsl galacticus_nodes iso_c_binding

Used by: subroutine dark_matter_mass_accretion_initialize

function: dark_matter_halo_mass_accretion_time_zhao2009
Description: Compute the time corresponding to nodeMass in the mass accretion history of thisNode using the algorithm of Zhao et al. [2009].
Code lines: 51

Contained by: module dark_matter_halo_mass_accretion_histories_zhao2009

Modules used: critical_overdensity galacticus_error ode_solver power_spectra

subroutine: dark_matter_mass_accretion_zhao2009_initialize
**Description:** Initializes the “Zhao2009” mass accretion history module.

**Code lines:** 13

**Contained by:** module `dark_matter_halo_mass_accretion_histories_zhao2009`

**Modules used:** `iso_varying_string`

**function:** `growthrateodes`

**Description:** System of differential equations to solve for the growth rate.

**Code lines:** 43

**Contained by:** module `dark_matter_halo_mass_accretion_histories_zhao2009`

**Modules used:** `critical_overdensity` `power_spectra`

**file:** `dark_matter_halos.mass_loss_rates.F90`

**Description:** Contains a module which implements calculations of mass loss rates from dark matter halos.

**Code lines:** 115

**module:** `dark_matter_halos_mass_loss_rates`

**Description:** Implements calculations of mass loss rates from dark matter halos.

**Code lines:** 95

**Contained by:** file `dark_matter_halos.mass_loss_rates.F90`

**Modules used:** `galacticus_nodes` `iso_varying_string`

**Used by:** subroutine `node_component_satellite_standard_rate_compute`

**subroutine:** `dark_matter_halo_mass_loss_rates_initialize`

**Description:** Initialize the dark matter halos mass loss rate module.

**Code lines:** 54

**Contained by:** module `dark_matter_halos_mass_loss_rates`

**Modules used:** `dark_matter_halos_mass_loss_rates_null` `dark_matter_halos_mass_loss_rates_vandenbosch` `galacticus_error` `input_parameters`

**function:** `dark_matter_halos_mass_loss_rate`

**Description:** Returns the rate of mass loss (in $M_\odot$/Gyr) from thisNode.

**Code lines:** 12

**Contained by:** module `dark_matter_halos_mass_loss_rates`

**file:** `dark_matter_halos.mass_loss_rates.null.F90`

**Description:** Contains a module which implements a null calculation of dark matter halo mass loss rates.

**Code lines:** 52

**module:** `dark_matter_halos_mass_loss_rates_null`

**Description:** Implements a null calculation of dark matter halo mass loss rates.

**Code lines:** 32

**Contained by:** file `dark_matter_halos.mass_loss_rates.null.F90`

**Used by:** subroutine `dark_matter_halo_mass_loss_rates_initialize`

**function:** `dark_matter_halos_mass_loss_rate_null`

**Description:** Returns the a zero rate of mass loss from dark matter halos.
19.1. Program units

Code lines: 8
Contained by: module dark_matter_halos_mass_loss_rates_null
Modules used: galacticus_nodes

subroutine: dark_matter_halos_mass_loss_rate_null_initialize
Description: Initializes the “null” dark matter halo mass loss rate method.
Code lines: 9
Contained by: module dark_matter_halos_mass_loss_rates_null
Modules used: iso_varying_string

file: dark_matter_halos.mass_loss_rates.vanDenBosch.F90
Description: Contains a module which implements a calculation of dark matter halo mass loss rates using the method of van den Bosch et al. [2005].
Code lines: 93

module: dark_matter_halos_mass_loss_rates_vandenbosch
Description: Implements a calculation of dark matter halo mass loss rates using the method of van den Bosch et al. [2005].
Code lines: 72
Contained by: file dark_matter_halos.mass_loss_rates.vanDenBosch.F90
Used by: subroutine dark_matter_halo_mass_loss_rates_initialize

function: dark_matter_halos_mass_loss_rate_vandenbosch
Description: Returns the rate of mass loss from dark matter halos using the prescription of van den Bosch et al. [2005].
Code lines: 29
Contained by: module dark_matter_halos_mass_loss_rates_vandenbosch
Modules used: cosmology_functions galacticus_nodes virial_density_contrast

subroutine: dark_matter_halos_mass_loss_rate_vandenbosch_initialize
Description: Initializes the “vanDenBosch2005” dark matter halo mass loss rate method.
Code lines: 21
Contained by: module dark_matter_halos_mass_loss_rates_vandenbosch
Modules used: cosmology_functions iso_varying_string virial_density_contrast

file: dark_matter_halos.scales.F90
Description: Contains a module which provides a class implementing scales of dark matter halos.
Code lines: 791

module: dark_matter_halo_scales
Description: Provides a class implementing scales of dark matter halos. An implementation of dark matter halo scales based on virial density contrast.
Code lines: 771
Contained by: file dark_matter_halos.scales.F90
Modules used: fgsl galacticus_nodes iso_varying_string kind_numbers tables virial_density_contrast

**function:** halo_spin_sample_get_template

*Code lines:* 3

*Contained by:* interface halo_spin_sample_get_template

**file:** dark_matter_halos.spins.distributions.delta_function.F90

*Description:* Contains a module which implements a delta function halo spin distribution.

*Code lines:* 69

**module:** halo_spin_distributions_delta_function

*Description:* Implements a delta function halo spin distribution (i.e. all halos have the same spin).

*Code lines:* 49

*Contained by:* file dark_matter_halos.spins.distributions.delta_function.F90

*Used by:* function halo_spin_distribution_sample

**function:** halo_spin_distribution_delta_function

*Description:* Return a halo spin from a delta function distribution.

*Code lines:* 8

*Contained by:* module halo_spin_distributions_delta_function

*Modules used:* galacticus_nodes

**subroutine:** halo_spin_distribution_delta_function_initialize

*Description:* Initializes the “delta function” halo spin distribution module.

*Code lines:* 23

*Contained by:* module halo_spin_distributions_delta_function

*Modules used:* input_parameters iso_varying_string

**file:** dark_matter_halos.spins.distributions.lognormal.F90

*Description:* Contains a module which implements a lognormal halo spin distribution.

*Code lines:* 132

**module:** halo_spin_distributions_lognormal

*Description:* Implements a lognormal halo spin distribution.

*Code lines:* 112

**interface:** `darkmatterprofileeinasto`
**Description:** Constructors for the `einasto` dark matter halo profile class.
**Code lines:** 4
**Contained by:** file `dark_matter_profiles.Einasto.F90`

**subroutine:** `einstastocalculationreset`
**Description:** Reset the dark matter profile calculation.
**Code lines:** 8
**Contained by:** file `dark_matter_profiles.Einasto.F90`
function: einastocircularvelocity
Description: Returns the circular velocity (in km/s) in the dark matter profile of node at the given radius (given in units of Mpc).
Code lines: 15
Contained by: file dark_matter_profiles.Einasto.F90
Modules used: numerical_constants_physical

function: einastocircularvelocitymaximum
Description: Returns the maximum circular velocity (in km/s) in the dark matter profile of node.
Code lines: 37
Contained by: file dark_matter_profiles.Einasto.F90
Modules used: numerical_constants_physical root_finder

function: einastocircularvelocitypeakradius
Description: Computes the derivative of the square of circular velocity for an Einasto density profile.
Code lines: 8
Contained by: function einastocircularvelocitymaximum
Modules used: gamma_functions

function: einastoconstructor
Description: Generic constructor for the einasto dark matter halo profile class.
Code lines: 46
Contained by: file dark_matter_profiles.Einasto.F90
Modules used: array_utilities galacticus_error

function: einastodefaultconstructor
Description: Default constructor for the einasto dark matter halo profile class.
Code lines: 8
Contained by: file dark_matter_profiles.Einasto.F90
Modules used: input_parameters

function: einastodensity
Description: Returns the density (in \(M_\odot\) Mpc\(^{-3}\)) in the dark matter profile of node at the given radius (given in units of Mpc).
Code lines: 21
Contained by: file dark_matter_profiles.Einasto.F90
Modules used: dark_matter_halo_scales

function: einastodensityscalefree
Description: Returns the density (in units such that the virial mass and scale length are unity) in an Einasto dark matter profile with given concentration and alpha at the given radius (given in units of the scale radius).
Code lines: 13
Contained by: file dark_matter_profiles.Einasto.F90
Modules used: gamma_functions numerical_constants_math

subroutine: einastodedestructor
Description: Destructor for the einasto dark matter halo profile class.

Code lines: 17  
Contained by: file dark_matter_profiles.Einasto.F90  
Modules used: numerical_interpolation

**function**: einastoenclosedmass  
**Description**: Returns the enclosed mass (in $M_\odot$) in the dark matter profile of node at the given radius (given in units of Mpc).

Code lines: 21  
Contained by: file dark_matter_profiles.Einasto.F90  
Modules used: dark_matter_halo_scales

**function**: einastoenclosedmassscalefree  
**Description**: Returns the enclosed mass (in units of the virial mass) in an Einasto dark matter profile with given concentration at the given radius (given in units of the scale radius).

Code lines: 14  
Contained by: file dark_matter_profiles.Einasto.F90  
Modules used: gamma_functions

**function**: einastoenergy  
**Description**: Return the energy of an Einasto halo density profile.

Code lines: 41  
Contained by: file dark_matter_profiles.Einasto.F90  
Modules used: dark_matter_halo_scales iso_c_binding numerical_interpolation

**function**: einastoenergygrowthrate  
**Description**: Return the energy of an Einasto halo density profile.

Code lines: 44  
Contained by: file dark_matter_profiles.Einasto.F90  
Modules used: dark_matter_halo_scales iso_c_binding numerical_interpolation

**subroutine**: einastoenergytablemake  
**Description**: Create a tabulation of the energy of Einasto profiles as a function of their concentration of $\alpha$ parameter.

Code lines: 134  
Contained by: file dark_matter_profiles.Einasto.F90  
Modules used: iso_c_binding memory_management numerical_constants_math numerical_integration numerical_interpolation numerical_ranges

**function**: einastojeansequationintegrand  
**Description**: Integrand for Einasto profile Jeans equation.

Code lines: 10  
Contained by: subroutine einastoenergytablemake  
Modules used: iso_c_binding

**function**: einastokineticenergyintegrand  
**Description**: Integrand for Einasto profile kinetic energy.
19.1. Program units

Code lines: 10
Contained by: subroutine einastoenergytablemake
Modules used: iso_c_binding

**function: einastopotentialenergyintegrand**
Description: Integrand for Einasto profile potential energy.
Code lines: 10
Contained by: subroutine einastoenergytablemake
Modules used: iso_c_binding

**subroutine: einastofourierprofiletablemake**
Description: Create a tabulation of the Fourier transform of Einasto profiles as a function of their $\alpha$ parameter and dimensionless wavenumber.
Code lines: 117
Contained by: file dark_matter_profiles.Einasto.F90
Modules used: galacticus_display iso_c_binding memory_management numerical_integration numerical_interpolation numerical_ranges

**function: einastofourierprofileintegrand**
Description: Integrand for Einasto Fourier profile.
Code lines: 11
Contained by: subroutine einastofourierprofiletablemake
Modules used: iso_c_binding numerical_constants_math

**function: einastofreefallradius**
Description: Returns the freefall radius in the Einasto density profile at the specified time (given in Gyr).
Code lines: 57
Contained by: file dark_matter_profiles.Einasto.F90
Modules used: iso_c_binding numerical_constants_astronomical numerical_constants_physical numerical_interpolation

**function: einastofreefallradiusincreaserate**
Description: Returns the rate of increase of the freefall radius in the Einasto density profile at the specified time (given in Gyr).
Code lines: 58
Contained by: file dark_matter_profiles.Einasto.F90
Modules used: iso_c_binding numerical_constants_astronomical numerical_constants_physical numerical_interpolation

**subroutine: einastofreefalltabulate**
Description: Tabulates the freefall time vs. freefall radius for Einasto halos.
Code lines: 80
Contained by: file dark_matter_profiles.Einasto.F90
Modules used: galacticus_display memory_management numerical_interpolation numerical_ranges

**function: einastofreefalltimescalefree**
Description: Compute the freefall time in a scale-free Einasto halo.
19. Source Code Documentation

**Code lines:** 32  
**Contained by:** file `dark_matter_profiles.Einasto.F90`  
**Modules used:** `iso_c_binding`  

**function: einastofreefalltimescalefreeintegrand**  
**Description:** Integrand function used for finding the free-fall time in Einasto halos.  
**Code lines:** 10  
**Contained by:** function `einastofreefalltimescalefree`  
**Modules used:** `iso_c_binding`  

**function: einastokspace**  
**Description:** Returns the Fourier transform of the Einasto density profile at the specified waveNumber (given in Mpc\(^{-1}\)).  
**Code lines:** 45  
**Contained by:** file `dark_matter_profiles.Einasto.F90`  
**Modules used:** `dark_matter_halo_scales`  

**function: einastopotential**  
**Description:** Returns the potential (in (km/s)^2) in the dark matter profile of node at the given radius (given in units of Mpc).  
**Code lines:** 26  
**Contained by:** file `dark_matter_profiles.Einasto.F90`  
**Modules used:** `dark_matter_halo_scales`  

**function: einastopotentialscalefree**  
**Description:** Returns the gravitational potential (in units where the virial mass and scale radius are unity) in an Einasto dark matter profile with given concentration and alpha at the given radius (given in units of the scale radius).  
**Code lines:** 15  
**Contained by:** file `dark_matter_profiles.Einasto.F90`  
**Modules used:** `gamma_functions`  

**function: einastoradiusfromspecificangularmomentum**  
**Description:** Returns the radius (in Mpc) in node at which a circular orbit has the given specificAngularMomentum (given in units of km s\(^{-1}\) Mpc).  
**Code lines:** 22  
**Contained by:** file `dark_matter_profiles.Einasto.F90`  
**Modules used:** `numerical_constants_physical`  

**function: einastoradiusfromspecificangularmomentumscalefree**  
**Description:** Comptue the radius at which a circular orbit has the given specificAngularMomentumScaleFree in a scale free Einasto profile.  
**Code lines:** 32  
**Contained by:** file `dark_matter_profiles.Einasto.F90`  
**Modules used:** `iso_c_binding`  

**subroutine: einastoradiusfromspecificangularmomentumtablemake**
19.1. Program units

**Description:** Create a tabulation of the relation between specific angular momentum and radius in an Einasto profile.

**Code lines:** 69

**Contained by:** file `dark_matter_profiles.Einasto.F90`

**Modules used:**
- gamma_functions
- numerical_interpolation
- memory_management
- numerical_ranges

**function: einastorotationnormalization**

**Description:** Return the rotation normalization of an Einasto halo density profile.

**Code lines:** 23

**Contained by:** file `dark_matter_profiles.Einasto.F90`

**Modules used:**
- dark_matter_halo_scales
- gamma_functions
- numerical_constants_math

**subroutine: einastostaterestore**

**Description:** Retrieve the tabulation state from the file.

**Code lines:** 15

**Contained by:** file `dark_matter_profiles.Einasto.F90`

**subroutine: einastostatestore**

**Description:** Write the tabulation state to file.

**Code lines:** 10

**Contained by:** file `dark_matter_profiles.Einasto.F90`

**file: dark_matter_profiles.F90**

**Description:** Contains a module which provides an object that implements dark matter halo profiles.

**Code lines:** 3073

**module: dark_matter_profiles**

**Description:** Provides an object that implements dark matter halo profiles. An implementation of isothermal dark matter halo profiles. An implementation of “Einasto” dark matter halo profiles. An implementation of Navarro et al. [1997] dark matter halo profiles.

**Code lines:** 3053

**Contained by:** file `dark_matter_profiles.F90`

**Modules used:**
- dark_matter_halo_scales
- fgsl
- galacticus_nodes
- iso_varying_string
- kind_numbers
- tables

**Used by:**
- function `freefall_radius_dark_matter_halo`

interface: darkmatterprofileisothermal
Description: Constructors for the isothermal dark matter halo profile class.
Code lines: 4
Contained by: module dark_matter_profiles

function: darkmatterprofilekspacenull
Description: Returns the normalized Fourier space density profile of the dark matter profile of node at the given waveNumber (given in units of Mpc$^{-1}$).
Code lines: 9
Contained by: module dark_matter_profiles
Modules used: galacticus_error

interface: darkmatterprofilenfw
Description: Constructors for the nfw dark matter halo profile class.
Code lines: 4
Contained by: module dark_matter_profiles

function: darkmatterprofilepotentialnull
Description: Returns the gravitational potential (in (km/s)$^2$) in the dark matter profile of node at the given radius (given in units of Mpc).
Code lines: 10
Contained by: module dark_matter_profiles
Modules used: galacticus_error

function: darkmatterprofileradiusfromspecificangularmomentumnull
Description: Returns the radius (in Mpc) in the dark matter profile of node at which the specific angular momentum of a circular orbit equals specificAngularMomentum (specified in units of km s$^{-1}$ Mpc).
Code lines: 9
19.1. Program units

**Contained by:** module dark_matter_profiles
**Modules used:** galacticus_error

**function:** darkmatterprofilerotationnormalizationnull
**Description:** Returns the relation between specific angular momentum and rotation velocity (assuming a rotation velocity that is constant in radius) for the given node. Specifically, the normalization, \( A \), returned is such that \( V_{\text{rot}} = AJ/M \)
**Code lines:** 8

**Subroutine:** darkmatterprofilestaterestore
**Description:** Restore the state of the object to file.
**Code lines:** 9

**Subroutine:** darkmatterprofilestatestore
**Description:** Store the state of the object to file.
**Code lines:** 9

**Subroutine:** einastocalculationreset
**Description:** Reset the dark matter profile calculation.
**Code lines:** 8

**Function:** einastocircularvelocity
**Description:** Returns the circular velocity (in km/s) in the dark matter profile of node at the given radius (given in units of Mpc).
**Code lines:** 15

**Function:** einastocircularvelocitymaximum
**Description:** Returns the maximum circular velocity (in km/s) in the dark matter profile of node.
**Code lines:** 37

**Function:** einastocircularvelocitiespeakradius
**Description:** Computes the derivative of the square of circular velocity for an Einasto density profile.
**Code lines:** 8

**Function:** einastoconstructor
**Description:** Generic constructor for the einasto dark matter halo profile class.
19. Source Code Documentation

**function: einastodensity**

*Description:* Returns the density (in $M_\odot \text{Mpc}^{-3}$) in the dark matter profile of node at the given radius (given in units of Mpc).

*Code lines:* 21

*Contained by:* module dark_matter_profiles

*Modules used:* dark_matter_halo_scales

**function: einastodensityscalefree**

*Description:* Returns the density (in units such that the virial mass and scale length are unity) in an Einasto dark matter profile with given concentration and alpha at the given radius (given in units of the scale radius).

*Code lines:* 13

*Contained by:* module dark_matter_profiles

*Modules used:* gamma_functions, numerical_constants_math

**subroutine: einastodestructor**

*Description:* Destructor for the einasto dark matter halo profile class.

*Code lines:* 17

*Contained by:* module dark_matter_profiles

*Modules used:* numerical_interpolation

**function: einastoenclosedmass**

*Description:* Returns the enclosed mass (in $M_\odot$) in the dark matter profile of node at the given radius (given in units of Mpc).

*Code lines:* 21

*Contained by:* module dark_matter_profiles

*Modules used:* dark_matter_halo_scales

**function: einastoenclosedmassscalefree**

*Description:* Returns the enclosed mass (in units of the virial mass) in an Einasto dark matter profile with given concentration at the given radius (given in units of the scale radius).

*Code lines:* 14

*Contained by:* module dark_matter_profiles

*Modules used:* gamma_functions

**function: einastoenergy**

*Description:* Return the energy of an Einasto halo density profile.

*Code lines:* 41

*Contained by:* module dark_matter_profiles

*Modules used:* dark_matter_halo_scales, iso_c_binding
19.1. Program units

**numerical_interpolation**

**function: einastoenergygrowthrate**

*Description:* Return the energy of an Einasto halo density profile.

*Code lines:* 44

*Contained by:* module `dark_matter_profiles`

*Modules used:* `dark_matter_halo_scales` `iso_c_binding` `numerical_interpolation`

**subroutine: einastoenergytablemake**

*Description:* Create a tabulation of the energy of Einasto profiles as a function of their concentration of $\alpha$ parameter.

*Code lines:* 134

*Contained by:* module `dark_matter_profiles`

*Modules used:* `iso_c_binding` `memory_management` `numerical_constants_math` `numerical_integration` `numerical_interpolation` `numerical_ranges`

**function: einastojeansequationintegrand**

*Description:* Integrand for Einasto profile Jeans equation.

*Code lines:* 10

*Contained by:* subroutine `einastoenergytablemake`

*Modules used:* `iso_c_binding`

**function: einastokineticenergyintegrand**

*Description:* Integrand for Einasto profile kinetic energy.

*Code lines:* 10

*Contained by:* subroutine `einastoenergytablemake`

*Modules used:* `iso_c_binding`

**function: einastopotentialenergyintegrand**

*Description:* Integrand for Einasto profile potential energy.

*Code lines:* 10

*Contained by:* subroutine `einastoenergytablemake`

*Modules used:* `iso_c_binding`

**subroutine: einastofourierprofiletablemake**

*Description:* Create a tabulation of the Fourier transform of Einasto profiles as a function of their $\alpha$ parameter and dimensionless wavenumber.

*Code lines:* 117

*Contained by:* module `dark_matter_profiles`

*Modules used:* `galacticus_display` `iso_c_binding` `memory_management` `numerical_integration` `numerical_interpolation` `numerical_ranges`

**function: einastofourierprofileintegrand**

*Description:* Integrand for Einasto Fourier profile.

*Code lines:* 11

*Contained by:* subroutine `einastofourierprofiletablemake`
Module: einastofreefallradius
Description: Returns the freefall radius in the Einasto density profile at the specified time (given in Gyr).
Code lines: 57
Modules used: iso_c_binding, numerical_constants_math

Function: einastofreefallradiusincreaserate
Description: Returns the rate of increase of the freefall radius in the Einasto density profile at the specified time (given in Gyr).
Code lines: 58
Modules used: iso_c_binding, numerical_constants_astronomical, numerical_constants_physical, numerical_interpolation

Subroutine: einastofreefalltabulate
Description: Tabulates the freefall time vs. freefall radius for Einasto halos.
Code lines: 80
Modules used: galacticus_display, memory_management, numerical_interpolation, numerical_ranges

Function: einastofreefalltimescalefree
Description: Computes the freefall time in a scale-free Einasto halo.
Code lines: 32
Modules used: iso_c_binding, numerical_integration

Function: einastofreefalltimescalefreeintegrand
Description: Integrand function used for finding the free-fall time in Einasto halos.
Code lines: 10
Modules used: iso_c_binding

Function: einastokspace
Description: Returns the Fourier transform of the Einasto density profile at the specified waveNumber (given in Mpc⁻¹).
Code lines: 45
Modules used: dark_matter_halo_scales, iso_c_binding, numerical_interpolation

Function: einastopotential
Description: Returns the potential (in (km/s)^2) in the dark matter profile of node at the given radius (given in units of Mpc).
Code lines: 26
Modules used: dark_matter_halo_scales, dark_matter_profiles_error_codes
19.1. Program units

function: einastopotentialscalefree
Description: Returns the gravitational potential (in units where the virial mass and scale radius are unity) in an Einasto dark matter profile with given concentration and alpha at the given radius (given in units of the scale radius).
Code lines: 15
Contained by: module dark_matter_profiles
Modules used: gamma_functions

function: einastoradiusfromspecificangularmomentum
Description: Returns the radius (in Mpc) in node at which a circular orbit has the given specificAngularMomentum (given in units of km s\(^{-1}\) Mpc).
Code lines: 22
Contained by: module dark_matter_profiles
Modules used: numerical_constants_physical

function: einastoradiusfromspecificangularmomentumscalefree
Description: Comptue the radius at which a circular orbit has the given specificAngularMomentumScaleFree in a scale free Einasto profile.
Code lines: 32
Contained by: module dark_matter_profiles
Modules used: iso_c_binding numerical_interpolation

subroutine: einastoradiusfromspecificangularmomentumtablemake
Description: Create a tabulation of the relation between specific angular momentum and radius in an Einasto profile.
Code lines: 69
Contained by: module dark_matter_profiles
Modules used: gamma_functions memory_management numerical_interpolation numerical_ranges

function: einastorotationnormalization
Description: Return the rotation normalization of an Einasto halo density profile.
Code lines: 23
Contained by: module dark_matter_profiles
Modules used: dark_matter_halo_scales gamma_functions numerical_constants_math

subroutine: einastostaterestore
Description: Retrieve the tabulation state from the file.
Code lines: 15
Contained by: module dark_matter_profiles

subroutine: einastostatestore
Description: Write the tabulation state to file.
Code lines: 10
Contained by: module dark_matter_profiles
source Code Documentation

subroutine: isothermalcalculationreset
Description: Reset the dark matter profile calculation.
Code lines: 8
Contained by: module dark_matter_profiles

function: isothermalcircularvelocity
Description: Returns the circular velocity (in km/s) in the dark matter profile of node at the given radius (given in units of Mpc). For an isothermal halo this is independent of radius and therefore equal to the virial velocity.
Code lines: 12
Contained by: module dark_matter_profiles
Modules used: dark_matter_halo_scales galacticus_nodes

function: isothermalcircularvelocitymaximum
Description: Returns the maximum circular velocity (in km/s) in the dark matter profile of node. For an isothermal halo circular velocity is independent of radius.
Code lines: 11
Contained by: module dark_matter_profiles
Modules used: dark_matter_halo_scales galacticus_nodes

function: isothermalconstructor
Description: Generic constructor for the isothermal dark matter halo profile class.
Code lines: 9
Contained by: module dark_matter_profiles
Modules used: input_parameters

function: isothermaldefaultconstructor
Description: Default constructor for the isothermal dark matter halo profile class.
Code lines: 8
Contained by: module dark_matter_profiles
Modules used: input_parameters

function: isothermaldensity
Description: Returns the density (in $M_{\odot} \text{Mpc}^{-3}$) in the dark matter profile of node at the given radius (given in units of Mpc).
Code lines: 15
Contained by: module dark_matter_profiles
Modules used: dark_matter_halo_scales galacticus_nodes numerical_constants_math

subroutine: isothermaldestructor
Description: Destructor for the isothermal dark matter halo profile class.
Code lines: 7
Contained by: module dark_matter_profiles

function: isothermalenclosedmass
Description: Returns the enclosed mass (in $M_{\odot}$) in the dark matter profile of node at the given radius (given in units of Mpc).
Code lines: 14
Contained by: module dark_matter_profiles
19.1. Program units

**Function: isothermalenergy**

*Description:* Return the energy of an isothermal halo density profile.

*Code lines:* 12

*Contained by:* module `dark_matter_profiles`

*Modules used:* `dark_matter_halo_scales` `galacticus_nodes`

**Function: isothermalenergygrowthrate**

*Description:* Return the rate of change of the energy of an isothermal halo density profile.

*Code lines:* 12

*Contained by:* module `dark_matter_profiles`

*Modules used:* `dark_matter_halo_scales` `galacticus_nodes`

**Function: isothermalfreefallradius**

*Description:* Returns the freefall radius in the isothermal density profile at the specified time (given in Gyr). For an isothermal potential, the freefall radius, $r_{ff}(t)$, is:

$$ r_{ff}(t) = \sqrt{\frac{2}{\pi}} V_{\text{virial}} t. $$  \hspace{1cm} (19.3)

*Code lines:* 16

*Contained by:* module `dark_matter_profiles`

*Modules used:* `dark_matter_halo_scales` `galacticus_nodes`

**Function: isothermalfreefallradiusincreaserate**

*Description:* Returns the rate of increase of the freefall radius in the isothermal density profile at the specified time (given in Gyr). For an isothermal potential, the rate of increase of the freefall radius, $\dot{r}_{ff}(t)$, is:

$$ \dot{r}_{ff}(t) = \sqrt{\frac{2}{\pi}} V_{\text{virial}}. $$  \hspace{1cm} (19.4)

*Code lines:* 16

*Contained by:* module `dark_matter_profiles`

*Modules used:* `dark_matter_halo_scales` `galacticus_nodes`

**Function: isothermalkspace**

*Description:* Returns the Fourier transform of the isothermal density profile at the specified waveNumber (given in Mpc$^{-1}$), using the expression given in Cooray and Sheth (2002; table 1).

*Code lines:* 22

*Contained by:* module `dark_matter_profiles`

*Modules used:* `dark_matter_halo_scales` `galacticus_nodes` `numerical_constants_astronomical`

**Function: isothermalpotential**

*Description:* Returns the potential (in (km/s)$^2$) in the dark matter profile of node at the given radius (given in units of Mpc).

*Code lines:* 24

*Contained by:* module `dark_matter_profiles`

*Modules used:* `dark_matter_halo_scales` `dark_matter_profiles_error_codes`
function: isothermalradiusfromspecificangularmomentum

Description: Returns the radius (in Mpc) in node at which a circular orbit has the given specificAngularMomentum (given in units of km s\(^{-1}\) Mpc). For an isothermal halo, the circular velocity is constant (and therefore equal to the virial velocity). Therefore, \( r = \frac{j}{V_{\text{virial}}} \)
where \( j(=\text{specificAngularMomentum}) \) is the specific angular momentum and \( r \) the required radius.

Code lines: 14

Modules used: dark_matter_profiles galacticus_nodes

function: isothermalrotationnormalization

Description: Return the normalization of the rotation velocity vs. specific angular momentum relation.

Code lines: 10

Modules used: dark_matter_profiles galacticus_nodes

function: nfwangularmomentumscalefree

Description: Returns the total angular momentum (in units of the virial mass times scale radius times [assumed constant] rotation speed) in an NFW dark matter profile with given concentration. This is given by:

\[
J = \int_{0}^{c} 4\pi x^3 \rho(x) dx / \int_{0}^{c} 4\pi x^2 \rho(x) dx,
\]
(19.5)

where \( x \) is radius in units of the scale radius and \( c \) is concentration. This can be evaluated to give

\[
J = \left[ 1 + c - 2 \ln(1 + c) - \frac{1}{1 + c} \right] / \left[ \ln(1 + c) - \frac{c}{1 + c} \right].
\]
(19.6)

Code lines: 16

Modules used: dark_matter_profiles

subroutine: nfwcalculationreset

Description: Reset the dark matter profile calculation.

Code lines: 10

Modules used: dark_matter_profiles

function: nfwcircularvelocity

Description: Returns the circular velocity (in km/s) in the dark matter profile of node at the given radius (given in units of Mpc).

Code lines: 15

Modules used: dark_matter_profiles numerical_constants_physical

function: nfwcircularvelocitymaximum

Description: Returns the maximum circular velocity (in km/s) in the dark matter profile of node.

Code lines: 15

Modules used: dark_matter_profiles numerical_constants_physical
function: nfwconstructor
Description: Generic constructor for the nfw dark matter halo profile class.
Code lines: 25
Contained by: module dark_matter_profiles

Contained by: function nfwprofileenergy
Modules used: iso_c_binding

function: nfwwkineticenergyintegrand
Description: Integrand for NFW profile kinetic energy.
Code lines: 10
Contained by: function nfwprofileenergy
Modules used: iso_c_binding

function: nfwwpotentialenergyintegrand
Description: Integrand for NFW profile potential energy.
Code lines: 10
Contained by: function nfwprofileenergy
Modules used: iso_c_binding

function: nfwwradiusfromspecificangularmomentum
**Description:** Returns the radius (in Mpc) in node at which a circular orbit has the given \texttt{specificAngularMomentum} (given in units of km s$^{-1}$ Mpc). For an NFW halo, the circular velocity is constant (and therefore equal to the virial velocity). Therefore, $r = j/V_{\text{virial}}$ where $j(=\texttt{specificAngularMomentum})$ is the specific angular momentum and $r$ the required radius.

**Contained by:** file *dark_matter_profiles.NFW.F90*

**function: nfwrotationnormalization**
*Description:* Return the normalization of the rotation velocity vs. specific angular momentum relation.
*Code lines:* 21
**Contained by:** file *dark_matter_profiles.NFW.F90*
**Modules used:** *dark_matter_halo_scales*

**function: nfwspecificangularmomentumscalefree**
*Description:* Returns the specific angular momentum, normalized to unit scale length and unit velocity at the scale radius, at position *radius* (in units of the scale radius) in an NFW profile.
*Code lines:* 9
**Contained by:** file *dark_matter_profiles.NFW.F90*

**subroutine: nfwstaterestore**
*Description:* Retrieve the tabulation state from the file.
*Code lines:* 16
**Contained by:** file *dark_matter_profiles.NFW.F90*

**subroutine: nfwstatestore**
*Description:* Write the tabulation state to file.
*Code lines:* 9
**Contained by:** file *dark_matter_profiles.NFW.F90*

**subroutine: nfwtabulate**
*Description:* Tabulate properties of the NFW halo profile which must be computed numerically.
*Code lines:* 35
**Contained by:** file *dark_matter_profiles.NFW.F90*

**file: dark_matter_profiles.error_codes.F90**
*Description:* Contains a module which provides error codes for dark matter profile calculations.
*Code lines:* 27

**module: dark_matter_profiles.error_codes**
*Description:* Provides error codes for dark matter profile calculations.
*Code lines:* 7
**Contained by:** file *dark_matter_profiles.error_codes.F90*
**Used by:**
- function *einstopotential*
- function *isothermalpotential*
- function *nfwpotential*
- function *nfwpotential scalefree*
- function *equivalent_circular_orbit_- solver*
- subroutine *satellite_orbit_extremum_- phase_space_coordinates*

**file: dark_matter_profiles.isothermal.F90**
*Description:* An implementation of isothermal dark matter halo profiles.
*Code lines:* 295
**Modules used:** *dark_matter_halo_scales*

**interface: darkmatterprofileisothermal**
Constructors for the isothermal dark matter halo profile class.

Description:
Reset the dark matter profile calculation.

Code lines: 8
Contained by: file dark_matter_profiles.isothermal.F90

Function: isothermalcircularvelocity
Description: Returns the circular velocity (in km/s) in the dark matter profile of node at the given radius (given in units of Mpc). For an isothermal halo this is independent of radius and therefore equal to the virial velocity.

Code lines: 12
Contained by: file dark_matter_profiles.isothermal.F90
Modules used: dark_matter_halo_scales galacticus_nodes

Function: isothermalcircularvelocitymaximum
Description: Returns the maximum circular velocity (in km/s) in the dark matter profile of node. For an isothermal halo circular velocity is independent of radius.

Code lines: 11
Contained by: file dark_matter_profiles.isothermal.F90
Modules used: dark_matter_halo_scales galacticus_nodes

Function: isothermalconstructor
Description: Generic constructor for the isothermal dark matter halo profile class.

Code lines: 9
Contained by: file dark_matter_profiles.isothermal.F90
Modules used: input_parameters

Function: isothermaldefaultconstructor
Description: Default constructor for the isothermal dark matter halo profile class.

Code lines: 8
Contained by: file dark_matter_profiles.isothermal.F90
Modules used: input_parameters

Function: isothermaldensity
Description: Returns the density (in $M_{\odot} \text{Mpc}^{-3}$) in the dark matter profile of node at the given radius (given in units of Mpc).

Code lines: 15
Contained by: file dark_matter_profiles.isothermal.F90
Modules used: dark_matter_halo_scales galacticus_nodes numerical_constants_math

Subroutine: isothermaldestructor
Description: Destructor for the isothermal dark matter halo profile class.

Code lines: 7
Contained by: file dark_matter_profiles.isothermal.F90
function: isothermalenclosedmass
Description: Returns the enclosed mass (in $M_\odot$) in the dark matter profile of node at the given radius (given in units of Mpc).
Code lines: 14
Contained by: file dark_matter_profiles.isothermal.F90
Modules used: dark_matter_halo_scales galacticus_nodes

function: isothermalenergy
Description: Return the energy of an isothermal halo density profile.
Code lines: 12
Contained by: file dark_matter_profiles.isothermal.F90
Modules used: dark_matter_halo_scales galacticus_nodes

function: isothermalenergygrowthrate
Description: Return the rate of change of the energy of an isothermal halo density profile.
Code lines: 12
Contained by: file dark_matter_profiles.isothermal.F90
Modules used: dark_matter_halo_scales galacticus_nodes

function: isothermalfreefallradius
Description: Returns the freefall radius in the isothermal density profile at the specified time (given in Gyr). For an isothermal potential, the freefall radius, $r_{ff}(t)$, is:

$$r_{ff}(t) = \sqrt{\frac{2}{\pi}} V_{\text{vir}} t.$$  \hspace{1cm} (19.9)

Code lines: 16
Contained by: file dark_matter_profiles.isothermal.F90
Modules used: dark_matter_halo_scales galacticus_nodes numerical_constants_astronomical

function: isothermalfreefallradiusincreaserate
Description: Returns the rate of increase of the freefall radius in the isothermal density profile at the specified time (given in Gyr). For an isothermal potential, the rate of increase of the freefall radius, $\dot{r}_{ff}(t)$, is:

$$\dot{r}_{ff}(t) = \sqrt{\frac{2}{\pi}} V_{\text{vir}}.$$  \hspace{1cm} (19.10)

Code lines: 16
Contained by: file dark_matter_profiles.isothermal.F90
Modules used: dark_matter_halo_scales galacticus_nodes numerical_constants_astronomical

function: isothermalkspace
Description: Returns the Fourier transform of the isothermal density profile at the specified waveNumber (given in Mpc$^{-1}$), using the expression given in Cooray and Sheth (2002; table 1).
Code lines: 22
Contained by: file dark_matter_profiles.isothermal.F90
Modules used: dark_matter_halo_scales exponential_integrals galacticus_nodes
function: isothermalpotential  
Description: Returns the potential (in (km/s)^2) in the dark matter profile of node at the given radius (given in units of Mpc).

Code lines: 24  
Contained by: file dark_matter_profiles.isothermal.F90  
Modules used: dark_matter_halo_scales dark_matter_profiles_error_codes galacticus_error galacticus_nodes

function: isothermalradiusfromspecificangularmomentum  
Description: Returns the radius (in Mpc) in node at which a circular orbit has the given specificAngularMomentum (given in units of km s^{-1} Mpc). For an isothermal halo, the circular velocity is constant (and therefore equal to the virial velocity). Therefore, \( r = \frac{j}{V_{\text{virial}}} \) where \( j (= \text{specificAngularMomentum}) \) is the specific angular momentum and \( r \) the required radius.

Code lines: 14  
Contained by: file dark_matter_profiles.isothermal.F90  
Modules used: dark_matter_halo_scales galacticus_nodes

function: isothermalrotationnormalization  
Description: Return the normalization of the rotation velocity vs. specific angular momentum relation.

Code lines: 10  
Contained by: file dark_matter_profiles.isothermal.F90  
Modules used: dark_matter_halo_scales galacticus_nodes

Code lines: 222

interface: darkmatterprofileconcentrationdiemerkravtsov2014  
Description: Constructors for the diemerKravtsov2014 dark matter halo profile concentration class.

Code lines: 4  

function: diemerkravtsov2014concentration  
Description: Return the concentration of the dark matter halo profile of node using the Diemer and Kravtsov [2014] algorithm.

Code lines: 23  
Modules used: cosmology_parameters critical_overdensity numerical_constants_math power_spectra

function: diemerkravtsov2014constructor  
Description: Constructor for the diemerKravtsov2014 dark matter halo profile concentration class.

Code lines: 15  
Modules used: galacticus_error
function: diemerkravtsov2014darkmatterprofiledefinition
Description: Return a dark matter density profile object defining that used in the definition of concentration in the Diemer and Kravtsov [2014] algorithm.
Code lines: 20
Modules used: dark_matter_halo_scales

function: diemerkravtsov2014defaultconstructor
Description: Default constructor for the diemerKravtsov2014 dark matter halo profile concentration class.
Code lines: 95
Modules used: input_parameters

function: diemerkravtsov2014densitycontrastdefinition
Description: Return a virial density contrast object defining that used in the definition of concentration in the Diemer and Kravtsov [2014] algorithm.
Code lines: 13

Description: An implementation of dark matter halo profile concentrations using the Dutton and Macciò [2014] algorithm.
Code lines: 207

interface: darkmatterprofileconcentrationduttonmaccio2014
Description: Constructors for the duttonMaccio2014 dark matter halo profile concentration class.
Code lines: 4

function: duttonmaccio2014concentration
Description: Return the concentration of the dark matter halo profile of node using the Dutton and Macciò [2014] algorithm.
Code lines: 23
Modules used: cosmology_functions

function: duttonmaccio2014constructor
Description: Constructor for the duttonMaccio2014 dark matter halo profile concentration class.
Code lines: 39
Modules used: galacticus_error

function: duttonmaccio2014darkmatterprofiledefinition
Description: Return a dark matter density profile object defining that used in the definition of concentration in the Diemer and Kravtsov [2014] algorithm.
Code lines: 30
Modules used: dark_matter_halo_scales
19. Source Code Documentation

**Contained by:** module `dark_matter_profiles_concentration`

**function: nfw1996concentration**
*Description:* Return the concentration of the dark matter halo profile of node using the Navarro et al. [1996] algorithm.
*Code lines:* 47
*Contained by:* module `dark_matter_profiles_concentration`
*Modules used:* `cosmology_functions` `critical_overdensity` `power_spectra` `root_finder` `virial_density_contrast`

**function: nfw1996constructor**
*Description:* Constructor for the nfw1996 dark matter halo profile concentration class.
*Code lines:* 9
*Contained by:* module `dark_matter_profiles_concentration`

**function: nfw1996darkmatterprofiledefinition**
*Description:* Return a dark matter density profile object defining that used in the definition of concentration in the Navarro et al. [1996] algorithm.
*Code lines:* 20
*Contained by:* module `dark_matter_profiles_concentration`
*Modules used:* `dark_matter_halo_scales`

**function: nfw1996defaultconstructor**
*Description:* Default constructor for the nfw1996 dark matter halo profile concentration class.
*Code lines:* 40
*Contained by:* module `dark_matter_profiles_concentration`
*Modules used:* `input_parameters`

**function: nfw1996densitycontrastdefinition**
*Description:* Return a virial density contrast object defining that used in the definition of concentration in the Navarro et al. [1996] algorithm.
*Code lines:* 12
*Contained by:* module `dark_matter_profiles_concentration`

**function: nfw1996rootfunction**
*Description:* Root function used in finding concentrations in the Navarro et al. [1996] method.
*Code lines:* 7
*Contained by:* module `dark_matter_profiles_concentration`

**function: prada2011b0**
*Description:* The function $B_0(x)$ as defined in eqn. (18) of Prada et al. [2011].
*Code lines:* 7
*Contained by:* module `dark_matter_profiles_concentration`

**function: prada2011b1**
*Description:* The function $B_1(x)$ as defined in eqn. (18) of Prada et al. [2011].
*Code lines:* 7
*Contained by:* module `dark_matter_profiles_concentration`
function: prada2011c
Description: The function $C(\sigma')$ as defined in eqn. (17) of Prada et al. [2011].
Code lines: 7
Contained by: module dark_matter_profiles_concentration

function: prada2011cmin
Description: The function $c_{\text{min}}(x)$ as defined in eqn. (19) of Prada et al. [2011].
Code lines: 8
Contained by: module dark_matter_profiles_concentration
Modules used: numerical_constants_math

function: prada2011concentration
Description: Return the concentration of the dark matter halo profile of node using the Prada et al. [2011] algorithm.
Code lines: 25
Contained by: module dark_matter_profiles_concentration
Modules used: cosmology_functions cosmology_parameters linear_growth power_spectra

function: prada2011constructor
Description: Constructor for the prada2011 dark matter halo profile concentration class.
Code lines: 19
Contained by: module dark_matter_profiles_concentration

function: prada2011darkmatterprofiledefinition
Description: Return a dark matter density profile object defining that used in the definition of concentration in the Prada et al. [2011] algorithm.
Code lines: 20
Contained by: module dark_matter_profiles_concentration
Modules used: dark_matter_halo_scales

function: prada2011defaultconstructor
Description: Default constructor for the prada2011 dark matter halo profile concentration class.
Code lines: 150
Contained by: module dark_matter_profiles_concentration
Modules used: input_parameters

function: prada2011densitycontrastdefinition
Description: Return a virial density contrast object defining that used in the definition of concentration in the Prada et al. [2011] algorithm.
Code lines: 12
Contained by: module dark_matter_profiles_concentration

function: prada2011inversesigmamin
Description: The function $\sigma_{\text{min}}^{-1}(x)$ as defined in eqn. (20) of Prada et al. [2011].
Code lines: 8
Contained by: module dark_matter_profiles_concentration
Modules used: numerical_constants_math
function: wdmconcentration
Description: Return the concentration of the dark matter halo profile of node using the warm dark matter modifier of Schneider et al. [2012].
Code lines: 16
Contained by: module dark_matter_profiles_concentration
Modules used: transfer_functions

function: wdmdefaultconstructor
Description: Default constructor for the wdm dark matter halo profile concentration class.
Code lines: 30
Contained by: module dark_matter_profiles_concentration
Modules used: input_parameters

function: wdmgenericconstructor
Description: Generic constructor for the warm dark matter (WDM) dark matter halo concentration class.
Code lines: 9
Contained by: module dark_matter_profiles_concentration

function: zhao2009concentration
Description: Return the concentration of the dark matter halo profile of node using the Zhao et al. [2009] algorithm.
Code lines: 19
Contained by: module dark_matter_profiles_concentration
Modules used: dark_matter_halo_formation_times

function: zhao2009darkmatterprofiledefinition
Description: Return a dark matter density profile object defining that used in the definition of concentration in the Zhao et al. [2009] algorithm.
Code lines: 19
Contained by: module dark_matter_profiles_concentration
Modules used: dark_matter_halo_scales

function: zhao2009defaultconstructor
Description: Default constructor for the zhao2009 dark matter halo profile concentration class.
Code lines: 6
Contained by: module dark_matter_profiles_concentration
Modules used: input_parameters

function: zhao2009densitycontrastdefinition
Description: Return a virial density contrast object defining that used in the definition of concentration in the Zhao et al. [2009] algorithm.
Code lines: 12
Contained by: module dark_matter_profiles_concentration

Description: An implementation of dark matter halo profile concentrations using the Gao et al. [2008] algorithm.
Code lines: 107
interface: darkmatterprofileconcentrationgao2008
Description: Constructors for the gao2008 dark matter halo profile concentration class.
Code lines: 3

**Contained by:** module dark_matter_profile_scales

**Modules used:** cosmology_functions  cosmology_parameters
dark_matter_halo_scales  dark_matter_profiles
dark_matter_profiles_concentration  galacticus_calculations_resets
galacticus_nodes  input_parameters
numerical_constants_math  root_finder
virial_density_contrast

**function:** densitycontrastrootfunction

**Description:** Root function used to find the radius in a dark matter profile which encloses a density contrast equal to the currently specified density contrast.

**Code lines:** 11

**Contained by:** function dark_matter_profile_scale

**function:** massrootfunction

**Description:** Root function used to find the mass of a halo corresponding to the definition used for a particular concentration class.

**Code lines:** 32

**Contained by:** function dark_matter_profile_scale

**file:** dark_matter_profiles.structure.shape.F90

**Description:** Contains a module which implements calculations of dark matter halo density profile shapes.

**Code lines:** 113

**module:** dark_matter_profiles_shapes

**Description:** Implements calculations of dark matter halo density profile shapes.

**Code lines:** 93

**Contained by:** file dark_matter_profiles.structure.shape.F90

**Modules used:** galacticus_nodes  iso_varying_string

**Used by:** subroutine node_component_dark_matter_- profile_scale_shape_initialize_shape

**function:** dark_matter_profile_shape

**Description:** Returns the shape of the dark matter profile of thisNode.
subroutine: dark_matter_shapes_initialize
Description: Initialize the dark matter profile module.
Code lines: 52
Contained by: module dark_matter_profiles_shapes
Modules used: dark_matter_profiles_shapes_gao2008 galacticus_error

Description: Contains a module which implements the Gao et al. [2008] Einasto halo shape algorithm.
Code lines: 71

module: dark_matter_profiles_shapes_gao2008
Description: Implements the Gao et al. [2008] Einasto halo shape algorithm.
Code lines: 51
Used by: subroutine dark_matter_shapes_gao2008_initialize

function: dark_matter_profile_shape_gao2008
Description: Returns the Einasto shape parameter, \( \alpha \), of the dark matter profile of thisNode using the method of Gao et al. [2008]. More specifically, the parameter is given by:

\[
\alpha = \begin{cases} 
0.155 + 0.0095\nu^2 & \text{if } \nu < 3.907 \\
0.3 & \text{if } \nu \geq 3.907 
\end{cases} 
\]

(19.11)

where \( \nu = \delta_c(t)/\sigma(M) \) is the peak height of the halo.

Code lines: 26
Contained by: module dark_matter_profiles_shapes_gao2008
Modules used: critical_overdensity galacticus_nodes power_spectra

subroutine: dark_matter_shapes_gao2008_initialize
Description: Initializes the “Gao2008” halo shape module.
Code lines: 10
Contained by: module dark_matter_profiles_shapes_gao2008
Modules used: iso_varying_string

file: dark_matter_profiles.structure_tasks.F90
Description: Contains a module which implements structure tasks related to the dark matter halo density profile.
Code lines: 215

module: dark_matter_profile_structure_tasks
Description: Implements structure tasks related to the dark matter halo density profile.
Code lines: 195
Contained by: file dark_matter_profiles.structure_tasks.F90

node_component_hot_halo_cold_mode
node_component_hot_halo_standard
node_component_satellite_standard
node_component_satellite_very_simple

file: events.node_merger.single_level_hierarchy.F90
Description: Contains a module which implements merger of nodes utilizing a single level substructure hierarchy.
Code lines: 99

**module: events_node_mergers_slh**
Description: Implements merger of nodes utilizing a single level substructure hierarchy.
Code lines: 79
Contained by: file events.node_merger.single_level_hierarchy.F90
Used by: subroutine events_node_merger

**subroutine: events_node_merger_do_slh**
Description: Processes a node merging event, utilizing a single level substructure hierarchy.
Code lines: 54
Contained by: module events_node_mergers_slh
Modules used: galacticus_error
galacticus_nodes
iso_varying_string
string_handling
satellite_promotion

**subroutine: events_node_merger_initialize_slh**
19.1. Program units

**Description:** Determine if use of this method is requested and set procedure pointer appropriately if it is.

**Code lines:** 10

**Contained by:** module events_node_mergers_slh

**Modules used:** iso_varying_string

**file:** events.node_promotion.index_shift.F90

**Description:** Contains a module which optionally shifts the index of a node about to be promoted to its parent node, allowing indices to be tracked along merger trees.

**Code lines:** 80

**module:** node_promotion_index_shifts

**Description:** Implements optional shifting of the index of a node about to be promoted to its parent node, allowing indices to be tracked along merger trees.

**Code lines:** 59

**Contained by:** file events.node_promotion.index_shift.F90

**Used by:** subroutine tree_node_promote

**subroutine:** node_promotion_index_shift

**Description:** Shifts the index of thisNode to its parent node just prior to promotion, thereby allowing indices to track galaxies through the tree.

**Code lines:** 39

**Contained by:** module node_promotion_index_shifts

**Modules used:** galacticus_nodes input_parameters

**file:** events.subhalo_promotion.F90

**Description:** Contains a module which handles node subhalo promotion events.

**Code lines:** 71

**module:** node_subhalo_promotions

**Description:** Handles subhalo promotion events.

**Code lines:** 51

**Contained by:** file events.subhalo_promotion.F90

**Used by:** subroutine scan_for_subhalo_promotions

**function:** node_subhalo_promotion

**Description:** Promotes a subhalo to be an isolated node.

**Code lines:** 41

**Contained by:** module node_subhalo_promotions

**Modules used:** galacticus_display galacticus_nodes iso_varying_string merger_trees_evolve_deadlock_status merger_trees_evolve_node string_handling

**file:** galactic_dynamics.bar_instability.ELN.F90

**Description:** Contains a module which implements calculations of bar instability based on the Efstathiou et al. [1982] criterion.

**Code lines:** 128

**module:** galactic_dynamics_bar_instabilities_eln

**Description:** Implements calculations of bar instability based on the Efstathiou et al. [1982] criterion.
19. Source Code Documentation

**Code lines:** 108
**Contained by:** file `galactic_dynamics.bar_instability.ELN.F90`
**Used by:** subroutine `galactic_dynamics_bar_instability_initialize`

**subroutine: bar_instability_timescale_eln**
**Description:** Computes a timescale for depletion of a disk to a pseudo-bulge via bar instability based on the criterion of Efstathiou et al. [1982].
**Code lines:** 54
**Contained by:** module `galactic_dynamics_bar_instabilities_eln`
**Modules used:** `galacticus_nodes`
**Modules used:** `numerical_constants_astronomical`
**Modules used:** `numerical_constants_physical`

**subroutine: galactic_dynamics_bar_instabilities_eln_initialize**
**Description:** Initializes the “ELN” bar instability module.
**Code lines:** 36
**Contained by:** module `galactic_dynamics_bar_instabilities_eln`
**Modules used:** `input_parameters`
**Modules used:** `iso_varying_string`

**file: galactic_dynamics.bar_instability.ELN_tidal.F90**
**Description:** Contains a module which implements calculations of bar instability based on the Efstathiou et al. [1982] criterion, but including the effects of tidal forces.
**Code lines:** 158

**module: galactic_dynamics_bar_instabilities_eln_tidal**
**Description:** Implements calculations of bar instability based on the Efstathiou et al. [1982] criterion, but including the effects of tidal forces.
**Code lines:** 137
**Contained by:** file `galactic_dynamics.bar_instability.ELN_tidal.F90`
**Modules used:** `galacticus_nodes`
**Used by:** subroutine `galactic_dynamics_bar_instability_initialize`

**subroutine: bar_instability_timescale_eln_tidal**
**Description:** Computes a timescale for depletion of a disk to a pseudo-bulge via bar instability based on the criterion of Efstathiou et al. [1982], but including an additional term due to external tidal forces.
**Code lines:** 67
**Contained by:** module `galactic_dynamics_bar_instabilities_eln_tidal`
**Modules used:** `galacticus_nodes`
**Modules used:** `numerical_constants_astronomical`
**Modules used:** `numerical_constants_physical`
**Modules used:** `satellites_tidal_fields`

**subroutine: galactic_dynamics_bar_instabilities_eln_tidal_initialize**
**Description:** Initializes the “ELN+tidal” bar instability module.
**Code lines:** 47
**Contained by:** module `galactic_dynamics_bar_instabilities_eln_tidal`
**Modules used:** `input_parameters`
**Modules used:** `iso_varying_string`

**file: galactic_dynamics.bar_instability.F90**
19.1. Program units

**Description:** Contains a module which implements calculations of bar instability in galactic disks.

**Code lines:** 111

**module: galactic_dynamics_bar_instabilities**

**Description:** Implements calculations of bar instability in galactic disks.

**Code lines:** 91

**Contained by:** file galactic_dynamics.bar_instability.F90

**Modules used:** galacticus_nodes iso_varying_string

**Used by:** subroutine node_component_disk_,-- exponential_rate_compute subroutine node_component_dynamics_,-- statistics_bars_record

**subroutine: bar_instability_timescale**

**Description:** Returns a timescale on which the bar instability depletes material from a disk into a pseudo-bulge. A negative value indicates no instability. Also returns the net torque due to any external force causing this instability.

**Code lines:** 12

**Contained by:** module galactic_dynamics_bar_instabilities

**subroutine: galactic_dynamics_bar_instability_initialize**

**Description:** Initialize the bar instability module.

**Code lines:** 56

**Contained by:** module galactic_dynamics_bar_instabilities

**Modules used:** galactic_dynamics_bar_instabilities_,-- eln galactic_dynamics_bar_instabilities_,-- eln_tidal galacticus_error null input_parameters

**file: galactic_dynamics.bar_instability.null.F90**

**Description:** Contains a module which implements a null calculation of bar instability.

**Code lines:** 57

**module: galactic_dynamics_bar_instabilities_null**

**Description:** Implements a null calculation of bar instability.

**Code lines:** 37

**Contained by:** file galactic_dynamics.bar_instability.null.F90

**Modules used:** galacticus_nodes

**Used by:** subroutine galactic_dynamics_bar_,-- instability_initialize

**subroutine: bar_instability_timescale_null**

**Description:** Assumes that disks are never bar unstable and so returns an infinite timescale for bar instability.

**Code lines:** 11

**Contained by:** module galactic_dynamics_bar_instabilities_null

**subroutine: galactic_dynamics_bar_instabilities_null_initialize**

**Description:** Initializes the “Null” bar instability module.

**Code lines:** 10
19. Source Code Documentation

**Contained by:** module galactic_dynamics_bar_instabilities_null

**Modules used:** iso_varying_string

Description: Contains a module which implements calculations of sizes of galactic components (or more general components).
Code lines: 113

module: galactic_structure_radii
19. Source Code Documentation

**Description:** Implements calculations of sizes of galactic components (or more general components).

**Code lines:** 93

**Contained by:** file `galactic_structure.radius_solver.F90`

**Modules used:** `galacticus_nodes` `iso_varying_string`

**Used by:** subroutine `galacticus_merger_tree-output`
subroutine `tree_node_compute-derivatives`
subroutine `satellite_merging_remnant-progenitor_properties_cole2000`
subroutine `satellite_merging_remnant-progenitor_properties_standard`

**subroutine:** `galactic_structure_radii_solve`

**Description:** Solve for the radii of galactic components in **thisNode**.

**Code lines:** 63

**Contained by:** module `galactic_structure_radii`

**Modules used:** `galactic_structure_radii_adiabatic` `galactic_structure_radii_fixed`
`galactic_structure_radii_linear` `galactic_structure_radii_simple`
`galacticus_error` `input_parameters`

**file:** `galactic_structure.radius_solver.adiabatic.F90`

**Description:** Contains a module which implements an adiabatic contraction galactic radii solver (including self-gravity of baryons) using the adiabatic contraction algorithm of Gnedin et al. [2004].

**Code lines:** 352

**module:** `galactic_structure_radii_adiabatic`

**Description:** Implements an adiabatic contraction galactic radii solver (including self-gravity of baryons) using an adiabatic contraction algorithm.

**Code lines:** 331

**Contained by:** file `galactic_structure.radius_solver.adiabatic.F90`

**Modules used:** `galactic_structure_radius_solver-procedures`

**Used by:** subroutine `galactic_structure_radii-solve`

**subroutine:** `galactic_structure_radii_adiabatic_initialize`

**Description:** Initializes the “adiabatic” galactic radii solver module.

**Code lines:** 46

**Contained by:** module `galactic_structure_radii_adiabatic`

**Modules used:** `input_parameters` `iso_varying_string`

**subroutine:** `galactic_structure_radii_solve_adiabatic`

**Description:** Find the radii of galactic components in **thisNode** using the “adiabatic” method.

**Code lines:** 105

**Contained by:** module `galactic_structure_radii_adiabatic`

**Modules used:** `cosmology_parameters` `galacticus_display`
`galacticus_error` `node_component_dark_matter_profile-scale`
`node_component_disk_exponential` `node_component_spheroid_standard`

**subroutine:** `solve_for_radius`

**Description:** Solve for the equilibrium radius of the given component.
19.1. Program units

**Code lines:** 150  
**Contained by:** module `galactic_structure_radiiadiabatic`  
**Modules used:**  
- `dark_matter_profiles`  
- `galactic_structure_options`  
- `galacticus_error`  
- `memory_management`  
- `numerical_constants_physical`  
- `string_handling`  

**file:** `galactic_structure.radius_solver.fixed.F90`  
**Description:** Contains a module which implements a “fixed” galactic radii solver in which sizes are always equal to the halo virial radius multiplied by its spin parameter and a multiplicative constant.  
**Code lines:** 151

**module:** `galactic_structure_radii_fixed`  
**Description:** Implements a “fixed” galactic radii solver in which sizes are always equal to the halo virial radius multiplied by its spin parameter and a multiplicative constant.  
**Code lines:** 130  
**Contained by:** file `galactic_structure.radius_solver.fixed.F90`  
**Modules used:** `galactic_structure_radius_solver_procedures`  
**Used by:** subroutine `galactic_structure_radii_solve`  

**subroutine:** `galactic_structure_radii_fixed_initialize`  
**Description:** Initializes the “fixed” galactic radii solver module.  
**Code lines:** 23  
**Contained by:** module `galactic_structure_radii_fixed`  
**Modules used:** `input_parameters`  

**subroutine:** `galactic_structure_radii_solve_fixed`  
**Description:** Find the radii of galactic components in `thisNode` using the “fixed” method.  
**Code lines:** 59  
**Contained by:** module `galactic_structure_radii_fixed`  
**Modules used:**  
- `node_component_dark_matter_profile_scale`  
- `node_component_disk_exponential`  
- `node_component_spheroid_standard`  

**subroutine:** `solve_for_radius`  
**Description:** Solve for the equilibrium radius of the given component.  
**Code lines:** 26  
**Contained by:** module `galactic_structure_radii_fixed`  
**Modules used:** `dark_matter_halo_scales`  

**file:** `galactic_structure.radius_solver.initial_radii.F90`  
**Description:** Contains a module which implements calculations of the initial radius in the dark matter halo for use when solving for galactic structure.  
**Code lines:** 125

**module:** `galactic_structure_initial_radii`
Description: Implements calculations of the initial radius in the dark matter halo for use when solving for galactic structure.

Code lines: 104

Contained by: file `galactic_structure.radius_solver.initial_radii.F90`

Modules used: `galacticus_nodes iso_varying_string`

Used by: function `dark_matter_profile_density_task`

function `dark_matter_profile_enclosed_mass_task`

subroutine `solve_for_radius`

**function: `galactic_structure_radius_initial`**

Description: Find the initial radius in the dark matter halo of `thisNode` corresponding to the given final radius.

Code lines: 11

Contained by: module `galactic_structure_initial_radii`

**function: `galactic_structure_radius_initial_derivative`**

Description: Find the derivative of the initial radius in the dark matter halo of `thisNode` with respect to the final radius corresponding to the given final radius.

Code lines: 12

Contained by: module `galactic_structure_initial_radii`

**subroutine: `galactic_structure_radius_initialInitialize`**

Description: Initialize the initial radius module for the galactic structure subsystem.

Code lines: 55

Contained by: module `galactic_structure_initial_radii`

Modules used: `galactic_structure_initial_radii_adiabatic galactic_structure_initial_radii_static galacticus_error input_parameters`

**file: `galactic_structure.radius_solver.initial_radii.adiabatic.F90`**

Description: Contains a module which implements calculations of initial radius in the dark matter halo using the adiabatic contraction algorithm of Gnedin et al. [2004].

Code lines: 433

**module: `galactic_structure_initial_radii_adiabatic`**

Description: Implements calculations of initial radius in the dark matter halo using the adiabatic contraction algorithm of Gnedin et al. [2004].

Code lines: 412

Contained by: file `galactic_structure.radius_solver.initial_radii.adiabatic.F90`

Modules used: `galactic_structure_options galacticus_nodes`

Used by: subroutine `galactic_structure_radius_initial_initialize`

**function: `adiabatic_solver_mean_orbital_radius`**

Description: Returns the orbit averaged radius for dark matter corresponding the given radius using the model of Gnedin et al. [2004].

Code lines: 8

Contained by: module `galactic_structure_initial_radii_adiabatic`

**function: `adiabatic_solver_mean_orbital_radius_derivative`**
19.1. Program units

Description: Returns the derivative of the orbit averaged radius for dark matter corresponding to the given radius using the model of Gnedin et al. [2004].

Code lines: 8

Contained by: module galactic_structure_initial_radii_adiabatic

function: component_enclosed_mass

Description: Unary function returning the enclosed mass in a component. Suitable for mapping over components. Ignores the dark matter profile.

Code lines: 13

Contained by: module galactic_structure_initial_radii_adiabatic

function: component_rotation_curve

Description: Unary function returning the squared rotation curve in a component. Suitable for mapping over components.

Code lines: 12

Contained by: module galactic_structure_initial_radii_adiabatic

function: component_rotation_curve_gradient

Description: Unary function returning the squared rotation curve gradient in a component. Suitable for mapping over components.

Code lines: 12

Contained by: module galactic_structure_initial_radii_adiabatic

subroutine: galactic_structure_initial_radii_adiabatic_initialize

Description: Initializes the “adiabatic” initial radii module.

Code lines: 37

Contained by: module galactic_structure_initial_radii_adiabatic

Modules used: input_parameters iso_varying_string

subroutine: galactic_structure_initial_radii_adiabatic_compute_factors

Description: Compute various factors needed when solving for the initial radius in the dark matter halo using the adiabatic contraction algorithm of Gnedin et al. [2004].

Code lines: 177

Contained by: module galactic_structure_initial_radii_adiabatic

Modules used: cosmology_parameters dark_matter_halo_scales
hot_halo_mass_distributions node_component_black_hole_simple_structure
node_component_black_hole_standard_structure_tasks
numerical_constants_physical node_component_hot_halo_cold_mode_structure_tasks

function: galactic_structure_radius_initial_adiabatic

Description: Compute the initial radius in the dark matter halo using the adiabatic contraction algorithm of Gnedin et al. [2004].

Code lines: 31

Contained by: module galactic_structure_initial_radii_adiabatic

Modules used: root_finder

function: galactic_structure_radius_initial_adiabatic_solver
19. Source Code Documentation

Description: Root function used in finding the initial radius in the dark matter halo when solving for adiabatic contraction.
Code lines: 17
Contained by: module galactic_structure_initial_radii_adiabatic
Modules used: dark_matter_profiles

function: galactic_structure_radius_initial_derivative_adiabatic
Description: Compute the derivative of the initial radius in the dark matter halo using the adiabatic contraction algorithm of Gnedin et al. [2004].
Code lines: 31
Contained by: module galactic_structure_initial_radii_adiabatic
Modules used: root_finder

function: galactic_structure_radius_initial_derivative_adiabatic_solver
Description: Root function used in finding the derivative of the initial radius in the dark matter halo when solving for adiabatic contraction.
Code lines: 21
Contained by: module galactic_structure_initial_radii_adiabatic
Modules used: dark_matter_profiles numerical_constants_math

file: galactic_structure.radius_solver.initial_radii.static.F90
Description: Contains a module which implements calculations of initial radius in which the dark matter halo is assumed to be static.
Code lines: 67

module: galactic_structure_initial_radii_static
Description: Implements calculations of initial radius in which the dark matter halo is assumed to be static.
Code lines: 47
Contained by: file galactic_structure.radius_solver.initial_radii.static.F90
Modules used: galacticus_nodes
Used by: subroutine galactic_structure_radius_initial_initialize

subroutine: galactic_structure_initial_radii_static_initialize
Description: Initiates the “static” initial radii module.
Code lines: 13
Contained by: module galactic_structure_initial_radii_static
Modules used: iso_varying_string

function: galactic_structure_radius_initial_derivative_static
Description: Compute the derivative of the initial radius in the dark matter halo assuming the halo is static.
Code lines: 8
Contained by: module galactic_structure_initial_radii_static

function: galactic_structure_radius_initial_static
Description: Compute the initial radius in the dark matter halo assuming the halo is static.
Code lines: 8
Contained by: module galactic_structure_initial_radii_static
file: galactic_structure.radius_solver.linear.F90
Description: Contains a module which implements a “linear” galactic radii solver (no adiabatic contraction and no self-gravity of baryons, and size simply scales in proportion to specific angular momentum).
Code lines: 129

module: galactic_structure_radii_linear
Description: Implements a “linear” galactic radii solver (no adiabatic contraction and no self-gravity of baryons, and size simply scales in proportion to specific angular momentum).
Code lines: 108
Contained by: file galactic_structure.radius_solver.linear.F90
Modules used: galactic_structure_radius_solver_procedures
Used by: subroutine galactic_structure_radii_linear_initialize

subroutine: galactic_structure_radii_linear_initialize
Description: Initializes the “linear” galactic radii solver module.
Code lines: 9
Contained by: module galactic_structure_radii_linear
Modules used: iso_varying_string

subroutine: galactic_structure_radii_solve_linear
Description: Find the radii of galactic components in thisNode using the “linear” method.
Code lines: 57
Contained by: module galactic_structure_radii_linear
Modules used: node_component_dark_matter_profile_scale
node_component_disk_exponential
node_component_spheroid_standard

subroutine: solve_for_radius
Description: Solve for the equilibrium radius of the given component.
Code lines: 23
Contained by: module galactic_structure_radii_linear
Modules used: dark_matter_halo_scales

file: galactic_structure.radius_solver.procedures.F90
Description: Contains a module which holds procedure pointers used by the galactic structure radii solver subsystem.
Code lines: 40

module: galactic_structure_radius_solver_procedures
Description: Holds procedure pointers used by the galactic structure radii solver subsystem.
Code lines: 20
Contained by: file galactic_structure.radius_solver.procedures.F90
Modules used: galacticus_nodes
Used by: module galactic_structure_radii_adiabatic
module galactic_structure_radii_fixed
module galactic_structure_radii_linear module galactic_structure_radii_simple

file: galactic_structure.radius_solver.simple.F90
Description: Contains a module which implements a simple galactic radii solver (no adiabatic contraction and no self-gravity of baryons).
Code lines: 172

module: galactic_structure_radii_simple
Description: Implements a simple galactic radii solver (no adiabatic contraction and no self-gravity of baryons).
Code lines: 152
Contained by: file galactic_structure.radius_solver.simple.F90
Modules used: galactic_structure_radius_solver_procedures
Used by: subroutine galactic_structure_radii_solve

subroutine: galactic_structure_radii_simple_initialize
Description: Initializes the “simple” galactic radii solver module.
Code lines: 23
Contained by: module galactic_structure_radii_simple
Modules used: input_parameters iso_varying_string

subroutine: galactic_structure_radii_solve_simple
Description: Find the radii of galactic components in thisNode using the “simple” method.
Code lines: 79
Contained by: module galactic_structure_radii_simple
Modules used: galacticus_error node_component_dark_matter_profile_scale
node_component_disk_exponential node_component_spheroid_standard

subroutine: solve_for_radius
Description: Solve for the equilibrium radius of the given component.
Code lines: 26
Contained by: module galactic_structure_radii_simple
Modules used: dark_matter_profiles

file: galactic_structure.rotation_curve.F90
Description: Contains a module which implements calculations of the rotation curve as a specified radius.

19.1. Program units

module: galacticus_output_analyses_mass_functions
Description: Performs analysis to compute a variety of mass functions. Currently supported mass functions include:

- The $z \approx 0.07$ stellar mass function in the SDSS measured by Li and White [2009].
  Assumes 0.07 dex random errors on stellar masses. This is approximate, but motivated by the discussion of Behroozi et al. [2010].

subroutine: galacticus_merger_tree_output_stllr_mss_mrphlgy
Description: Determines whether thisNode has sufficient stellar mass to be output.
Code lines: 25
Contained by: module galacticus_merger_tree_output_stllr_mss_mrphlgs
19. Source Code Documentation

**Modules used:** galacticus_nodes

**subroutine:** galacticus_merger_tree_output_stllr_mss_mrphlgy_initialize

*Description:* Initializes the stellar mass filter module.
*Code lines:* 41
*Contained by:* module galacticus_merger_tree_output_stllr_mss_mrphlgys

**Modules used:** input_parameters iso_varying_string

**file:** galacticus.output.merger_tree.final_descendent.F90

*Description:* Contains a module which handles outputting of tree final descendent data to the GALACTICUS output file.
*Code lines:* 165

**module:** galacticus_output_trees_final_descendents

*Description:* Handles outputting of tree final descendent data to the GALACTICUS output file.
*Code lines:* 145
*Contained by:* file galacticus.output.merger_tree.final_descendent.F90

**Modules used:** galacticus_nodes

**Used by:** subroutine count_properties subroutine establish_property_names subroutine galacticus_merger_tree_output

**subroutine:** galacticus_output_tree_final_descendents

*Description:* Store descendent properties in the GALACTICUS output file buffers.
*Code lines:* 35
*Contained by:* module galacticus_output_trees_final_descendents

**Modules used:** galacticus_nodes galacticus_output_times kind_numbers

**subroutine:** galacticus_output_tree_final_descendents_initialize

*Description:* Initializes the module by determining whether or not descendent data should be output.
*Code lines:* 30
*Contained by:* module galacticus_output_trees_final_descendents

**Modules used:** galacticus_error input_parameters iso_varying_string

**subroutine:** galacticus_output_tree_final_descendents_names

*Description:* Set the names of descendent properties to be written to the GALACTICUS output file.
*Code lines:* 28
*Contained by:* module galacticus_output_trees_final_descendents

**subroutine:** galacticus_output_tree_final_descendents_property_count

*Description:* Account for the number of descendent properties to be written to the GALACTICUS output file.
*Code lines:* 14
*Contained by:* module galacticus_output_trees_final_descendents

**Modules used:** galacticus_nodes

**file:** galacticus.output.merger_tree.half_light_properties.F90
19.1. Program units

**Description:** Contains a module which handles outputting of galaxy half-light properties (radii and masses).

**Code lines:** 196

**module:** galacticus_output_tree_half_light_properties

**Description:** Handles outputting of galaxy half-light radii and associated masses.

**Code lines:** 176

**Contained by:** file galacticus.output.merger_tree.half_light_properties.F90

**Modules used:** galacticus_nodes

**Used by:** subroutine count_properties subroutine establish_property_names subroutine galacticus_merger_tree_output

**subroutine:** galacticus_output_tree_half_light

**Description:** Store density contrast properties in the GALACTICUS output file buffers.

Code lines: 13
Contained by: module galacticus_output_trees_velocity_dispersion

function: galacticus_output_trees_line_of_sight_velocity_dispersion
Description: Compute the line-of-sight velocity dispersion at the given radius.
Code lines: 22
Contained by: module galacticus_output_trees_velocity_dispersion
Modules used: fgsl iso_c_binding numerical_integration
function: galacticus_output_trees_velocity_dispersion_density_integrand
Description: Integrand function used for computing line-of-sight velocity dispersions.
Code lines: 15
Contained by: module galacticus_output_trees_velocity_dispersion
Modules used: galactic_structure_densities iso_c_binding

function: galacticus_output_trees_vlcty_dsprsn_vlcty_dnsty_intgrnd
Description: Integrand function used for computing line-of-sight velocity dispersions. Specifically, we wish to evaluate the integral:
\[
\int_{r_i}^{r_o} \sigma^2(r) \rho(r) \frac{r}{\sqrt{r^2 - r_i^2}} dr,
\]
where \( r_i \) is the impact parameter, \( r_o \) is an outer radius at which we assume \( \rho(r_o)\sigma^2(r_o) = 0 \) (i.e. it is the radius at which we begin integrating the Jeans equation), \( \rho(r) \) is density, and \( \sigma(r) \) is the velocity dispersion at radius \( r \). Assuming spherical symmetry and isotropic velocity dispersion, the Jeans equation tells us
\[
\rho(r)\sigma^2(r) = \int_r^{r_o} \frac{GM(<r')}{r'^2} \rho(r') dr',
\]
where \( G \) is the gravitational constant, and \( M(<r) \) is the total mass contained within radius \( r \). Equation (19.12) can then be simplified using integration by parts to give:
\[
\left[ \sigma^2(r) \rho(r) \sqrt{r^2 - r_i^2} \right]_{r_i}^{r_o} + \int_{r_i}^{r_o} \frac{d}{dr} \left[ \sigma^2(r) \rho(r) \right] \sqrt{r^2 - r_i^2} dr.
\]
The first term is zero at both limits (due to the constraint \( \rho(r_o)\sigma^2(r_o) = 0 \) at \( r_o \) and due to \( \sqrt{r^2 - r_i^2} = 0 \) at \( r_i \)), and the second term can be simplified using eqn. (19.13) to give
\[
\int_{r_i}^{r_o} \frac{GM(<r)}{r^2} \rho(r) \sqrt{r^2 - r_i^2} dr.
\]

function: galacticus_output_trees_vlcty_dsprsn_lambdar_intgrnd1
Description: Integrand function used for integrating line-of-sight surface density dispersion over area.
Code lines: 15
Contained by: module galacticus_output_trees_velocity_dispersion
Modules used: galactic_structure_densities iso_c_binding

function: galacticus_output_trees_vlcty_dsprsn_dnsty_srfc_intgrnd
Description: Integrand function used for integrating the $\lambda_R$ statistic of Cappellari et al. [2007]. In this case we want to evaluate

$$\int_0^r 2\pi r'\Sigma(r')\sqrt{\sigma^2(r') + V^2(r')}dr',$$  \hspace{1cm} (19.16)

where $\Sigma(r)$ is the projected surface density (in mass or light) of the galaxy at radius $r$, $\sigma^2(r)$ is the measured velocity dispersion and $V(r)$ the measured rotation speed. Assuming that the selected component is purely dispersion dominated with velocity dispersion $\sigma_s(r)$, and that rotation is present in only the disk component with rotation curve $V_d(r)$ then we can model the velocity distribution, $P(V)$, at $r$ as the sum of a Gaussian of width $\sigma_s(r)$ and normalized area $\Sigma_s(r)$, and a delta function at $V_d(r)$ with normalized area $\Sigma_d(r)$. The measured rotation speed is then:

$$V(r) = \frac{\int_{-\infty}^{+\infty} P(V)\mathcal{V}d\mathcal{V}}{\int_{-\infty}^{+\infty} P(V)d\mathcal{V}} = \frac{\Sigma_d(r)V_d(r)}{[\Sigma_d(r) + \Sigma_s(r)]},$$  \hspace{1cm} (19.17)

and the measured velocity dispersion is:

$$\sigma^2(r) = \frac{\int_{-\infty}^{+\infty} P(V)[V - V(r)]^2d\mathcal{V}}{\int_{-\infty}^{+\infty} P(V)d\mathcal{V}} = \frac{\Sigma_s(r)[\sigma^2_s(r)] + \Sigma_d(r)[V_d(r) - V(r)]^2}{[\Sigma_d(r) + \Sigma_s(r)]^2}.$$  \hspace{1cm} (19.18)

Code lines: 59

**subroutine:** geometry_surveys_caputi_2011_ukidss_uds_initialize

**Description:** Initializes the “Caputi-2011-UKIDSS-UDS” survey geometry module.

**Code lines:** 18
**Contained by:** module geometry_surveys_caputi_2011_ukidss_uds

**Modules used:**
- input_parameters
- iso_varying_string

**file:** geometry.surveys.F90

**Description:** Contains a module which implements geometries of galaxy surveys.

**Code lines:** 160

**module:** geometry_surveys

**Description:** Implements geometries of galaxy surveys.

**Code lines:** 140
**Contained by:** file geometry.surveys.F90

**Modules used:**
- iso_varying_string

**Used by:**
- program conditional_mass_function
- subroutine mass_function_covariance_matrix

**function:** geometry_survey_distance_maximum

**Description:** Returns the maximum distance (in Mpc) at which a galaxy of the specified mass (in $M_\odot$) could be detected.

**Code lines:** 12
**Contained by:** module geometry_surveys
19.1. Program units

function: geometry_survey_solid_angle
Description: Returns the solid angle (in steradians) of the survey.
Code lines: 11
Contained by: module geometry_surveys

function: geometry_survey_volume_maximum
Description: Returns the maximum volume (in Mpc$^3$) at which a galaxy of the specified mass (in $M_\odot$) could be detected.
Code lines: 12
Contained by: module geometry_surveys

subroutine: geometry_survey_window_functions
Description: Returns the window functions on a grid of the specified size (gridCount cells in each dimension) for galaxies of the specified mass1 and mass2 (in $M_\odot$). The boxLength should be set to an appropriate value to fully enclose (with sufficient buffering to allow for Fourier transformation) the two window functions.
Code lines: 19
Contained by: module geometry_surveys
Modules used: iso_c_binding

subroutine: geometry_surveys_initialize
Description: Initialize the spheroid star formation timecale module.
Code lines: 55
Contained by: module geometry_surveys
Modules used: galacticus_error geometry_surveys_caputi_2011_ukidss_uds geometry_surveys_li_white_2009_sdss geometry_surveys_martin_2010_alfalfa input_parameters

file: geometry_surveys.Li-White-2009-SDSS.F90
Description: Contains a module which implements the survey geometry used by Li and White [2009].
Code lines: 210

module: geometry_surveys_li_white_2009_sdss
Description: Implements the survey geometry used by Li and White [2009].
Code lines: 190
Contained by: file geometry_surveys.Li-White-2009-SDSS.F90
Used by: subroutine geometry_surveys_initialize

function: geometry_survey_distance_maximum_li_white_2009_sdss
Description: Compute the maximum distance at which a galaxy is visible.
Code lines: 18
Contained by: module geometry_surveys_li_white_2009_sdss
Modules used: cosmology_functions cosmology_functions_options

function: geometry_survey_solid_angle_li_white_2009_sdss
Description: Return the solid angle of the Li and White [2009] sample.
Code lines: 7
19. Source Code Documentation

Contained by: module geometry_surveys_li_white_2009_sdss

function: geometry_survey_volume_maximum_li_white_2009_sdss
Description: Compute the maximum volume in which a galaxy of given mass could have been observed.
Code lines: 8
Contained by: module geometry_surveys_li_white_2009_sdss

subroutine: geometry_survey_window_functions_li_white_2009_sdss

Code lines: 71

Contained by: file hot_halo.ram_pressure_stripping.timescale.ram_pressure_acceleration.F90

Used by: function hot_halo_ram_pressure_stripping_timescale

**function: hot_halo_ram_pressure_timescale_ram_pressure_accel**

**Description:** Computes the hot halo ram pressure stripping timescale, based on the acceleration due to ram pressure forces. This timescale is approximated as \[ \tau \approx \sqrt{2} \frac{r_{\text{outer}} \Sigma_{\text{outer}}}{P_{\text{ram}}} \], where \( r_{\text{outer}} \) is the current outer radius of the hot halo, \( \Sigma_{\text{outer}} \) is the surface density at that radius, and \( P_{\text{ram}} \) is the ram pressure force (per unit area). The surface density is approximated as \( \Sigma_{\text{outer}} \approx r_{\text{outer}} \rho_{\text{outer}} \), where \( \rho_{\text{outer}} \) is the density at the outer radius.

*Code lines:* 11
*Contained by:* module `instruments_filters`

**function: filter_get_index**
*Description:* Return the index for the specified filter, loading that filter if necessary.
*Code lines:* 26
*Contained by:* module `instruments_filters`

**function: filter_name**
*Description:* Return the name of the specified filter.
*Code lines:* 8
*Contained by:* module `instruments_filters`

**function: filter_response**
*Description:* Return the filter response function at the given wavelength (specified in Angstroms). Note that we follow the convention of Hogg et al. [2002] and assume that the filter response gives the fraction of incident photons received by the detector at a given wavelength, multiplied by the relative photon response (which will be 1 for a photon-counting detector such as a CCD, or proportional to the photon energy for a bolometer/calorimeter type detector.
*Code lines:* 15
*Contained by:* module `instruments_filters`
*Modules used:* `numerical_interpolation`

**subroutine: filter_response_load**
*Description:* Load a filter response curve.
*Code lines:* 85
*Contained by:* module `instruments_filters`
*Modules used:* `fox_dom`, `galacticus_error`, `galacticus_input_paths`, `io_xml`, `memory_management`, `string_handling`
function: filter_vega_offset
Description: Return the Vega to AB magnitude offset for the specified filter.
Code lines: 9
Contained by: module instruments_filters
Modules used: galacticus_error

type: filtertype
Description: A structure which holds filter response curves.
Code lines: 11
Contained by: module instruments_filters

file: intergalactic_medium.state.F90
Description: Contains a module which provides a class for calculations of the intergalactic medium thermal and ionization state.
Code lines: 1577

module: intergalactic_medium_state
Description: Provides a class for calculations of the intergalactic medium thermal and ionization state. An implementation of the intergalactic medium state class for a simplistic model of instantaneous and full reionization. An implementation of the intergalactic medium state class for an internal model of instantaneous and full reionization. An implementation of the intergalactic medium state class in which state is read from file. An implementation of the intergalactic medium state class in which state is computed using RECFAST.
Code lines: 1557
Contained by: file intergalactic_medium.state.F90
Modules used: cosmology_functions

Used by: function coldmodechemicalmasses
function naozbarkana2007failedfraction
function naozbarkana2007failedfraction
function coldmodedefaultconstructor
function simpledefaultconstructor
module intergalactic_medium_state_-internal_evolver
module radiation_intergalactic_-background_internal

function: fileconstructor
Description: Constructor for the file IGM state class.
Code lines: 9
Contained by: module intergalactic_medium_state
Modules used: cosmology_functions

function: filedefaultconstructor
Description: Default constructor for the file IGM state class.
Code lines: 26
Contained by: module intergalactic_medium_state
Modules used: input_parameters

function: fileelectronfraction
Description: Return the electron fraction in the intergalactic medium at the specified time by interpolating in tabulated data,
19.1. Program units

- **Code lines:** 12
- **Contained by:** module `intergalactic_medium_state`
- **Modules used:** `numerical_interpolation`

### function: fileneutralheliumfraction
- **Description:** Return the neutral helium fraction in the intergalactic medium at the specified time by interpolating in tabulated data.
- **Code lines:** 12
- **Contained by:** module `intergalactic_medium_state`
- **Modules used:** `numerical_interpolation`

### function: fileneutralhydrogenfraction
- **Description:** Return the neutral hydrogen fraction in the intergalactic medium at the specified time by interpolating in tabulated data.
- **Code lines:** 12
- **Contained by:** module `intergalactic_medium_state`
- **Modules used:** `numerical_interpolation`

### subroutine: filereaddata
- **Description:** Read in data describing the state of the intergalactic medium.
- **Code lines:** 45
- **Contained by:** module `intergalactic_medium_state`
- **Modules used:** `cosmology_functions` `fox_dom` `galacticus_error` `io_xml`

### function: filesinglyionizedheliumfraction
- **Description:** Return the neutral helium fraction in the intergalactic medium at the specified time by interpolating in tabulated data.
- **Code lines:** 12
- **Contained by:** module `intergalactic_medium_state`
- **Modules used:** `numerical_interpolation`

### function: filetemperature
- **Description:** Return the temperature of the intergalactic medium at the specified time by interpolating in tabulated data.
- **Code lines:** 12
- **Contained by:** module `intergalactic_medium_state`
- **Modules used:** `numerical_interpolation`

### interface: intergalacticmediumstate

- **Contained by:** module `intergalactic_medium_state`

### type: intergalacticmediumstateclass
- **Code lines:** 82
- **Contained by:** module `intergalactic_medium_state`

### function: intergalacticmediumstateconstructordefault
- **Description:** Return a pointer to the default `intergalacticMediumState` object.
- **Code lines:** 8
function: intergalacticmediumstateconstructornamed
Description: Return a pointer to a newly created intergalacticMediumState object of the specified type.
Code lines: 44
Contained by: module intergalactic_medium_state
Modules used: galacticus_error iso_varying_string

function: intergalacticmediumstatedoublyionizedheliumfraction
Description: Return the doubly-ionized fraction of helium in the IGM at the given time.
Code lines: 7
Contained by: module intergalactic_medium_state

function: intergalacticmediumstateelectronfractionnull
Description: Return the electron fraction (relative to hydrogen) in the IGM at the given time.
Code lines: 8
Contained by: module intergalactic_medium_state
Modules used: galacticus_error

function: intergalacticmediumstateelectronscatteringintegrand
Description: Integrand for electron scattering optical depth calculations.
Code lines: 27
Contained by: module intergalactic_medium_state
Modules used: cosmology_functions cosmology_parameters iso_c_binding numerical_constants_astronomical numerical_constants_physical

function: intergalacticmediumstateelectronscatteringopticaldepth
Description: Return the electron scattering optical depth from the present day back to the given time in the IGM.
Code lines: 24
Contained by: module intergalactic_medium_state
Modules used: galacticus_error

subroutine: intergalacticmediumstateelectronscatteringtabulate
Description: Construct a table of electron scattering optical depth as a function of cosmological time.
Code lines: 49
Contained by: module intergalactic_medium_state
Modules used: cosmology_functions fgsl iso_c_binding numerical_integration galacticus_error

function: intergalacticmediumstateelectronscatteringtime
Description: Return the cosmological time at which the given electron scattering opticalDepth is reached (integrating from the present day) in the IGM.
Code lines: 35
Contained by: module intergalactic_medium_state
Modules used: cosmology_functions galacticus_error

interface: intergalacticmediumstatefile
19.1. Program units

**Description:** Constructors for the file intergalactic medium state class.

**Code lines:** 4

**Contained by:** module `intergalactic_medium_state`

**Subroutine:** `intergalacticmediumstateinitialize`

**Description:** Initialize the default `intergalacticMediumState` object.

**Code lines:** 64

**Contained by:** module `intergalactic_medium_state`

**Modules used:** `galacticus_error`, `input_parameters`, `iso_varying_string`

**Interface:** `intergalacticmediumstateinternal`

**Description:** Constructors for the internal intergalactic medium state class.

**Code lines:** 3

**Contained by:** module `intergalactic_medium_state`

**Function:** `intergalacticmediumstateisfinalizable`

**Description:** Return true if this object can be finalized.

**Code lines:** 7

**Contained by:** module `intergalactic_medium_state`

**Function:** `intergalacticmediumstateneutralheliumfractionnull`

**Description:** Return the neutral fraction of helium in the IGM at the given time.

**Code lines:** 8

**Contained by:** module `intergalactic_medium_state`

**Modules used:** `galacticus_error`

**Function:** `intergalacticmediumstateneutralhydrogenfractionnull`

**Description:** Return the neutral fraction of hydrogen in the IGM at the given time.

**Code lines:** 8

**Contained by:** module `intergalactic_medium_state`

**Modules used:** `galacticus_error`

**Interface:** `intergalacticmediumstaterecfast`

**Description:** Constructors for the RECFAST intergalactic medium state class.

**Code lines:** 4

**Contained by:** module `intergalactic_medium_state`

**Interface:** `intergalacticmediumstatesimple`

**Description:** Constructors for the simple intergalactic medium state class.

**Code lines:** 4

**Contained by:** module `intergalactic_medium_state`

**Function:** `intergalacticmediumstatesinglyionizedheliumfractionnull`

**Description:** Return the singly-ionized fraction of helium in the IGM at the given time.

**Code lines:** 8

**Contained by:** module `intergalactic_medium_state`

**Modules used:** `galacticus_error`
function: intergalacticmediumstatesinglyionizedhydrogenfraction
Description: Return the singly-ionized fraction of hydrogen in the IGM at the given time.
Code lines: 7
Contained by: module intergalactic_medium_state

function: intergalacticmediumstatetemperaturenull
Description: Return the temperature (in Kelvin) of the IGM at the given time.
Code lines: 8
Contained by: module intergalactic_medium_state
Modules used: galacticus_error

function: internaldefaultconstructor
Description: Default constructor for the internal IGM state class.
Code lines: 23
Contained by: module intergalactic_medium_state
Modules used: input_parameters

subroutine: internaldensityhelium1set
Description: Set He1 densities in the internal intergalactic medium state class.
Code lines: 11
Contained by: module intergalactic_medium_state
Modules used: memory_management

subroutine: internaldensityhelium2set
Description: Set He2 densities in the internal intergalactic medium state class.
Code lines: 11
Contained by: module intergalactic_medium_state
Modules used: memory_management

subroutine: internaldensityhelium3set
Description: Set He3 densities in the internal intergalactic medium state class.
Code lines: 11
Contained by: module intergalactic_medium_state
Modules used: memory_management

subroutine: internaldensityhydrogen1set
Description: Set H1 densities in the internal intergalactic medium state class.
Code lines: 11
Contained by: module intergalactic_medium_state
Modules used: memory_management

subroutine: internaldensityhydrogen2set
Description: Set H2 densities in the internal intergalactic medium state class.
Code lines: 11
Contained by: module intergalactic_medium_state
Modules used: memory_management
function: internalelectronfraction
Description: Return the electron fraction of the IGM in the internal model.
Code lines: 37
Contained by: module intergalactic_medium_state
Modules used: fgsl
  iso_c_binding
  numerical_interpolation

function: internalfilteringmass
Description: Return the filtering mass of the IGM in the internal model.
Code lines: 31
Contained by: module intergalactic_medium_state
Modules used: fgsl
  iso_c_binding
  numerical_interpolation

subroutine: internalmassfilteringset
Description: Set filtering masses in the internal intergalactic medium state class.
Code lines: 11
Contained by: module intergalactic_medium_state
Modules used: memory_management

function: internalneutralheliumfraction
Description: Return the neutral helium fraction of the IGM in the internal model.
Code lines: 35
Contained by: module intergalactic_medium_state
Modules used: fgsl
  iso_c_binding
  numerical_interpolation

function: internalneutralhydrogenfraction
Description: Return the neutral hydrogen fraction of the IGM in the internal model.
Code lines: 35
Contained by: module intergalactic_medium_state
Modules used: fgsl

*Code lines:* 8

*Contained by:* module generalized_press_schechter_branching

**function: generalized_press_schechter_branching_probability**  
*Description:* Return the probability per unit change in $\delta_{\text{crit}}$ that a halo of mass haloMass at time deltaCritical will undergo a branching to progenitors with mass greater than massResolution.  
*Code lines:* 27

*Contained by:* module generalized_press_schechter_branching

*Modules used:* iso_c_binding numerical_integration
function: generalized_press_schechter_subresolution_fraction
Description: Return the fraction of mass accreted in subresolution halos, i.e. those below massResolution, per unit change in \( \delta_{crit} \) for a halo of mass haloMass at time deltaCritical. The integral is computed numerically.
Code lines: 65
Contained by: module generalized_press_schechter_branching
Modules used: excursion_sets_first_crossings galacticus_display galacticus_error iso_c_binding iso_varying_string merger_tree_branching_modifiers numerical_integration

function: merging_rate
Description: Computes the merging rate of dark matter halos in the generalized Press-Schechter algorithm. This “merging rate” is specifically defined as
\[
\frac{d^2f}{d\ln M_{child}d\delta c} = 2\sigma^2(M_{child}) \left. \frac{d\ln \sigma}{d\ln M} \right|_{M=M_{child}} \frac{dt}{dt} \frac{df_{12}}{dt},
\] (19.21)
where \( df_{12}/dt \) is the excursion set barrier crossing probability per unit time for the effective barrier \( B'(S_{child}|S_{parent},t) \equiv B(S_{child},t - \delta t) - B(S_{parent},t) \) in the limit \( \delta t \to 0 \).

function: branching_probability_integrand
19.1. Program units

**Description:** Integrand for the branching probability.

**Code lines:** 12

**Contained by:** module `modified_press_schechter_branching`

**Modules used:** `iso_c_binding`

**subroutine: compute_common_factors**

**Description:** Precomputes some useful factors that are used in the modified Press-Schechter branching integrals.

**Code lines:** 8

**Contained by:** module `modified_press_schechter_branching`

**function: merging_rate**

**Description:** Merging rate from Press-Schechter. The constant factor of $\sqrt{2/\pi}$ not included here—instead it is included in a multiplicative prefactor by which integrals over this function are multiplied.

**Code lines:** 15

**Contained by:** module `modified_press_schechter_branching`

**function: modification_function**

**Description:** Empirical modification of the progenitor mass function from Parkinson et al. [2008]. The constant factors of $G_0(\delta_p/\sigma_p)^{\gamma_2}$ and $1/\sigma_p^{\gamma_1}$ are not included here—instead they are included in a multiplicative prefactor by which integrals over this function are multiplied.

**Code lines:** 11

**Contained by:** module `modified_press_schechter_branching`

**function: modified_press_schechter_branch_mass**

**Description:** Determine the mass of one of the halos to which the given halo branches, given the branching probability, \texttt{probability}. Typically, \texttt{probabilityFraction} is found by multiplying Modified_Press_Schechter_Branching_Probability() by a random variable drawn in the interval 0–1 if a halo branches. This routine then finds the progenitor mass corresponding to this value.

**Code lines:** 33

**Contained by:** module `modified_press_schechter_branching`

**Modules used:** `root_finder`

**function: modified_press_schechter_branch_mass_root**

**Code lines:** 12

**Contained by:** module `modified_press_schechter_branching`

**Modules used:** `iso_c_binding`, `numerical_integration`

**subroutine: modified_press_schechter_branching_initialize**

**Description:** Initialize the modified Press-Schechter branching routines.

**Code lines:** 64

**Contained by:** module `modified_press_schechter_branching`

**Modules used:** `input_parameters`, `iso_varying_string`

**function: modified_press_schechter_branching_maximum_step**

**Description:** Return the maximum allowed step in $\delta_{crit}$ that a halo of mass \texttt{haloMass} at time \texttt{deltaCritical} should be allowed to take.

**Code lines:** 17
19. Source Code Documentation

**Contained by:** module *modified_press_schechter_branching*

**function:** *modified_press_schechter_branching_probability*

**Description:** Return the probability per unit change in $\delta_{\text{crit}}$ that a halo of mass $\text{haloMass}$ at time $\delta_{\text{critical}}$ will undergo a branching to progenitors with mass greater than $\text{massResolution}$.

**Code lines:** 26

**Contained by:** module *modified_press_schechter_branching*

**Modules used:** iso_c_binding, numerical_integration

**function:** *modified_press_schechter_subresolution_fraction*

**Description:** Return the fraction of mass accreted in subresolution halos, i.e. those below $\text{massResolution}$, per unit change in $\delta_{\text{crit}}$ for a halo of mass $\text{haloMass}$ at time $\delta_{\text{critical}}$. The integral is computed analytically in terms of the $2F_1$ hypergeometric function.

**Code lines:** 28

**Contained by:** module *modified_press_schechter_branching*

**Modules used:** hypergeometric_functions

**function:** *progenitor_mass_function*

**Description:** Progenitor mass function from Press-Schechter. The constant factor of the parent halo mass is not included here—instead it is included in a multiplicative prefactor by which integrals over this function are multiplied.

**Code lines:** 9

**Contained by:** module *modified_press_schechter_branching*

**file:** merger_trees.branching_probability.modifier.F90

**Description:** Contains a module which implements modifiers for merger tree branching probabilities.

**Code lines:** 111

**module:** merger_tree_branching_modifiers

**Description:** Implements modifiers for merger tree branching probabilities.

**Code lines:** 91

**Contained by:** file merger_trees.branching_probability.modifier.F90

**Modules used:** iso_varying_string

**Used by:** function generalized_press_schechter_, subresolution_fraction

**function:** merger_tree_branching_modifier

**Description:** Return a modifier for merger tree branching probabilities.

**Code lines:** 11

**Contained by:** module *merger_tree_branching_modifiers*

**subroutine:** tree_branching_modifiers_initialize

**Description:** Initializes the tree branching modifier module.

**Code lines:** 53

**Contained by:** module *merger_tree_branching_modifiers*

**Modules used:** galacticus_error, input_parameters, merger_tree_branching_modifiers_null, merger_tree_branching_modifiers_parkinson
file: merger_trees.branching_probability.modifier.Parkinson.F90

  - iso_c_binding

**file:** merger_trees.construct.read.F90

- **Description:** Contains a module which implements reading of merger trees from a file.
- **Code lines:** 2670

**module:** merger_tree_read

- **Description:** Implements reading of merger trees from a file.
- **Code lines:** 2650
- **Contained by:** file merger_trees.construct.read.F90
- **Modules used:**
  - galacticus_nodes
  - iso_varying_string
  - kind_numbers
  - merger_tree_read_importers
- **Used by:** function merger_tree_create

**subroutine:** assign_isolated_node_indices
19. Source Code Documentation

**Description:** Assign to each node the number of the corresponding isolated node.

**Code lines:** 40

**Contained by:** module `merger_tree_read`

**subroutine:** `assign_mergers`

**Description:** Assign pointers to merge targets.

**Code lines:** 41

**Contained by:** module `merger_tree_read`

**Modules used:**
- `galacticus_error`
- `string_handling`

**subroutine:** `assign_particle_counts`

**Description:** Assign particle counts to nodes.

**Code lines:** 20

**Contained by:** module `merger_tree_read`

**subroutine:** `assign_scale_radii`

**Description:** Assign scale radii to nodes.

**Code lines:** 142

**Contained by:** module `merger_tree_read`

**Modules used:**
- `dark_matter_halo_scales`
- `dark_matter_profile_scales`
- `dark_matter_profiles_concentration`
- `fallbackscalemethod`
- `galacticus_display`
- `galacticus_error`
- `input_parameters`
- `root_finder`

**subroutine:** `assign_spin_parameters`

**Description:** Assign spin parameters to nodes.

**Code lines:** 55

**Contained by:** module `merger_tree_read`

**Modules used:**
- `dark_matter_profiles`
- `galacticus_error`
- `halo_spin_distributions`
- `numerical_constants_physical`

**subroutine:** `assign_uniqueids_to_clones`

**Description:** Assign new uniqueID values to any cloned nodes inserted into the trees.

**Code lines:** 12

**Contained by:** module `merger_tree_read`

**subroutine:** `assign_velocity_dispersions`

**Description:** Assign velocity dispersions to nodes.

**Code lines:** 20

**Contained by:** module `merger_tree_read`

**subroutine:** `assign_velocity_maxima`

**Description:** Assign velocity maxima to nodes.

**Code lines:** 20

**Contained by:** module `merger_tree_read`

**subroutine:** `build_child_and_sibling_links`

**Description:** Build child and sibling links between nodes.

**Code lines:** 62
19.1. Program units

**Contained by:** module `merger_tree_read`
**Modules used:** `memory_management`

**subroutine: build_descendent_pointers**
**Description:** Builds pointers from each node to its descendent node.
**Code lines:** 44
**Contained by:** module `merger_tree_read`
**Modules used:** `galacticus_display` `galacticus_error`
**Code lines:** 44

**subroutine: build_isolated_parent_pointers**
**Description:** Create parent pointer links between isolated nodes and assign times and masses to those nodes.
**Code lines:** 82
**Contained by:** module `merger_tree_read`
**Modules used:** `galacticus_error` `string_handling`

**subroutine: build_parent_pointers**
**Description:** Build pointers to node parents.
**Code lines:** 42
**Contained by:** module `merger_tree_read`
**Modules used:** `galacticus_error` `string_handling`

**subroutine: build_subhalo_mass_histories**
**Description:** Build and attached bound mass histories to subhalos.
**Code lines:** 135
**Contained by:** module `merger_tree_read`
**Modules used:** `cosmology_functions` `galacticus_error`
**Code lines:** 135

**subroutine: create_branch_jump_event**
**Description:** Create a matched-pair of branch jump events in the given nodes.
**Code lines:** 18
**Contained by:** module `merger_tree_read`
**Modules used:** `node_branch_jumps`

**subroutine: create_node_array**
**Description:** Create an array of standard nodes and associated structures.
**Code lines:** 53
**Contained by:** module `merger_tree_read`
**Modules used:** `memory_management`

**subroutine: create_node_indices**
**Description:** Create a sorted list of node indices with an index into the original array.
**Code lines:** 34
**Contained by:** module `merger_tree_read`
**Modules used:** `galacticus_display` `memory_management`
**Code lines:** 34

sort `string_handling`
function: descendant_node_sort_index
  Description: Return the sort index of the given descendantIndex.
  Code lines: 9
  Contained by: module merger_tree_read
  Modules used: arrays_search

subroutine: destroy_node_indices
  Description: Destroy the sorted list of node indices.
  Code lines: 10
  Contained by: module merger_tree_read
  Modules used: memory_management

subroutine: dump_tree
  Description: Dumps the tree structure to a file in a format suitable for processing with DOT.
  Code lines: 64
  Contained by: module merger_tree_read

subroutine: enforce_subhalo_status
  Description: Ensure that any node which was once a subhalo remains a subhalo.
  Code lines: 69
  Contained by: module merger_tree_read
  Modules used: galacticus_error string_handling

function: half_mass_radius_root
  Description: Function used to find scale radius of dark matter halos given their half-mass radius.
  Code lines: 14
  Contained by: module merger_tree_read
  Modules used: dark_matter_profiles

function: is_subhalo_subhalo_merger
  Description: Returns true if thisNode undergoes a subhalo-subhalo merger.
  Code lines: 24
  Contained by: module merger_tree_read

function: last_host_descendent
  Description: Return a pointer to the last descendent that can be reached from thisNode when descending through hosts.
  Code lines: 11
  Contained by: module merger_tree_read

subroutine: merger_tree_read_do
  Description: Read a merger tree from file.
  Code lines: 268

numerical_constants_boolean

**function: node_location**
*Description:* Return the location in the original array of the given nodeIndex.
*Code lines:* 15
*Contained by:* module merger_tree_read
*Modules used:* arrays_search

**function: orbit_construct**
*Description:* Construct a Keplerian orbit given body masses, positions, and relative velocities.
*Code lines:* 15
*Contained by:* module merger_tree_read
*Modules used:* kepler_orbits vectors

**subroutine: phase_space_position_realize**
*Description:* Modify relative positions and velocities to account for both any periodicity of the simulated volume, and for Hubble flow.
*Code lines:* 22
*Contained by:* module merger_tree_read
*Modules used:* cosmology_functions numerical_constants_boolean

**type: progenitoriterator**
*Code lines:* 43
*Contained by:* module merger_tree_read

**function: progenitoriteratorcurrent**
*Description:* Return a pointer to the current progenitor in a progenitor iterator object.
*Code lines:* 9
*Contained by:* module merger_tree_read

**subroutine: progenitoriteratordescendentset**
*Description:* Initialize a progenitor iterator object by storing the index of the target node and finding the location of the first progenitor (if any).
*Code lines:* 23
*Contained by:* module merger_tree_read

**function: progenitoriteratorexist**
*Description:* Return true if progenitors exist, false otherwise.
*Code lines:* 7
19. Source Code Documentation

function: progenitoriteratorindex
Description: Return the node index of the current progenitor in a progenitor iterator object.
Code lines: 9
Contained by: module merger_tree_read

function: progenitoriteratornext
Description: Move to the next progenitor using a progenitor iterator object, returning true if the next progenitor exists, false if it does not.
Code lines: 25
Contained by: module merger_tree_read

subroutine: scan_for_branch_jumps
Description: Search for subhalos which move between branches/trees.
Code lines: 136
Contained by: module merger_tree_read
Modules used: galacticus_display iso_varying_string string_handling

subroutine: scan_for_mergers
Description: Scan for and record mergers between nodes.
Code lines: 261
Contained by: module merger_tree_read
Modules used: dark_matter_halo_scales galacticus_error kepler_orbits string_handling vectors virial_orbits

subroutine: scan_for_subhalo_promotions
Description: Scan for cases where a subhalo stops being a subhalo and so must be promoted.
Code lines: 59
Contained by: module merger_tree_read
Modules used: node_subhalo_promotions

subroutine: time_until_merging_subresolution
Description: Compute the additional time until merging after a subhalo is lost from the tree (presumably due to limited resolution).
Code lines: 127
Contained by: module merger_tree_read
Modules used: galacticus_display galacticus_error input_parameters kepler_orbits satellite_merging_timescales string_handling vectors

subroutine: validate_isolated_halos
Description: Ensure that nodes have valid primary progenitors.
Code lines: 42
Contained by: module merger_tree_read
file: merger_trees.construct.read.importer.F90
Description: Contains a module which provides an object that implements importing of merger trees from file.
Code lines: 3716

module: merger_tree_read_importers
Description: Provides an object that implements importing of merger trees from file. An implementation of the merger tree importer class for GALACTICUS format merger tree files. An implementation of the merger tree importer class for GALACTICUS format merger tree files.
Code lines: 3696
Contained by: file merger_trees.construct.read.importer.F90

function: sussingtreesareselfcontained
Description: Return a Boolean integer specifying whether or not the trees are self-contained.
Code lines: 8
Contained by: module merger_tree_read_importers
Modules used: numerical_constants_boolean

function: sussingtreeshavesubhalos
Description: Return a Boolean integer specifying whether or not the trees have subhalos.
Code lines: 8
Contained by: module merger_tree_read_importers
Modules used: numerical_constants_boolean

function: sussingtreeweight
Description: Return the weight to assign to trees.
Code lines: 15
Contained by: module merger_tree_read_importers
Modules used: cosmology_functions galacticus_error numerical_constants_astronomical numerical_constants_boolean

function: sussingvalueisbad
Description: Determine if a value in a “Sussing” merger tree file is bad
Code lines: 13
Contained by: module merger_tree_read_importers

function: sussingvelocitiesincludehubbleflow
Description: Return a Boolean integer specifying whether or not velocities include the Hubble flow.
Code lines: 8
Contained by: module merger_tree_read_importers
Modules used: numerical_constants_boolean

function: sussingvelocitydispersionavailable
Description: Return true if halo velocity dispersions are available.
Code lines: 7
Contained by: module merger_tree_read_importers

function: sussingvelocitymaximumavailable
Description: Return true if halo rotation curve velocity maxima are available.
Code lines: 7
Contained by: module merger_tree_read_importers

file: merger_trees.construct.read.importer.SussingMergerTrees.F90
Description: An implementation of the merger tree importer class for GALACTICUS format merger tree files.
Code lines: 1791
Modules used: io_hdf5 iso_varying_string stateful_types
interface: mergertreeimportersussing
Description: Constructors for the GALACTICUS format merger tree importer class.
Code lines: 3
Contained by: file merger_trees.construct.read.importer.SussingMergerTrees.F90

type: nodedata_sussing
Description: Extension of the nodeData class for “Sussing Merger Trees” format merger trees [Srisawat et al., 2013].
Code lines: 2
Contained by: file merger_trees.construct.read.importer.SussingMergerTrees.F90

function: sussingangularmomenta3davailable
Description: Return true if angular momenta vectors are available.
Code lines: 7
Contained by: file merger_trees.construct.read.importer.SussingMergerTrees.F90

function: sussingangularmomentaavailable
Description: Return true if angular momenta are available.
Code lines: 7
Contained by: file merger_trees.construct.read.importer.SussingMergerTrees.F90

function: sussingangularmomentaincludesubhalos
Description: Return a Boolean specifying whether or not the halo angular momenta include the contribution from subhalos.
Code lines: 8
Contained by: file merger_trees.construct.read.importer.SussingMergerTrees.F90
Modules used: galacticus_error

subroutine: sussingclose
Description: Close a GALACTICUS format merger tree file.
Code lines: 6
Contained by: file merger_trees.construct.read.importer.SussingMergerTrees.F90

function: sussingcubelength
Description: Return the length of the simulation cube.
Code lines: 12
Contained by: file merger_trees.construct.read.importer.SussingMergerTrees.F90
Modules used: numerical_constants_astronomical numerical_constants_boolean

function: sussingdefaultconstructor
Description: Default constructor for the “Sussing Merger Trees” format [Srisawat et al., 2013] merger tree importer.
Code lines: 206
Contained by: file merger_trees.construct.read.importer.SussingMergerTrees.F90
Modules used: galacticus_error input_parameters

subroutine: sussingdestructor
Description: Destructor for the GALACTICUS format merger tree importer class.

**Modules used:**  input_parameters

**file:** merger_trees.construct.state_restore.F90

*Description:* Contains a module which implements storing and restoring of the complete internal state of a merger tree.

*Code lines:* 263

**module:** merger_trees_state_store

*Description:* Implements storing and restoring of the complete internal state of a merger tree. Useful primarily for debugging purposes to begin running a tree from just prior to the point of failure.

*Code lines:* 243

*Contained by:* file merger_trees.construct.state_restore.F90

*Modules used:* iso_varying_string kind_numbers

*Used by:* function merger_tree_create

**subroutine:** merger_tree_state_restore

*Description:* Restores the state of a merger tree from file.

*Code lines:* 76

*Contained by:* module merger_trees_state_store

*Modules used:* galacticus_error galacticus_nodes galacticus_state string_handling

**subroutine:** merger_tree_state_store

*Description:* Store the complete internal state of a merger tree to file.

*Code lines:* 63

*Contained by:* module merger_trees_state_store

*Modules used:* galacticus_nodes galacticus_state

**subroutine:** merger_tree_state_store_initialize

*Description:* Initialize the “state restore” method for constructing merger trees.

*Code lines:* 27

*Contained by:* module merger_trees_state_store

*Modules used:* input_parameters

**subroutine:** merger_tree_state_walk_tree

*Description:* Walk a merger tree for the purposes of storing the full state to file. Includes walking of formation nodes.

*Code lines:* 17

*Contained by:* module merger_trees_state_store

*Modules used:* galacticus_nodes

**function:** node_array_position

*Description:* Returns the position of a node in the output list given its index.

*Code lines:* 15

*Contained by:* module merger_trees_state_store

**function:** pointed_at_node

*Description:* Return a pointer to a node, given its position in the array of nodes. Return a null pointer if the array index is −1.

file: merger_trees.evolve.timesteps.history.F90
Description: Contains a module which implements a time-stepping criterion for merger tree evolution which permits global histories to be stored.
Code lines: 384

module: merger_tree_timesteps_history
Description: Implements a simple time-stepping criterion for merger tree evolution.
Code lines: 363
Contained by: file merger_trees.evolve.timesteps.history.F90
Modules used: fgsl galacticus_nodes
Used by: subroutine galacticus_output_close_file function time_step_get

subroutine: merger_tree_history_store
Description: Store various properties in global arrays.
Code lines: 55
Contained by: module merger_tree_timesteps_history
Modules used: galactic_structure_enclosed_masses galactic_structure_options
iso_c_binding numerical_interpolation

subroutine: merger_tree_history_write
Description: Store the global history data to the GALACTICUS output file.
Code lines: 150
Contained by: module merger_tree_timesteps_history
Modules used: galacticus_hdf5 numerical_constants_astronomical

subroutine: merger_tree_timestep_history
Description: Determines the timestep to go to the next tabulation point for global history storage.
Code lines: 122
Contained by: module merger_tree_timesteps_history
file: merger_trees.evolve.timesteps.record_evolution.F90
Description: Contains a module which implements a time-stepping criterion for merger tree evolution which permits evolution of the main branch galaxy to be stored.
Code lines: 274

module: merger_tree_timesteps_record_evolution
Description: Implements a time-stepping criterion for merger tree evolution which permits evolution of the main branch galaxy to be stored.
Code lines: 253
Contained by: file merger_trees.evolve.timesteps.record_evolution.F90
Modules used: fgsl
Used by: subroutine galacticus_merger_tree_record_evolution_output, function time_step_get_output

subroutine: merger_tree_record_evolution_output
Description: Store Fourier-space halo profiles to the output file.
Code lines: 50
Contained by: module merger_tree_timesteps_record_evolution
Modules used: galacticus_hdf5, galacticus_nodes, galacticus_output_times, iso_c_binding, iso_varying_string, numerical_constants_astronomical, string_handling

subroutine: merger_tree_record_evolution_store
Description: Store properties of the main progenitor galaxy.
Code lines: 31
Contained by: module merger_tree_timesteps_record_evolution
Modules used: galactic_structure_enclosed_masses, galactic_structure_options, galactic_nodes, iso_c_binding, numerical_interpolation

subroutine: merger_tree_timestep_record_evolution
Description: Determines the timestep to go to the next tabulation point for galaxy evolution storage.
Code lines: 121
Contained by: module merger_tree_timesteps_record_evolution
Modules used: cosmology_functions, evolve_to_time_reports, input_parameters, iso_c_binding, iso_varying_string, memory_management, merger_trees_evolve_timesteps_template, numerical_interpolation, numerical_ranges
subroutine: reset_records
Description: Resets recorded datasets to zero.
Code lines: 8
Contained by: module merger_tree_timesteps_record_evolution

file: merger_trees.evolve.timesteps.report.F90
Description: Contains a module which reports on timestepping criteria.
Code lines: 50

module: evolve_to_time_reports
Description: Contains functions which report on timestepping criteria.
Code lines: 30
Contained by: file merger_trees.evolve.timesteps.report.F90
Used by: function evolve_to_time subroutine merger_tree_timestep_history subroutine merger_tree_timestep_- record_evolution subroutine merger_tree_timestep_- satellite subroutine merger_tree_timestep_simple subroutine node_component_dynamics_- statistics_bars_timestep

subroutine: evolve_to_time_report
Description: Display a report on evolution timestep criteria.
Code lines: 20
Contained by: module evolve_to_time_reports
Modules used: galacticus_display iso_varying_string kind_numbers string_handling

file: merger_trees.evolve.timesteps.satellite.F90
Description: Contains a module which implements a time-stepping criterion for merger tree evolution which stops evolution when a merger is about to happen.
Code lines: 231

module: merger_tree_timesteps_satellite
Code lines: 210
Contained by: file merger_trees.evolve.timesteps.satellite.F90
Used by: function time_step_get

subroutine: merger_tree_timestep_satellite
Description: Determines the timestep to go to the time at which the node merges.
Code lines: 107
Contained by: module merger_tree_timesteps_satellite
Modules used: evolve_to_time_reports input_parameters iso_varying_string merger_trees_evolve_timesteps_- template

subroutine: satellite_merger_process
Description: Process a satellite node which has undergone a merger with its host node.
Code lines: 80
Contained by: module merger_tree_timesteps_satellite

**Contained by:** module abundances_structure

**Modules used:** memory_management

**function:** abundances_divide

**Description:** Divide an abundances object by a scalar.

**Code lines:** 12

**Contained by:** module abundances_structure

**subroutine:** abundances_dump

**Description:** Reset an abundances object.

**Code lines:** 23

**Contained by:** module abundances_structure

**Modules used:** galacticus_display

**subroutine:** abundances_dump_raw

**Description:** Dump an abundances object to binary.

**Code lines:** 12

**Contained by:** module abundances_structure

**function:** abundances_get_metallicity

**Description:** Return the metallicity of the self structure.

**Code lines:** 40

**Contained by:** module abundances_structure

**Modules used:** galacticus_error

**function:** abundances_helium_mass_fraction

**Description:** Returns the mass fraction of helium.

**Code lines:** 13

**Contained by:** module abundances_structure

**function:** abundances_helium_number_fraction

**Description:** Returns the mass fraction of helium.

**Code lines:** 16

**Contained by:** module abundances_structure

**function:** abundances_hydrogen_mass_fraction

**Description:** Returns the mass fraction of hydrogen.

**Code lines:** 14

**Contained by:** module abundances_structure

**function:** abundances_hydrogen_number_fraction

**Description:** Returns the number fraction of hydrogen.

**Code lines:** 16

**Contained by:** module abundances_structure

**subroutine:** abundances_increment

**Description:** Increment an abundances object.

**Code lines:** 12

**Contained by:** module abundances_structure
subroutine: abundances_initialize
Description: Initialize the abundanceStructure object module. Determines which abundances are to be tracked.
Code lines: 48
Contained by: module abundances_structure
Modules used: atomic_data input_parameters memory_management

function: abundances_is_zero
Description: Test whether an abundances object is zero.
Code lines: 15
Contained by: module abundances_structure

subroutine: abundances_mass_to_mass_fraction
Description: Convert abundance masses to mass fractions by dividing by mass while ensuring that the fractions remain within the range 0–1.
Code lines: 15
Contained by: module abundances_structure

subroutine: abundances_mass_to_mass_fraction_packed
Description: Convert abundance masses to mass fractions by dividing by mass while ensuring that the fractions remain within the range 0–1.
Code lines: 29
Contained by: module abundances_structure

function: abundances_max
Description: Return an element-by-element max() on two abundances objects.
Code lines: 9
Contained by: module abundances_structure

function: abundances_multiply
Description: Multiply an abundances object by a scalar.
Code lines: 12
Contained by: module abundances_structure

function: abundances_multiply_switched
Description: Multiply a scalar by an abundances object.
Code lines: 9
Contained by: module abundances_structure

function: abundances_names
Description: Return a name for the specified entry in the abundances structure.
Code lines: 23
Contained by: module abundances_structure
Modules used: galacticus_error

subroutine: abundances_output
Description: Store an abundances object in the output buffers.
Code lines: 16
19. Source Code Documentation

- **abundances_output_count**
  - **Description:** Increment the output count to account for an abundances object.
  - **Code lines:** 9
  - **Contained by:** module abundances_structure

- **abundances_output_names**
  - **Description:** Assign names to output buffers for an abundances object.
  - **Code lines:** 25
  - **Contained by:** module abundances_structure

- **abundances_property_count**
  - **Description:** Return the number of properties required to track abundances. This is equal to the number of elements tracked, elementsCount, plus one since we always track a total metallicity.
  - **Code lines:** 10
  - **Contained by:** module abundances_structure

- **abundances_read_raw**
  - **Description:** Read an abundances object from binary.
  - **Code lines:** 12
  - **Contained by:** module abundances_structure

- **abundances_reset**
  - **Description:** Reset an abundances object.
  - **Code lines:** 11
  - **Contained by:** module abundances_structure

- **abundances_serialize**
  - **Description:** Pack abundances from an array into an abundances structure.
  - **Code lines:** 18

*Contained by:* module `histories`

**function: history_exists**
*Description:* Returns true if the history has been created.
*Code lines:* 7
*Contained by:* module `histories`

**subroutine: history_extend**
*Description:* Extends a history to encompass the given time range.
*Code lines:* 115
*Contained by:* module `histories`
*Modules used:* `galacticus_error iso_varying_string numerical_ranges range string_handling`

**subroutine: history_increment**
*Description:* Adds the data in `addHistory` to that in `thisHistory`. This function is designed for histories that track instantaneous rates. The rates in `addHistory` are interpolated to the times in `thisHistory` and added to the rates in `thisHistory`.
*Code lines:* 64
*Contained by:* module `histories`
*Modules used:* `fgsl galacticus_error iso_c_binding numerical_interpolation`

**function: history_is_zero**
*Description:* Test whether a history object is all zero.
*Code lines:* 10
subroutine: history_long_integer_builder
Description: Build a longIntegerHistory object from the given XML historyDefinition.
Code lines: 10
Contained by: module histories
Modules used: fox_dom galacticus_error

subroutine: history_long_integer_clone
Description: Clone a longIntegerHistory object.
Code lines: 19

**file: objects.kepler_orbits.F90**
*Description:* Contains a module which defines an orbit structure for use in GALACTICUS.
*Code lines:* 1029

**module: kepler_orbits**
*Description:* Defines an orbit structure for use in GALACTICUS.
function: kepler_orbits_angular_momentum
Description: Return the angular momentum for this orbit.
Code lines: 15
Contained by: module kepler_orbits

subroutine: kepler_orbits_angular_momentum_set
Description: Sets the tangential velocity to the specified value.
Code lines: 13
Contained by: module kepler_orbits

function: kepler_orbits_apocenter_radius
**19. Source Code Documentation**

*Description:* Return the apocenter radius for this orbit.
*Code lines:* 21
*Contained by:* module *kepler_orbits*

**subroutine: kepler_orbits_apocenter_radius_set**
*Description:* Sets the apocenter radius to the specified value.
*Code lines:* 13
*Contained by:* module *kepler_orbits*

**subroutine: kepler_orbits_assert_is_defined**
*Description:* Assert that an orbit is defined - quit with an error if it is not.
*Code lines:* 11
*Contained by:* module *kepler_orbits*
*Modules used:* galacticus_error

**subroutine: kepler_orbits_builder**
*Description:* Build a *keplerOrbit* object from the given XML *keplerOrbitDefinition*.
*Code lines:* 43
*Contained by:* module *kepler_orbits*
*Modules used:* fox_dom galacticus_error

**subroutine: kepler_orbits_destroy**
*Description:* Destroy an orbit.
*Code lines:* 7
*Contained by:* module *kepler_orbits*

**subroutine: kepler_orbits_dump**
*Description:* Reset an orbit to a null state.
*Code lines:* 63
*Contained by:* module *kepler_orbits*
*Modules used:* galacticus_display iso_varying_string

**subroutine: kepler_orbits_dump_raw**
*Description:* Dump a *keplerOrbit* object in binary.
*Code lines:* 18
*Contained by:* module *kepler_orbits*

**function: kepler_orbits_eccentricity**
*Description:* Return the eccentricity for this orbit.
*Code lines:* 18
*Contained by:* module *kepler_orbits*

**subroutine: kepler_orbits_eccentricity_set**
*Description:* Sets the tangential velocity to the specified value.
*Code lines:* 13
*Contained by:* module *kepler_orbits*

**function: kepler_orbits_energy**
*Description:* Return the energy for this orbit.
19.1. Program units

Code lines: 20
Contained by: module kepler_orbits
Modules used: numerical_constants_physical

subroutine: kepler_orbits_energy_set
Description: Sets the tangential velocity to the specified value.
Code lines: 13
Contained by: module kepler_orbits

function: kepler_orbits_host_mass
Description: Return the host mass for this orbit.
Code lines: 12
Contained by: module kepler_orbits
 Modules used: galacticus_error

function: kepler_orbits_is_bound
Description: Returns true if the orbit is bound.
Code lines: 13
Contained by: module kepler_orbits

function: kepler_orbits_is_defined
Description: Returns true if the orbit is fully defined. For the orbits consider here, in which we don’t care about the orientation of the orbital plane or the argument of pericenter, this requires that three orbital parameter be set (in addition to the masses of the orbitting bodies).
Code lines: 30
Contained by: module kepler_orbits

subroutine: kepler_orbits_masses_set
Description: Sets the masses of the two orbitting objects in a keplerOrbit object.
Code lines: 14
Contained by: module kepler_orbits

subroutine: kepler_orbits_output
Description: Store a keplerOrbit object in the output buffers.
Code lines: 20
Contained by: module kepler_orbits
 Modules used: kind_numbers

subroutine: kepler_orbits_output_count
Description: Increment the output count to account for a keplerOrbit object.
Code lines: 9
Contained by: module kepler_orbits

subroutine: kepler_orbits_output_names
Description: Assign names to output buffers for a keplerOrbit object.
Code lines: 29
Contained by: module kepler_orbits
 Modules used: numerical_constants_astronomical
function: kepler_orbits_pericenter_radius
Description: Return the pericenter radius for this orbit.
Code lines: 17
Contained by: module kepler_orbits

subroutine: kepler_orbits_pericenter_radius_set
Description: Sets the pericenter radius to the specified value.
Code lines: 13
Contained by: module kepler_orbits

subroutine: kepler_orbits_propagate
Description: Propagate an orbit along its path.
Code lines: 32
Contained by: module kepler_orbits
Modules used: galacticus_error numerical_constants_physical

function: kepler_orbits_radius
Description: Return the radius for this orbit.
Code lines: 12
Contained by: module kepler_orbits
Modules used: galacticus_error

subroutine: kepler_orbits_radius_set
Description: Sets the radius to the specified value.
Code lines: 13

subroutine: kepler_orbits_read_raw
Description: Read a keplerOrbit object in binary.
Code lines: 18
Contained by: module kepler_orbits

subroutine: kepler_orbits_reset
Description: Reset an orbit to a null state.
Code lines: 20
Contained by: module kepler_orbits

function: kepler_orbits_semi_major_axis
Description: Return the semi-major axis for this orbit.
Code lines: 18
Contained by: module kepler_orbits

subroutine: kepler_orbits_semi_major_axis_set
Description: Sets the semi-major axis to the specified value.
Code lines: 13
Contained by: module kepler_orbits
function: kepler_orbits_specific_reduced_mass
Description: Return the specific reduced mass for this orbit.
Code lines: 12
Contained by: module kepler_orbits
Modules used: galacticus_error

function: kepler_orbits_velocity_radial
Description: Return the radial velocity for this orbit.
Code lines: 22
Contained by: module kepler_orbits
Modules used: galacticus_error

subroutine: kepler_orbits_velocity_radial_set
Description: Sets the radial velocity to the specified value.
Code lines: 13
Contained by: module kepler_orbits

function: kepler_orbits_velocity_scale
Description: Return the velocity scale for the orbit.
Code lines: 15
Contained by: module kepler_orbits
Modules used: galacticus_error numerical_constants_physical

function: kepler_orbits_velocity_tangential
Description: Return the tangential velocity for this orbit.
Code lines: 27
Contained by: module kepler_orbits
Modules used: galacticus_error

subroutine: kepler_orbits_velocity_tangential_set
Description: Sets the tangential velocity to the specified value.
Code lines: 13
Contained by: module kepler_orbits

type: keplerorbit
Description: The structure used for describing orbits in GALACTICUS. This object will automatically convert from one set of orbital parameters to another where possible. The orbitting bodies (a satellite orbitting around its host) are treated as point masses, and the usual "reduced mass" framework is used, such that radii and velocities are measured relative to a stationary host. Energy and angular momentum are defined per unit satellite mass (not per unit reduced mass). Note that not all interconversions between elements are implemented. The object works by attempting to get the radial and tangential velocities and the radius. If it can obtain these, any other parameter can be computed. Getting these three parameters relies on having known conversions from other possible combinations of parameters.

19.1. Program units

**subroutine: merger_tree_data_structure_set_property_column**
- **Description:** Set column mapping from the input file.
- **Code lines:** 24
- **Contained by:** module `merger_tree_data_structure`
- **Modules used:** `memory_management`

**subroutine: merger_tree_data_structure_set_property_double**
- **Description:** Set a property in the merger trees.
- **Code lines:** 63
- **Contained by:** module `merger_tree_data_structure`
- **Modules used:** `galacticus_error` `memory_management`

**subroutine: merger_tree_data_structure_set_property_integer8**
- **Description:** Set a property in the merger trees.
- **Code lines:** 44
- **Contained by:** module `merger_tree_data_structure`
- **Modules used:** `galacticus_error` `memory_management`

**subroutine: merger_tree_data_structure_set_self_contained**
- **Description:** Set the particle mass used in the trees.
- **Code lines:** 10
- **Contained by:** module `merger_tree_data_structure`

**subroutine: merger_tree_data_structure_set_self_hosting_halo_id**
- **Description:** Set the host ID in case of self-hosting halos. Default is host ID = node ID.
- **Code lines:** 10
- **Contained by:** module `merger_tree_data_structure`

**subroutine: merger_tree_data_structure_set_tree_count**
- **Description:** Set the total number of trees in merger trees.
- **Code lines:** 10
- **Contained by:** module `merger_tree_data_structure`

**subroutine: merger_tree_data_structure_set_tree_indices**
- **Description:** Set the merger tree index arrays.
- **Code lines:** 41
- **Contained by:** module `merger_tree_data_structure`
- **Modules used:** `memory_management`

**subroutine: merger_tree_data_structure_set_units**
- **Description:** Set the units system.
- **Code lines:** 43
- **Contained by:** module `merger_tree_data_structure`
- **Modules used:** `galacticus_error`

**subroutine: merger_tree_data_validate_trees**
- **Description:** Validate the merger trees.
- **Code lines:** 11
19. Source Code Documentation

**Contained by:**  module **merger_tree_data_structure**
**Modules used:**  **galacticus_error**

**type:**  **mergertreedata**
**Description:**  A structure that holds raw merger tree data.
**Code lines:**  161
**Contained by:**  module **merger_tree_data_structure**

**subroutine:**  **store_unit_attributes_galacticus**
**Description:**  Store attributes describing the unit system.
**Code lines:**  13
**Contained by:**  module **merger_tree_data_structure**
**Modules used:**  **io_hdf5**

**subroutine:**  **store_unit_attributes_irate**
**Description:**  Store unit attributes in IRATE format files.
**Code lines:**  39
**Contained by:**  module **merger_tree_data_structure**
**Modules used:**  **io_hdf5**  **numerical_constants_prefixes**

**type:**  **treemetadata**
**Description:**  Structure that holds metadata for the trees.
**Code lines:**  10
**Contained by:**  module **merger_tree_data_structure**

**type:**  **unitsmetadata**
**Description:**  A structure that holds metadata on units used.
**Code lines:**  6
**Contained by:**  module **merger_tree_data_structure**

**file:**  **objects.merger_trees.dump.F90**
**Description:**  Contains a module which implements dumping of the structure of a merger tree to a file for plotting with DOT.
**Code lines:**  216

**module:**  **merger_trees_dump**
**Description:**  Implements dumping of the structure of a merger tree to a file for plotting with DOT.
**Code lines:**  196
**Contained by:**  file **objects.merger_trees.dump.F90**
**Modules used:**  **iso_c_binding**  **kind_numbers**
**Used by:**  subroutine **merger_tree_structure_dump**  subroutine **merger_tree_evolve_to**
subroutine **merger_tree_regrid_time**

**subroutine:**  **merger_tree_dump**
| **Description:** | Dumps the tree structure to a file in a format suitable for processing with **dot**. Nodes are shown as circles if isolated or rectangles if satellites. Isolated nodes are connected to their descendent halo, while satellites are connected (by red lines) to their host halo. Optionally, a list of node indices to highlight can be specified. |
| **Code lines:** | 180 |
| **Contained by:** | module **merger_trees_dump** |
| **Modules used:** | **galacticus_nodes**  
**iso_varying_string** |
file: objects.merger_trees.information_content.F90
Description: Contains a module which computes the cladistic information content (CIC) of a merger tree.
Code lines: 69

module: merger_trees_information_content
Description: Implements computation of the cladistic information content (CIC) of a merger tree.
Code lines: 49
Contained by: file objects.merger_trees.information_content.F90

function: merger_tree_cladistic_information_content
Description: Compute the cladistic information content (CIC; Thorley et al. 1998) of a merger tree in bits.
Code lines: 39
Contained by: module merger_trees_information_content
Modules used: factorials galacticus_nodes

file: objects.nodes.F90
Description: Contains a module which implements an object hierarchy for nodes in merger trees and all of their constituent physical components.
Code lines: 57195

module: galacticus_nodes

Code lines: 57174
Contained by: file objects.nodes.F90
Modules used: abundances_structure chemical_abundances_structure galacticus_error histories io_hdf5 iso_varying_string kepler_orbits memory_management numerical_constants_astronomical stellar_luminosities_structure tensors

function: agestatisticscountlinked
Description: Returns the number of ageStatistics components in self.
Code lines: 19
Contained by: module galacticus_nodes

subroutine: agestatisticscreatebyinterrupt
Description: Create the ageStatistics component of self via an interrupt.
Code lines: 8
Contained by: module galacticus_nodes

subroutine: agestatisticscreatelinked
Description: Create the ageStatistics component of self.
Code lines: 29
Contained by: module galacticus_nodes

Modules used: galacticus_display iso_varying_string string_handling

subroutine: agestatisticsdestroylinked
Description: Destroy the ageStatistics component of self.
Code lines: 13
Contained by: module galacticus_nodes

function: agestatisticsdiskintegratedsfr
Description: Returns the default value for the diskIntegratedSFR property for the ageStatistics component class.
Code lines: 12
19.1. Program units

**function: agestatisticsdiskintegratedsfrattributematch**
*Description:* Return a text list of component implementations in the *ageStatistics* class that have the desired attributes for the *diskIntegratedSFR* property
*Code lines:* 25
*Contained by:* module *galacticus_nodes*
*Modules used:* *iso_varying_string*

**function: agestatisticsdiskintegratedsfrisgettable**
*Description:* Returns true if the *diskIntegratedSFR* property is gettable for the *ageStatistics* component class.
*Code lines:* 7
*Contained by:* module *galacticus_nodes*

**subroutine: agestatisticsdiskintegratedsfrrate**
*Description:* Accept a rate set for the *diskIntegratedSFR* property of the *ageStatistics* component class. Trigger an interrupt to create the component.
*Code lines:* 15
*Contained by:* module *galacticus_nodes*
*Modules used:* *galacticus_error*

**function: agestatisticsdisktimeweightedintegratedsfr**
*Description:* Returns the default value for the *diskTimeWeightedIntegratedSFR* property for the *ageStatistics* component class.
*Code lines:* 12
*Contained by:* module *galacticus_nodes*

**function: agestatisticsdisktimeweightedintegratedsfrattributematch**
*Description:* Return a text list of component implementations in the *ageStatistics* class that have the desired attributes for the *diskTimeWeightedIntegratedSFR* property
*Code lines:* 25
*Contained by:* module *galacticus_nodes*
*Modules used:* *iso_varying_string*

**function: agestatisticsdisktimeweightedintegratedsfrisgettable**
*Description:* Returns true if the *diskTimeWeightedIntegratedSFR* property is gettable for the *ageStatistics* component class.
*Code lines:* 7
*Contained by:* module *galacticus_nodes*

**subroutine: agestatisticsdisktimeweightedintegratedsfrrate**
*Description:* Accept a rate set for the *diskTimeWeightedIntegratedSFR* property of the *ageStatistics* component class. Trigger an interrupt to create the component.
*Code lines:* 15
*Contained by:* module *galacticus_nodes*
*Modules used:* *galacticus_error*

**function: agestatisticsget**
Source Code Documentation

**Description:** Returns the `ageStatistics` component of `self`.

**Code lines:** 27

**Contained by:** module `galacticus_nodes`

**Modules used:** `galacticus_error`

**function: agestatisticsnullbindingdouble0inout**

**Description:** A null get function for rank 0 double precisions.

**Code lines:** 7

**Contained by:** module `galacticus_nodes`

**function: agestatisticsnullbindinginteger0in**

**Description:** A null get function for rank 0 integers.

**Code lines:** 7

**Contained by:** module `galacticus_nodes`

**subroutine: agestatisticsnullbindingratedouble0inout**

**Description:** A null rate function for rank 0 double precisions.

**Code lines:** 9

**Contained by:** module `galacticus_nodes`

**subroutine: agestatisticsnullbindingrateinteger0in**

**Description:** A null rate function for rank 0 integers.

**Code lines:** 9

**Contained by:** module `galacticus_nodes`

**subroutine: agestatisticsnullbindingsetdouble0inout**

**Description:** A null set function for rank 0 double precisions.

**Code lines:** 7

**Contained by:** module `galacticus_nodes`

**subroutine: agestatisticsnullbindingsetinteger0in**

**Description:** A null set function for rank 0 integers.

**Code lines:** 7

**Contained by:** module `galacticus_nodes`

**function: agestatisticsspheroidintegratedsfr**

**Description:** Returns the default value for the `spheroidIntegratedSFR` property for the `ageStatistics` component class.

**Code lines:** 12

**Contained by:** module `galacticus_nodes`

**function: agestatisticsspheroidintegratedsfrattributematch**

**Description:** Return a text list of component implementations in the `ageStatistics` class that have the desired attributes for the `spheroidIntegratedSFR` property

**Code lines:** 25

**Contained by:** module `galacticus_nodes`

**Modules used:** `iso_varying_string`

**function: agestatisticsspheroidintegratedsfrisgettable**
19.1. Program units

**Description:** Returns true if the `spheroidIntegratedSFR` property is gettable for the `ageStatistics` component class.

**Code lines:** 7

**Contained by:** module `galacticus_nodes`

**subroutine:** `agestatisticsspheroidintegratedsfrrate`

**Description:** Accept a rate set for the `spheroidIntegratedSFR` property of the `ageStatistics` component class. Trigger an interrupt to create the component.

**Code lines:** 15

**Contained by:** module `galacticus_nodes`

**Modules used:** `galacticus_error`

**function:** `agestatisticsstandarddiskintegratedsfrcount`

**Description:** Return a count of the number of scalar properties in the `diskIntegratedSFR` property of the `AgeStatisticsStandard` component implementation.

**Code lines:** 7

**Contained by:** module `galacticus_nodes`

**function:** `agestatisticsstandarddiskintegratedsfrget`

**Description:** Return the `diskIntegratedSFR` property of the `AgeStatisticsStandard` component implementation.

**Code lines:** 8

**Contained by:** module `galacticus_nodes`
subroutine: agestatisticsstandarddiskintegratedsfrrate
Description: Accumulate to the diskIntegratedSFR property rate of change of the AgeStatisticsStandard component implementation.
Code lines: 10
Contained by: module galacticus_nodes

subroutine: agestatisticsstandarddiskintegratedsfrscale
Description: Set the diskIntegratedSFR property scale of the AgeStatisticsStandard component implementation.
Code lines: 8
Contained by: module galacticus_nodes

subroutine: agestatisticsstandarddiskintegratedsfrset
Description: Set the diskIntegratedSFR property of the AgeStatisticsStandard component implementation.
Code lines: 11
Contained by: module galacticus_nodes
Modules used: memory_management

function: agestatisticsstandarddisktimeweightedintegratedsfrcount
Description: Return a count of the number of scalar properties in the diskTimeWeightedIntegratedSFR property of the ageStatisticsStandard component implementation.
Code lines: 7
Contained by: module galacticus_nodes

function: agestatisticsstandarddisktimeweightedintegratedsfrget
Description: Return the diskTimeWeightedIntegratedSFR property of the AgeStatisticsStandard component implementation.
Code lines: 8
Contained by: module galacticus_nodes

subroutine: agestatisticsstandarddisktimeweightedintegratedsfrrate
Description: Accumulate to the diskTimeWeightedIntegratedSFR property rate of change of the AgeStatisticsStandard component implementation.
Code lines: 10
Contained by: module galacticus_nodes

subroutine: agestatisticsstandarddisktimeweightedintegratedsfrscale
Description: Set the diskTimeWeightedIntegratedSFR property scale of the AgeStatisticsStandard component implementation.
Code lines: 8
Contained by: module galacticus_nodes

subroutine: agestatisticsstandarddisktimeweightedintegratedsfrset
Description: Set the diskTimeWeightedIntegratedSFR property of the AgeStatisticsStandard component implementation.
Code lines: 11
Contained by: module galacticus_nodes
Modules used: memory_management
function: agestatisticsstandardspheroidintegratedsfrcount
Description: Return a count of the number of scalar properties in the spheroidIntegratedSFR property of the ageStatisticsStandard component implementation.
Code lines: 7
Contained by: module galacticus_nodes

function: agestatisticsstandardspheroidintegratedsfrget
Description: Return the spheroidIntegratedSFR property of the AgeStatisticsStandard component implementation.
Code lines: 8
Contained by: module galacticus_nodes

subroutine: agestatisticsstandardspheroidintegratedsfrrate
Description: Accumulate to the spheroidIntegratedSFR property rate of change of the AgeStatisticsStandard component implementation.
Code lines: 10
Contained by: module galacticus_nodes

subroutine: agestatisticsstandardspheroidintegratedsfrscale
Description: Set the spheroidIntegratedSFR property scale of the AgeStatisticsStandard component implementation.
Code lines: 8
Contained by: module galacticus_nodes

subroutine: agestatisticsstandardspheroidintegratedsfrset
Description: Set the spheroidIntegratedSFR property of the AgeStatisticsStandard component implementation.
Code lines: 11
Contained by: module galacticus_nodes
Modules used: memory_management

function: agestatisticsstandardspheroidtimeweightedintegratedsfrcount
Description: Return a count of the number of scalar properties in the spheroidTimeWeightedIntegratedSFR property of the ageStatisticsStandard component implementation.
Code lines: 7
Contained by: module galacticus_nodes

function: agestatisticsstandardspheroidtimeweightedintegratedsfrget
Description: Return the spheroidTimeWeightedIntegratedSFR property of the AgeStatisticsStandard component implementation.
Code lines: 8

*Description:* Set the radialPosition property scale of the BlackHoleStandard component implementation.
*Code lines:* 8
*Contained by:* module galacticus_nodes

**subroutine:** blackholestandardradialpositionset
*Description:* Set the radialPosition property of the BlackHoleStandard component implementation.
*Code lines:* 11
*Contained by:* module galacticus_nodes
*Modules used:* memory_management

**function:** blackholestandardradiativeefficiencyget
*Description:* Get the value of the radiativeEfficiency property of the BlackHoleStandard component using a deferred function.
*Code lines:* 8
*Contained by:* module galacticus_nodes

**subroutine:** blackholestandardradiativeefficiencygetfunction
*Description:* Set the function to be used for get of the radiativeEfficiency property of the BlackHoleStandard component class.
function: blackholestandardradiativeefficiencygetisattached
Description: Return true if the deferred function used to get the radiativeEfficiency property of the BlackHoleStandard component class has been attached.
Code lines: 5
Contained by: module galacticus_nodes

function: blackholestandardspincount
Description: Return a count of the number of scalar properties in the spin property of the blackHoleStandard component implementation.
Code lines: 7
Contained by: module galacticus_nodes

subroutine: blackholestandardspinrate
Description: Accumulate to the spin property rate of change of the BlackHoleStandard component implementation.
Code lines: 10
Contained by: module galacticus_nodes

subroutine: blackholestandardspinscale
Description: Set the spin property scale of the BlackHoleStandard component implementation.
Code lines: 8
Contained by: module galacticus_nodes

subroutine: blackholestandardspinset
Description: Set the spin property of the BlackHoleStandard component implementation.
Code lines: 11
Contained by: module galacticus_nodes
Modules used: memory_management

function: blackholestandardtripleinteractiontimeget
Description: Return the tripleInteractionTime property of the BlackHoleStandard component implementation.
Code lines: 8
Contained by: module galacticus_nodes

subroutine: blackholestandardtripleinteractiontimeset
Description: Set the tripleInteractionTime property of the BlackHoleStandard component implementation.
Code lines: 9
Contained by: module galacticus_nodes
Modules used: memory_management

function: blackholetripleinteractiontime
Description: Returns the default value for the tripleInteractionTime property for the blackHole component class.
Code lines: 8
Contained by: module galacticus_nodes
function: blackholetripleinteractiontimeattributematch
Description: Return a text list of component implementations in the blackHole class that have the desired attributes for the tripleInteractionTime property
Code lines: 27
Contained by: module galacticus_nodes
Modules used: iso_varying_string

function: blackholetripleinteractiontimeisgettable
Description: Returns true if the tripleInteractionTime property is gettable for the blackHole component class.
Code lines: 6
Contained by: module galacticus_nodes

function: boolean_false
Description: Returns Boolean false always.
Code lines: 6
Contained by: module galacticus_nodes

function: boolean_true
Description: Returns Boolean true always.
Code lines: 6
Contained by: module galacticus_nodes

function: darkmatterprofilecountlinked
Description: Returns the number of darkMatterProfile components in self.
Code lines: 19
Contained by: module galacticus_nodes

subroutine: darkmatterprofilecreatebyinterrupt
Description: Create the darkMatterProfile component of self via an interrupt.
Code lines: 8
Contained by: module galacticus_nodes

subroutine: darkmatterprofilecreatelinked
Description: Create the darkMatterProfile component of self.
Code lines: 29
Contained by: module galacticus_nodes
Modules used: galacticus_display iso_varying_string string_handling

subroutine: darkmatterprofiledestroylinked
Description: Destroy the darkMatterProfile component of self.
Code lines: 13
Contained by: module galacticus_nodes

function: darkmatterprofileget
Description: Returns the darkMatterProfile component of self.
Code lines: 27
function: darkmatterprofilenullbindingdouble0inout
Description: A null get function for rank 0 double precisions.
Code lines: 7
Contained by: module galacticus_nodes

function: darkmatterprofilenullbindinginteger0in
Description: A null get function for rank 0 integers.
Code lines: 7
Contained by: module galacticus_nodes

subroutine: darkmatterprofilenullbindingratedouble0inout
Description: A null rate function for rank 0 double precisions.
Code lines: 9
Contained by: module galacticus_nodes

subroutine: darkmatterprofilenullbindingrateinteger0in
Description: A null rate function for rank 0 integers.
Code lines: 9
Contained by: module galacticus_nodes

subroutine: darkmatterprofilenullbindingsetdouble0inout
Description: A null set function for rank 0 double precisions.
Code lines: 7
Contained by: module galacticus_nodes

subroutine: darkmatterprofilenullbindingsetinteger0in
Description: A null set function for rank 0 integers.
Code lines: 7
Contained by: module galacticus_nodes

function: darkmatterprofilescalegrowthrate
Description: Returns the default value for the scaleGrowthRate property for the darkMatterProfile component class.
Code lines: 8
Contained by: module galacticus_nodes

function: darkmatterprofilescalegrowthrate
Description: Returns the default value for the scaleGrowthRate property for the darkMatterProfile component class.
Code lines: 8
Contained by: module galacticus_nodes

function: darkmatterprofilescalegrowthrate
Description: Returns the default value for the scaleGrowthRate property for the darkMatterProfile component class.
Code lines: 8
Contained by: module galacticus_nodes

function: darkmatterprofilescalegrowthrate
Description: Returns the default value for the scaleGrowthRate property for the darkMatterProfile component class.
Code lines: 8
Contained by: module galacticus_nodes

function: darkmatterprofilescalegrowthrate
Description: Returns the default value for the scaleGrowthRate property for the darkMatterProfile component class.
Code lines: 8
Contained by: module galacticus_nodes

function: darkmatterprofilescalegrowthrate
Description: Returns the default value for the scaleGrowthRate property for the darkMatterProfile component class.
Code lines: 8

function: darkmatterprofilescaleisgettable
Description: Returns true if the scale property is gettable for the darkMatterProfile component class.
Code lines: 6
Contained by: module galacticus_nodes

function: darkmatterprofilescalepresetscalecount
Description: Return a count of the number of scalar properties in the scale property of the darkMatterProfileScalePreset component implementation.
Code lines: 7
Contained by: module galacticus_nodes

function: darkmatterprofilescalepresetscaleget
Description: Return the scale property of the DarkMatterProfileScalePreset component implementation.
Code lines: 8
Contained by: module galacticus_nodes

function: darkmatterprofilescalepresetscalegrowthrateget
Description: Return the scaleGrowthRate property of the DarkMatterProfileScalePreset component implementation.
Code lines: 8
Contained by: module galacticus_nodes

subroutine: darkmatterprofilescalepresetscalegrowthrateset
Description: Set the scaleGrowthRate property of the DarkMatterProfileScalePreset component implementation.
Code lines: 9
Contained by: module galacticus_nodes
Modules used: memory_management

subroutine: darkmatterprofilescalepresetscalerate
Description: Accumulate to the scale property rate of change of the DarkMatterProfileScalePreset component implementation.
Code lines: 10
Contained by: module galacticus_nodes
subroutine: darkmatterprofilescalepresentscalescale
Description: Set the scale property scale of the DarkMatterProfileScalePreset component implementation.
Code lines: 8
Contained by: module galacticus_nodes

subroutine: darkmatterprofilescalepresentscaleset
Description: Set the scale property of the DarkMatterProfileScalePreset component implementation.
Code lines: 11
Contained by: module galacticus_nodes
Modules used: memory_management

function: darkmatterprofilescalecount
Description: Return a count of the number of scalar properties in the scale property of the darkMatterProfileScale component implementation.
Code lines: 7
Contained by: module galacticus_nodes

function: darkmatterprofilescaleget
Description: Get the value of the scale property of the DarkMatterProfileScale component using a deferred function.
Code lines: 8
Contained by: module galacticus_nodes

subroutine: darkmatterprofilescalegetfunction
Description: Set the function to be used for get of the scale property of the DarkMatterProfileScale component class.
Code lines: 8
Contained by: module galacticus_nodes

function: darkmatterprofilescalegetisattached
Description: Return true if the deferred function used to get the scale property of the DarkMatterProfileScale component class has been attached.
Code lines: 5
Contained by: module galacticus_nodes

function: darkmatterprofilescalegetvalue
Description: Return the scale property of the DarkMatterProfileScale component implementation.
Code lines: 8

Subroutine: diskexponentialradiusset
   Description: Set the radius property of the DiskExponential component implementation.
   Code lines: 9
   Contained by: module galacticus_nodes
   Modules used: memory_management

Function: diskexponentialstarformationhistorycount
   Description: Return a count of the number of scalar properties in the starFormationHistory property of the diskExponential component implementation.
   Code lines: 7
   Contained by: module galacticus_nodes

Function: diskexponentialstarformationhistoryget
   Description: Return the starFormationHistory property of the DiskExponential component implementation.
   Code lines: 8
   Contained by: module galacticus_nodes

Subroutine: diskexponentialstarformationhistoryrate
   Description: Accumulate to the starFormationHistory property rate of change of the DiskExponential component implementation.
   Code lines: 10
   Contained by: module galacticus_nodes

Subroutine: diskexponentialstarformationhistoryscale
   Description: Set the starFormationHistory property scale of the DiskExponential component implementation.
   Code lines: 8
   Contained by: module galacticus_nodes

Subroutine: diskexponentialstarformationhistoryset
19. Source Code Documentation

**Description:** Set the `starFormationHistory` property of the `DiskExponential` component implementation.

**Code lines:** 11

**Contained by:** module `galacticus_nodes`

**Modules used:** `memory_management`

**function:** `diskexponentialstarformationrateget`

**Description:** Get the value of the `starFormationRate` property of the `DiskExponential` component using a deferred function.

**Code lines:** 8

**Contained by:** module `galacticus_nodes`

**subroutine:** `diskexponentialstarformationrategetfunction`

**Description:** Set the function to be used for get of the `starFormationRate` property of the `DiskExponential` component class.

**Code lines:** 8

**Contained by:** module `galacticus_nodes`

**function:** `diskexponentialstarformationrategetisattached`

**Description:** Return true if the deferred function used to get the `starFormationRate` property of the `DiskExponential` component class has been attached.

**Code lines:** 5

**Contained by:** module `galacticus_nodes`

**function:** `diskexponentialstellarpropertieshistorycount`

**Description:** Return a count of the number of scalar properties in the `stellarPropertiesHistory` property of the `diskExponential` component implementation.

**Code lines:** 7

**Contained by:** module `galacticus_nodes`

**function:** `diskexponentialstellarpropertieshistoryget`

**Description:** Return the `stellarPropertiesHistory` property of the `DiskExponential` component implementation.

**Code lines:** 8

**Contained by:** module `galacticus_nodes`

**subroutine:** `diskexponentialstellarpropertieshistoryrate`

**Description:** Accumulate to the `stellarPropertiesHistory` property rate of change of the `DiskExponential` component implementation.

**Code lines:** 10

**Contained by:** module `galacticus_nodes`

**subroutine:** `diskexponentialstellarpropertieshistoryscale`

**Description:** Set the `stellarPropertiesHistory` property scale of the `DiskExponential` component implementation.

**Code lines:** 8

**Contained by:** module `galacticus_nodes`

**subroutine:** `diskexponentialstellarpropertieshistoryset`

**Description:** Set the `stellarPropertiesHistory` property of the `DiskExponential` component implementation.

Code lines: 11
Contained by: module galacticus_nodes
Modules used: memory_management

**function: diskexponentialvelocityget**  
*Description:* Return the velocity property of the DiskExponential component implementation.  
*Code lines:* 8  
*Contained by:* module galacticus_nodes

**subroutine: diskexponentialvelocityset**  
*Description:* Set the velocity property of the DiskExponential component implementation.  
*Code lines:* 9  
*Contained by:* module galacticus_nodes

**function: diskget**  
*Description:* Returns the disk component of self.  
*Code lines:* 27  
*Contained by:* module galacticus_nodes

**function: diskhalfmassradius**  
*Description:* Returns the default value for the halfMassRadius property for the disk component class.  
*Code lines:* 8  
*Contained by:* module galacticus_nodes

**function: diskhalfmassradiusattributematch**  
*Description:* Return a text list of component implementations in the disk class that have the desired attributes for the halfMassRadius property  
*Code lines:* 27  
*Contained by:* module galacticus_nodes

**function: diskhalfmassradiusisgettable**  
*Description:* Returns true if the halfMassRadius property is gettable for the disk component class.  
*Code lines:* 6  
*Contained by:* module galacticus_nodes

**function: diskisinitialized**  
*Description:* Returns the default value for the isInitialized property for the disk component class.  
*Code lines:* 8  
*Contained by:* module galacticus_nodes

**function: diskisinitializedattributematch**  
*Description:* Return a text list of component implementations in the disk class that have the desired attributes for the isInitialized property  
*Code lines:* 27  
*Contained by:* module galacticus_nodes

**Modules used:**
- memory_management
function: diskisinitializedisgettable
Description: Returns true if the isInitialized property is gettable for the disk component class.
Code lines: 6
Contained by: module galacticus_nodes

function: diskluminositiesstellar
Description: Returns the default value for the luminositiesStellar property for the disk component class.
Code lines: 8
Contained by: module galacticus_nodes

function: diskluminositiesstellarattributematch
Description: Return a text list of component implementations in the disk class that have the desired attributes for the luminositiesStellar property
Code lines: 25
Contained by: module galacticus_nodes
Modules used: iso_varying_string

function: diskluminositiesstellarisgettable
Description: Returns true if the luminositiesStellar property is gettable for the disk component class.
Code lines: 6
Contained by: module galacticus_nodes

function: diskmassgas
Description: Returns the default value for the massGas property for the disk component class.
Code lines: 8
Contained by: module galacticus_nodes

function: diskmassgasattributematch
Description: Return a text list of component implementations in the disk class that have the desired attributes for the massGas property
Code lines: 34
Contained by: module galacticus_nodes
Modules used: iso_varying_string

function: diskmassgasisgettable
Description: Returns true if the massGas property is gettable for the disk component class.
Code lines: 6
Contained by: module galacticus_nodes

subroutine: diskmassgasrate
Description: Accept a rate set for the massGas property of the disk component class. Trigger an interrupt to create the component.
Code lines: 15
Contained by: module galacticus_nodes
Modules used: galacticus_error

function: diskmassstellar
Description: Returns the default value for the massStellar property for the disk component class.
19.1. Program units

function: diskmassstellarattributematch
Description: Return a text list of component implementations in the disk class that have the desired attributes for the massStellar property.
Code lines: 34
Contained by: module galacticus_nodes
Modules used: iso_varying_string

function: diskmassstellarisgettable
Description: Returns true if the massStellar property is gettable for the disk component class.
Code lines: 6
Contained by: module galacticus_nodes

function: disknullbindingabundances0inout
Description: A null get function for rank 0 typeabundances.
Code lines: 7
Contained by: module galacticus_nodes

function: disknullbindingdouble0inout
Description: A null get function for rank 0 double precisions.
Code lines: 7
Contained by: module galacticus_nodes

function: disknullbindinghistory0inout
Description: A null get function for rank 0 typehistories.
Code lines: 7
Contained by: module galacticus_nodes

function: disknullbindinginteger0in
Description: A null get function for rank 0 integers.

Modules used: \texttt{iso\_varying\_string}

\textbf{function: hothaloabundancescoldisgettable}

Description: Returns true if the \texttt{abundancesCold} property is gettable for the \texttt{hotHalo} component class.
Code lines: 6
Contained by: module \texttt{galacticus\_nodes}

\textbf{subroutine: hothaloabundancescoldrate}

Description: Accept a rate set for the \texttt{abundancesCold} property of the \texttt{hotHalo} component class. Trigger an interrupt to create the component.
Code lines: 15
Contained by: module \texttt{galacticus\_nodes}
Modules used: \texttt{galacticus\_error}

\textbf{function: hothaloabundancesisgettable}

Description: Returns true if the \texttt{abundances} property is gettable for the \texttt{hotHalo} component class.
Code lines: 6
Contained by: module \texttt{galacticus\_nodes}

\textbf{subroutine: hothaloabundancesrate}

Description: Accept a rate set for the \texttt{abundances} property of the \texttt{hotHalo} component class. Trigger an interrupt to create the component.
Code lines: 15
Contained by: module \texttt{galacticus\_nodes}
Modules used: \texttt{galacticus\_error}

\textbf{function: hothaloangularmomentum}

Description: Returns the default value for the \texttt{angularMomentum} property for the \texttt{hotHalo} component class.
Code lines: 8
Contained by: module \texttt{galacticus\_nodes}

\textbf{function: hothaloangularmomentumattributematch}

Description: Return a text list of component implementations in the \texttt{hotHalo} class that have the desired attributes for the \texttt{angularMomentum} property.
Code lines: 25
Contained by: module \texttt{galacticus\_nodes}
Modules used: \texttt{iso\_varying\_string}

\textbf{function: hothaloangularmomentumcold}
Description: Returns the default value for the \texttt{angular MomentumCold} property for the \texttt{hotHalo} component class.

Code lines: 8

Contained by: module \texttt{galacticus\_nodes}

\textbf{function: hothalo\_angular\_momentum\_cold\_attributematch}

Description: Return a text list of component implementations in the \texttt{hotHalo} class that have the desired attributes for the \texttt{angular MomentumCold} property.

Code lines: 25

Contained by: module \texttt{galacticus\_nodes}

Modules used: \texttt{iso\_varying\_string}

\textbf{function: hothalo\_angular\_momentum\_cold\_isgettable}

Description: Returns true if the \texttt{angular MomentumCold} property is gettable for the \texttt{hotHalo} component class.

Code lines: 6

Contained by: module \texttt{galacticus\_nodes}

\textbf{subroutine: hothalo\_angular\_momentum\_cold\_rate}

Description: Accept a rate set for the \texttt{angular MomentumCold} property of the \texttt{hotHalo} component class. Trigger an interrupt to create the component.

Code lines: 15

Contained by: module \texttt{galacticus\_nodes}

Modules used: \texttt{galacticus\_error}

\textbf{function: hothalo\_angular\_momentum\_isgettable}

Description: Returns true if the \texttt{angular Momentum} property is gettable for the \texttt{hotHalo} component class.

Code lines: 6

Contained by: module \texttt{galacticus\_nodes}

\textbf{subroutine: hothalo\_angular\_momentum\_rate}

Description: Accept a rate set for the \texttt{angular Momentum} property of the \texttt{hotHalo} component class. Trigger an interrupt to create the component.

Code lines: 15

Contained by: module \texttt{galacticus\_nodes}

Modules used: \texttt{galacticus\_error}

\textbf{function: hothalo\_chemicals}

Description: Returns the default value for the \texttt{chemicals} property for the \texttt{hotHalo} component class.

Code lines: 8

Contained by: module \texttt{galacticus\_nodes}

\textbf{function: hothalo\_chemicals\_attributematch}

Description: Return a text list of component implementations in the \texttt{hotHalo} class that have the desired attributes for the \texttt{chemicals} property.

Code lines: 25

Contained by: module \texttt{galacticus\_nodes}

Modules used: \texttt{iso\_varying\_string}

\textbf{function: hothalo\_chemicals\_isgettable}
19. Source Code Documentation

**Description:** Returns true if the chemicals property is gettable for the hotHalo component class.
**Code lines:** 6
**Contained by:** module galacticus_nodes

**subroutine: hothalochemicalsrat**

**Description:** Accept a rate set for the chemicals property of the hotHalo component class. Trigger an interrupt to create the component.
**Code lines:** 15
**Contained by:** module galacticus_nodes
**Modules used:** galacticus_error

**function: hothalocoldmodeabundancescoldcount**

**Description:** Return a count of the number of scalar properties in the abundancesCold property of the hotHaloColdMode component implementation.
**Code lines:** 7
**Contained by:** module galacticus_nodes

**function: hothalocoldmodeabundancescoldget**

**Description:** Return the abundancesCold property of the HotHaloColdMode component implementation.
**Code lines:** 8
**Contained by:** module galacticus_nodes

**subroutine: hothalocoldmodeabundancescoldrate**

**Description:** Accumulate to the abundancesCold property rate of change of the HotHaloColdMode component implementation.
**Code lines:** 10
**Contained by:** module galacticus_nodes

**subroutine: hothalocoldmodeabundancescoldscale**

**Description:** Set the abundancesCold property scale of the HotHaloColdMode component implementation.
**Code lines:** 8
**Contained by:** module galacticus_nodes

**subroutine: hothalocoldmodeabundancescoldset**

**Description:** Set the abundancesCold property of the HotHaloColdMode component implementation.
**Code lines:** 11
**Contained by:** module galacticus_nodes
**Modules used:** memory_management

**function: hothalocoldmodeangularmomentumcoldcount**

**Description:** Return a count of the number of scalar properties in the angularMomentumCold property of the hotHaloColdMode component implementation.
**Code lines:** 7
**Contained by:** module galacticus_nodes

**function: hothalocoldmodeangularmomentumcoldget**

**Description:** Return the angularMomentumCold property of the HotHaloColdMode component implementation.
**Code lines:** 8
**Contained by:** module galacticus_nodes
subroutine: hothalocoldmodeangularmomentumcoldrate
Description: Accumulate to the angularMomentumCold property rate of change of the HotHaloColdMode component implementation.
Code lines: 10
Contained by: module galacticus_nodes

subroutine: hothalocoldmodeangularmomentumcoldscale
Description: Set the angularMomentumCold property scale of the HotHaloColdMode component implementation.
Code lines: 8
Contained by: module galacticus_nodes

subroutine: hothalocoldmodeangularmomentumcoldset
Description: Set the angularMomentumCold property of the HotHaloColdMode component implementation.
Code lines: 11
Contained by: module galacticus_nodes
Modules used: memory_management

function: hothalocoldmodemasscoldcount
Description: Return a count of the number of scalar properties in the massCold property of the HotHaloColdMode component implementation.
Code lines: 7
Contained by: module galacticus_nodes

function: hothalocoldmodemasscoldget
Description: Return the massCold property of the HotHaloColdMode component implementation.
Code lines: 8
Contained by: module galacticus_nodes

subroutine: hothalocoldmodemasscoldrate
Description: Accumulate to the massCold property rate of change of the HotHaloColdMode component implementation.
Code lines: 10
Contained by: module galacticus_nodes

subroutine: hothalocoldmodemasscoldscale
Description: Set the massCold property scale of the HotHaloColdMode component implementation.
Code lines: 8
Contained by: module galacticus_nodes

subroutine: hothalocoldmodemasscoldset
Description: Set the massCold property of the HotHaloColdMode component implementation.
Code lines: 11
Contained by: module galacticus_nodes
Modules used: memory_management

function: hothalocoldmodeouterradiussgrowthrate
Description: Call the deferred function for the outerRadiusGrowthRate method of the HotHaloColdMode component.
19. Source Code Documentation

subroutine: hothalocoldmodeouterradiusgrowthratedeferredfunctionset
Description: Set the function to be used for the outerRadiusGrowthRate method of the HotHaloColdMode component.
Code lines: 8
Contained by: module galacticus_nodes

function: hothalocoldmodeouterradiusgrowthratedfrrdfnctnisset
Description: Return true if the deferred function for the outerRadiusGrowthRate method of the HotHaloColdMode component has been set.
Code lines: 5
Contained by: module galacticus_nodes

subroutine: hothalocoldmodeoutflowreturn
Description: Call the deferred function for the outflowReturn method of the HotHaloColdMode component.
Code lines: 16
Contained by: module galacticus_nodes

subroutine: hothalocoldmodeoutflowreturndfrrdfnctnisset
Description: Set the function to be used for the outflowReturn method of the HotHaloColdMode component.
Code lines: 8
Contained by: module galacticus_nodes

function: hothalocoldmodeoutflowreturndfrrdfnctnisset
Description: Return true if the deferred function for the outflowReturn method of the HotHaloColdMode component has been set.
Code lines: 5
Contained by: module galacticus_nodes

function: hothalocountlinked
Description: Returns the number of hotHalo components in self.
Code lines: 19
Contained by: module galacticus_nodes

subroutine: hothalocreatebyinterrupt
Description: Create the hotHalo component of self via an interrupt.
Code lines: 12
Contained by: module galacticus_nodes

subroutine: hothalocreatelinked
Description: Create the hotHalo component of self.
Code lines: 29
Contained by: module galacticus_nodes

Modules used: galacticus_display iso_varying_string

Contained by: module galacticus_nodes

subroutine: hothalostandardangularmomentumscale
Description: Set the angularMomentum property scale of the HotHaloStandard component implementation.
Code lines: 8
Contained by: module galacticus_nodes

subroutine: hothalostandardangularmomentumset
Description: Set the angularMomentum property of the HotHaloStandard component implementation.
Code lines: 11
Contained by: module galacticus_nodes
Modules used: memory_management

function: hothalostandardchemicalscount
Description: Return a count of the number of scalar properties in the chemicals property of the HotHaloStandard component implementation.
Code lines: 7
Contained by: module galacticus_nodes

function: hothalostandardchemicalsget
Description: Return the chemicals property of the HotHaloStandard component implementation.
Code lines: 8
Contained by: module galacticus_nodes

subroutine: hothalostandardchemicalsrate
Description: Accumulate to the chemicals property rate of change of the HotHaloStandard component implementation.
Code lines: 10
Contained by: module galacticus_nodes

subroutine: hothalostandardchemicalsscale
Description: Set the chemicals property scale of the HotHaloStandard component implementation.
Code lines: 8
Contained by: module galacticus_nodes

subroutine: hothalostandardchemicalsset
Description: Set the chemicals property of the HotHaloStandard component implementation.
Code lines: 11
Contained by: module galacticus_nodes
Modules used: memory_management

subroutine: hothalostandardcreatefunctionset
Description: Set the create function for the HotHaloStandard component.
Code lines: 6
Contained by: module galacticus_nodes

subroutine: hothalostandardheatsourcerate
Description: Set the rate of the heatSource property of the HotHaloStandard component using a deferred function.
Code lines: 10
19.1. Program units

**Contained by:** module galacticus_nodes

**subroutine:** hothalostandardheatsourceratefunction
- **Description:** Set the function to be used for rate of the heatSource property of the HotHaloStandard component class.
- **Code lines:** 8
- **Contained by:** module galacticus_nodes

**function:** hothalostandardheatsourcerateisattached
- **Description:** Return true if the deferred function used to rate the heatSource property of the HotHaloStandard component class has been attached.
- **Code lines:** 5
- **Contained by:** module galacticus_nodes

**subroutine:** hothalostandardhothalocoolingabundancesrate
- **Description:** Set the rate of the hotHaloCoolingAbundances property of the HotHaloStandard component using a deferred function.
- **Code lines:** 10
- **Contained by:** module galacticus_nodes

**subroutine:** hothalostandardhothalocoolingangularmomentumrate
- **Description:** Set the rate of the hotHaloCoolingAngularMomentum property of the HotHaloStandard component using a deferred function.
- **Code lines:** 10
- **Contained by:** module galacticus_nodes

**subroutine:** hothalostandardhothalocoolingmassrate
- **Description:** Set the rate of the hotHaloCoolingMass property of the HotHaloStandard component using a deferred function.
- **Code lines:** 10
- **Contained by:** module galacticus_nodes

**function:** hothalostandardisinitializedget
- **Description:** Return the isInitialized property of the HotHaloStandard component implementation.
- **Code lines:** 8
- **Contained by:** module galacticus_nodes

**subroutine:** hothalostandardisinitializedset
- **Description:** Set the isInitialized property of the HotHaloStandard component implementation.
- **Code lines:** 9
- **Modules used:** memory_management

**function:** hothalostandardmasscount
- **Description:** Return a count of the number of scalar properties in the mass property of the HotHaloStandard component implementation.
- **Code lines:** 7
- **Contained by:** module galacticus_nodes

**function:** hothalostandardmassget
**Description:** Return the mass property of the HotHaloStandard component implementation.

**Code lines:** 8

**Contained by:** module galacticus_nodes

**subroutine: hothalostandardmassrate**

**Description:** Accumulate to the mass property rate of change of the HotHaloStandard component implementation.

**Code lines:** 10

**Contained by:** module galacticus_nodes

**subroutine: hothalostandardmassscale**

**Description:** Set the mass property scale of the HotHaloStandard component implementation.

**Code lines:** 8

**Contained by:** module galacticus_nodes

**subroutine: hothalostandardmassset**

**Description:** Set the mass property of the HotHaloStandard component implementation.

**Code lines:** 11

**Contained by:** module galacticus_nodes

**Modules used:** memory_management

**subroutine: hothalostandardmasssinkrate**

**Description:** Set the rate of the massSink property of the HotHaloStandard component using a deferred function.

**Code lines:** 10

**Contained by:** module galacticus_nodes

**subroutine: hothalostandardmasssinkratefunction**

**Description:** Set the function to be used for rate of the massSink property of the HotHaloStandard component class.

**Code lines:** 8

**Contained by:** module galacticus_nodes

**function: hothalostandardmasssinkrateisattached**

**Description:** Return true if the deferred function used to rate the massSink property of the HotHaloStandard component class has been attached.

**Code lines:** 5

**Contained by:** module galacticus_nodes

**function: hothalostandardouterradiuscount**

**Description:** Return a count of the number of scalar properties in the outerRadius property of the HotHaloStandard component implementation.

**Code lines:** 7

**Contained by:** module galacticus_nodes

**function: hothalostandardouterradiusget**

**Description:** Get the value of the outerRadius property of the HotHaloStandard component using a deferred function.

**Code lines:** 8

**Contained by:** module galacticus_nodes

**subroutine: hothalostandardouterradiusgetfunction**
19.1. Program units

Description: Set the function to be used for get of the outerRadius property of the HotHaloStandard component class.
Code lines: 8
Contained by: module galacticus_nodes

function: hothalostandardouterradiusgetisattached
Description: Return true if the deferred function used to get the outerRadius property of the HotHaloStandard component class has been attached.
Code lines: 5
Contained by: module galacticus_nodes

function: hothalostandardouterradiusgetvalue
Description: Return the outerRadius property of the HotHaloStandard component implementation.
Code lines: 8
Contained by: module galacticus_nodes

function: hothalostandardouterradiusgrowthrate
Description: Call the deferred function for the outerRadiusGrowthRate method of the HotHaloStandard component.
Code lines: 14
Contained by: module galacticus_nodes
Modules used: galacticus_error

subroutine: hothalostandardouterradiusgrowthratedeferredfunctionset
Description: Set the function to be used for the outerRadiusGrowthRate method of the HotHaloStandard component.
Code lines: 8
Contained by: module galacticus_nodes

function: hothalostandardouterradiusgrowthratedfrrdfnctnisset
Description: Return true if the deferred function for the outerRadiusGrowthRate method of the HotHaloStandard component has been set.
Code lines: 5
Contained by: module galacticus_nodes

subroutine: hothalostandardouterradiusrate
Description: Accumulate to the outerRadius property rate of change of the HotHaloStandard component implementation.
Code lines: 10
Contained by: module galacticus_nodes

subroutine: hothalostandardouterradiusscale
Description: Set the outerRadius property scale of the HotHaloStandard component implementation.
Code lines: 8
Contained by: module galacticus_nodes

subroutine: hothalostandardouterradiusset
Description: Set the outerRadius property of the HotHaloStandard component implementation.
Code lines: 11
Contained by: module galacticus_nodes
19. Source Code Documentation

**Modules used:** memory_management

**function:** hothalostandardoutflowedabundancescount

*Description:* Return a count of the number of scalar properties in the outflowedAbundances property of the hotHaloStandard component implementation.

*Code lines:* 7
*Contained by:* module galacticus_nodes

**function:** hothalostandardoutflowedabundancesget

*Description:* Return the outflowedAbundances property of the HotHaloStandard component implementation.

*Code lines:* 8
*Contained by:* module galacticus_nodes

**subroutine:** hothalostandardoutflowedabundancesrate

*Description:* Accumulate to the outflowedAbundances property rate of change of the HotHaloStandard component implementation.

*Code lines:* 10
*Contained by:* module galacticus_nodes

**subroutine:** hothalostandardoutflowedabundancesscale

*Description:* Set the outflowedAbundances property scale of the HotHaloStandard component implementation.

*Code lines:* 8
*Contained by:* module galacticus_nodes

**subroutine:** hothalostandardoutflowedabundancesset

*Description:* Set the outflowedAbundances property of the HotHaloStandard component implementation.

*Code lines:* 11
*Contained by:* module galacticus_nodes
*Modules used:* memory_management

**function:** hothalostandardoutflowedangularmomentumcount

*Description:* Return a count of the number of scalar properties in the outflowedAngularMomentum property of the hotHaloStandard component implementation.

*Code lines:* 7
*Contained by:* module galacticus_nodes

**function:** hothalostandardoutflowedangularmomentumget

*Description:* Return the outflowedAngularMomentum property of the HotHaloStandard component implementation.

*Code lines:* 8
*Contained by:* module galacticus_nodes

**subroutine:** hothalostandardoutflowedangularmomentumrate

*Description:* Accumulate to the outflowedAngularMomentum property rate of change of the HotHaloStandard component implementation.

*Code lines:* 10
*Contained by:* module galacticus_nodes

**subroutine:** hothalostandardoutflowedangularmomentumscale
19.1. Program units

Description: Set the `outflowedAngularMomentum` property scale of the `HotHaloStandard` component implementation.

Code lines: 8

Contained by: module `galacticus_nodes`

**subroutine: hothalostandardoutflowedangularmomentumset**

Description: Set the `outflowedAngularMomentum` property of the `HotHaloStandard` component implementation.

Code lines: 11

Contained by: module `galacticus_nodes`

Modules used: `memory_management`

**function: hothalostandardoutflowedmasscount**

Description: Return a count of the number of scalar properties in the `outflowedMass` property of the `hotHaloStandard` component implementation.

Code lines: 7

Contained by: module `galacticus_nodes`

**function: hothalostandardoutflowedmassget**

Description: Return the `outflowedMass` property of the `HotHaloStandard` component implementation.

Code lines: 8

Contained by: module `galacticus_nodes`

**subroutine: hothalostandardoutflowedmassrate**

Description: Accumulate to the `outflowedMass` property rate of change of the `HotHaloStandard` component implementation.

Code lines: 10

Contained by: module `galacticus_nodes`

**subroutine: hothalostandardoutflowedmassscale**

Description: Set the `outflowedMass` property scale of the `HotHaloStandard` component implementation.

Code lines: 8

Contained by: module `galacticus_nodes`

**subroutine: hothalostandardoutflowedmassset**

Description: Set the `outflowedMass` property of the `HotHaloStandard` component implementation.

Code lines: 11

Contained by: module `galacticus_nodes`

Modules used: `memory_management`

**subroutine: hothalostandardoutflowingabundancesrate**

Description: Set the rate of the `outflowingAbundances` property of the `HotHaloStandard` component using a deferred function.

Code lines: 10

Contained by: module `galacticus_nodes`

**subroutine: hothalostandardoutflowingabundancesratefunction**

Description: Set the function to be used for rate of the `outflowingAbundances` property of the `HotHaloStandard` component class.

Code lines: 8

Contained by: module `galacticus_nodes`
function: hothalostandardoutflowingabundancesrateisattached
Description: Return true if the deferred function used to rate the `outflowingAbundances` property of the `HotHaloStandard` component class has been attached.
Code lines: 5
Contained by: module galacticus_nodes

subroutine: hothalostandardoutflowingangularmomentumrate
Description: Set the rate of the `outflowingAngularMomentum` property of the `HotHaloStandard` component using a deferred function.
Code lines: 10
Contained by: module galacticus_nodes

subroutine: hothalostandardoutflowingangularmomentumratefunction
Description: Set the function to be used for rate of the `outflowingAngularMomentum` property of the `HotHaloStandard` component class.
Code lines: 8
Contained by: module galacticus_nodes

function: hothalostandardoutflowingangularmomentumrateisattached
Description: Return true if the deferred function used to rate the `outflowingAngularMomentum` property of the `HotHaloStandard` component class has been attached.
Code lines: 5
Contained by: module galacticus_nodes

subroutine: hothalostandardoutflowingmassrate
Description: Set the rate of the `outflowingMass` property of the `HotHaloStandard` component using a deferred function.
Code lines: 10
Contained by: module galacticus_nodes

subroutine: hothalostandardoutflowingmassratefunction
Description: Set the function to be used for rate of the `outflowingMass` property of the `HotHaloStandard` component class.
Code lines: 8
Contained by: module galacticus_nodes

function: hothalostandardoutflowingmassrateisattached
Description: Return true if the deferred function used to rate the `outflowingMass` property of the `HotHaloStandard` component class has been attached.
Code lines: 5
Contained by: module galacticus_nodes

subroutine: hothalostandardoutflowreturn
Description: Call the deferred function for the `outflowReturn` method of the `HotHaloStandard` component.
Code lines: 16
Contained by: module galacticus_nodes
Modules used: galacticus_error
19.1. Program units

**subroutine:** hothalostandardoutflowreturndeferredfunctionset
- **Description:** Set the function to be used for the `outflowReturn` method of the `HotHaloStandard` component.
- **Code lines:** 8
- **Contained by:** module `galacticus_nodes`

**function:** hothalostandardoutflowreturndfrrdfnctnisset
- **Description:** Return true if the deferred function for the `outflowReturn` method of the `HotHaloStandard` component has been set.
- **Code lines:** 5
- **Contained by:** module `galacticus_nodes`

**function:** hothalostandardstrippedabundancescount
- **Description:** Return a count of the number of scalar properties in the `strippedAbundances` property of the `hotHaloStandard` component implementation.
- **Code lines:** 7
- **Contained by:** module `galacticus_nodes`

**function:** hothalostandardstrippedabundancesget
- **Description:** Return the `strippedAbundances` property of the `HotHaloStandard` component implementation.
- **Code lines:** 8
- **Contained by:** module `galacticus_nodes`

**subroutine:** hothalostandardstrippedabundancesrate
- **Description:** Accumulate to the `strippedAbundances` property rate of change of the `HotHaloStandard` component implementation.
- **Code lines:** 10
- **Contained by:** module `galacticus_nodes`

**subroutine:** hothalostandardstrippedabundancesscale
- **Description:** Set the `strippedAbundances` property scale of the `HotHaloStandard` component implementation.
- **Code lines:** 8
- **Contained by:** module `galacticus_nodes`

**subroutine:** hothalostandardstrippedabundancesset
- **Description:** Set the `strippedAbundances` property of the `HotHaloStandard` component implementation.
- **Code lines:** 11
- **Contained by:** module `galacticus_nodes`
- **Modules used:** `memory_management`

**function:** hothalostandardstrippedmasscount
- **Description:** Return a count of the number of scalar properties in the `strippedMass` property of the `hotHaloStandard` component implementation.
- **Code lines:** 7
- **Contained by:** module `galacticus_nodes`

**function:** hothalostandardstrippedmassget
Description: Return the strippedMass property of the HotHaloStandard component implementation.
Code lines: 8
Contained by: module galacticus_nodes

subroutine: hothalostandardstrippedmassrate
Description: Accumulate to the strippedMass property rate of change of the HotHaloStandard component implementation.
Code lines: 10
Contained by: module galacticus_nodes

subroutine: hothalostandardstrippedmassscale
Description: Set the strippedMass property scale of the HotHaloStandard component implementation.
Code lines: 8
Contained by: module galacticus_nodes

subroutine: hothalostandardstrippedmassset
Description: Set the strippedMass property of the HotHaloStandard component implementation.
Code lines: 11
Contained by: module galacticus_nodes
Modules used: memory_management

function: hothalostandardunaccretedmasscount
Description: Return a count of the number of scalar properties in the unaccretedMass property of the HotHaloStandard component implementation.
Code lines: 7
Contained by: module galacticus_nodes

function: hothalostandardunaccretedmassget
Description: Return the unaccretedMass property of the HotHaloStandard component implementation.
Code lines: 8
Contained by: module galacticus_nodes

subroutine: hothalostandardunaccretedmassrate
Description: Accumulate to the unaccretedMass property rate of change of the HotHaloStandard component implementation.
Code lines: 10
Contained by: module galacticus_nodes

subroutine: hothalostandardunaccretedmassscale
Description: Set the unaccretedMass property scale of the HotHaloStandard component implementation.
Code lines: 8
Contained by: module galacticus_nodes

subroutine: hothalostandardunaccretedmassset
Description: Set the unaccretedMass property of the HotHaloStandard component implementation.
Code lines: 11
Contained by: module galacticus_nodes
Modules used: memory_management
function: hothalostrippedabundances
Description: Returns the default value for the strippedAbundances property for the hotHalo component class.
Code lines: 8
Contained by: module galacticus_nodes

function: hothalostrippedabundancesattributematch
Description: Return a text list of component implementations in the hotHalo class that have the desired attributes for the strippedAbundances property.
Code lines: 25
Contained by: module galacticus_nodes
Modules used: iso_varying_string

function: hothalostrippedabundancesisgettable
Description: Returns true if the strippedAbundances property is gettable for the hotHalo component class.
Code lines: 6
Contained by: module galacticus_nodes

function: hothalotrackedoutflowabundances
Description: Returns the default value for the trackedOutflowAbundances property for the hotHalo component class.
Code lines: 8
Contained by: module galacticus_nodes

function: hothalotrackedoutflowabundancesattributematch
Description: Return a text list of component implementations in the hotHalo class that have the desired attributes for the trackedOutflowAbundances property.
Code lines: 25
Contained by: module galacticus_nodes
Modules used: iso_varying_string

function: hothalotrackedoutflowabundancesisgettable
Description: Returns true if the trackedOutflowAbundances property is gettable for the hotHalo component class.
Code lines: 6
Contained by: module galacticus_nodes

function: hothalostrippedmass
Description: Returns the default value for the strippedMass property for the hotHalo component class.
Code lines: 8
Contained by: module galacticus_nodes

function: hothalostrippedmassattributematch
Description: Return a text list of component implementations in the hotHalo class that have the desired attributes for the strippedMass property.
Code lines: 25
Contained by: module galacticus_nodes
Modules used: iso_varying_string

function: hothalostrippedmassisgettable
Description: Returns true if the strippedMass property is gettable for the hotHalo component class.
Code lines: 6
Contained by: module galacticus_nodes
function: hothalotrackedoutflowabundancesisgettable
Description: Returns true if the trackedOutflowAbundances property is gettable for the hotHalo component class.
Code lines: 6
Contained by: module galacticus_nodes

function: hothalotrackedoutflowmass
Description: Returns the default value for the trackedOutflowMass property for the hotHalo component class.
Code lines: 8
Contained by: module galacticus_nodes

function: hothalotrackedoutflowmassattributematch
Description: Return a text list of component implementations in the hotHalo class that have the desired attributes for the trackedOutflowMass property
Code lines: 25
Contained by: module galacticus_nodes
Modules used: iso_varying_string

function: hothalotrackedoutflowmassisgettable
Description: Returns true if the trackedOutflowMass property is gettable for the hotHalo component class.
Code lines: 6
Contained by: module galacticus_nodes

function: hothalounaccretedmass
Description: Returns the default value for the unaccretedMass property for the hotHalo component class.
Code lines: 8
Contained by: module galacticus_nodes

function: hothalounaccretedmassattributematch
Description: Return a text list of component implementations in the hotHalo class that have the desired attributes for the unaccretedMass property
Code lines: 25
Contained by: module galacticus_nodes
Modules used: iso_varying_string

function: hothalounaccretedmassisgettable
Description: Returns true if the unaccretedMass property is gettable for the hotHalo component class.
Code lines: 6
Contained by: module galacticus_nodes

subroutine: hothalounaccretedmassrate
Description: Accept a rate set for the unaccretedMass property of the hotHalo component class. Trigger an interrupt to create the component.
Code lines: 15
Contained by: module galacticus_nodes
Modules used: galacticus_error
19.1. Program units

subroutine: hothaloverysimplehothalocoolingmassrate
Description: Set the rate of the hotHaloCoolingMass property of the HotHaloVerySimple component using a deferred function.
Code lines: 10
Contained by: module galacticus_nodes

function: hothaloverysimplemasscount
Description: Return a count of the number of scalar properties in the mass property of the hotHaloVerySimple component implementation.
Code lines: 7
Contained by: module galacticus_nodes

function: hothaloverysimplemassget
Description: Return the mass property of the HotHaloVerySimple component implementation.
Code lines: 8
Contained by: module galacticus_nodes

subroutine: hothaloverysimplemassrate
Description: Accumulate to the mass property rate of change of the HotHaloVerySimple component implementation.
Code lines: 10
Contained by: module galacticus_nodes

subroutine: hothaloverysimplemassscale
Description: Set the mass property scale of the HotHaloVerySimple component implementation.
Code lines: 8
Contained by: module galacticus_nodes

subroutine: hothaloverysimplemassset
Description: Set the mass property of the HotHaloVerySimple component implementation.
Code lines: 11
Contained by: module galacticus_nodes

Modules used: memory_management

function: hothaloverysimpleouterradiusget
Description: Get the value of the outerRadius property of the HotHaloVerySimple component using a deferred function.
Code lines: 8
Contained by: module galacticus_nodes

subroutine: hothaloverysimpleouterradiusgetfunction
Description: Set the function to be used for get of the outerRadius property of the HotHaloVerySimple component class.
Code lines: 8
Contained by: module galacticus_nodes

function: hothaloverysimpleouterradiusgetisattached
Description: Return true if the deferred function used to get the outerRadius property of the HotHaloVerySimple component class has been attached.
Code lines: 5
Contained by: module galacticus_nodes

**subroutine: hothaloverysimpleoutflowingmassrate**

*Description:* Set the rate of the `outflowingMass` property of the `HotHaloVerySimple` component using a deferred function.

Code lines: 10
Contained by: module galacticus_nodes

**subroutine: hothaloverysimpleoutflowingmassratefunction**

*Description:* Set the function to be used for rate of the `outflowingMass` property of the `HotHaloVerySimple` component class.

Code lines: 8
Contained by: module galacticus_nodes

**function: hothaloverysimpleoutflowingmassrateisattached**

*Description:* Return true if the deferred function used to rate the `outflowingMass` property of the `HotHaloVerySimple` component class has been attached.

Code lines: 5
Contained by: module galacticus_nodes

**function: indicesbranchtip**

*Description:* Returns the default value for the `branchTip` property for the `indices` component class.

Code lines: 8
Contained by: module galacticus_nodes

**function: indicesbranchtipattributematch**

*Description:* Return a text list of component implementations in the `indices` class that have the desired attributes for the `branchTip` property.

Code lines: 27
Contained by: module galacticus_nodes

**Modules used:** iso_varying_string

**function: indicesbranchtipisgettable**

*Description:* Returns true if the `branchTip` property is gettable for the `indices` component class.

Code lines: 6
Contained by: module galacticus_nodes

**function: indicescountlinked**

*Description:* Returns the number of `indices` components in `self`.

Code lines: 19
Contained by: module galacticus_nodes

**subroutine: indicescreatebyinterrupt**

*Description:* Create the `indices` component of `self` via an interrupt.

Code lines: 8
Contained by: module galacticus_nodes

**subroutine: indicescreatelinked**
19.1. Program units

*Description:* Create the `indices` component of `self`.
*Code lines:* 29
*Contained by:* module `galacticus_nodes`
*Modules used:* `galacticus_display` `iso_varying_string` `string_handling`

**subroutine:** `indicesdestroylinked`
*Description:* Destroy the `indices` component of `self`.
*Code lines:* 13
*Contained by:* module `galacticus_nodes`

**function:** `indicesget`
*Description:* Returns the `indices` component of `self`.
*Code lines:* 27
*Contained by:* module `galacticus_nodes`
*Modules used:* `galacticus_error`

**function:** `indicesnullbindinginteger0in`
*Description:* A null get function for rank 0 integers.
*Code lines:* 7
*Contained by:* module `galacticus_nodes`

**function:** `indicesnullbindinglonginteger0inout`
*Description:* A null get function for rank 0 integer(kind=kind_int8)s.
*Code lines:* 7
*Contained by:* module `galacticus_nodes`

**subroutine:** `indicesnullbindingrateinteger0in`
*Description:* A null rate function for rank 0 integers.
*Code lines:* 9
*Contained by:* module `galacticus_nodes`

**subroutine:** `indicesnullbindingratelonginteger0inout`
*Description:* A null rate function for rank 0 integer(kind=kind_int8)s.
*Code lines:* 9
*Contained by:* module `galacticus_nodes`

**subroutine:** `indicesnullbindingsetinteger0in`
*Description:* A null set function for rank 0 integers.
*Code lines:* 7
*Contained by:* module `galacticus_nodes`

**subroutine:** `indicesnullbindingsetlonginteger0inout`
*Description:* A null set function for rank 0 integer(kind=kind_int8)s.
*Code lines:* 7
*Contained by:* module `galacticus_nodes`

**function:** `indicesstandardbranchtipget`
*Description:* Return the `branchTip` property of the `IndicesStandard` component implementation.
subroutine: indicesstandardbranchtipset  
Description: Set the branchTip property of the IndicesStandard component implementation.

function: interoutputcountlinked  
Description: Returns the number of interOutput components in self.

subroutine: interoutputcreatebyinterrupt  
Description: Create the interOutput component of self via an interrupt.

subroutine: interoutputcreatelinked  
Description: Create the interOutput component of self.

subroutine: interoutputdestroylinked  
Description: Destroy the interOutput component of self.

function: interoutputdiskstarformationrate  
Description: Returns the default value for the diskStarFormationRate property for the interOutput component class.

function: interoutputdiskstarformationrateattributematch  
Description: Return a text list of component implementations in the interOutput class that have the desired attributes for the diskStarFormationRate property

function: interoutputdiskstarformationrateisgettable  
Description: Returns true if the diskStarFormationRate property is gettable for the interOutput component class.
subroutine: interoutputdiskstarformationraterate
Description: Accept a rate set for the diskStarFormationRate property of the interOutput component class. Trigger an interrupt to create the component.
Code lines: 15
Contained by: module galacticus_nodes
Modules used: galacticus_error

function: interoutputget
Description: Returns the interOutput component of self.
Code lines: 27
Contained by: module galacticus_nodes
Modules used: galacticus_error

function: interoutputnullbindingdouble0inout
Description: A null get function for rank 0 double precisions.
Code lines: 7
Contained by: module galacticus_nodes

function: interoutputnullbindinginteger0in
Description: A null get function for rank 0 integers.
Code lines: 7
Contained by: module galacticus_nodes

subroutine: interoutputnullbindingratedouble0inout
Description: A null rate function for rank 0 double precisions.
Code lines: 9
Contained by: module galacticus_nodes

subroutine: interoutputnullbindingrateinteger0in
Description: A null rate function for rank 0 integers.
Code lines: 9
Contained by: module galacticus_nodes

subroutine: interoutputnullbindingsetdouble0inout
Description: A null set function for rank 0 double precisions.
Code lines: 7
Contained by: module galacticus_nodes

subroutine: interoutputnullbindingsetinteger0in
Description: A null set function for rank 0 integers.
Code lines: 7
Contained by: module galacticus_nodes

function: interoutputspheroidstarformationrate
Description: Returns the default value for the spheroidStarFormationRate property for the interOutput component class.
Code lines: 12
Contained by: module galacticus_nodes
function: interoutputspheroidstarformationrateattributematch
Description: Return a text list of component implementations in the interOutput class that have the desired attributes for the spheroidStarFormationRate property
Code lines: 25
Contained by: module galacticus_nodes
Modules used: iso_varying_string

function: interoutputspheroidstarformationrateisgettable
Description: Returns true if the spheroidStarFormationRate property is gettable for the interOutput component class.
Code lines: 7
Contained by: module galacticus_nodes

subroutine: interoutputspheroidstarformationraterate
Description: Accept a rate set for the spheroidStarFormationRate property of the interOutput component class. Trigger an interrupt to create the component.
Code lines: 15
Contained by: module galacticus_nodes
Modules used: galacticus_error

function: interoutputstandarddiskstarformationratecount
Description: Return a count of the number of scalar properties in the diskStarFormationRate property of the InterOutputStandard component implementation.
Code lines: 7
Contained by: module galacticus_nodes

19. Source Code Documentation

**Description:** Return a text list of component implementations in the `massFlowStatistics` class that have the desired attributes for the `cooledMass` property

**Code lines:** 25

**Contained by:** module `galacticus_nodes`

**Modules used:** `iso_varying_string`

**function: massflowstatisticscooledmassisgettable**

**Description:** Returns true if the `cooledMass` property is gettable for the `massFlowStatistics` component class.

**Code lines:** 6

**Contained by:** module `galacticus_nodes`

**function: massflowstatisticscountlinked**

**Description:** Returns the number of `massFlowStatistics` components in `self`.

**Code lines:** 19

**Contained by:** module `galacticus_nodes`

**subroutine: massflowstatisticscreatebyinterrupt**

**Description:** Create the `massFlowStatistics` component of `self` via an interrupt.

**Code lines:** 8

**Contained by:** module `galacticus_nodes`

**subroutine: massflowstatisticscreatelinked**

**Description:** Create the `massFlowStatistics` component of `self`.

**Code lines:** 29

**Contained by:** module `galacticus_nodes`

**Modules used:** `galacticus_display` `iso_varying_string` `string_handling`

**subroutine: massflowstatisticsdestroylinked**

**Description:** Destroy the `massFlowStatistics` component of `self`.

**Code lines:** 13

**Contained by:** module `galacticus_nodes`

**function: massflowstatisticsget**

**Description:** Returns the `massFlowStatistics` component of `self`.

**Code lines:** 27

**Contained by:** module `galacticus_nodes`

**Modules used:** `galacticus_error`

**function: massflowstatisticsnullbindingdouble0inout**

**Description:** A null get function for rank 0 double precisions.

**Code lines:** 7

**Contained by:** module `galacticus_nodes`

**function: massflowstatisticsnullbindinginteger0in**

**Description:** A null get function for rank 0 integers.

**Code lines:** 7

**Contained by:** module `galacticus_nodes`

Modules used: fox_dom  memory_management  galacticus_error

function: node_component_agestatisticsstandard_count
Description: Return a count of the serialization of a standard implementation of the ageStatistics component.
Code lines: 8
Contained by: module galacticus_nodes

subroutine: node_component_agestatisticsstandard_deserialize_rates
Description: Serialize rates of a standard implementation of the ageStatistics component.
Code lines: 17
Contained by: module galacticus_nodes

subroutine: node_component_agestatisticsstandard_deserialize_scales
Description: Serialize scales of a standard implementation of the ageStatistics component.
Code lines: 17
Contained by: module galacticus_nodes

subroutine: node_component_agestatisticsstandard_deserialize_values
Description: Serialize values of a standard implementation of the ageStatistics component.
Code lines: 17
Contained by: module galacticus_nodes

subroutine: node_component_agestatisticsstandard_destroy
Description: Destroy a standard implementation of the ageStatistics component.
Code lines: 7
Contained by: module galacticus_nodes
Modules used: memory_management

subroutine: node_component_agestatisticsstandard_dump
Description: Dump the contents of a standard implementation of the ageStatistics component.
Code lines: 25
Contained by: module galacticus_nodes
Modules used: galacticus_display  iso_varying_string  string_handling

subroutine: node_component_agestatisticsstandard_dump_raw
Description: Dump the contents of a standard implementation of the ageStatistics component in binary.
Code lines: 11
Contained by: module galacticus_nodes

subroutine: node_component_agestatisticsstandard_dump_xml
Description: Dump the contents of a standard implementation of the ageStatistics component to XML.
Code lines: 13
Contained by: module galacticus_nodes

subroutine: node_component_agestatisticsstandard_initalizor
Description: Initialize a standard implementation of the ageStatistics component.
function: node_component_agestatisticsstandard_is_active
Description: Return true if the standard implementation of the ageStatistics component is the active choice.
Code lines: 6
Contained by: module galacticus_nodes

subroutine: node_component_agestatisticsstandard_name_from_index
Description: Return the name of the property of given index for a standard implementation of the ageStatistics component.
Code lines: 29
Contained by: module galacticus_nodes
Modules used: iso_varying_string

subroutine: node_component_agestatisticsstandard_ode_step_rates_init
Description: Initialize rates in a standard implementation of the ageStatistics component for an ODE solver step.
Code lines: 10
Contained by: module galacticus_nodes

subroutine: node_component_agestatisticsstandard_ode_stepscalesinit
Description: Initialize scales in a standard implementation of the ageStatistics component for an ODE solver step.
Code lines: 9
Contained by: module galacticus_nodes

subroutine: node_component_agestatisticsstandard_output_count
Description: Increment output property count for a standard implementation of the ageStatistics component.
Code lines: 10
Contained by: module galacticus_nodes

subroutine: node_component_agestatisticsstandard_output_names
Description: Establish property names for a standard implementation of the ageStatistics component.
Code lines: 63
Contained by: module galacticus_nodes

**subroutine**: node_component_blackholenull_odestepscalesinit
*Description*: Initialize scales in a null implementation of the blackHole component for an ODE solver step.
*Code lines*: 5
*Contained by*: module galacticus_nodes

**subroutine**: node_component_blackholenull_output_count
*Description*: Increment output property count for a null implementation of the blackHole component.
*Code lines*: 9
*Contained by*: module galacticus_nodes

**subroutine**: node_component_blackholenull_output_names
*Description*: Establish property names for a null implementation of the blackHole component.
*Code lines*: 11
*Contained by*: module galacticus_nodes

**subroutine**: node_component_blackholenull_read_raw
*Description*: Read the contents of a null implementation of the blackHole component in binary.
*Code lines*: 8
*Contained by*: module galacticus_nodes
*Modules used*: memory_management

**subroutine**: node_component_blackholenull_serialize_rates
19. Source Code Documentation

Description: Serialize rates of a null implementation of the blackHole component.
Code lines: 7
Contained by: module galacticus_nodes

subroutine: node_component_blackholenull_serialize_scales
Description: Serialize scales of a null implementation of the blackHole component.
Code lines: 7
Contained by: module galacticus_nodes

subroutine: node_component_blackholenull_serialize_values
Description: Serialize values of a null implementation of the blackHole component.
Code lines: 7
Contained by: module galacticus_nodes

function: node_component_blackholenull_type
Description: Returns the type for the null implementation of the blackHole component.
Code lines: 8
Contained by: module galacticus_nodes

subroutine: node_component_blackholesimple_builder
Description: Build a simple implementation of the blackHole component.
Code lines: 19
Contained by: module galacticus_nodes
Modules used: fox_dom memory_management galacticus_error

function: node_component_blackholesimple_count
Description: Return a count of the serialization of a simple implementation of the blackHole component.
Code lines: 8
Contained by: module galacticus_nodes

subroutine: node_component_blackholesimple_deserialize_rates
Description: Serialize rates of a simple implementation of the blackHole component.
Code lines: 11
Contained by: module galacticus_nodes

subroutine: node_component_blackholesimple_deserialize_scales
Description: Serialize scales of a simple implementation of the blackHole component.
Code lines: 11
Contained by: module galacticus_nodes

subroutine: node_component_blackholesimple_deserialize_values
Description: Serialize values of a simple implementation of the blackHole component.
Code lines: 11
Contained by: module galacticus_nodes

subroutine: node_component_blackholesimple_destroy
Description: Destroy a simple implementation of the blackHole component.
Code lines: 7

function: node_component_darkmatterprofilescaleshape_deserialize_type
Description: Returns the type for the scaleShape implementation of the darkMatterProfile component.
Code lines: 8
Contained by: module galacticus_nodes

subroutine: node_component_darkmatterprofilescaleshape_serialize_rates
Description: Serialize rates of a scalePreset implementation of the darkMatterProfile component.
Code lines: 11
Contained by: module galacticus_nodes

subroutine: node_component_darkmatterprofilescaleshape_serialize_scales
Description: Serialize scales of a scalePreset implementation of the darkMatterProfile component.
Code lines: 11
Contained by: module galacticus_nodes

subroutine: node_component_darkmatterprofilescaleshape_serialize_values
Description: Serialize values of a scalePreset implementation of the darkMatterProfile component.
Code lines: 11
Contained by: module galacticus_nodes

function: node_component_darkmatterprofilescaleshape_serialize_type
Description: Returns the type for the scaleShape implementation of the darkMatterProfile component.
Code lines: 8
Contained by: module galacticus_nodes

subroutine: node_component_darkmatterprofilescaleshape_builder
Description: Build a scaleShape implementation of the darkMatterProfile component.
Code lines: 26
Contained by: module galacticus_nodes
Modules used: fox_dom galacticus_error memory_management

function: node_component_darkmatterprofilescaleshape_count
Description: Return a count of the serialization of a scaleShape implementation of the darkMatterProfile component.
Code lines: 8
Contained by: module galacticus_nodes

subroutine: node_component_darkmatterprofilescaleshape_deserialize_rates
Description: Serialize rates of a scaleShape implementation of the darkMatterProfile component.
Code lines: 16
Contained by: module galacticus_nodes

subroutine: node_component_darkmatterprofilescaleshape_deserialize_scales
Description: Serialize scales of a scaleShape implementation of the darkMatterProfile component.
Code lines: 16
Contained by: module galacticus_nodes

subroutine: node_component_darkmatterprofilescaleshape_deserialize_values
Description: Serialize values of a scaleShape implementation of the darkMatterProfile component.
Code lines: 16
Contained by: module galacticus_nodes

function: node_component_darkmatterprofilescaleshape_deserialize_type
Description: Returns the type for the scaleShape implementation of the darkMatterProfile component.
Code lines: 8
Contained by: module galacticus_nodes

subroutine: node_component_darkmatterprofilescaleshape_serialize_rates
Description: Serialize rates of a scalePreset implementation of the darkMatterProfile component.
Code lines: 11
Contained by: module galacticus_nodes

subroutine: node_component_darkmatterprofilescaleshape_serialize_scales
Description: Serialize scales of a scalePreset implementation of the darkMatterProfile component.
Code lines: 11
Contained by: module galacticus_nodes

subroutine: node_component_darkmatterprofilescaleshape_serialize_values
Description: Serialize values of a scalePreset implementation of the darkMatterProfile component.
Code lines: 11
Contained by: module galacticus_nodes

function: node_component_darkmatterprofilescaleshape_serialize_type
Description: Returns the type for the scaleShape implementation of the darkMatterProfile component.
Code lines: 8
Contained by: module galacticus_nodes
19. Source Code Documentation

**Contained by:** module galacticus_nodes

**subroutine:** node_component_darkmatterprofilescaleshape_deserialize_values
**Description:** Serialize values of a scaleShape implementation of the darkMatterProfile component.
**Code lines:** 16
**Contained by:** module galacticus_nodes

**subroutine:** node_component_darkmatterprofilescaleshape_destroy
**Description:** Destroy a scaleShape implementation of the darkMatterProfile component.
**Code lines:** 7
**Contained by:** module galacticus_nodes
**Modules used:** memory_management

**subroutine:** node_component_darkmatterprofilescaleshape_dump
**Description:** Dump the contents of a scaleShape implementation of the darkMatterProfile component.
**Code lines:** 20
**Contained by:** module galacticus_nodes
**Modules used:** galacticus_display iso_varying_string string_handling

**subroutine:** node_component_darkmatterprofilescaleshape_dump_raw
**Description:** Dump the contents of a scaleShape implementation of the darkMatterProfile component in binary.
**Code lines:** 10
**Contained by:** module galacticus_nodes

**subroutine:** node_component_darkmatterprofilescaleshape_dump_xml
**Description:** Dump the contents of a scaleShape implementation of the darkMatterProfile component to XML.
**Code lines:** 12
**Contained by:** module galacticus_nodes

**subroutine:** node_component_darkmatterprofilescaleshape_initializor
**Description:** Initialize a scaleShape implementation of the darkMatterProfile component.
**Code lines:** 10
**Contained by:** module galacticus_nodes
**Modules used:** memory_management

**function:** node_component_darkmatterprofilescaleshape_is_active
**Description:** Return true if the scaleShape implementation of the darkMatterProfile component is the active choice.
**Code lines:** 6
**Contained by:** module galacticus_nodes

**subroutine:** node_component_darkmatterprofilescaleshape_name_from_index
**Description:** Return the name of the property of given index for a scaleShape implementation of the darkMatterProfile component.
**Code lines:** 16
**Contained by:** module galacticus_nodes
**Modules used:** iso_varying_string
subroutine: node_component_darkmatterprofilescaleshape_ode_step_rates_init
Description: Initialize rates in a scaleShape implementation of the darkMatterProfile component for an ODE solver step.
Code lines: 8
Contained by: module galacticus_nodes

subroutine: node_component_darkmatterprofilescaleshape_odestepscalesinit
Description: Initialize scales in a scaleShape implementation of the darkMatterProfile component for an ODE solver step.
Code lines: 7
Contained by: module galacticus_nodes

subroutine: node_component_darkmatterprofilescaleshape_output_count
Description: Increment output property count for a scaleShape implementation of the darkMatterProfile component.
Code lines: 11
Contained by: module galacticus_nodes

subroutine: node_component_darkmatterprofilescaleshape_output_names
Description: Establish property names for a scaleShape implementation of the darkMatterProfile component.
Code lines: 25
Contained by: module galacticus_nodes

subroutine: node_component_darkmatterprofilescaleshape_read_raw
Description: Read the contents of a scaleShape implementation of the darkMatterProfile component in binary.
Code lines: 11
Contained by: module galacticus_nodes
Modules used: memory_management

subroutine: node_component_darkmatterprofilescaleshape_serialize_rates
Description: Serialize rates of a scaleShape implementation of the darkMatterProfile component.
Code lines: 16
Contained by: module galacticus_nodes

subroutine: node_component_darkmatterprofilescaleshape_serialize_scales
Description: Serialize scales of a scaleShape implementation of the darkMatterProfile component.
Code lines: 16
Contained by: module galacticus_nodes

subroutine: node_component_darkmatterprofilescaleshape_serialize_values
Description: Serialize values of a scaleShape implementation of the darkMatterProfile component.
Code lines: 16
Contained by: module galacticus_nodes

function: node_component_darkmatterprofilescaleshape_type
Description: Returns the type for the scaleShape implementation of the darkMatterProfile component.
19. Source Code Documentation

Code lines: 8
Contained by: module galacticus_nodes

**function: node_component_density_null**
Description: A null implementation of the density in a component. Always returns zero.
Code lines: 10
Contained by: module galacticus_nodes

**subroutine: node_component_deserialize_null**
Description: Deserialize a generic treenode component.
Code lines: 7
Contained by: module galacticus_nodes

**subroutine: node_component_disk_builder**
Description: Build a generic disk component.
Code lines: 10
Contained by: module galacticus_nodes
Modules used: fox_dom galacticus_error

**subroutine: node_component_disk_destroy**
Description: Destroys a disk component.
Code lines: 7
Contained by: module galacticus_nodes

**subroutine: node_component_disk_dump**
Description: Dump the contents of a generic disk component.
Code lines: 10
Contained by: module galacticus_nodes
Modules used: galacticus_display iso_varying_string

**subroutine: node_component_disk_exponential_attach_pipes**
Description: Attach cooling pipes to the exponential disk component.
Code lines: 14
Contained by: module galacticus_nodes
Modules used: galacticus_error

**function: node_component_disk_exponential_density**
Description: Computes the density at a given position for an exponential disk.
Code lines: 52
Contained by: module galacticus_nodes
Modules used: coordinate_systems galactic_structure_options	node_component_disk_exponential_data numerical_constants_math
tables

**function: node_component_disk_exponential_enclosed_mass**
Description: Computes the mass within a given radius for an exponential disk.
Code lines: 45
Contained by: module galacticus_nodes
Modules used: galactic_structure_options node_component_disk_exponential_data
19.1. Program units

tables

**function**: node_component_disk_exponential_half_mass_radius
*Description*: Return the half-mass radius of the exponential disk.
*Code lines*: 8
*Contained by*: module galacticus_nodes

**function**: node_component_disk_exponential_potential
*Description*: Compute the gravitational potential due to an exponential disk.
*Code lines*: 42
*Contained by*: module galacticus_nodes
*Modules used*: bessel_functions, galactic_structure_options, node_component_disk_exponential_data, numerical_constants_physical, tables

**function**: node_component_disk_exponential_rotation_curve
*Description*: Computes the rotation curve at a given radius for an exponential disk.
*Code lines*: 45
*Contained by*: module galacticus_nodes
*Modules used*: galactic_structure_options, node_component_disk_exponential_data, numerical_constants_physical, tables

**function**: node_component_disk_exponential_rotation_curve_gradient
*Description*: Computes the rotation curve gradient for an exponential disk.
*Code lines*: 33
*Contained by*: module galacticus_nodes
*Modules used*: galactic_structure_options, node_component_disk_exponential_data, numerical_constants_physical, tables

dependencies: galacticus_error

**function**: node_component_disk_exponential_surface_density
*Description*: Computes the surface density at a given position for an exponential disk.
*Code lines*: 67
*Contained by*: module galacticus_nodes
*Modules used*: galactic_structure_options, node_component_disk_exponential_data, numerical_constants_math, tables

**subroutine**: node_component_disk_initializor
*Description*: Initialize a generic disk component.
*Code lines*: 8
*Contained by*: module galacticus_nodes
*Modules used*: galacticus_error

**subroutine**: node_component_disk_move
*Description*: Move instances of the disk component, from one node to another.
*Code lines*: 81
*Contained by*: module galacticus_nodes
*Modules used*: galacticus_error
subroutine: node_component_disk_output
Description: Output properties for a disk component.
Code lines: 41
Contained by: module galacticus_nodes

subroutine: node_component_disk_output_count
Description: Increment the count of properties to output for a generic disk component.
Code lines: 13
Contained by: module galacticus_nodes

subroutine: node_component_disk_output_names
Description: Establish property names for a generic disk component.
Code lines: 15
Contained by: module galacticus_nodes

subroutine: node_component_disk_remove
Description: Removes an instance of the disk component, shifting other instances to keep the array contiguous.
Code lines: 47
Contained by: module galacticus_nodes

**Code lines:** 6
**Contained by:** module galacticus_nodes

**subroutine:** node_component_mergingstatisticsnull_name_from_index
**Description:** Return the name of the property of given index for a null implementation of the mergingStatistics component.
**Code lines:** 9
**Contained by:** module galacticus_nodes
**Modules used:** iso_varying_string

**subroutine:** node_component_mergingstatisticsnull_ode_step_rates_init
**Description:** Initialize rates in a null implementation of the mergingStatistics component for an ODE solver step.
**Code lines:** 6
**Contained by:** module galacticus_nodes

**subroutine:** node_component_mergingstatisticsnull_odestepscalesinit
**Description:** Initialize scales in a null implementation of the mergingStatistics component for an ODE solver step.
**Code lines:** 5
**Contained by:** module galacticus_nodes

**subroutine:** node_component_mergingstatisticsnull_output_count
**Description:** Increment output property count for a null implementation of the mergingStatistics component.
**Code lines:** 9
**Contained by:** module galacticus_nodes

**subroutine:** node_component_mergingstatisticsnull_output_names
**Description:** Establish property names for a null implementation of the mergingStatistics component.
**Code lines:** 11
**Contained by:** module galacticus_nodes

**subroutine:** node_component_mergingstatisticsnull_read_raw
**Description:** Read the contents of a null implementation of the mergingStatistics component in binary.
**Code lines:** 8
**Contained by:** module galacticus_nodes
**Modules used:** memory_management

**subroutine:** node_component_mergingstatisticsnull_serialize_rates
**Description:** Serialize rates of a null implementation of the mergingStatistics component.
**Code lines:** 7
**Contained by:** module galacticus_nodes
subroutine: node_component_mergingstatisticsnull_serialize_scales
Description: Serialize scales of a null implementation of the mergingStatistics component.
Code lines: 7
Contained by: module galacticus_nodes

subroutine: node_component_mergingstatisticsnull_serialize_values
Description: Serialize values of a null implementation of the mergingStatistics component.
Code lines: 7
Contained by: module galacticus_nodes

function: node_component_mergingstatisticsnull_type
Description: Returns the type for the null implementation of the mergingStatistics component.
Code lines: 8
Contained by: module galacticus_nodes

subroutine: node_component_mergingstatisticsrecent_builder
Description: Build a recent implementation of the mergingStatistics component.
Code lines: 22
Contained by: module galacticus_nodes
Modules used: fox_dom galacticus_error memory_management

function: node_component_mergingstatisticsrecent_count
Description: Return a count of the serialization of a recent implementation of the mergingStatistics component.
Code lines: 7
Contained by: module galacticus_nodes

subroutine: node_component_mergingstatisticsrecent_deserialize_rates
Description: Serialize rates of a recent implementation of the mergingStatistics component.
Code lines: 7
Contained by: module galacticus_nodes

subroutine: node_component_mergingstatisticsrecent_deserialize_scales
Description: Serialize scales of a recent implementation of the mergingStatistics component.
Code lines: 7
Contained by: module galacticus_nodes

subroutine: node_component_mergingstatisticsrecent_deserialize_values
Description: Serialize values of a recent implementation of the mergingStatistics component.
Code lines: 7
Contained by: module galacticus_nodes

19. Source Code Documentation

**Description:** Establish property names for a preset implementation of the position component.

**Code lines:** 53

**Contained by:** module galacticus_nodes

**subroutine: node_component_positionpreset_read_raw**

**Description:** Read the contents of a preset implementation of the position component in binary.

**Code lines:** 23

**Contained by:** module galacticus_nodes

**Modules used:** memory_management

**subroutine: node_component_positionpreset_serialize_rates**

**Description:** Serialize rates of a preset implementation of the position component.

**Code lines:** 7

**Contained by:** module galacticus_nodes

**subroutine: node_component_positionpreset_serialize_scales**

**Description:** Serialize scales of a preset implementation of the position component.

**Code lines:** 7

**Contained by:** module galacticus_nodes

**subroutine: node_component_positionpreset_serialize_values**

**Description:** Serialize values of a preset implementation of the position component.

**Code lines:** 7

**Contained by:** module galacticus_nodes

**function: node_component_positionpreset_type**

**Description:** Returns the type for the preset implementation of the position component.

**Code lines:** 8

**Contained by:** module galacticus_nodes

**function: node_component_potential_null**

**Description:** A null implementation of the gravitational potential in a component. Always returns zero.

**Code lines:** 10

**Contained by:** module galacticus_nodes

**function: node_component_rotation_curve_gradient_null**

**Description:** A null implementation of the gradient of the rotation curve due to a component. Always returns zero.

**Code lines:** 10

**Contained by:** module galacticus_nodes

**function: node_component_rotation_curve_null**

**Description:** A null implementation of the rotation curve due to a component. Always returns zero.

**Code lines:** 10

**Contained by:** module galacticus_nodes

**subroutine: node_component_satellite_builder**

**Description:** Build a generic satellite component.

**Code lines:** 10

19.1. Program units

**Contained by:** module galacticus_nodes

**subroutine:** node_component_satellitenull_deserialize_rates
*Description:* Serialize rates of a null implementation of the satellite component.
*Code lines:* 7
*Contained by:* module galacticus_nodes

**subroutine:** node_component_satellitenull_deserialize_scales
*Description:* Serialize scales of a null implementation of the satellite component.
*Code lines:* 7
*Contained by:* module galacticus_nodes

**subroutine:** node_component_satellitenull_deserialize_values
*Description:* Serialize values of a null implementation of the satellite component.
*Code lines:* 7
*Contained by:* module galacticus_nodes

**subroutine:** node_component_satellitenull_destroy
*Description:* Destroy a null implementation of the satellite component.
*Code lines:* 7
*Contained by:* module galacticus_nodes
*Modules used:* memory_management

**subroutine:** node_component_satellitenull_dump
*Description:* Dump the contents of a null implementation of the satellite component.
*Code lines:* 9
*Contained by:* module galacticus_nodes
*Modules used:* galacticus_display iso_varying_string string_handling

**subroutine:** node_component_satellitenull_dump_raw
*Description:* Dump the contents of a null implementation of the satellite component in binary.
*Code lines:* 7
*Contained by:* module galacticus_nodes

**subroutine:** node_component_satellitenull_dump_xml
*Description:* Dump the contents of a null implementation of the satellite component to XML.
*Code lines:* 7
*Contained by:* module galacticus_nodes

**subroutine:** node_component_satellitenull_initializor
*Description:* Initialize a null implementation of the satellite component.
*Code lines:* 7
*Contained by:* module galacticus_nodes
*Modules used:* memory_management

**function:** node_component_satellitenull_is_active
*Description:* Return true if the null implementation of the satellite component is the active choice.
*Code lines:* 6
19. Source Code Documentation

**Contained by:** module galacticus_nodes

**subroutine:** node_component_satellitenull_name_from_index

*Description:* Return the name of the property of given index for a null implementation of the satellite component.

*Code lines:* 9

**Contained by:** module galacticus_nodes

**Modules used:** iso_varying_string

**subroutine:** node_component_satellitenull_ode_step_rates_init

*Description:* Initialize rates in a null implementation of the satellite component for an ODE solver step.

*Code lines:* 6

**Contained by:** module galacticus_nodes

**subroutine:** node_component_satellitenull_odestepscalesinit

*Description:* Initialize scales in a null implementation of the satellite component for an ODE solver step.

*Code lines:* 5

**Contained by:** module galacticus_nodes

**subroutine:** node_component_satellitenull_output_count

*Description:* Increment output property count for a null implementation of the satellite component.

*Code lines:* 9

**Contained by:** module galacticus_nodes

**subroutine:** node_component_satellitenull_output_names

*Description:* Establish property names for a null implementation of the satellite component.

*Code lines:* 11

**Contained by:** module galacticus_nodes

**subroutine:** node_component_satellitenull_read_raw

*Description:* Read the contents of a null implementation of the satellite component in binary.

*Code lines:* 8

**Modules used:** module galacticus_nodes

**subroutine:** node_component_satellitenull_serialize_rates

*Description:* Serialize rates of a null implementation of the satellite component.

*Code lines:* 7

**Contained by:** module galacticus_nodes

**subroutine:** node_component_satellitenull_serialize_scales

*Description:* Serialize scales of a null implementation of the satellite component.

*Code lines:* 7

**Contained by:** module galacticus_nodes

**subroutine:** node_component_satellitenull_serialize_values

*Description:* Serialize values of a null implementation of the satellite component.

*Code lines:* 7

**Contained by:** module galacticus_nodes
function: node_component_satellitenull_type
Description: Returns the type for the null implementation of the satellite component.
Code lines: 8
Contained by: module galacticus_nodes

subroutine: node_component_serialize_null
Description: Serialize a generic tree node component.
Code lines: 7
Contained by: module galacticus_nodes

subroutine: node_component_spheroid_builder
Description: Build a generic spheroid component.
Code lines: 10
Contained by: module galacticus_nodes
Modules used: fox_dom galacticus_error
subroutine: node_component_spheroid_destroy
Description:        Destroys a spheroid component.
Code lines:          7
Contained by:        module galacticus_nodes

subroutine: node_component_spheroid_dump
Description:        Dump the contents of a generic spheroid component.
Code lines:          10
Contained by:        module galacticus_nodes
Modules used:        galacticus_display iso_varying_string

subroutine: node_component_spheroid_initializor
Description:        Initialize a generic spheroid component.
Code lines:          8
Contained by:        module galacticus_nodes
Modules used:        galacticus_error

subroutine: node_component_spheroid_move
Description:        Move instances of the spheroid component, from one node to another.
Code lines:          67
Contained by:        module galacticus_nodes
Modules used:        galacticus_error

subroutine: node_component_spheroid_output
Description:        Output properties for a spheroid component.
Code lines:          35
Contained by:        module galacticus_nodes

subroutine: node_component_spheroid_output_count
Description:        Increment the count of properties to output for a generic spheroid component.
Code lines:          13
Contained by:        module galacticus_nodes

subroutine: node_component_spheroid_output_names
Description:        Establish property names for a generic spheroid component.
Code lines:          15
Contained by:        module galacticus_nodes

subroutine: node_component_spheroid_remove
Description:        Removes an instance of the spheroid component, shifting other instances to keep the array contiguous.
Code lines:          39
Contained by:        module galacticus_nodes
Modules used:        galacticus_error

function: node_component_spheroid_standard_density
Description:        Computes the density at a given position for an standard spheroid.
Code lines:          49
19. Source Code Documentation

Contains by: module galacticus_nodes
Modules used: coordinates galactic_structure_options
node_component_spheroid_standard_data numerical_constants_math

function node_component_spheroid_standard_enclosed_mass
Description: Computes the mass within a given radius for an standard spheroid.
Code lines: 45
Contained by: module galacticus_nodes
Modules used: galactic_structure_options node_component_spheroid_standard_data

function node_component_spheroid_standard_half_mass_radius
Description: Return the half-mass radius of the standard spheroid.
Code lines: 12
Contained by: module galacticus_nodes
Modules used: mass_distributions node_component_spheroid_standard_data

function node_component_spheroid_standard_potential
Description: Return the potential due to the standard spheroid.
Code lines: 30
Contained by: module galacticus_nodes
Modules used: coordinates galactic_structure_options
node_component_spheroid_standard_data numerical_constants_physical

function node_component_spheroid_standard_rotation_curve
Description: Computes the rotation curve at a given radius for a standard spheroid.
Code lines: 21
Contained by: module galacticus_nodes
Modules used: galactic_structure_options numerical_constants_physical

function node_component_spheroid_standard_rotation_curve_gradient
Description: Computes the rotation curve gradient for the standard spheroid.
Code lines: 26
Contained by: module galacticus_nodes
Modules used: galactic_structure_options numerical_constants_math
numerical_constants_physical numerical_constants_prefixes

function node_component_spheroid_type
Description: Returns the type for the spheroid component.
Code lines: 8
Contained by: module galacticus_nodes

subroutine node_component_spheroidnull_builder
Description: Build a null implementation of the spheroid component.
Code lines: 10
Contained by: module galacticus_nodes
Modules used: fox_dom galacticus_error
memory_management
function: node_component_spheroidnull_count
Description: Return a count of the serialization of a null implementation of the spheroid component.
Code lines: 7
Contained by: module galacticus_nodes

subroutine: node_component_spheroidnull_deserialize_rates
Description: Serialize rates of a null implementation of the spheroid component.
Code lines: 7
Contained by: module galacticus_nodes

subroutine: node_component_spheroidnull_deserialize_scales
Description: Serialize scales of a null implementation of the spheroid component.
Code lines: 7
Contained by: module galacticus_nodes

subroutine: node_component_spheroidnull_deserialize_values
Description: Serialize values of a null implementation of the spheroid component.
Code lines: 7
Contained by: module galacticus_nodes

subroutine: node_component_spheroidnull_destroy
Description: Destroy a null implementation of the spheroid component.
Code lines: 7
Contained by: module galacticus_nodes
Modules used: memory_management

subroutine: node_component_spheroidnull_dump
Description: Dump the contents of a null implementation of the spheroid component.
Code lines: 9
Contained by: module galacticus_nodes
Modules used: galacticus_display iso_varying_string string_handling

subroutine: node_component_spheroidnull_dump_raw
Description: Dump the contents of a null implementation of the spheroid component in binary.
Code lines: 7
Contained by: module galacticus_nodes

subroutine: node_component_spheroidnull_dump_xml
Description: Dump the contents of a null implementation of the spheroid component to XML.
Code lines: 7
Contained by: module galacticus_nodes

subroutine: node_component_spheroidnull_initializor
Description: Initialize a null implementation of the spheroid component.
Code lines: 7
Contained by: module galacticus_nodes
19. Source Code Documentation

Modules used: memory_management

function: node_component_spheroidnull_is_active
Description: Return true if the null implementation of the spheroid component is the active choice.
Code lines: 6
contained by: module galacticus_nodes

subroutine: node_component_spheroidnull_name_from_index
Description: Return the name of the property of given index for a null implementation of the spheroid component.
Code lines: 9
Contains by: module galacticus_nodes
Modules used: iso_varying_string

subroutine: node_component_spheroidnull_ode_step_rates_init
Description: Initialize rates in a null implementation of the spheroid component for an ODE solver step.
Code lines: 6
Contains by: module galacticus_nodes

subroutine: node_component_spheroidnull_odestepscalesinit
Description: Initialize scales in a null implementation of the spheroid component for an ODE solver step.
Code lines: 5
Contains by: module galacticus_nodes

subroutine: node_component_spheroidnull_output_count
Description: Increment output property count for a null implementation of the spheroid component.
Code lines: 9
Contains by: module galacticus_nodes

subroutine: node_component_spheroidnull_output_names
Description: Establish property names for a null implementation of the spheroid component.
Code lines: 11
Contains by: module galacticus_nodes

subroutine: node_component_spheroidnull_read_raw
Description: Read the contents of a null implementation of the spheroid component in binary.
Code lines: 8
Contains by: module galacticus_nodes
Modules used: memory_management

subroutine: node_component_spheroidnull_serialize_rates
Description: Serialize rates of a null implementation of the spheroid component.
Code lines: 7
Contains by: module galacticus_nodes

subroutine: node_component_spheroidnull_serialize_scales
Description: Serialize scales of a null implementation of the spheroid component.
Code lines: 7
Contains by: module galacticus_nodes
19.1. Program units

**subroutine**: node_component_spheroidnull_serialize_values
*Description*: Serialize values of a null implementation of the spheroid component.
*Code lines*: 7
*Contained by*: module galacticus_nodes

**function**: node_component_spheroidnull_type
*Description*: Returns the type for the null implementation of the spheroid component.
*Code lines*: 8
*Contained by*: module galacticus_nodes

**subroutine**: node_component_spheroidstandard_builder
*Description*: Build a standard implementation of the spheroid component.
*Code lines*: 79
*Contained by*: module galacticus_nodes
*Modules used*: fox_dom, galacticus_error, memory_management

**function**: node_component_spheroidstandard_count
*Description*: Return a count of the serialization of a standard implementation of the spheroid component.
*Code lines*: 13
*Contained by*: module galacticus_nodes

**subroutine**: node_component_spheroidstandard_deserialize_rates
*Description*: Serialize rates of a standard implementation of the spheroid component.
*Code lines*: 30
*Contained by*: module galacticus_nodes

**subroutine**: node_component_spheroidstandard_deserialize_scales
*Description*: Serialize scales of a standard implementation of the spheroid component.
*Code lines*: 30
*Contained by*: module galacticus_nodes

**subroutine**: node_component_spheroidstandard_deserialize_values
*Description*: Serialize values of a standard implementation of the spheroid component.
*Code lines*: 30
*Contained by*: module galacticus_nodes

**subroutine**: node_component_spheroidstandard_destroy
*Description*: Destroy a standard implementation of the spheroid component.
*Code lines*: 22
*Contained by*: module galacticus_nodes
*Modules used*: memory_management

**subroutine**: node_component_spheroidstandard_dump
*Description*: Dump the contents of a standard implementation of the spheroid component.
*Code lines*: 51
*Contained by*: module galacticus_nodes

*Description:* Dump the contents of a random implementation of the spin component to XML.
*Code lines:* 11
*Contained by:* module galacticus_nodes

**subroutine:** node_component_spinrandom_initializor
*Description:* Initialize a random implementation of the spin component.
*Code lines:* 8
*Contained by:* module galacticus_nodes
*Modules used:* memory_management

**function:** node_component_spinrandom_is_active
*Description:* Return true if the random implementation of the spin component is the active choice.
*Code lines:* 6
19.1. Program units

Contained by: module galacticus_nodes

subroutine: node_component_spinrandom_name_from_index
Description: Return the name of the property of given index for a random implementation of the spin component.
Code lines: 14
Contained by: module galacticus_nodes
Modules used: iso_varying_string

subroutine: node_component_spinrandom_ode_step_rates_init
Description: Initialize rates in a random implementation of the spin component for an ODE solver step.
Code lines: 7
Contained by: module galacticus_nodes

subroutine: node_component_spinrandom_odestepscalesinit
Description: Initialize scales in a random implementation of the spin component for an ODE solver step.
Code lines: 6
Contained by: module galacticus_nodes

subroutine: node_component_spinrandom_output_count
Description: Increment output property count for a random implementation of the spin component.
Code lines: 10
Contained by: module galacticus_nodes

subroutine: node_component_spinrandom_output_names
Description: Establish property names for a random implementation of the spin component.
Code lines: 24
Contained by: module galacticus_nodes

subroutine: node_component_spinrandom_read_raw
Description: Read the contents of a random implementation of the spin component in binary.
Code lines: 9
Contained by: module galacticus_nodes
Modules used: memory_management

subroutine: node_component_spinrandom_serialize_rates
Description: Serialize rates of a random implementation of the spin component.
Code lines: 11
Contained by: module galacticus_nodes

subroutine: node_component_spinrandom_serialize_scales
Description: Serialize scales of a random implementation of the spin component.
Code lines: 11
Contained by: module galacticus_nodes

subroutine: node_component_spinrandom_serialize_values
Description: Serialize values of a random implementation of the spin component.
Code lines: 11
Contained by: module galacticus_nodes
function: node_component_spinrandom_type
Description: Returns the type for the random implementation of the spin component.
Code lines: 8
Contained by: module galacticus_nodes

function: node_component_surface_density_null
Description: A null implementation of the surface density in a component. Always returns zero.
Code lines: 10
Contained by: module galacticus_nodes

subroutine: node_dump
Description: Dump node content.
Code lines: 131
Contained by: module galacticus_nodes
Modules used: galacticus_display iso_varying_string string_handling

subroutine: node_dump_raw
Description: Dump node content in binary.
Code lines: 363
Contained by: module galacticus_nodes

subroutine: node_dump_xml
Description: Dump node content.
Code lines: 126
Contained by: module galacticus_nodes
Modules used: galacticus_display iso_varying_string string_handling

subroutine: node_output
Code lines: 101
Contained by: module galacticus_nodes

subroutine: node_output_count
Description: Increment the count of properties to output for this node.
Code lines: 99
Contained by: module galacticus_nodes

subroutine: node_output_names
Description: Establish the names of properties to output for this node.
Code lines: 101
Contained by: module galacticus_nodes

function: node_property_name_from_index
Description: Return the name of a property given its index.
Code lines: 241
Contained by: module galacticus_nodes
19.1. Program units

Modules used: iso_varying_string

subroutine: node_read_raw
Description: Dump node content in binary.
Code lines: 544
Contained by: module galacticus_nodes

type: nodecomponent
Description: A class for components in nodes.
Code lines: 204
Contained by: module galacticus_nodes

type: nodecomponentagestatistics
Description: Type for the ageStatistics component class.
Code lines: 265
Contained by: module galacticus_nodes

type: nodecomponentagestatisticsnull
Description: Class for the null implementation of the ageStatistics component.
Code lines: 31
Contained by: module galacticus_nodes

type: nodecomponentagestatisticsstandard
Description: Class for the standard implementation of the ageStatistics component.
Code lines: 113
Contained by: module galacticus_nodes

type: nodecomponentbasic
Description: Type for the basic component class.
Code lines: 272
Contained by: module galacticus_nodes

type: nodecomponentbasicnonevolving
Description: Class for the nonEvolving implementation of the basic component.
Code lines: 81
Contained by: module galacticus_nodes

type: nodecomponentbasicnull
Description: Class for the null implementation of the basic component.
Code lines: 31
Contained by: module galacticus_nodes

type: nodecomponentbasicstandard
Description: Class for the standard implementation of the basic component.
Code lines: 101
Contained by: module galacticus_nodes

type: nodecomponentbasicstandardtracking
Description: Class for the standardTracking implementation of the basic component.
19. Source Code Documentation

Code lines: 50
Contained by: module galacticus_nodes

type: nodecomponentblackhole
Description: Type for the blackHole component class.
Code lines: 363
Contained by: module galacticus_nodes

type: nodecomponentblackholenull
Description: Class for the null implementation of the blackHole component.
Code lines: 31
Contained by: module galacticus_nodes

type: nodecomponentblackholesimple
Description: Class for the simple implementation of the blackHole component.
Code lines: 57
Contained by: module galacticus_nodes

type: nodecomponentblackholestandard
Description: Class for the standard implementation of the blackHole component.
Code lines: 145
Contained by: module galacticus_nodes

type: nodecomponentdarkmatterprofile
Description: Type for the darkMatterProfile component class.
Code lines: 237
Contained by: module galacticus_nodes

type: nodecomponentdarkmatterprofilenull
Description: Class for the null implementation of the darkMatterProfile component.
Code lines: 31
Contained by: module galacticus_nodes

type: nodecomponentdarkmatterprofilescalescale
Description: Class for the scale implementation of the darkMatterProfile component.
Code lines: 85
Contained by: module galacticus_nodes

type: nodecomponentdarkmatterprofilescalescaleshape
Description: Class for the scaleShape implementation of the darkMatterProfile component.
Code lines: 70
Contained by: module galacticus_nodes

type: nodecomponentdisk
19.1. Program units

**Description:** Type for the disk component class.
**Code lines:** 657
**Contained by:** module `galacticus_nodes`  

**type: nodecomponentdiskexponential**
**Description:** Class for the exponential implementation of the disk component.
**Code lines:** 277
**Contained by:** module `galacticus_nodes`  

**type: nodecomponentdisknull**
**Description:** Class for the null implementation of the disk component.
**Code lines:** 31
**Contained by:** module `galacticus_nodes`  

**type: nodecomponentdiskverysimple**
**Description:** Class for the verySimple implementation of the disk component.
**Code lines:** 81
**Contained by:** module `galacticus_nodes`  

**type: nodecomponentdynamicsstatistics**
**Description:** Type for the `dynamicsStatistics` component class.
**Code lines:** 146
**Contained by:** module `galacticus_nodes`  

**type: nodecomponentdynamicsstatisticsbars**
**Description:** Class for the bars implementation of the `dynamicsStatistics` component.
**Code lines:** 91
**Contained by:** module `galacticus_nodes`  

**type: nodecomponentdynamicsstatisticsnull**
**Description:** Class for the null implementation of the `dynamicsStatistics` component.
**Code lines:** 31
**Contained by:** module `galacticus_nodes`  

**type: nodecomponentformationtime**
**Description:** Type for the `formationTime` component class.
**Code lines:** 69
**Contained by:** module `galacticus_nodes`  

**type: nodecomponentformationtimecole2000**
**Description:** Class for the Cole2000 implementation of the `formationTime` component.
**Code lines:** 35
**Contained by:** module `galacticus_nodes`  

**type: nodecomponentformationtimenull**
**Description:** Class for the null implementation of the `formationTime` component.
**Code lines:** 31
**Contained by:** module `galacticus_nodes`
type: nodecomponenthosthistory
Description: Type for the hostHistory component class.
Code lines: 76
Contained by: module galacticus_nodes

type: nodecomponenthosthistorynull
Description: Class for the null implementation of the hostHistory component.
Code lines: 31
Contained by: module galacticus_nodes

type: nodecomponenthosthistorystandard
Description: Class for the standard implementation of the hostHistory component.
Code lines: 50
Contained by: module galacticus_nodes

type: nodecomponenthothalo
Description: Type for the hotHalo component class.
Code lines: 1350
Contained by: module galacticus_nodes

type: nodecomponenthothalocoldmode
Description: Class for the coldMode implementation of the hotHalo component.
Code lines: 135
Contained by: module galacticus_nodes

type: nodecomponenthothalonull
Description: Class for the null implementation of the hotHalo component.
Code lines: 31
Contained by: module galacticus_nodes

type: nodecomponenthothalooutflowtracking
Description: Class for the outflowTracking implementation of the hotHalo component.
Code lines: 116
Contained by: module galacticus_nodes

type: nodecomponenthothalostandard
Description: Class for the standard implementation of the hotHalo component.
Code lines: 462
Contained by: module galacticus_nodes

type: nodecomponenthothaloverysimple
Description: Class for the verySimple implementation of the hotHalo component.
Code lines: 95
Contained by: module galacticus_nodes

type: nodecomponentindices
Description: Type for the indices component class.
Code lines: 76
19.1. Program units

```
contained by: module galacticus_nodes

type: nodecomponentindicesnull
  description: Class for the null implementation of the indices component.

function: positionpositionhistory
Description: Returns the default value for the positionHistory property for the position component class.
Code lines: 8
**function: positionpositionhistoryattributematch**

*Description:* Return a text list of component implementations in the `position` class that have the desired attributes for the `positionHistory` property.

*Code lines:* 27

*Contained by:* module `galacticus_nodes`

*Modules used:* `iso_varying_string`

**function: positionpositionhistoryisgettable**

*Description:* Returns true if the `positionHistory` property is gettable for the `position` component class.

*Code lines:* 6

*Contained by:* module `galacticus_nodes`

**function: positionpositionisgettable**

*Description:* Returns true if the `position` property is gettable for the `position` component class.

*Code lines:* 7

*Contained by:* module `galacticus_nodes`

**function: positionpresetposition**

*Description:* Return the position of the node.

*Code lines:* 32

*Contained by:* module `galacticus_nodes`

*Modules used:* `fgsl`, `iso_c_binding`, `numerical_interpolation`

**function: positionpresetpositionhistoryget**

*Description:* Return the `positionHistory` property of the `PositionPreset` component implementation.

*Code lines:* 8

*Contained by:* module `galacticus_nodes`

**subroutine: positionpresetpositionhistoryset**

*Description:* Set the `positionHistory` property of the `PositionPreset` component implementation.

*Code lines:* 9

*Contained by:* module `galacticus_nodes`

*Modules used:* `memory_management`

**subroutine: positionpresetpositionset**

*Description:* Set the `position` property of the `PositionPreset` component implementation.

*Code lines:* 17

*Contained by:* module `galacticus_nodes`

*Modules used:* `memory_management`

**function: positionpresetvelocity**

*Description:* Return the velocity of the node.

*Code lines:* 32

*Contained by:* module `galacticus_nodes`

*Modules used:* `fgsl`, `iso_c_binding`, `numerical_interpolation`
**subroutine: positionpresetvelocityset**

*Description:* Set the *velocity* property of the *PositionPreset* component implementation.

*Code lines:* 17

*Contained by:* module `galacticus_nodes`

*Modules used:* `memory_management`

**function: positionvelocity**

*Description:* Returns the default value for the *velocity* property for the *position* component class.

*Code lines:* 13

*Contained by:* module `galacticus_nodes`

**function: positionvelocityattributematch**

*Description:* Return a text list of component implementations in the *position* class that have the desired attributes for the *velocity* property.

*Code lines:* 27

*Contained by:* module `galacticus_nodes`

*Modules used:* `iso_varying_string`

**function: positionvelocityisgettable**

*Description:* Returns true if the *velocity* property is gettable for the *position* component class.

*Code lines:* 7

*Contained by:* module `galacticus_nodes`

**function: satelliteboundmass**

*Description:* Returns the default value for the *boundMass* property for the *satellite* component class.

*Code lines:* 22

*Contained by:* module `galacticus_nodes`

**function: satelliteboundmassattributematch**

*Description:* Return a text list of component implementations in the *satellite* class that have the desired attributes for the *boundMass* property.

*Code lines:* 45

*Contained by:* module `galacticus_nodes`

*Modules used:* `iso_varying_string`

**function: satelliteboundmasshistory**

*Description:* Returns the default value for the *boundMassHistory* property for the *satellite* component class.

*Code lines:* 8

*Contained by:* module `galacticus_nodes`

**function: satelliteboundmasshistoryattributematch**

*Description:* Return a text list of component implementations in the *satellite* class that have the desired attributes for the *boundMassHistory* property.

*Code lines:* 27

*Contained by:* module `galacticus_nodes`

*Description:* A null get function for rank 0 integers.

*Code lines:* 7

*Contained by:* module *galacticus_nodes*

**function:** satellitenullbindingkeplerorbit0inout

*Description:* A null get function for rank 0 typekeplerorbits.

*Code lines:* 7

*Contained by:* module *galacticus_nodes*

**function:** satellitenullbindinglonginteger0inout

*Description:* A null get function for rank 0 integer(kind=kind_int8)s.

*Code lines:* 7

*Contained by:* module *galacticus_nodes*

**function:** satellitenullbindinglongintegerhistory0inout

*Description:* A null get function for rank 0 typelongintegerhistorys.

*Code lines:* 7

*Contained by:* module *galacticus_nodes*

**subroutine:** satellitenullbindingratedouble0inout

*Description:* A null rate function for rank 0 double precisions.

*Code lines:* 9

*Contained by:* module *galacticus_nodes*

**subroutine:** satellitenullbindingratedouble1inout

*Description:* A null rate function for rank 1 double precisions.

*Code lines:* 9

*Contained by:* module *galacticus_nodes*

**subroutine:** satellitenullbindingratehistory0inout

*Description:* A null rate function for rank 0 typehistorys.

*Code lines:* 9

*Contained by:* module *galacticus_nodes*

**subroutine:** satellitenullbindingrateinteger0in

*Description:* A null rate function for rank 0 integers.

*Code lines:* 9

*Contained by:* module *galacticus_nodes*

**subroutine:** satellitenullbindingratekeplerorbit0inout

*Description:* A null rate function for rank 0 typekeplerorbits.
19.1. Program units

**subroutine:** satellitenullbindingratelonginteger0inout

*Description:* A null rate function for rank 0 integer(kind=kind_int8)s.

*Code lines:* 9
*Contained by:* module galacticus_nodes

**subroutine:** satellitenullbindingratelongintegerhistory0inout

*Description:* A null rate function for rank 0 typelongintegerhistories.

*Code lines:* 9
*Contained by:* module galacticus_nodes

**subroutine:** satellitenullbindingratetensordimension3symmetric0inout

*Description:* A null rate function for rank 0 typetensordimension3symmetrics.

*Code lines:* 9
*Contained by:* module galacticus_nodes

**subroutine:** satellitenullbindingsetdouble0inout

*Description:* A null set function for rank 0 double precisions.

*Code lines:* 7
*Contained by:* module galacticus_nodes

**subroutine:** satellitenullbindingsetdouble1inout

*Description:* A null set function for rank 1 double precisions.

*Code lines:* 7
*Contained by:* module galacticus_nodes

**subroutine:** satellitenullbindingsethistory0inout

*Description:* A null set function for rank 0 typehistories.

*Code lines:* 7
*Contained by:* module galacticus_nodes

**subroutine:** satellitenullbindingsetinteger0in

*Description:* A null set function for rank 0 integers.

*Code lines:* 7
*Contained by:* module galacticus_nodes

**subroutine:** satellitenullbindingsetkeplerorbit0inout

*Description:* A null set function for rank 0 typekeplerorbits.

*Code lines:* 7
*Contained by:* module galacticus_nodes

*Description:* A null set function for rank 0 integer(kind=kind_int8)s.

*Code lines:* 7
*Contained by:* module galacticus_nodes

**subroutine:** satellitenullbindingsetlongintegerhistory0inout
19. Source Code Documentation

Description: A null set function for rank 0 typelongintegerhistorys.
Code lines: 7
Contained by: module galacticus_nodes

subroutine: satellitenullbindingsettensorrank2dimension3symmetric0inout
Description: A null set function for rank 0 typetensorrank2dimension3symmetrics.
Code lines: 7
Contained by: module galacticus_nodes

function: satellitenullbindingtensorrank2dimension3symmetric0inout
Description: A null get function for rank 0 typetensorrank2dimension3symmetrics.
Code lines: 7
Contained by: module galacticus_nodes

function: satelliteorbitingboundmasscount
Description: Return a count of the number of scalar properties in the boundMass property of the satelliteOrbiting component implementation.
Code lines: 7
Contained by: module galacticus_nodes

function: satelliteorbitingboundmassget
Description: Return the boundMass property of the SatelliteOrbiting component implementation.
Code lines: 8
Contained by: module galacticus_nodes

subroutine: satelliteorbitingboundmassrate
Description: Accumulate to the boundMass property rate of change of the SatelliteOrbiting component implementation.
Code lines: 10
Contained by: module galacticus_nodes

subroutine: satelliteorbitingboundmassscale
Description: Set the boundMass property scale of the SatelliteOrbiting component implementation.
Code lines: 8
Contained by: module galacticus_nodes

subroutine: satelliteorbitingboundmassset
Description: Set the boundMass property of the SatelliteOrbiting component implementation.
Code lines: 11
Contained by: module galacticus_nodes
Modules used: memory_management

function: satelliteorbitingmergetimeget
Description: Return the mergeTime property of the SatelliteOrbiting component implementation.
Code lines: 8
Contained by: module galacticus_nodes

subroutine: satelliteorbitingmergetimeset
Description: Set the mergeTime property of the SatelliteOrbiting component implementation.
19.1. Program units

function: satelliteorbitingpositioncount
Description: Return a count of the number of scalar properties in the position property of the satelliteOrbiting component implementation.
Code lines: 9
Contained by: module galacticus_nodes

function: satelliteorbitingpositionget
Description: Return the position property of the SatelliteOrbiting component implementation.
Code lines: 11
Contained by: module galacticus_nodes

subroutine: satelliteorbitingpositionrate
Description: Accumulate to the position property rate of change of the SatelliteOrbiting component implementation.
Code lines: 8
Contained by: module galacticus_nodes

subroutine: satelliteorbitingpositionscale
Description: Set the position property scale of the SatelliteOrbiting component implementation.
Code lines: 10
Contained by: module galacticus_nodes

subroutine: satelliteorbitingpositionset
Description: Set the position property of the SatelliteOrbiting component implementation.
Code lines: 35
Contained by: module galacticus_nodes

function: satelliteorbitingtidalheatingnormalizedcount
Description: Return a count of the number of scalar properties in the tidalHeatingNormalized property of the satelliteOrbiting component implementation.
Code lines: 7
Contained by: module galacticus_nodes

function: satelliteorbitingtidalheatingnormalizedget
Description: Return the tidalHeatingNormalized property of the SatelliteOrbiting component implementation.
Code lines: 8
Contained by: module galacticus_nodes

subroutine: satelliteorbitingtidalheatingnormalizedrate
Description: Accumulate to the tidalHeatingNormalized property rate of change of the SatelliteOrbiting component implementation.
Code lines: 10
Contained by: module galacticus_nodes
subroutine: satelliteorbitingtidalheatingnormalizedscale
Description: Set the tidalHeatingNormalized property scale of the SatelliteOrbiting component implementation.
Code lines: 8
Contained by: module galacticus_nodes

subroutine: satelliteorbitingtidalheatingnormalizedset
Description: Set the tidalHeatingNormalized property of the SatelliteOrbiting component implementation.
Code lines: 11
Contained by: module galacticus_nodes
Modules used: memory_management

function: satelliteorbitingtidaltensorpathintegratedcount
Description: Return a count of the number of scalar properties in the tidalTensorPathIntegrated property of the SatelliteOrbiting component implementation.
Code lines: 7
Contained by: module galacticus_nodes

function: satelliteorbitingtidaltensorpathintegratedget
Description: Return the tidalTensorPathIntegrated property of the SatelliteOrbiting component implementation.
Code lines: 8
Contained by: module galacticus_nodes

subroutine: satelliteorbitingtidaltensorpathintegratedrate
Description: Accumulate to the tidalTensorPathIntegrated property rate of change of the SatelliteOrbiting component implementation.
Code lines: 10
Contained by: module galacticus_nodes

subroutine: satelliteorbitingtidaltensorpathintegratedscale
Description: Set the tidalTensorPathIntegrated property scale of the SatelliteOrbiting component implementation.
Code lines: 8
Contained by: module galacticus_nodes

subroutine: satelliteorbitingtidaltensorpathintegratedset
Description: Set the tidalTensorPathIntegrated property of the SatelliteOrbiting component implementation.
Code lines: 11
Contained by: module galacticus_nodes
Modules used: memory_management

function: satelliteorbitingvelocitycount
Description: Return a count of the number of scalar properties in the velocity property of the SatelliteOrbiting component implementation.
Code lines: 11
Contained by: module galacticus_nodes
function: satelliteorbitingvelocityget
Description: Return the velocity property of the SatelliteOrbiting component implementation.
Code lines: 8
Contained by: module galacticus_nodes

subroutine: satelliteorbitingvelocityrate
Description: Accumulate to the velocity property rate of change of the SatelliteOrbiting component implementation.
Code lines: 10
Contained by: module galacticus_nodes

subroutine: satelliteorbitingvelocityscale
Description: Set the velocity property scale of the SatelliteOrbiting component implementation.
Code lines: 8
Contained by: module galacticus_nodes

subroutine: satelliteorbitingvelocityset
Description: Set the velocity property of the SatelliteOrbiting component implementation.
Code lines: 35
Contained by: module galacticus_nodes
Modules used: memory_management

function: satelliteorbitingvirialorbitget
Description: Return the virialOrbit property of the SatelliteOrbiting component implementation.
Code lines: 8
Contained by: module galacticus_nodes

subroutine: satelliteorbitingvirialorbitset
Description: Set the virialOrbit property of the SatelliteOrbiting component implementation.
Code lines: 9
Contained by: module galacticus_nodes
Modules used: memory_management

function: satelliteposition
Description: Returns the default value for the position property for the satellite component class.
Code lines: 13
Contained by: module galacticus_nodes

function: satellitepositionattributematch
Description: Return a text list of component implementations in the satellite class that have the desired attributes for the position property
Code lines: 25
Contained by: module galacticus_nodes
Modules used: iso_varying_string

function: satellitepositionisgettable
Description: Returns true if the position property is gettable for the satellite component class.
Code lines: 7
19. Source Code Documentation

Contains by: module galacticus_nodes

function: satellitepresetboundmasshistoryget
Description: Return the boundMassHistory property of the SatellitePreset component implementation.
Code lines: 8
Contains by: module galacticus_nodes

subroutine: satellitepresetboundmasshistoryset
Description: Set the boundMassHistory property of the SatellitePreset component implementation.
Code lines: 9
Contains by: module galacticus_nodes
Modules used: memory_management

function: satellitepresetmergeboundmass
Description: Return the satellite bound mass at the current time.
Code lines: 32
Contains by: module galacticus_nodes
Modules used: memory_management

function: satellitepresetnodeindex
Description: Return the satellite node index.
Code lines: 35
Contains by: module galacticus_nodes
Modules used: memory_management

function: satellitepresetnodeindexhistoryget
Description: Return the nodeIndexHistory property of the SatellitePreset component implementation.
Code lines: 8
Contains by: module galacticus_nodes

subroutine: satellitepresetnodeindexhistoryset
Description: Set the nodeIndexHistory property of the SatellitePreset component implementation.
Code lines: 9
Contains by: module galacticus_nodes
Modules used: memory_management

function: satellitepresettimeofmergingget
Description: Return the timeOfMerging property of the SatellitePreset component implementation.
Code lines: 8
Contains by: module galacticus_nodes

subroutine: satellitepresettimeofmergingset
Description: Set the timeOfMerging property of the SatellitePreset component implementation.
Code lines: 9
function: satellitepresetvirialorbitget
Description: Return the virialOrbit property of the SatellitePreset component implementation.
Code lines: 8
Contained by: module galacticus_nodes

subroutine: satellitepresetvirialorbitset
Description: Set the virialOrbit property of the SatellitePreset component implementation.
Code lines: 9
Contained by: module galacticus_nodes
Modules used: memory_management

function: satellitestandardboundmasscount
Description: Return a count of the number of scalar properties in the boundMass property of the SatelliteStandard component implementation.
Code lines: 7
Contained by: module galacticus_nodes

function: satellitestandardboundmassget
Description: Return the boundMass property of the SatelliteStandard component implementation.
Code lines: 8
Contained by: module galacticus_nodes

subroutine: satellitestandardboundmassrate
Description: Accumulate to the boundMass property rate of change of the SatelliteStandard component implementation.
Code lines: 10
Contained by: module galacticus_nodes

subroutine: satellitestandardboundmassscale
Description: Set the boundMass property scale of the SatelliteStandard component implementation.
Code lines: 8
Contained by: module galacticus_nodes

subroutine: satellitestandardboundmassset
Description: Set the boundMass property of the SatelliteStandard component implementation.
Code lines: 11
Contained by: module galacticus_nodes
Modules used: memory_management

function: satellitestandardmergetimecount
Description: Return a count of the number of scalar properties in the mergeTime property of the SatelliteStandard component implementation.
Code lines: 7
Contained by: module galacticus_nodes

subroutine: satellitestandardmergetimerate
Description: Accumulate to the mergeTime property rate of change of the SatelliteStandard component implementation.
module galacticus_nodes

subroutine satellitestandardmergetimescale
Description: Set the mergeTime property scale of the SatelliteStandard component implementation.

subroutine satellitestandardmergetimeset
Description: Set the mergeTime property of the SatelliteStandard component implementation.

Modules used: memory_management

function satellitestandardvirialorbitget
Description: Get the value of the virialOrbit property of the SatelliteStandard component using a deferred function.

function satellitestandardvirialorbitgetfunction
Description: Set the function to be used for get of the virialOrbit property of the SatelliteStandard component class.

function satellitestandardvirialorbitgetisattached
Description: Return true if the deferred function used to get the virialOrbit property of the SatelliteStandard component class has been attached.

function satellitestandardvirialorbitgetvalue
Description: Return the virialOrbit property of the SatelliteStandard component implementation.

subroutine satellitestandardvirialorbitset
Description: Set the value of the virialOrbit property of the SatelliteStandard component using a deferred function.

subroutine satellitestandardvirialorbitsetfunction
Description: Set the function to be used for set of the virialOrbit property of the SatelliteStandard component class.

function satellitestandardvirialorbitsetisattached
19.1. Program units

Description: Return true if the deferred function used to set the virialOrbit property of the SatelliteStandard component class has been attached.
Code lines: 5
Contained by: module galacticus_nodes

subroutine: satellitestandardvirialorbitsetvalue
Description: Set the virialOrbit property of the SatelliteStandard component implementation.
Code lines: 9
Contained by: module galacticus_nodes
Modules used: memory_management

function: satellitetidalheatingnormalized
Description: Returns the default value for the tidalHeatingNormalized property for the satellite component class.
Code lines: 8
Contained by: module galacticus_nodes

function: satellitetidalheatingnormalizedattributematch
Description: Return a text list of component implementations in the satellite class that have the desired attributes for the tidalHeatingNormalized property
Code lines: 25
Contained by: module galacticus_nodes
Modules used: iso_varying_string

function: satellitetidalheatingnormalizedisgettable
Description: Returns true if the tidalHeatingNormalized property is gettable for the satellite component class.
Code lines: 6
Contained by: module galacticus_nodes

function: satellitetidaltensorpathintegrated
Description: Returns the default value for the tidalTensorPathIntegrated property for the satellite component class.
Code lines: 8
Contained by: module galacticus_nodes

function: satellitetidaltensorpathintegratedattributematch
Description: Return a text list of component implementations in the satellite class that have the desired attributes for the tidalTensorPathIntegrated property
Code lines: 25
Contained by: module galacticus_nodes
Modules used: iso_varying_string

function: satellitetidaltensorpathintegratedisgettable
Description: Returns true if the tidalTensorPathIntegrated property is gettable for the satellite component class.
Code lines: 6
Contained by: module galacticus_nodes

function: satellitetimeofmerging
19. Source Code Documentation

**function**: satellitetimeofmergingattributematch

*Description:* Return a text list of component implementations in the satellite class that have the desired attributes for the timeOfMerging property.

*Code lines:* 24

*Contained by:* module galacticus_nodes

**function**: satellitetimeofmergingisgettable

*Description:* Returns true if the timeOfMerging property is gettable for the satellite component class.

*Code lines:* 60

*Contained by:* module galacticus_nodes

**function**: satellitevelocity

*Description:* Returns the default value for the velocity property for the satellite component class.

*Code lines:* 13

*Contained by:* module galacticus_nodes

**function**: satellitevelocityattributematch

*Description:* Return a text list of component implementations in the satellite class that have the desired attributes for the velocity property.

*Code lines:* 25

*Contained by:* module galacticus_nodes

**function**: satellitevelocityisgettable

*Description:* Returns true if the velocity property is gettable for the satellite component class.

*Code lines:* 10

*Contained by:* module galacticus_nodes

**function**: satelliteverysimplemergetimecount

*Description:* Return a count of the number of scalar properties in the mergeTime property of the SatelliteVerySimple component implementation.

*Code lines:* 1

*Contained by:* module galacticus_nodes

**subroutine**: satelliteverysimplemergetimerate

*Description:* Accumulate to the mergeTime property rate of change of the SatelliteVerySimple component implementation.

*Code lines:* 7

*Contained by:* module galacticus_nodes

**subroutine**: satelliteverysimplemergetimescale

*Description:* Set the mergeTime property scale of the SatelliteVerySimple component implementation.

*Code lines:* 8

*Contained by:* module galacticus_nodes
19.1. Program units

```
Contained by: module galacticus_nodes

subroutine: satelliteverysimplemergetimeset
Description: Set the mergeTime property of the SatelliteVerySimple component implementation.
Code lines: 11
Contained by: module galacticus_nodes
Modules used: memory_management

function: satellitevirialorbit
Description: Returns the default value for the virialOrbit property for the satellite component class.
Code lines: 8
Contained by: module galacticus_nodes

function: satellitevirialorbitattributematch
Description: Return a text list of component implementations in the satellite class that have the desired attributes for the virialOrbit property
Code lines: 49
Contained by: module galacticus_nodes
Modules used: iso_varying_string

function: satellitevirialorbitisgettable
Description: Returns true if the virialOrbit property is gettable for the satellite component class.
Code lines: 6
Contained by: module galacticus_nodes

function: serializetoarraycount
Description: Return a count of the size of the serialized treeNode object.
Code lines: 218
Contained by: module galacticus_nodes

subroutine: serializetoarrayrates
Description: Serialize rates to array.
Code lines: 307
Contained by: module galacticus_nodes
Modules used: memory_management

subroutine: serializetoarrayscales
Description: Serialize scales to array.
Code lines: 307
Contained by: module galacticus_nodes
Modules used: memory_management

subroutine: serializetoarrayvalues
Description: Serialize values to array.
Code lines: 307
Contained by: module galacticus_nodes
Modules used: memory_management

function: spheroidabundancesgas
```
Description: Returns the default value for the `abundancesGas` property for the `spheroid` component class.

Code lines: 8

Contained by: module `galacticus_nodes`

function: `spheroidabundancesgasattributematch`
Description: Return a text list of component implementations in the `spheroid` class that have the desired attributes for the `abundancesGas` property.

Code lines: 25

Contained by: module `galacticus_nodes`

Modules used: `iso_varying_string`

function: `spheroidabundancesgasisgettable`
Description: Returns true if the `abundancesGas` property is gettable for the `spheroid` component class.

Code lines: 6

Contained by: module `galacticus_nodes`

subroutine: `spheroidabundancesgasrate`
Description: Accept a rate set for the `abundancesGas` property of the `spheroid` component class. Trigger an interrupt to create the component.

Code lines: 15

Contained by: module `galacticus_nodes`

Modules used: `galacticus_error`

function: `spheroidabundancesstellar`
Description: Returns the default value for the `abundancesStellar` property for the `spheroid` component class.

Code lines: 8

Contained by: module `galacticus_nodes`

function: `spheroidabundancesstellarattributematch`
Description: Return a text list of component implementations in the `spheroid` class that have the desired attributes for the `abundancesStellar` property.

Code lines: 25

Contained by: module `galacticus_nodes`

Modules used: `iso_varying_string`

function: `spheroidabundancesstellarisgettable`
Description: Returns true if the `abundancesStellar` property is gettable for the `spheroid` component class.

Code lines: 6

Contained by: module `galacticus_nodes`

subroutine: `spheroidabundancesstellarrate`
Description: Accept a rate set for the `abundancesStellar` property of the `spheroid` component class. Trigger an interrupt to create the component.

Code lines: 15

Contained by: module `galacticus_nodes`

Modules used: `galacticus_error`

function: `spheroidangularmomentum`
19.1. Program units

**Description:** Returns the default value for the `angularMomentum` property for the `spheroid` component class.

**Code lines:** 8

**Contained by:** module `galacticus_nodes`

**function:** `spheroidangularmomentumattributematch`

**Description:** Return a text list of component implementations in the `spheroid` class that have the desired attributes for the `angularMomentum` property.

**Code lines:** 25

**Contained by:** module `galacticus_nodes`

**Modules used:** `iso_varying_string`

**function:** `spheroidangularmomentumisgettable`

**Description:** Returns true if the `angularMomentum` property is gettable for the `spheroid` component class.

**Code lines:** 6

**Contained by:** module `galacticus_nodes`

**subroutine:** `spheroidangularmomentumrate`

**Description:** Accept a rate set for the `angularMomentum` property of the `spheroid` component class. Trigger an interrupt to create the component.

**Code lines:** 15

**Contained by:** module `galacticus_nodes`

**Modules used:** `galacticus_error`

**function:** `spheroidcountlinked`

**Description:** Returns the number of `spheroid` components in `self`.

**Code lines:** 19

**Contained by:** module `galacticus_nodes`

**subroutine:** `spheroidcreatebyinterrupt`

**Description:** Create the `spheroid` component of `self` via an interrupt.

**Code lines:** 12

**Contained by:** module `galacticus_nodes`

**subroutine:** `spheroidcreatelinked`

**Description:** Create the `spheroid` component of `self`.

**Code lines:** 29

**Contained by:** module `galacticus_nodes`

**Modules used:** `galacticus_display` `iso_varying_string` `string_handling`

**subroutine:** `spheroiddestroylinked`

**Description:** Destroy the `spheroid` component of `self`.

**Code lines:** 13

**Contained by:** module `galacticus_nodes`

**function:** `spheroidenergygasinput`

**Description:** Returns the default value for the `energyGasInput` property for the `spheroid` component class.

**Code lines:** 8
19. Source Code Documentation

**function: spheroidenergygasinputattributematch**

*Description:* Return a text list of component implementations in the **spheroid** class that have the desired attributes for the **energyGasInput** property.

*Code lines:* 27

*Contained by:* module **galacticus_nodes**

*Modules used:* **iso_varying_string**

**function: spheroidenergygasinputisgettable**

*Description:* Returns true if the **energyGasInput** property is gettable for the **spheroid** component class.

*Code lines:* 6

*Contained by:* module **galacticus_nodes**

**function: spheroidget**

*Description:* Returns the **spheroid** component of **self**.

*Code lines:* 27

*Contained by:* module **galacticus_nodes**

*Modules used:* **galacticus_error**

**function: spheroidhalfmassradius**

*Description:* Returns the default value for the **halfMassRadius** property for the **spheroid** component class.

*Code lines:* 8

*Contained by:* module **galacticus_nodes**

**function: spheroidhalfmassradiusattributematch**

*Description:* Return a text list of component implementations in the **spheroid** class that have the desired attributes for the **halfMassRadius** property.

*Code lines:* 27

*Contained by:* module **galacticus_nodes**

*Modules used:* **iso_varying_string**

**function: spheroidhalfmassradiusisgettable**

*Description:* Returns true if the **halfMassRadius** property is gettable for the **spheroid** component class.

*Code lines:* 6

*Contained by:* module **galacticus_nodes**

**function: spheroidisinitialized**

*Description:* Returns the default value for the **isInitialized** property for the **spheroid** component class.

*Code lines:* 8

*Contained by:* module **galacticus_nodes**

**function: spheroidisinitializedattributematch**

*Description:* Return a text list of component implementations in the **spheroid** class that have the desired attributes for the **isInitialized** property.

*Code lines:* 27

*Contained by:* module **galacticus_nodes**

*Modules used:* **iso_varying_string**

**function: spheroidisinitializedisgettable**

*Description:* Returns true if the **isInitialized** property is gettable for the **spheroid** component class.

*Code lines:* 6

*Contained by:* module **galacticus_nodes**

1646
function: spheroidisinitializedisgettable
Description: Returns true if the isInitialized property is gettable for the spheroid component class.
Code lines: 6
Contained by: module galacticus_nodes

function: spheroidluminositiesstellar
Description: Returns the default value for the luminositiesStellar property for the spheroid component class.
Code lines: 8
Contained by: module galacticus_nodes

function: spheroidluminositiesstellarattributematch
Description: Return a text list of component implementations in the spheroid class that have the desired attributes for the luminositiesStellar property
Code lines: 25
Contained by: module galacticus_nodes
Modules used: iso_varying_string

function: spheroidluminositiesstellarisgettable
Description: Returns true if the luminositiesStellar property is gettable for the spheroid component class.
Code lines: 6
Contained by: module galacticus_nodes

subroutine: spheroidluminositiesstellarrate
Description: Accept a rate set for the luminositiesStellar property of the spheroid component class. Trigger an interrupt to create the component.

function: spheroidnullbindingabundances0inout
19.1. Program units

- **Description:** A null get function for rank 0 type abundances.
  
  **Code lines:** 7

  **Contained by:** module `galacticus_nodes`

- **function:** `spheroidnullbindingdouble0inout`

  **Description:** A null get function for rank 0 double precisions.

  **Code lines:** 7

  **Contained by:** module `galacticus_nodes`

- **function:** `spheroidnullbindinghistory0inout`

  **Description:** A null get function for rank 0 type histories.

  **Code lines:** 7

  **Contained by:** module `galacticus_nodes`

- **function:** `spheroidnullbindinginteger0in`

  **Description:** A null get function for rank 0 integers.

  **Code lines:** 7

  **Contained by:** module `galacticus_nodes`

- **function:** `spheroidnullbindinglogical0inout`

  **Description:** A null get function for rank 0 logicals.

  **Code lines:** 7

  **Contained by:** module `galacticus_nodes`

- **subroutine:** `spheroidnullbindingrateabundances0inout`

  **Description:** A null rate function for rank 0 type abundances.

  **Code lines:** 9

  **Contained by:** module `galacticus_nodes`

- **subroutine:** `spheroidnullbindingratedouble0inout`

  **Description:** A null rate function for rank 0 double precisions.

  **Code lines:** 9

  **Contained by:** module `galacticus_nodes`

- **subroutine:** `spheroidnullbindingratehistory0inout`

  **Description:** A null rate function for rank 0 type histories.

  **Code lines:** 9

  **Contained by:** module `galacticus_nodes`

- **subroutine:** `spheroidnullbindingrateinteger0in`

  **Description:** A null rate function for rank 0 integers.

  **Code lines:** 9

  **Contained by:** module `galacticus_nodes`

- **subroutine:** `spheroidnullbindingratelogical0inout`

  **Description:** A null rate function for rank 0 logicals.

  **Code lines:** 9

  **Contained by:** module `galacticus_nodes`
19. Source Code Documentation

subroutine: spheroidnullbindingratestellarluminosities0inout
Description: A null rate function for rank 0 type stellar luminosities.
Code lines: 9
Contained by: module galacticus_nodes

subroutine: spheroidnullbindingsetabundances0inout
Description: A null set function for rank 0 type abundances.
Code lines: 7
Contained by: module galacticus_nodes

subroutine: spheroidnullbindingsetdouble0inout
Description: A null set function for rank 0 double precisions.
Code lines: 7
Contained by: module galacticus_nodes

subroutine: spheroidnullbindingsethistory0inout
Description: A null set function for rank 0 type histories.
Code lines: 7
Contained by: module galacticus_nodes

subroutine: spheroidnullbindingsetinteger0in
Description: A null set function for rank 0 integers.
Code lines: 7
Contained by: module galacticus_nodes

subroutine: spheroidnullbindingsetlogical0inout
Description: A null set function for rank 0 logicals.
Code lines: 7
Contained by: module galacticus_nodes

subroutine: spheroidnullbindingsetstellarluminosities0inout
Description: A null set function for rank 0 type stellar luminosities.
Code lines: 7
Contained by: module galacticus_nodes

function: spheroidnullbindingstellarluminosities0inout
Description: A null get function for rank 0 type stellar luminosities.
Code lines: 7
Contained by: module galacticus_nodes

function: spheroidradius
Description: Returns the default value for the radius property for the spheroid component class.
Code lines: 8
Contained by: module galacticus_nodes

function: spheroidradiusattributematch
Description: Return a text list of component implementations in the spheroid class that have the desired attributes for the radius property.
Code lines: 27
19.1. Program units

function: spheroidradiusisgettable
Description: Returns true if the radius property is gettable for the spheroid component class.
Code lines: 6
Contained by: module galacticus_nodes

function: spheroidstandardabundancesgascount
Description: Return a count of the number of scalar properties in the abundancesGas property of the spheroidStandard component implementation.
Code lines: 7
Contained by: module galacticus_nodes

function: spheroidstandardabundancesgasget
Description: Return the abundancesGas property of the SpheroidStandard component implementation.
Code lines: 8
Contained by: module galacticus_nodes

subroutine: spheroidstandardabundancesgasrate
Description: Accumulate to the abundancesGas property rate of change of the SpheroidStandard component implementation.
Code lines: 10
Contained by: module galacticus_nodes

subroutine: spheroidstandardabundancesgasrategeneric
Description: Set the rate of the abundancesGas property of the SpheroidStandard component via a generic nodeComponent.
Code lines: 24
Contained by: module galacticus_nodes
Modules used: galacticus_error

subroutine: spheroidstandardabundancesgasscale
Description: Set the abundancesGas property scale of the SpheroidStandard component implementation.
Code lines: 8
Contained by: module galacticus_nodes

subroutine: spheroidstandardabundancesgasset
Description: Set the abundancesGas property of the SpheroidStandard component implementation.
Code lines: 11
Contained by: module galacticus_nodes
Modules used: memory_management

function: spheroidstandardabundancesstellarcount
Description: Return a count of the number of scalar properties in the abundancesStellar property of the spheroidStandard component implementation.
Code lines: 7
Contained by: module galacticus_nodes
function: spheroidstandardabundancesstellarget
Description: Return the abundancesStellar property of the SpheroidStandard component implementation.
Code lines: 8
Contained by: module galacticus_nodes

subroutine: spheroidstandardabundancesstellarrate
Description: Accumulate to the abundancesStellar property rate of change of the SpheroidStandard component implementation.
Code lines: 10
Contained by: module galacticus_nodes

subroutine: spheroidstandardabundancesstellarrategeneric
Description: Set the rate of the abundancesStellar property of the SpheroidStandard component via a generic nodeComponent.
Code lines: 24
Contained by: module galacticus_nodes
Modules used: galacticus_error

subroutine: spheroidstandardabundancesstellarscale
Description: Set the abundancesStellar property scale of the SpheroidStandard component implementation.
Code lines: 8
Contained by: module galacticus_nodes

subroutine: spheroidstandardabundancesstellarset
Description: Set the abundancesStellar property of the SpheroidStandard component implementation.
Code lines: 11
Contained by: module galacticus_nodes
Modules used: memory_management

function: spheroidstandardangularmomentumcount
Description: Return a count of the number of scalar properties in the angularMomentum property of the spheroidStandard component implementation.
Code lines: 7
Contained by: module galacticus_nodes

function: spheroidstandardangularmomentumget
Description: Return the angularMomentum property of the SpheroidStandard component implementation.
Code lines: 8
Contained by: module galacticus_nodes

subroutine: spheroidstandardangularmomentumrate
Description: Accumulate to the angularMomentum property rate of change of the SpheroidStandard component implementation.
Code lines: 10
Contained by: module galacticus_nodes

subroutine: spheroidstandardangularmomentumrategeneric
19.1. Program units

*Description:* Set the rate of the \texttt{angularMomentum} property of the \texttt{SpheroidStandard} component via a generic \texttt{nodeComponent}.

*Code lines:* 24

*Contained by:* module \texttt{galacticus_nodes}

*Modules used:* \texttt{galacticus_error}

**subroutine:** \texttt{spheroidstandardangularmomentumscale}

*Description:* Set the \texttt{angularMomentum} property scale of the \texttt{SpheroidStandard} component implementation.

*Code lines:* 8

*Contained by:* module \texttt{galacticus_nodes}

**subroutine:** \texttt{spheroidstandardangularmomentumset}

*Description:* Set the \texttt{angularMomentum} property of the \texttt{SpheroidStandard} component implementation.

*Code lines:* 11

*Contained by:* module \texttt{galacticus_nodes}

*Modules used:* \texttt{memory_management}

**subroutine:** \texttt{spheroidstandardcreatefunctionset}

*Description:* Set the create function for the \texttt{SpheroidStandard} component.

*Code lines:* 6

*Contained by:* module \texttt{galacticus_nodes}

**subroutine:** \texttt{spheroidstandardenergygasinputrate}

*Description:* Set the rate of the \texttt{energyGasInput} property of the \texttt{SpheroidStandard} component using a deferred function.

*Code lines:* 10

*Contained by:* module \texttt{galacticus_nodes}

**subroutine:** \texttt{spheroidstandardenergygasinputratefunction}

*Description:* Set the function to be used for rate of the \texttt{energyGasInput} property of the \texttt{SpheroidStandard} component class.

*Code lines:* 8

*Contained by:* module \texttt{galacticus_nodes}

**function:** \texttt{spheroidstandardenergygasinputrateisattached}

*Description:* Return true if the deferred function used to rate the \texttt{energyGasInput} property of the \texttt{SpheroidStandard} component class has been attached.

*Code lines:* 5

*Contained by:* module \texttt{galacticus_nodes}

**function:** \texttt{spheroidstandardisinitializedget}

*Description:* Return the \texttt{is Initialized} property of the \texttt{SpheroidStandard} component implementation.

*Code lines:* 8

*Contained by:* module \texttt{galacticus_nodes}

**subroutine:** \texttt{spheroidstandardisinitializedset}

*Description:* Set the \texttt{is Initialized} property of the \texttt{SpheroidStandard} component implementation.

*Code lines:* 9

*Contained by:* module \texttt{galacticus_nodes}
19. Source Code Documentation

Modules used: memory_management

function: spheroidstandardluminositiesstellarcoun
Description: Return a count of the number of scalar properties in the luminositiesStellar property of the spheroidStandard component implementation.
Code lines: 7
Contained by: module galacticus_nodes

function: spheroidstandardluminositiesstellarget
Description: Return the luminositiesStellar property of the SpheroidStandard component implementation.
Code lines: 8
Contained by: module galacticus_nodes

subroutine: spheroidstandardluminositiesstellarrate
Description: Accumulate to the luminositiesStellar property rate of change of the SpheroidStandard component implementation.
Code lines: 10
Contained by: module galacticus_nodes

subroutine: spheroidstandardluminositiesstellarrategeneric
Description: Set the rate of the luminositiesStellar property of the SpheroidStandard component via a generic nodeComponent.
Code lines: 24
Contained by: module galacticus_nodes
Modules used: galacticus_error

subroutine: spheroidstandardluminositiesstellarscale
Description: Set the luminositiesStellar property scale of the SpheroidStandard component implementation.
Code lines: 8
Contained by: module galacticus_nodes

subroutine: spheroidstandardluminositiesstellarset
Description: Set the luminositiesStellar property of the SpheroidStandard component implementation.
Code lines: 11
Contained by: module galacticus_nodes
Modules used: memory_management

function: spheroidstandardmassgascount
Description: Return a count of the number of scalar properties in the massGas property of the spheroidStandard component implementation.
Code lines: 7
Contained by: module galacticus_nodes

function: spheroidstandardmassgasget
Description: Return the massGas property of the SpheroidStandard component implementation.
Code lines: 8
Contained by: module galacticus_nodes
**19.1. Program units**

**subroutine: spheroidstandardmassgasrate**
*Description:* Accumulate to the `massGas` property rate of change of the `SpheroidStandard` component implementation.
*Code lines:* 10
*Contained by:* module `galacticus_nodes`

**subroutine: spheroidstandardmassgasrategeneric**
*Description:* Set the rate of the `massGas` property of the `SpheroidStandard` component via a generic `nodeComponent`.
*Code lines:* 24
*Contained by:* module `galacticus_nodes`
*Modules used:* `galacticus_error`

**subroutine: spheroidstandardmassgasscale**
*Description:* Set the `massGas` property scale of the `SpheroidStandard` component implementation.
*Code lines:* 8
*Contained by:* module `galacticus_nodes`

**subroutine: spheroidstandardmassgasset**
*Description:* Set the `massGas` property of the `SpheroidStandard` component implementation.
*Code lines:* 11
*Contained by:* module `galacticus_nodes`
*Modules used:* `memory_management`

**subroutine: spheroidstandardmassgassinkrate**
*Description:* Set the rate of the `massGasSink` property of the `SpheroidStandard` component using a deferred function.
*Code lines:* 10
*Contained by:* module `galacticus_nodes`

**subroutine: spheroidstandardmassgassinkratefunction**
*Description:* Set the function to be used for rate of the `massGasSink` property of the `SpheroidStandard` component class.
*Code lines:* 8
*Contained by:* module `galacticus_nodes`

**function: spheroidstandardmassgassinkrateisattached**
*Description:* Return true if the deferred function used to rate the `massGasSink` property of the `SpheroidStandard` component class has been attached.
*Code lines:* 5
*Contained by:* module `galacticus_nodes`

**function: spheroidstandardmassstellarcount**
*Description:* Return a count of the number of scalar properties in the `massStellar` property of the `spheroidStandard` component implementation.
*Code lines:* 7
*Contained by:* module `galacticus_nodes`

**function: spheroidstandardmassstellarget**
**Description:** Return the massStellar property of the SpheroidStandard component implementation.

**Code lines:** 8

**Contained by:** module galacticus_nodes

**subroutine: spheroidstandardmassstellarrate**

**Description:** Accumulate to the massStellar property rate of change of the SpheroidStandard component implementation.

**Code lines:** 10

**Contained by:** module galacticus_nodes

**subroutine: spheroidstandardmassstellarrategeneric**

**Description:** Set the rate of the massStellar property of the SpheroidStandard component via a generic nodeComponent.

**Code lines:** 24

**Contained by:** module galacticus_nodes

**Modules used:** galacticus_error

**subroutine: spheroidstandardmassstellarscale**

**Description:** Set the massStellar property scale of the SpheroidStandard component implementation.

**Code lines:** 8

**Contained by:** module galacticus_nodes

**subroutine: spheroidstandardmassstellarset**

**Description:** Set the massStellar property of the SpheroidStandard component implementation.

**Code lines:** 11

**Contained by:** module galacticus_nodes

**Modules used:** memory_management

**function: spheroidstandardradiusget**

**Description:** Return the radius property of the SpheroidStandard component implementation.

**Code lines:** 8

**Contained by:** module galacticus_nodes

**subroutine: spheroidstandardradiusset**

**Description:** Set the radius property of the SpheroidStandard component implementation.

**Code lines:** 9

**Contained by:** module galacticus_nodes

**Modules used:** memory_management

**function: spheroidstandardstarformationhistorycount**

**Description:** Return a count of the number of scalar properties in the starFormationHistory property of the spheroidStandard component implementation.

**Code lines:** 7

**Contained by:** module galacticus_nodes

**function: spheroidstandardstarformationhistoryget**

**Description:** Return the starFormationHistory property of the SpheroidStandard component implementation.

**Code lines:** 8

**Contained by:** module galacticus_nodes
**19.1. Program units**

**subroutine: spheroidstandardstarformationhistoryrate**
*Description:* Accumulate to the starFormationHistory property rate of change of the SpheroidStandard component implementation.
*Code lines:* 10
*Contained by:* module galacticus_nodes

**subroutine: spheroidstandardstarformationhistoryrategeneric**
*Description:* Set the rate of the starFormationHistory property of the SpheroidStandard component via a generic nodeComponent.
*Code lines:* 24
*Contained by:* module galacticus_nodes
*Modules used:* galacticus_error

**subroutine: spheroidstandardstarformationhistoryscale**
*Description:* Set the starFormationHistory property scale of the SpheroidStandard component implementation.
*Code lines:* 8
*Contained by:* module galacticus_nodes

**subroutine: spheroidstandardstarformationhistoryset**
*Description:* Set the starFormationHistory property of the SpheroidStandard component implementation.
*Code lines:* 11
*Contained by:* module galacticus_nodes
*Modules used:* memory_management

**function: spheroidstandardstarformationrateget**
*Description:* Get the value of the starFormationRate property of the SpheroidStandard component using a deferred function.
*Code lines:* 8
*Contained by:* module galacticus_nodes

**subroutine: spheroidstandardstarformationrategetfunction**
*Description:* Set the function to be used for get of the starFormationRate property of the SpheroidStandard component class.
*Code lines:* 8
*Contained by:* module galacticus_nodes

**function: spheroidstandardstarformationrategetisattached**
*Description:* Return true if the deferred function used to get the starFormationRate property of the SpheroidStandard component class has been attached.
*Code lines:* 5
*Contained by:* module galacticus_nodes

**function: spheroidstandardstellarpropertieshistorycount**
*Description:* Return a count of the number of scalar properties in the stellarPropertiesHistory property of the spheroidStandard component implementation.
*Code lines:* 7
*Contained by:* module galacticus_nodes
function: spheroidstandardstellarpropertieshistoryget
Description: Return the stellarPropertiesHistory property of the SpheroidStandard component implementation.
Code lines: 8
Contained by: module galacticus_nodes

subroutine: spheroidstandardstellarpropertieshistoryrate
Description: Accumulate to the stellarPropertiesHistory property rate of change of the SpheroidStandard component implementation.
Code lines: 10
Contained by: module galacticus_nodes

subroutine: spheroidstandardstellarpropertieshistoryrategeneric
Description: Set the rate of the stellarPropertiesHistory property of the SpheroidStandard component via a generic nodeComponent.
Code lines: 24
Contained by: module galacticus_nodes
Modules used: galacticus_error

subroutine: spheroidstandardstellarpropertieshistoryscale
Description: Set the stellarPropertiesHistory property scale of the SpheroidStandard component implementation.
Code lines: 8
Contained by: module galacticus_nodes

subroutine: spheroidstandardstellarpropertieshistoryset
Description: Set the stellarPropertiesHistory property of the SpheroidStandard component implementation.
Code lines: 11
Contained by: module galacticus_nodes
Modules used: memory_management

function: spheroidstandardvelocityget
Description: Return the velocity property of the SpheroidStandard component implementation.
Code lines: 8
Contained by: module galacticus_nodes

subroutine: spheroidstandardvelocityset
Description: Set the velocity property of the SpheroidStandard component implementation.
Code lines: 9
Contained by: module galacticus_nodes
Modules used: memory_management

function: spheroidstarformationhistory
Description: Returns the default value for the starFormationHistory property for the spheroid component class.
Code lines: 8
Contained by: module galacticus_nodes
19.1. Program units

function: spheroidstarformationhistoryattributematch
Description: Return a text list of component implementations in the spheroid class that have the desired attributes for the starFormationHistory property
Code lines: 25
Contained by: module galacticus_nodes
Modules used: iso_varying_string

function: spheroidstarformationhistoryisgettable
Description: Returns true if the starFormationHistory property is gettable for the spheroid component class.
Code lines: 6
Contained by: module galacticus_nodes

subroutine: spheroidstarformationhistoryrate
Description: Accept a rate set for the starFormationHistory property of the spheroid component class. Trigger an interrupt to create the component.
Code lines: 15
Contained by: module galacticus_nodes
Modules used: galacticus_error

function: spheroidstarformationrate
Description: Returns the default value for the starFormationRate property for the spheroid component class.
Code lines: 8
Contained by: module galacticus_nodes

** Modules used:**

- `iso_varying_string`
function: tree_node_constructor
Description: Return a pointer to a newly created and initialized treeNode.
Code lines: 19
Contained by: module galacticus_nodes

subroutine: tree_node_copy_node_to
Description: Make a copy of self in targetNode.
Code lines: 510
Contained by: module galacticus_nodes

function: tree_node_create_event
Description: Create a new event in a tree node.
Code lines: 21
Contained by: module galacticus_nodes

subroutine: tree_node_create_initialize
Description: Initializes tree node create by calling all relevant initialization routines.
Code lines: 15
Contained by: module galacticus_nodes
Modules used: input_parameters

function: tree_node_get_earliest_progenitor
Description: Returns a pointer to the earliest progenitor of self.
Code lines: 14
Contained by: module galacticus_nodes

function: tree_node_get_last_satellite
Description: Returns a pointer to the final satellite node associated with self.
Code lines: 11
Contained by: module galacticus_nodes

function: tree_node_index
Description: Returns the index of a treeNode.
Code lines: 17
Contained by: module galacticus_nodes

subroutine: tree_node_index_set
Description: Sets the index of a treeNode.
Code lines: 8
Contained by: module galacticus_nodes

function: tree_node_is_on_main_branch
Description: Returns true if self is on the main branch.
Code lines: 17
Contained by: module galacticus_nodes

function: tree_node_is_primary_progenitor
Description: Returns true if self is the primary progenitor of its parent node.
Code lines: 14
Contained by: module galacticus_nodes

function: tree_node_is_primary_progenitor_of_index
Description: Return true if self is a progenitor of the node with index targetNodeIndex.
Code lines: 21
Contained by: module galacticus_nodes

function: tree_node_is_primary_progenitor_of_node
Description: Return true if self is a progenitor of targetNode.
Code lines: 21
Contained by: module galacticus_nodes

function: tree_node_is_progenitor_of_index
Description: Return true if self is a progenitor of the node with index targetNodeIndex.
Code lines: 20
Contained by: module galacticus_nodes

function: tree_node_is_progenitor_of_node
Description: Return true if self is a progenitor of targetNode.
Code lines: 20
Contained by: module galacticus_nodes

function: tree_node_is_satellite
Description: Returns true if self is a satellite.
Code lines: 27
Contained by: module galacticus_nodes

function: tree_node_merges_with_node
Description: Returns a pointer to the node with which thisNode will merge.
Code lines: 15
Contained by: module galacticus_nodes

subroutine: tree_node_move_components
Description: Move components from self to targetNode.
Code lines: 224
Contained by: module galacticus_nodes

subroutine: tree_node_ode_step_rates_initialize
Description: Initialize the rates in components of tree node self in preparation for an ODE solver step.
Code lines: 217
Contained by: module galacticus_nodes

subroutine: tree_node_ode_step_scales_initialize
Description: Initialize the scales in components of tree node self in preparation for an ODE solver step.
Code lines: 217
Contained by: module galacticus_nodes

subroutine: tree_node_remove_from_host
Description: Remove self from the linked list of its host node's satellites.
Code lines: 36
Contained by: module galacticus_nodes
Modules used: galacticus_display string_handling

subroutine: tree_node_remove_from_mergee
Description: Remove self from the linked list of its host node's satellites.
Code lines: 38
Contained by: module galacticus_nodes
Modules used: galacticus_display string_handling

subroutine: tree_node_remove_paired_event
Description: Removed a paired event from self. Matching is done on the basis of event ID.
Code lines: 33
Contained by: module galacticus_nodes

function: tree_node_type
Description: Returns the name of a treeNode object.
Code lines: 8
Contained by: module galacticus_nodes

function: tree_node_unique_id
Description: Returns the unique ID of a treeNode.
Code lines: 17
Contained by: module galacticus_nodes

subroutine: tree_node_unique_id_set
Description: Sets the index of a treeNode.
Code lines: 16
Contained by: module galacticus_nodes

subroutine: tree_node_walk_branch
Description: This function provides a mechanism for walking through the branches of the merger tree. Given a pointer self to a branch of the tree, it will return the next node that should be visited in the tree. Thus, if self is initially set to the base of the merger tree and Merger._Tree_Walk_Branch() is called repeatedly it will walk through every node of the branch. Once the entire branch has been walked, a null() pointer will be returned, indicating that there are no more nodes to walk. Each node will be visited once and once only if the branch is walked in this way.
Code lines: 35
Contained by: module galacticus_nodes

subroutine: tree_node_walk_branch_with_satellites

Description: This function provides a mechanism for walking through the branches of the merger tree. Given a pointer self to a branch of the tree, it will return the next node that should be visited in the tree. Thus, if self is initially set to the base of the merger tree and Merger_Tree_Walk_Branch() is called repeatedly it will walk through every node of the branch. Once the entire branch has been walked, a null() pointer will be returned, indicating that there are no more nodes to walk. Each node will be visited once and once only if the branch is walked in this way. Note that it is important that the walk descends to satellites before descending to children: the routines that destroy merger tree branches rely on this since child nodes are used in testing whether a node is a satellite—if they are destroyed prior to the test being made then problems with dangling pointers will occur.

Code lines: 53
Contained by: module galacticus_nodes

subroutine: tree_node_walk_tree
**Description:** This function provides a mechanism for walking through an entire merger tree. Given a pointer `self` to a node of the tree, it will return the next node that should be visited in the tree. Thus, if `self` is initially set to the base of the merger tree and `Merger_Tree_Walk()` is called repeatedly it will walk through every node of the tree. Once the entire tree has been walked, a `null()` pointer will be returned, indicating that there are no more nodes to walk. Each node will be visited once and once only if the tree is walked in this way.

**Code lines:** 36  
**Contained by:** module galacticus_nodes

**subroutine:** tree_node_walk_tree_under_construction  
**Description:** This function provides a mechanism for walking through a merger tree that is being built.  
**Code lines:** 42  
**Contained by:** module galacticus_nodes

**subroutine:** tree_node_walk_tree_with_satellites  
**Description:** Merger tree walk function which also descends through satellite nodes. Note that it is important that the walk descends to satellites before descending to children: the routines that destroy merger tree branches rely on this since child nodes are used in testing whether a node is a satellite—if they are destroyed prior to the test being made then problems with dangling pointers will occur.  
**Code lines:** 48

Description: Contains a module which implements top-level functions for node components.
19. Source Code Documentation

**module:** node_components

*Description:* Implements top-level functions for node components.

*Code lines:* 48

*Contained by:* file objects.nodes.components.F90

*Used by:* function galacticus_task_evolve_tree, subroutine halo_mass_function_compute

**subroutine:** node_components_initialize

*Description:* Perform initialization tasks for node components.

*Code lines:* 39

*Contained by:* module node_components

*Modules used:* node_component_black_hole_standard, node_component_dark_matter_profile-, node_component_disk_exponential, node_component_disk_very_simple, node_component_hot_halo_standard, node_component_satellite_standard, node_component_spheroid_standard

**file:** objects.nodes.components.age_statistics.standard.F90

*Description:* Contains a module which implements the standard galaxy age statistics component.

*Code lines:* 196

**module:** node_component_age_statistics_standard

*Description:* Implements the standard galaxy age statistics component.

*Code lines:* 176

*Contained by:* file objects.nodes.components.age_statistics.standard.F90

*Modules used:* galacticus_nodes

*Used by:* subroutine tree_node_compute_derivatives, subroutine tree_node_evolve, subroutine satellite_merger_process

**subroutine:** node_component_age_statistics_standard_rate_compute

*Description:* Compute the exponential disk node mass rate of change.

*Code lines:* 32

*Contained by:* module node_component_age_statistics_standard

*Modules used:* galacticus_nodes, galacticus_output_times

**subroutine:** node_component_age_statistics_standard_satellite_merger

*Description:* Remove any age statistics quantities associated with thisNode and add them to the merge target.

*Code lines:* 52

*Contained by:* module node_component_age_statistics_standard

*Modules used:* galacticus_error, satellite_merging_mass_movements-descendants

**subroutine:** node_component_age_statistics_standard_scale_set

*Description:* Set scales for properties of thisNode.

*Code lines:* 27

*Contained by:* module node_component_age_statistics_standard

Code lines: 31
Contained by: module node_component_hot_halo_cold_mode
Modules used: abundances_structure dark_matter_halo_scales

subroutine: node_component_hot_halo_cold_mode_thread_initialize
Description: Initializes the tree node hot halo methods module.
Code lines: 12
19.1. Program units

**Description:**

Initialize the contents of the hot halo component for any sub-resolution accretion (i.e. the gas that would have been accreted if the merger tree had infinite resolution).

**Code lines:**

34

**Description:**

Contains a module which implements structure tasks for the cold mode hot halo component.

**Code lines:**

175

**Description:**

Implements structure tasks for the cold mode hot halo component.

**Code lines:**

155

**Description:**

Computes the density at a given position for a dark matter profile.

**Code lines:**

40

**Description:**

Computes the mass within a given radius for the cold mode hot halo component.

**Code lines:**

38

**Description:**

Computes the rotation curve gradient at a given radius for the hot halo density profile.

**Code lines:**

*Description:* Initializes the random spin component module.

*Code lines:* 25
*Contained by:* module node_component_spin_random
*Modules used:* galacticus_nodes

**subroutine: node_component_spin_random_initialize_spins**

*Description:* Initialize the spin of thisNode.

*Code lines:* 45
*Contained by:* module node_component_spin_random
*Modules used:* halo_spin_distributions

**subroutine: node_component_spin_random_promote**

*Description:* Ensure that thisNode is ready for promotion to its parent. In this case, we simply update the spin of thisNode to be that of its parent.

*Code lines:* 23
*Contained by:* module node_component_spin_random
*Modules used:* galacticus_error

**file: objects.radiation.F90**

*Description:* Contains a module which defines the radiation structure data type, used to describe radiation fields. (Currently only includes CMB radiation temperature.)

*Code lines:* 397

**module: radiation_structure**

*Description:* Defines the radiation structure data type, used to describe radiation fields. (Currently only includes CMB radiation temperature.)

*Code lines:* 376
*Contained by:* file objects.radiation.F90
*Used by:*

**function** `intergalactic_medium_state_`  
**module** `node_component_hot_halo_cold_`  
**internal_odes**  
**module** `node_component_hot_halo_`  
**standard**

**function**: `cross_section_integrand`  
**Description**: Integrand function used in integrating a radiation field over a cross section function.  
**Code lines**: 13  
**Contained by**: module `radiation_structure`  
**Modules used**: `iso_c_binding`

**subroutine**: `radiation_define`  
**Description**: Define which radiation fields are active in this radiation object.  
**Code lines**: 20  
**Contained by**: module `radiation_structure`  
**Modules used**: `memory_management`

**function**: `radiation_flux`  
**Description**: Return the flux of the radiation object in units of ergs cm$^{-2}$ Hz$^{-1}$ ster$^{-1}$ at the specified wavelength (in Å).  
**Code lines**: 42  
**Contained by**: module `radiation_structure`  
**Modules used**: `radiation_cmb`  
`radiation_intergalactic_background`  
`radiation_null`

**function**: `radiation_integrate_over_cross_section`  
**Description**: Integrate the photon number of the radiation field over a given cross-section function (which should return the cross section in units of cm$^2$), i.e.:  
\[
\frac{4\pi}{h} \int_{\lambda_1}^{\lambda_2} \sigma(\lambda) j_\nu(\lambda) \frac{d\lambda}{\lambda},
\]  
(19.22)

where $j_\nu$ is the flux of energy per unit area per unit solid angle and per unit frequency.

Modules used: galacticus_error

function: stellar_luminosities_multiply
Description: Multiply a stellar luminosities object by a scalar.
Code lines: 11
Contained by: module stellar_luminosities_structure

function: stellar_luminosities_multiply_switched
Description: Multiply a stellar luminosities object by a scalar.
Code lines: 11
Contained by: module stellar_luminosities_structure

function: stellar_luminosities_name
Description: Return a name for the specified entry in the stellar luminosities structure.
Code lines: 16
Contained by: module stellar_luminosities_structure
Modules used: galacticus_error

subroutine: stellar_luminosities_output
Description: Store a stellarLuminosities object in the output buffers.
Code lines: 22
Contained by: module stellar_luminosities_structure
Modules used: kind_numbers

subroutine: stellar_luminosities_output_count
Description: Increment the output count to account for a stellarLuminosities object.
Code lines: 11
function: stellar_luminosities_output_count_get
Description: Compute the number of luminosities to be output at a given time.
Code lines: 13
Contained by: module stellar_luminosities_structure

subroutine: stellar_luminosities_output_names
Description: Assign names to output buffers for a stellarLuminosities object.
Code lines: 25
Contained by: module stellar_luminosities_structure

function: stellar_luminosities_property_count
Description: Return the number of properties required to track stellar luminosities.
Code lines: 8
Contained by: module stellar_luminosities_structure

subroutine: stellar_luminosities_read_raw
Description: Read an stellarLuminosities object from binary.
Code lines: 14
Contained by: module stellar_luminosities_structure

subroutine: stellar_luminosities_reset
Description: Reset an stellarLuminosities object.
Code lines: 12
Contained by: module stellar_luminosities_structure

subroutine: stellar_luminosities_serialize
Description: Unpack stellar luminosities from a stellarLuminosities structure into an array.
Code lines: 15
Contained by: module stellar_luminosities_structure

subroutine: stellar_luminosities_set
Description: Set the luminosity in each band for a single stellar population of given mass with the specified abundancesStellar and which formed at cosmological time with IMF specified by imfSelected.
Code lines: 24
Contained by: module stellar_luminosities_structure
Modules used: abundances_structure stellar_population_luminosities

subroutine: stellar_luminosities_set_to_unity
Description: Set an stellarLuminosities object to unity.
Code lines: 12
Contained by: module stellar_luminosities_structure

subroutine: stellar_luminosities_special_cases
Description: Modify the input list of luminosities for special cases.
Code lines: 97
Contained by: module stellar_luminosities_structure

*Modules used:* galacticus_nodes

*Used by:* function ram_pressure_stripping_mass_loss_rate_spheroid

**function:** ram_pressure_stripping_mass_loss_rate_spheroid_simple
Computes the mass loss rate from spheroids due to ram pressure stripping assuming a simple model. Specifically, the mass loss rate is

\[ \dot{M}_{\text{gas}} = -\alpha M_{\text{gas}}/\tau_{\text{spheroid}}, \]  

(19.26)

where

\[ \alpha = F_{\text{ram}}/F_{\text{gravity}}, \]  

(19.27)

\( F_{\text{ram}} \) is the ram pressure force from the hot halo (see §13.18), and

\[ F_{\text{gravity}} = \frac{4}{3} \rho_{\text{gas}}(r_{1/2}) \frac{GM_{\text{total}}(r_{1/2})}{r_{1/2}} \]  

(19.28)

is the gravitational restoring force in the spheroid at the half-mass radius, \( r_{1/2} \) [Takeda et al., 1984].

19.1. Program units

Description: Takes a virial orbit and adjusts the energy to account for the change in the definition of potential between the original halo in which the orbit was defined and the current halo. Since the potential at the virial radius of halos is always defined to be $\Phi(r_{\text{vir}}) = -V_{\text{vir}}^2$, then the specific energy transforms as:

$$e \rightarrow e + V_{\text{vir},0}^2 + \Phi(r_{\text{vir},0}),$$

(19.29)

where subscript 0 refers to the original halo in which the orbit was defined and $\Phi(r)$ is the potential of the current halo.

   Code lines: 25
   Contained by: module star_formation_imf
   Modules used: iso_c_binding stellar_feedback

function: imf_descriptor
   Description: Return a full descriptor for the IMF with the specified index.
   Code lines: 16
   Contained by: module star_formation_imf
   Modules used: galacticus_error

function: imf_energy_input_rate_noninstantaneous
   Description: Returns the energy input rate for a simple stellar population in \((\text{km/s})^2 \text{ Gyr}^{-1}\). The IMF is determined from the given \texttt{starFormationRate} and \texttt{fuelAbundances}. The energy input rate is computed for the given \texttt{age} (in Gyr). The cumulative energy input is computed on a grid of age and metallicity. This is stored to file and will be read back in on subsequent runs. This is useful as computation of the table is relatively slow.
   Code lines: 307
   Contained by: module star_formation_imf

function: imf_maximum_mass
   Description: Returns the maximum mass in the selected IMF.
   Code lines: 37
   Contained by: module star_formation_imf

function: imf_metal_yield_rate_noninstantaneous
**Description:** Returns the metal yield rate for a simple stellar population, either for the total metallicity or, if `atomIndex` is given, for the specified element. The IMF is determined from the given `starFormationRate` and `fuelAbundances`. The metal yield rate (in fraction of the population’s mass returned to the ISM as new metals per Gyr) is computed for the given `age` (in Gyr). The metal yield is computed on a grid of age and metallicity. This is stored to file and will be read back in on subsequent runs. This is useful as computation of the table is relatively slow.

**Used by:**
- subroutine `galacticus_calculations_reset`
- subroutine `star_formation_rate_surface_density_disks_initialize`
function: star_formation_rate_surface_density_disk_ks

Description: Returns the star formation rate surface density (in $M_\odot$ Gyr$^{-1}$ Mpc$^{-2}$) for star formation in the galactic disk of thisNode. The disk is assumed to obey the Kennicutt-Schmidt law:

$$\Sigma_\star = A \left( \frac{x_h \Sigma_{\text{gas}}}{M_\odot \text{pc}^{-2}} \right)^N,$$

where $A = \text{[starFormationKennicuttSchmidtNormalization]}$ and $N = \text{[starFormationKennicuttSchmidtExponent]}$. Optionally, star formation is truncated for gas surface densities below a critical density of:

$$\Sigma_{\text{crit}} = \frac{q_{\text{crit}} \kappa \sigma_{\text{gas}}}{\pi G},$$

where $\kappa$ is the epicyclic frequency in the disk, $\sigma_{\text{gas}}$ is the velocity dispersion of gas in the disk and $q_{\text{crit}} = \text{[toomreParameterCritical]}$ is a dimensionless constant of order unity which controls where the critical density occurs. $\sigma_{\text{gas}}$ is assumed to be a constant equal to $\text{[velocityDispersionDiskGas]}$ and the disk is assumed to have a flat rotation curve such that $\kappa = \sqrt{2V/R}$.

19. Source Code Documentation

**function: sneia_cumulative_number**
*Description:* Return the cumulative number of Type Ia supernovae from stars of given initialMass, age and metallicity.
*Code lines:* 11
*Contained by:* module supernovae_type_ia

**function: sneia_cumulative_yield**
*Description:* Return the cumulative yield of Type Ia supernovae from stars of given initialMass, age and metallicity.
*Code lines:* 12
*Contained by:* module supernovae_type_ia

**subroutine: supernovae_type_ia_initialize**
*Description:* Initialize the Type Ia supernovae module.
*Code lines:* 52
*Contained by:* module supernovae_type_ia

**file: stellar_astrophysics.supernovae_type_Ia.Nagashima.F90**
*Description:* Contains a module which implements calculations related to Type Ia supernovae.
*Code lines:* 149

**module: supernovae_type_ia_nagashima**
*Description:* Implements calculations related to Type Ia supernovae.
*Code lines:* 129
*Contained by:* file stellar_astrophysics.supernovae_type_Ia.Nagashima.F90
*Used by:* subroutine supernovae_type_ia_initialize

**function: sneia_cumulative_number_nagashima**
*Description:* Compute the cumulative number of Type Ia supernovae originating per unit mass of stars that form with given initialMass and metallicity after a time age. The calculation is based on that of Nagashima et al. [2005]. The number returned here assumes a distribution of binary mass ratios and so only makes sense once it is integrated over an initial mass function.
*Code lines:* 29
*Contained by:* module supernovae_type_ia_nagashima
*Modules used:* stellar_astrophysics

**function: sneia_cumulative_yield_nagashima**
*Description:* Compute the cumulative yield from Type Ia supernovae originating per unit mass of stars that form with given initialMass and metallicity after a time age. The calculation is based on the Type Ia rate calculation of Nagashima et al. [2005] and the Type Ia yields from Nomoto et al. [1997]. The number returned here assumes a distribution of binary mass ratios and so only makes sense once it is integrated over an initial mass function.
*Code lines:* 19
*Contained by:* module supernovae_type_ia_nagashima

**subroutine: supernovae_type_ia_nagashima_initialize**
19.1. Program units

**Description:** Initialize the “Nagashima” Type Ia supernovae module.

**Code lines:** 56

**Contained by:** module `supernovae_type_ia_nagashima`

**Modules used:**
- `atomic_data`
- `fox_dom`
- `galacticus_error`
- `galacticus_input_paths`
- `io_xml`
- `iso_varying_string`
- `memory_management`

**file:** `stellar_astrophysics.tracks.F90`

**Description:** Contains a module which implements calculation of stellar tracks.

**Code lines:** 127

**module:** `stellar_astrophysics_tracks`

**Description:** Implements stellar tracks.

**Code lines:** 107

**Contained by:** file `stellar_astrophysics.tracks.F90`

**Modules used:** `iso_varying_string`

**Used by:**
- function `stellar_winds_mass_loss_rate_leitherer1992`
- function `stellar_winds_terminal_velocity_leitherer1992`

**function:** `stellar_effective_temperature`

**Description:** Returns the effective temperature of a star of given `initialMass`, `metallicity` and `age`.

**Code lines:** 12

**Contained by:** module `stellar_astrophysics_tracks`

**function:** `stellar_luminosity`

**Description:** Returns the bolometric luminosity of a star of given `initialMass`, `metallicity` and `age`.

**Code lines:** 12

**Contained by:** module `stellar_astrophysics_tracks`

**subroutine:** `stellar_tracks_initialize`

**Description:** Initialize the cosmology functions module.

**Code lines:** 52

**Contained by:** module `stellar_astrophysics_tracks`

**Modules used:**
- `galacticus_error`
- `input_parameters`
- `stellar_astrophysics_tracks_file`

**file:** `stellar_astrophysics.tracks.file.F90`

**Description:** Contains a module which implements calculation of stellar tracks.

**Code lines:** 338

**module:** `stellar_astrophysics_tracks_file`

**Description:** Implements stellar tracks.

**Code lines:** 318

**Contained by:** file `stellar_astrophysics.tracks.file.F90`

**Modules used:** `fgsl`

**Used by:** subroutine `stellar_tracks_initialize`
function: stellar_effective_temperature_file
Description: Return the effective temperature (in Kelvin) for a star of given initialMass, metallicity and age.
Code lines: 20
Contained by: module stellar_astrophysics_tracks_file
Modules used: iso_c_binding

function: stellar_luminosity_file
Description: Return the bolometric luminosity (in $L_\odot$) for a star of given initialMass, metallicity and age.
Code lines: 20
Contained by: module stellar_astrophysics_tracks_file
Modules used: iso_c_binding

subroutine: stellar_tracks_initialize_file
Description: Initialize the stellar tracks module.
Code lines: 133
Contained by: module stellar_astrophysics_tracks_file
Modules used: galacticus_error, galacticus_input_paths, input_parameters, io_hdf5, iso_varying_string, memory_management, string_handling

function: stellar_tracks_interpolation_do
Description: Using precomputed factors, interpolate in metallicity, mass and age in the given stellarTracks.
Code lines: 22
Contained by: module stellar_astrophysics_tracks_file
Modules used: iso_c_binding

subroutine: stellar_tracks_interpolation_get
Description: Get interpolating factors for stellar tracks.
Code lines: 89
Contained by: module stellar_astrophysics_tracks_file
Modules used: iso_c_binding, numerical_interpolation

file: stellar_astrophysics.winds.F90
Description: Contains a module which provides calculations of stellar winds.
Code lines: 124

module: stellar_astrophysics_winds
Description: Provides calculations of stellar winds.
Code lines: 104
Contained by: file stellar_astrophysics.winds.F90
Modules used: iso_varying_string
Used by: function wind_energy_integrand
subroutine: stellar_winds_initialize
19.1. Program units

**Description:** Initialize the stellar winds module.

**Code lines:** 52

**Contained by:** module `stellar_astrophysics_winds`

**Modules used:**
- `galacticus_error`
- `input_parameters`
- `stellar_astrophysics_winds_leitherer1992`

**Function:** `stellar_winds_mass_loss_rate`

**Description:** Return the mass loss rate (in $M_\odot$/Gyr) from stars of given initialMass, age and metallicity.

**Code lines:** 11

**Contained by:** module `stellar_astrophysics_winds`

**Function:** `stellar_winds_terminal_velocity`

**Description:** Return the terminal velocity (in km/s) of winds from stars of given initialMass, age and metallicity.

**Code lines:** 11

**Contained by:** module `stellar_astrophysics_winds`

**File:** `stellar_astrophysics.winds.Leitherer1992.F90`

**Description:** Contains a module which implements a calculation of winds from stellar populations using the fitting formulae of Leitherer et al. [1992].

**Code lines:** 93

**Module:** `stellar_astrophysics_winds_leitherer1992`

**Description:** Implements a calculation of winds from stellar populations using the fitting formulae of Leitherer et al. [1992].

**Code lines:** 73

**Contained by:** file `stellar_astrophysics.winds.Leitherer1992.F90`

**Modules used:** `numerical_constants_astronomical`

**Used by:** subroutine `stellar_winds_initialize`

**Subroutine:** `stellar_winds_leitherer1992_initialize`

**Description:** Initialize the "Leitherer1992" stellar winds module.

**Code lines:** 14

**Contained by:** module `stellar_astrophysics_winds_leitherer1992`

**Modules used:** `iso_varying_string`

**Function:** `stellar_winds_mass_loss_rate_leitherer1992`

**Description:** Compute the mass loss rate (in $M_\odot$/Gyr) from a star of given initialMass, age and metallicity using the fitting formula of Leitherer et al. [1992].

**Code lines:** 19

**Contained by:** module `stellar_astrophysics_winds_leitherer1992`

**Modules used:** `stellar_astrophysics_tracks`

**Function:** `stellar_winds_terminal_velocity_leitherer1992`

**Description:** Compute the terminal velocity (in km/s) from a star of given initialMass, age and metallicity using the fitting formula of Leitherer et al. [1992].

**Code lines:** 19

**Contained by:** module `stellar_astrophysics_winds_leitherer1992`
Modules used: stellar_astrophysics_tracks

file: stellar_populations.luminosities.F90
Description: Contains a module which implements calculations of stellar population luminosities in the AB magnitude system.
Code lines: 361

module: stellar_population_luminosities
Description: Implements calculations of stellar population luminosities in the AB magnitude system.
Code lines: 341
Contained by: file stellar_populations.luminosities.F90
Modules used: abundances_structure fgs1 iso_c_binding
Used by: subroutine stellar_luminosities_set

function: spectrapostprocessorconstructordefault
Description: Return a pointer to the default spectrapostprocessor object.
Code lines: 8
Contained by: module stellar_population_spectra_postprocess
function: spectrapostprocessorconstructornamed
Description: Return a pointer to a newly created spectraPostprocessor object of the specified type.
Code lines: 58
Contained by: module stellar_population_spectra_postprocess
Modules used: galacticus_error iso_varying_string

interface: spectrapostprocessoridentity
Description: Constructors for the identity spectrum postprocessor class.
Code lines: 3
Contained by: module stellar_population_spectra_postprocess

subroutine: spectrapostprocessorinitialize
Description: Initialize the default spectraPostprocessor object.
Code lines: 75
Contained by: module stellar_population_spectra_postprocess
Modules used: galacticus_error input_parameters iso_varying_string

interface: spectrapostprocessorinoue2014
Description: Constructors for the inoue2014 spectrum postprocessor class.
Code lines: 3
Contained by: module stellar_population_spectra_postprocess

function: spectrapostprocessorisfinalizable
Description: Return true if this object can be finalized.
Code lines: 7
Contained by: module stellar_population_spectra_postprocess

interface: spectrapostprocessorlycsuppress
Description: Constructors for the lycSuppress spectrum postprocessor class.
Code lines: 3
Contained by: module stellar_population_spectra_postprocess

interface: spectrapostprocessormadau1995
Description: Constructors for the madau1995 spectrum postprocessor class.
Code lines: 3
Contained by: module stellar_population_spectra_postprocess

interface: spectrapostprocessormeiksin2006
Description: Constructors for the meiksin2006 spectrum postprocessor class.
Code lines: 3
Contained by: module stellar_population_spectra_postprocess

interface: spectrapostprocessorrecent
Description: Constructors for the recent spectrum postprocessor class.
Code lines: 4
Contained by: module stellar_population_spectra_postprocess
function: stellar_population_spectrum_postprocess
Description: Return a multiplicative factor by which a stellar population spectrum should be modified by any postprocessing.
Code lines: 16
Contained by: module stellar_population_spectra_postprocess

function: stellar_population_spectrum_postprocess_chain_methods
Description: Return a label describing the postprocessing methods used in the indicated chain.
Code lines: 8
Contained by: module stellar_population_spectra_postprocess

function: stellar_population_spectrum_postprocess_index
Description: Return the index to the specified postprocessing chain.
Code lines: 90
Contained by: module stellar_population_spectra_postprocess
Modules used: galacticus_error input_parameters string_handling

subroutine: stellar_population_spectrum_postprocess_initialize
Description: Initialize the stellar population spectra postprocessing module
Code lines: 18
Contained by: module stellar_population_spectra_postprocess

file: stellar_populations.spectra.postprocess.Inoue2014.F90
Description: An implementation of a spectrum postprocessor that applies the Inoue et al. [2014] calculation of the attenuation of spectra by the intergalactic medium.
Code lines: 124

subroutine: inoue2014apply
Description: Suppress the Lyman continuum in a spectrum.
Code lines: 73
Contained by: file stellar_populations.spectra.postprocess.Inoue2014.F90
Modules used: factorials gamma_functions numerical_constants_atomic

function: inoue2014defaultconstructor
Description: Default constructor for the inoue2014 spectrum postprocessor class.
Code lines: 6
Contained by: file stellar_populations.spectra.postprocess.Inoue2014.F90

interface: spectrapostprocessorinoue2014
Description: Constructors for the inoue2014 spectrum postprocessor class.
Code lines: 3
Contained by: file stellar_populations.spectra.postprocess.Inoue2014.F90

file: stellar_populations.spectra.postprocess.Lyman_continuum_suppress.F90
Description: An implementation of a spectrum postprocessor that suppresses the Lyman continuum.
Code lines: 56
19. Source Code Documentation

subroutine: lycsuppressapply
Description: Suppress the Lyman continuum in a spectrum.
Code lines: 10
Contained by: file stellar_populations.spectra.postprocess.Lyman_continuum_suppress.F90
Modules used: numerical_constants_atomic

function: lycsuppressdefaultconstructor
Description: Default constructor for the lycSuppress spectrum postprocessor class.
Code lines: 6
Contained by: file stellar_populations.spectra.postprocess.Lyman_continuum_suppress.F90

interface: spectrapostprocessorlycsuppress
Description: Constructors for the lycSuppress spectrum postprocessor class.
Code lines: 3
Contained by: file stellar_populations.spectra.postprocess.Lyman_continuum_suppress.F90

Description: An implementation of a spectrum postprocessor that applies the Madau [1995] calculation of the attenuation of spectra by the intergalactic medium.
Code lines: 85

subroutine: madau1995apply
Description: Suppress the Lyman continuum in a spectrum.
Code lines: 38
Modules used: numerical_constants_atomic

function: madau1995defaultconstructor
Description: Default constructor for the madau1995 spectrum postprocessor class.
Code lines: 6

interface: spectrapostprocessormadau1995
Description: Constructors for the madau1995 spectrum postprocessor class.
Code lines: 3

file: stellar_populations.spectra.postprocess.Meiksin2006.F90
Description: An implementation of a spectrum postprocessor that applies the Meiksin [2006] calculation of the attenuation of spectra by the intergalactic medium.
Code lines: 132

subroutine: meiksin2006apply
Description: Suppress the Lyman continuum in a spectrum.
Code lines: 85
Contained by: file stellar_populations.spectra.postprocess.Meiksin2006.F90
Modules used: factorials gamma_functions numerical_constants_atomic
function: meiksin2006defaultconstructor
Description: Default constructor for the meiksin2006 spectrum postprocessor class.
Code lines: 6
Contained by: file stellar_populations.spectra.postprocess.Meiksin2006.F90

interface: spectrapostprocessorsmeiksin2006
Description: Constructors for the meiksin2006 spectrum postprocessor class.
Code lines: 3
Contained by: file stellar_populations.spectra.postprocess.Meiksin2006.F90

file: stellar_populations.spectra.postprocess.identity.F90
Description: An implementation of a spectrum postprocessor that does nothing.
Code lines: 55

subroutine: identityapply
Description: Perform an identity postprocessing on a spectrum.
Code lines: 9
Contained by: file stellar_populations.spectra.postprocess.identity.F90

function: identitydefaultconstructor
Description: Default constructor for the identity spectrum postprocessor class.
Code lines: 6
Contained by: file stellar_populations.spectra.postprocess.identity.F90

interface: spectrapostprocessorentity
Description: Constructors for the identity spectrum postprocessor class.
Code lines: 3
Contained by: file stellar_populations.spectra.postprocess.identity.F90

file: stellar_populations.spectra.postprocess.recent.F90
Description: An implementation of a spectrum postprocessor that keeps only recent populations.
Code lines: 87

subroutine: recentapply
Description: Perform an recent postprocessing on a spectrum.
Code lines: 9
Contained by: file stellar_populations.spectra.postprocess.recent.F90

function: recentdefaultconstructor
Description: Default constructor for the recent spectrum postprocessor class.
Code lines: 23
Contained by: file stellar_populations.spectra.postprocess.recent.F90
Modules used: input_parameters

function: recentgenericconstructor
Description: Generic constructor for the recent spectrum postprocessor class.
Code lines: 8
Contained by: file stellar_populations.spectra.postprocess.recent.F90
19. Source Code Documentation

interface: spectrapostprocessorrecent
Description: Constructors for the recent spectrum postprocessor class.
Code lines: 4
Contained by: file stellar_populations.spectra.postprocess.recent.F90

file: structure_formation.cosmological_mass_variance.filtered_power_spectrum.F90
Description: Contains a module which implements calculation of \( \sigma(M) \) via filtering of the power spectrum.
Code lines: 210

module: cosmological_mass_variance_filtered_power_spectrum
Description: Implements calculation of \( \sigma(M) \) via filtering of the power spectrum.
Code lines: 190
Contained by: file structure_formation.cosmological_mass_variance.filtered_power_spectrum.F90
Used by: subroutine galacticus_state_retrieve subroutine galacticus_state_store subroutine initialize_cosmological_mass_variance

subroutine: cosmological_mass_variance_filtered_power_spectrum_initialize
Description: Initializes the \( \sigma(M) \) calculation for the “filtered power spectrum” method.
Code lines: 34
Contained by: module cosmological_mass_variance_filtered_power_spectrum Modules used: input_parameters iso_varying_string

subroutine: cosmological_mass_variance_filtered_power_spectrum_tabulate
Description: Tabulate the virial density contrast for the Kitayama and Suto [1996] fitting function module.
Code lines: 37
Contained by: module cosmological_mass_variance_filtered_power_spectrum Modules used: tables

subroutine: cosmological_mass_variance_fps_state_retrieve
Description: Retrieve the tabulation state from the file.
Code lines: 10
Contained by: module cosmological_mass_variance_filtered_power_spectrum Modules used: fgsl

subroutine: cosmological_mass_variance_fps_state_store
Description: Write the tabulation state to file.
Code lines: 9
Contained by: module cosmological_mass_variance_filtered_power_spectrum Modules used: fgsl

function: variance_integral
Description: Compute the root-variance of mass in spheres enclosing the given mass from the power spectrum.
Code lines: 30
Contained by: module cosmological_mass_variance_filtered_power_spectrum Modules used: cosmology_parameters iso_c_binding numerical_constants_math numerical_integration

function: collapsing_mass_root
Description: Function used in finding the mass of halo just collapsing at a given cosmic epoch.
Code lines: 7
Contained by: module critical_overdensity
Modules used: power_spectra

function: critical_overdensity_collapsing_mass
Description: Return the mass scale just collapsing at the given cosmic time.
Code lines: 28
Contained by: module critical_overdensity
Modules used: cosmology_functions root_finder

function: critical_overdensity_forCollapse
Description: Return the linear theory critical overdensity for collapse at the given cosmic time.
Code lines: 47
Contained by: module critical_overdensity
Modules used: cosmology_functions galacticus_error

function: critical_overdensity_forCollapse_timeGradient
Description: Return the derivative with respect to time of the linear theory critical overdensity for collapse at the given cosmic time.
Code lines: 47
Contained by: module critical_overdensity
Modules used: cosmology_functions galacticus_error

subroutine: critical_overdensity_initialize
Description: Initializes the critical overdensity module.
Code lines: 64
Contained by: module critical_overdensity
Modules used: array_utilities critical_overdensities_kitayama_-suto1996 galacticus_error input_parameters sphericalCollapse_matter_dark_energy sphericalCollapse_matter_lambda

function: critical_overdensity_massScaling
Description: Return a multiplicative, mass-dependent factor by which the critical overdensity should be scaled.
Code lines: 11
Contained by: module critical_overdensity

function: critical_overdensity_massScaling_gradient
Description: Return the gradient with mass of a multiplicative, mass-dependent factor by which the critical overdensity should be scaled.

Description: Return the rate of non-crossing for excursion sets beginning at the given variance and time.
Code lines: 10
Contained by: module excursion_sets_first_crossings

file: structure_formation.excursion_sets.first_crossing_distribution.Farahi.F90
Description: Contains a module which implements a fast and accurate method to solve the excursion set barrier crossing problem for generic barriers.
Code lines: 667

module: excursion_sets_first_crossing_farahi
Description: Implements a fast and accurate method to solve the excursion set barrier crossing problem for generic barriers.

Code lines: 643
Contained by: file `structure_formation.excursion_sets.first_crossing_distribution.Farahi.F90`
Modules used: `fgsl`, `iso_c_binding`, `iso_varying_string`
Used by: subroutine `excursion_sets_first_crossings_initialize`;

function: `erfapproximation`
Description: An approximation to the error function that is designed to be very accurate in the vicinity of zero and infinity.

Code lines: 17
Contained by: module `excursion_sets_first_crossing_farahi`
Modules used: `numerical_constants_math`

function: `excursion_sets_barrier_effective`
Description: The effective barrier for conditional excursion sets.

Code lines: 18
Contained by: module `excursion_sets_first_crossing_farahi`
Modules used: `excursion_sets_barriers`, `kind_numbers`

subroutine: `excursion_sets_first_crossing_farahi_initialize`
Description: Initialize the “Farahi” first crossing distribution method for excursion sets module.

Code lines: 40
Contained by: module `excursion_sets_first_crossing_farahi`
Modules used: `input_parameters`

subroutine: `excursion_sets_first_crossing_farahi_read_file`
Description: Read tabulated data on excursion set first crossing probabilities from file.

Code lines: 88
Contained by: module `excursion_sets_first_crossing_farahi`
Modules used: `file_utilities`, `io_hdf5`, `memory_management`, `numerical_interpolation`

subroutine: `excursion_sets_first_crossing_farahi_write_file`
Description: Write tabulated data on excursion set first crossing probabilities to file.

Code lines: 32
Contained by: module `excursion_sets_first_crossing_farahi`
Modules used: `hdf5`, `io_hdf5`

function: `excursion_sets_first_crossing_probability_farahi`
Description: Return the probability for excursion set first crossing using the methodology of Farahi.

Code lines: 110
Contained by: module `excursion_sets_first_crossing_farahi`
Modules used: `excursion_sets_barriers`, `galacticus_display`, `kind_numbers`, `memory_management`, `numerical_interpolation`, `numerical_ranges`
function: excursion_sets_first_crossing_rate_farahi

Description: Return the rate for excursion set first crossing.

Code lines: 62

Contained by: module excursion_sets_first_crossing_farahi

Modules used: numerical_interpolation

subroutine: excursion_sets_first_crossing_rate_tabulate_farahi

Description: Tabulate the excursion set crossing rate.

Code lines: 158

Contained by: module excursion_sets_first_crossing_farahi

Modules used: cosmology_functions galacticus_display kind_numbers memory_management numerical_interpolation numerical_ranges

function: excursion_sets_non_crossing_rate_farahi

Description: Return the rate for excursion set non-crossing.

Code lines: 34

Contained by: module excursion_sets_first_crossing_farahi

Modules used: numerical_interpolation

function: make_variance_range

Description: Builds a numerical range between rangeMinimum and rangeMaximum using rangeNumber points with spacing that varies from logarithmic to linear spacing with the transition point controlled by ratioAtMaximum.

Code lines: 16

Contained by: module excursion_sets_first_crossing_farahi

file: structure_formation.excursion_sets.first_crossing_distribution.Zhang_Hui.F90

Description: Contains a module which implements the first crossing distribution for excursion set calculations of dark matter halo formation using the methodology of Zhang and Hui [2006].

Code lines: 171

module: excursion_sets_first_crossing_zhang_hui

Description: Implements the first crossing distribution for excursion set calculations of dark matter halo formation using the methodology of Zhang and Hui [2006].

Code lines: 150

Contained by: file structure_formation.excursion_sets.first_crossing_distribution.Zhang_Hui.F90

Modules used: fgsl

Used by: subroutine excursion_sets_first_crossings_initialize

function: excursion_sets_first_crossing_probability_zhang_hui

Description: Return the probability for excursion set first crossing using the methodology of Zhang and Hui [2006].

*Contained by:* module excursion_sets_first_crossing_linear_barrier
*Modules used:* excursion_sets_barriers numerical_constants_math

**function: excursion_sets_first_crossing_rate_linear**
19.1. Program units

**Description:** Return the rate for excursion set first crossing assuming a linear barrier. Uses the analytic solution for this case Sheth [1998], Sheth and Tormen [2002] with a simple offset in the starting coordinates. The rate of barrier crossing is computed by solving for the first crossing distribution at a slightly earlier time and then dividing through by that time interval.

**Code lines:** 19

**Contained by:** module excursion_sets_first_crossing_linear_barrier
19. Source Code Documentation

Modules used: numerical_constants_math

function: excursion_sets_non_crossing_rate_linear
Description: Return the rate for excursion set non-crossing assuming a linear barrier. For a linear barrier the integral over the crossing probability (from zero to infinite variance) equals unity, so all trajectories cross. The non-crossing rate is therefore zero.

Code lines: 9
Contained by: module excursion_sets_first_crossing_linear_barrier

function: cosmological_mass_root_variance
Description: Computes the fractional mass fluctuation in real-space spherical top hats enclosing mass
Code lines: 13
Contained by: module power_spectra
19.1. Program units

function: cosmological_mass_root_variance_logarithmic_derivative
Description: Computes the logarithmic derivative in the fractional mass fluctuation in real-space spherical
top hats enclosing mass mass.
Code lines: 9
Contained by: module power_spectra

subroutine: cosmological_mass_root_variance_plus_logarithmic_derivative
Description: Returns both the fractional mass fluctuation in real-space spherical top hats enclosing mass
mass and its logarithmic derivative.
Code lines: 17
Contained by: module power_spectra

subroutine: initialize_cosmological_mass_variance
Description: Ensure that $\sigma(M)$ is tabulated over a range that includes logMass. The default normalization,
$\sigma_9 = 0.817$, is taken from Hinshaw et al. 2012; CMB+$H_0$+BAO).
Code lines: 84
Contained by: module power_spectra
Modules used: cosmological_mass_variance_filtered_power_spectrum
power_spectrum
galacticus_error
input_parameters
numerical_constants_math

function: mass_from_cosmolgical_root_variance
Description: Computes the mass corresponding to the given fractional mass fluctuation in real-space
spherical top hats.
Code lines: 32
Contained by: module power_spectra

function: power_spectrum
Description: Return the cosmological power spectrum for $k =$wavenumber [Mpc$^{-1}$].
Code lines: 35
Contained by: module power_spectra
Modules used: cosmology_parameters galacticus_error
numerical_constants_math

function: power_spectrum_dimensionless
Description: Return the dimensionless power spectrum, $\Delta^2(k)$, for $k =$wavenumber [Mpc$^{-1}$].
Code lines: 8
Contained by: module power_spectra
Modules used: numerical_constants_math

function: power_spectrum_logarithmic_derivative
Description: Return the logarithmic derivative of the power spectrum, $d \ln P(k)/d \ln k$, for $k =$wavenumber [Mpc$^{-1}$].
Code lines: 9
Contained by: module power_spectra
Modules used: primordial_power_spectra transfer_functions

function: sigma_8
19. Source Code Documentation

Description: Return the value of $\sigma_8$.
Code lines: 11
Contained by: module *power_spectra*

**file**: *structure_formation.power_spectrum.nonlinear.CosmicEmu.F90*
Description: Contains a module which implements the nonlinear power spectrum using the code of Lawrence et al. [2010].
Code lines: 163

**module**: *power_spectra_nonlinear_cosmicemu*
Description: Implements the nonlinear power spectrum using the code of Lawrence et al. [2010].
Code lines: 143
Contained by: file *structure_formation.power_spectrum.nonlinear.CosmicEmu.F90*
Modules used: *fgsl*
Used by: subroutine *power_spectrum_nonlinear_-
initialize*

**function**: *power_spectrum_nonlinear_cosmicemu*
Description: Return a nonlinear power spectrum equal using the code of Lawrence et al. [2010].
Code lines: 108
Contained by: module *power_spectra_nonlinear_cosmicemu*
Modules used: *cosmology_functions cosmology_parameters*

**file: structure_formation.power_spectrum.variance.window_function.sharp_kSpace.F90**
- **Description:** Contains a module which implements sharp in \( k \)-space window function for power spectrum variance computation.
- **Code lines:** 111

**module: power_spectrum_window_functions_sharp_kspace**
19.1. Program units

**Description:** Implements a sharp in k-space window function for power spectrum variance computation.

**Code lines:** 90

**Contained by:** file `structure_formation.power_spectrum.variance.window_function.sharp_kSpace.F90`

**Used by:** subroutine `power_spectrum_window_functions_initialize`

**Function:** `power_spectrum_window_function_sharp_kSpace`

**Description:** Top hat in real space window function Fourier transformed into k-space used in computing the variance of the power spectrum. The normalization of the filter is chosen such that, in real-space, \( W(r = 0) = 1 \). This results in a contained mass of \( M = 6\pi^2\bar{\rho}k_s^{-3} \) if \( k_s \) is the cut-off wavelength for the filter.

**Code lines:** 17

**Contained by:** module `power_spectrum_window_functions_sharp_kSpace`

**Function:** `power_spectrum_window_function_wavenumber_maximum_sharp_kSpace`

**Description:** Top hat in real space window function Fourier transformed into k-space used in computing the variance of the power spectrum. The normalization of the filter is chosen such that, in real-space, \( W(r = 0) = 1 \). This results in a contained mass of \( M = 6\pi^2\bar{\rho}k_s^{-3} \) if \( k_s \) is the cut-off wavelength for the filter.

**Code lines:** 9

**Contained by:** module `power_spectrum_window_functions_sharp_kSpace`

**Subroutine:** `power_spectrum_window_functions_sharp_kSpace_initialize`

**Description:** Initializes the “kSpaceSharp” power spectrum variance window function module.

**Code lines:** 44

**Contained by:** module `power_spectrum_window_functions_sharp_kSpace`

**Modules used:**
- `cosmology_parameters`
- `input_parameters`
- `iso_varying_string`
- `numerical_constants_math`

**File:** `structure_formation.power_spectrum.variance.window_function.top_hat.F90`

**Description:** Contains a module which implements top-hat window function for power spectrum variance computation.

**Code lines:** 86

**Module:** `power_spectrum_window_functions_top_hat`

**Description:** Implements top-hat window function for power spectrum variance computation.

**Code lines:** 65

**Contained by:** file `structure_formation.power_spectrum.variance.window_function.top_hat.F90`

**Used by:**
- function `variance_integrand_tophat`
- subroutine `power_spectrum_window_functions_initialize`

**Function:** `power_spectrum_window_function_top_hat`

**Description:** Top hat in real space window function Fourier transformed into k-space used in computing the variance of the power spectrum.

**Code lines:** 26

**Contained by:** module `power_spectrum_window_functions_top_hat`

**Modules used:**
- `cosmology_parameters`
- `numerical_constants_math`

**Function:** `power_spectrum_window_function_wavenumber_maximum_top_hat`
**Description:** Maximum wavenumber for a top hat in real space window function Fourier transformed into k-space used in computing the variance of the power spectrum.

**Code lines:** 9

**Contained by:** module `power_spectrum_window_functions_top_hat`

**Subroutine:** `power_spectrum_window_functions_top_hat_initialize`

**Description:** Initializes the “topHat” power spectrum variance window function module.

**Code lines:** 13

**Contained by:** module `power_spectrum_window_functions_top_hat`

**Modules used:** `iso_varying_string`

**File:** `structure_formation.power_spectrum.variance.window_function.top_hat_kspace_sharp_hybrid.F90`

**Description:** Contains a module which implements top-hat window function for power spectrum variance computation.

**Code lines:** 161

**Module:** `power_spectrum_window_functions_th_kss_hybrid`

**Description:** Implements top-hat window function for power spectrum variance computation.

**Code lines:** 140

**Contained by:** file `structure_formation.power_spectrum.variance.window_function.top_hat_kspace_sharp_hybrid.F90`

**Used by:** subroutine `power_spectrum_window_functions_initialize`

**Function:** `power_spectrum_window_function_th_kss_hybrid`

**Description:** Computes a window function for calculations of the variance in the power spectrum. Specifically, uses a convolution of top-hat real-space and sharp k-space window functions. The top-hat radius is \( r_{th} \), while the k-space cut-off wavenumber is \( k_s = a/r_s \), where \( a = \) [powerSpectrumWindowFunctionSharpKSpaceNormalization]. The two radii are chosen such that \( r_{th}^2 + r_s^2 = (3M/4\pi\rho)^{1/3} \) and \( r_s = \beta r_{th} \) where \( \beta = \) [powerSpectrumWindowFunctionSharpKSpaceTopHatRadiiRatio].

**Code lines:** 49

**Contained by:** module `power_spectrum_window_functions_th_kss_hybrid`

**Modules used:** `cosmology_parameters` `numerical_constants_math`

**Function:** `power_spectrum_window_function_wavenumber_maximum_th_kss_hybrid`

**Description:** Computes the maximum wavenumber at which the window function for calculations of the variance in the power spectrum is non-zero. Specifically, uses a convolution of top-hat real-space and sharp k-space window functions. The top-hat radius is \( r_{th} \), while the k-space cut-off wavenumber is \( k_s = a/r_s \), where \( a = \) [powerSpectrumWindowFunctionSharpKSpaceNormalization]. The two radii are chosen such that \( r_{th}^2 + r_s^2 = (3M/4\pi\rho)^{1/3} \) and \( r_s = \beta r_{th} \) where \( \beta = \) [powerSpectrumWindowFunctionSharpKSpaceTopHatRadiiRatio].

**Code lines:** 13

**Contained by:** module `power_spectrum_window_functions_th_kss_hybrid`

**Subroutine:** `power_spectrum_window_functions_th_kss_hybrid_initialize`

**Description:** Initializes the “topHatKSpaceSharpHybrid” power spectrum variance window function module.

**Code lines:** 55

memory_management  unit_tests

**file**: tests.NFW96_concentration.dark_energy.F90

*Description*: Contains a program which tests the Navarro et al. [1996] halo concentration algorithm in a dark energy Universe. Comparisons are made to the “charden” code written by Julio Navarro.

*Code lines*: 99

**program**: test_nfw96_concentration_dark_energy

*Description*: Tests the Navarro et al. [1996] halo concentration algorithm in a dark energy Universe. Comparisons are made to the “charden” code written by Julio Navarro.

*Code lines*: 77

*Contained by*: file tests.NFW96_concentration.dark_energy.F90

**Modules used**: cosmology_functions  cosmology_parameters
dark_matter_profiles_concentration  galacticus_nodes
input_parameters  iso_varying_string
memory_management  string_handling
unit_tests

**file**: tests.ODE_solver.F90

*Description*: Contains a program to test ODE solver routines.

*Code lines*: 75
19.1. Program units

**program:** test_ode_solver

*Description:* Tests that ODE solver routines work.

*Code lines:* 55

*Contained by:* file tests.ODE_solver.F90

*Modules used:*
- fgs1
- iso_c_binding
- ode_solver
- test_ode_solver_functions
- unit_tests

**file:** tests.ODE_solver.functions.F90

*Description:* Contains a module of ODEs for unit tests.

*Code lines:* 55

**module:** test_ode_solver_functions

*Description:* Contains ODEs for unit tests.

*Code lines:* 35

*Contained by:* file tests.ODE_solver.functions.F90

*Modules used:*
- fgs1
- iso_c_binding

*Used by:* program test_ode_solver

**function:** ode_set_1

*Description:* A set of ODEs for unit tests.

*Code lines:* 10

*Contained by:* module test_ode_solver_functions

**function:** ode_set_2

*Description:* A set of ODEs for unit tests.

*Code lines:* 11

*Contained by:* module test_ode_solver_functions

**file:** tests.Prada2011_concentration.F90

*Description:* Contains a program which tests the Prada et al. [2011] halo concentration algorithm.

*Code lines:* 92

**program:** test_prada2011_concentration

*Description:* Tests the Prada et al. [2011] halo concentration algorithm. Values of concentration were read from their Figure 12.

*Code lines:* 72

*Contained by:* file tests.Prada2011_concentration.F90

*Modules used:*
- cosmology_functions
- dark_matter_profiles_concentration
- input_parameters
- memory_management
- cosmology_parameters
- galacticus_nodes
- iso_varying_string
- unit_tests

**file:** tests.Zhao2009_algorithms.EdS.F90

*Description:* Contains a program which tests the Zhao et al. [2009] halo mass formation history and halo concentration algorithms in an Einstein-de Sitter Universe.

*Code lines:* 132

**program:** test_zhao2009_flat
**Description:** Tests the Zhao et al. [2009] halo mass formation history and halo concentration algorithms in an Einstein-de Sitter Universe. Comparisons are made to the “mandc”. Note that comparison tolerances are relatively large since we have not attempted to match details (such as critical density calculation) with “mandc”.

**Code lines:** 111

**Contained by:** file tests.Zhao2009_algorithms.EdS.F90

**Modules used:**
- cosmology_functions
- dark_matter_profiles_concentration
- galacticus_input_paths
- input_parameters
- memory_management
- unit_tests
- dark_matter_halo_mass_accretion_histories
- file_utilities
- galacticus_nodes
- iso_varying_string
- string_handling

**file:** tests.Zhao2009_algorithms.dark_energy.F90

**Description:** Contains a program which tests the Zhao et al. [2009] halo mass formation history and halo concentration algorithms in a dark energy Universe.

**Code lines:** 133

**program:** test_zhao2009_dark_energy

**Description:** Tests the Zhao et al. [2009] halo mass formation history and halo concentration algorithms in a dark energy Universe. Comparisons are made to the “mandc”. Note that comparison tolerances are relatively large since we have not attempted to match details (such as critical density calculation) with “mandc”.

**Code lines:** 112

**Contained by:** file tests.Zhao2009_algorithms.dark_energy.F90

**Modules used:**
- cosmology_functions
- dark_matter_profiles_concentration
- galacticus_input_paths
- input_parameters
- memory_management
- unit_tests
- dark_matter_halo_mass_accretion_histories
- file_utilities
- galacticus_nodes
- iso_varying_string
- string_handling

**file:** tests.Zhao2009_algorithms.open.F90

**Description:** Contains a program which tests the Zhao et al. [2009] halo mass formation history and halo concentration algorithms in an open Universe.

**Code lines:** 133

**program:** test_zhao2009_open

**Description:** Tests the Zhao et al. [2009] halo mass formation history and halo concentration algorithms in an open Universe. Comparisons are made to the “mandc”. Note that comparison tolerances are relatively large since we have not attempted to match details (such as critical density calculation) with “mandc”.

**Code lines:** 112

**Contained by:** file tests.Zhao2009_algorithms.open.F90

**Modules used:**
- cosmology_functions
- dark_matter_profiles_concentration
- galacticus_input_paths
- input_parameters
- unit_tests
- dark_matter_halo_mass_accretion_histories
- file_utilities
- galacticus_nodes
- iso_varying_string
- string_handling
19.1. Program units

memory_management  string_handling
unit_tests

file: tests.abundances.F90
Description: Contains a program to test abundances objects functions.
Code lines: 56

program: test_abundances
Description: Test abundances objects.
Code lines: 36
Contained by: file tests.abundances.F90
Modules used: abundances_structure  input_parameters
iso_varying_string  memory_management
unit_tests

file: tests.arrays.F90
Description: Contains a program to test the array functions.
Code lines: 191

program: test_array_monotonicity
Description: Tests that array functions.
Code lines: 171
Contained by: file tests.arrays.F90
Modules used: array_utilities  iso_varying_string
kind_numbers  unit_tests

file: tests.black_hole_fundamentals.F90
Description: Contains a program to test the black hole fundamental functions.
Code lines: 45

program: test_black_hole_fundamentals
Description: Tests of black hole fundamental functions.
Code lines: 25
Contained by: file tests.black_hole_fundamentals.F90
Modules used: black_hole_fundamentals  unit_tests

file: tests.bug745815.F90
Code lines: 93

program: tests_bug745815
Description: Tests for regression of Bug #745815 (http://bugs.launchpad.net/galacticus/+bug/745815):
Skipping of a node during a tree walk.
Code lines: 75
Contained by: file tests.bug745815.F90
Modules used: galacticus_nodes  input_parameters
iso_varying_string  kind_numbers
memory_management  unit_tests

file: tests.comoving_distance.F90
19. Source Code Documentation

Code lines: 95

**program: tests_comoving_distance**

*Description:* Tests comoving distance calculations for various universes. Distances calculated using Python implementation of Ned Wright’s cosmology calculator.

*Code lines:* 77

*Contained by:* file `tests.comoving_distance.F90`

*Modules used:* cosmology_functions, cosmology_functions_options, cosmology_parameters, input_parameters, iso_varying_string, memory_management, unit_tests

**file: tests.comparisons.F90**

*Description:* Contains a program to test numerical comparison functions.

*Code lines:* 39

**program: test_comparison**

*Description:* Tests that numerical comparison functions work.

*Code lines:* 19

*Contained by:* file `tests.comparisons.F90`

*Modules used:* numerical_comparison, unit_tests

**file: tests.cosmic_age.F90**

*Code lines:* 108

**program: tests_cosmic_age**

*Description:* Tests cosmic age calculations for various Universes. Ages calculated using Python implementation of Ned Wright’s cosmology calculator.

*Code lines:* 90

*Contained by:* file `tests.cosmic_age.F90`

*Modules used:* cosmology_functions, cosmology_parameters, input_parameters, iso_varying_string, memory_management, numerical_constants_math, unit_tests

**file: tests.geometry.coordinate_systems.F90**

*Description:* Contains a program to coordinate system functions.

*Code lines:* 49

**program: test_coordinate_systems**

*Description:* Tests of coordinate system functions.

*Code lines:* 29

*Contained by:* file `tests.geometry.coordinate_systems.F90`

*Modules used:* coordinate_systems, numerical_constants_math, unit_tests

**file: tests.halo_mass_function.Tinker.F90**

*Description:* Contains a program which tests the Tinker et al. [2008] mass function by comparing to Jeremy Tinker’s code.

*Code lines:* 94
19.1. Program units

**program: tests_halo_mass_function_tinker**

*Description:* Tests the Tinker et al. [2008] mass function by comparing to Jeremy Tinker’s code.

*Code lines:* 73

*Contained by:* file `tests.halo_mass_function.Tinker.F90`

*Modules used:* cosmology_functions, critical_overdensity, halo_mass_function, iso_varying_string, memory_management, unit_tests

**file: tests.hashes.F90**

*Description:* Contains a program to test features of the hashes (i.e. associative arrays) module.

*Code lines:* 70

**program: test_hashes**

*Description:* Tests features of the hashes (i.e. associative arrays) module.

*Code lines:* 50

*Contained by:* file `tests.hashes.F90`

*Modules used:* hashes, memory_management, unit_tests

**file: tests.hashes.cryptographic.F90**

*Description:* Contains a program to test features of cryptographic hashes.

*Code lines:* 45

**program: test_hashes_cryptographic**

*Description:* Contains a program to test features of cryptographic hashes.

*Code lines:* 25

*Contained by:* file `tests.hashes.cryptographic.F90`

*Modules used:* hashes_cryptographic, iso_varying_string, memory_management, unit_tests

**file: tests.hashes.perfect.F90**

*Description:* Contains a program to test perfect hashing algorithms.

*Code lines:* 72

**program: test_perfect_hashes**

*Description:* Tests perfect hashing algorithms.

*Code lines:* 52

*Contained by:* file `tests.hashes.perfect.F90`

*Modules used:* hashes_perfect, kind_numbers, memory_management, unit_tests

**file: tests.integration.F90**

*Description:* Contains a program to test integration routines.

*Code lines:* 59

**program: test_integration**
19. Source Code Documentation

**Description:** Tests that numerical integration routines work.

**Code lines:** 39

**Contained by:** file `tests.integration.F90`

**Modules used:**
- iso_c_binding
- numerical_constants_math
- numerical_integration
- test_integration_functions
- unit_tests

**file:** `tests.integration.functions.F90`

**Description:** Contains a module of integrands for unit tests.

**Code lines:** 79

**module:** `test_integration_functions`

**Description:** Contains integrands for unit tests.

**Code lines:** 59

**Contained by:** file `tests.integration.functions.F90`

**Modules used:**
- f gsl
- iso_c_binding

**Used by:** program `test_integration`

**function:** `integrand1`

**Description:** Integral for unit testing.

**Code lines:** 9

**Contained by:** module `test_integration_functions`

**function:** `integrand2`

**Description:** Integral for unit testing.

**Code lines:** 9

**Contained by:** module `test_integration_functions`

**function:** `integrand3`

**Description:** Integral for unit testing.

**Code lines:** 9

**Contained by:** module `test_integration_functions`

**function:** `integrand4`

**Description:** Integral for unit testing.

**Code lines:** 10

**Contained by:** module `test_integration_functions`

**Modules used:**
- numerical_integration

**file:** `tests.interpolation.2D.F90`

**Description:** Contains a program to test 2D interpolation routines.

**Code lines:** 55

**program:** `test_interpolation_2d`

**Description:** Tests that 2D interpolation routines work.

**Code lines:** 35

**Contained by:** file `tests.interpolation.2D.F90`

**Modules used:**
- numerical_interpolation_2d_irregular
- unit_tests
19.1. Program units

file: tests.interpolation.F90
Description: Contains a program to test the numerical interpolation code.
Code lines: 60

program: test_interpolation
Description: Tests that numerical interpolation code works correctly.
Code lines: 40
Contained by: file tests.interpolation.F90
Modules used: fgs1

file: tests.kepler_orbits.F90
Code lines: 138

program: tests_kepler_orbits
Description: Tests for orbital parameter conversions.
Code lines: 120
Contained by: file tests.kepler_orbits.F90
Modules used: input_parameters iso_varying_string
kepler_orbits memory_management
numerical_constants_physical unit_tests

file: tests.linear_growth.EdS.F90
Code lines: 57

program: tests_linear_growth_eds
Description: Tests linear growth calculations.
Code lines: 39
Contained by: file tests.linear_growth.EdS.F90
Modules used: cosmology_functions input_parameters
iso_varying_string linear_growth
memory_management unit_tests

file: tests.linear_growth.cosmological_constant.F90
Code lines: 59

program: tests_linear_growth_cosmological_constant
Description: Tests linear growth calculations for a cosmological constant Universe. Growth rates are compared to calculations taken from Andrew Hamilton's "growl" code available at: http://casa.colorado.edu/ ajsh/growl/
Code lines: 41
Contained by: file tests.linear_growth.cosmological_constant.F90
Modules used: cosmology_functions input_parameters
iso_varying_string linear_growth
memory_management unit_tests

file: tests.linear_growth.dark_energy.F90
Code lines: 59
19. Source Code Documentation

program: tests_linear_growth_dark_energy
Description: Tests linear growth calculations for a dark energy Universe. Growth rates are compared to Figure 1 of Linder and Jenkins (2003; MNRAS; 346; 573; http://adsabs.harvard.edu/abs/2003MNRAS.346..573L).
Code lines: 41
Contained by: file tests.linear_growth.dark_energy.F90
Modules used: cosmology_functions input_parameters
iso_varying_string linear_growth
memory_management unit_tests

file: tests.linear_growth.open.F90
Description: Contains a program to test the numerical range making code.
Code lines: 55

program: tests_linear_growth_open
Description: Tests linear growth calculations for an open Universe. Growth rates are compared to calculations taken from: http://www.icosmos.co.uk/index.html
Code lines: 37
Contained by: file tests.linear_growth.open.F90
Modules used: cosmology_functions input_parameters
iso_varying_string linear_growth
unit_tests

file: tests.make_ranges.F90
Description: Contains a program to test mass distributions.
Code lines: 125

program: test_make_ranges
Description: Tests that numerical range making code works correctly.
Code lines: 32
Contained by: file tests.make_ranges.F90
Modules used: array_utilities numerical_ranges
unit_tests

file: tests.mass_distributions.F90
Description: Contains a program to test mass distributions.
Code lines: 105

program: test_mass_distributions
Description: Tests mass distributions.
Code lines: 105
Contained by: file tests.mass_distributions.F90
Modules used: coordinates mass_distributions
memory_management numerical_constants_math
unit_tests

file: tests.math_special_functions.F90
Description: Contains a program to test mathematical special functions.
Code lines: 92
19.1. Program units

program: test_math_special_functions
Description: Tests of mathematical special functions.
Code lines: 72
Contained by: file tests.math_special_functions.F90
Modules used: bessel_functions exponential_integrals
factorials gamma_functions
hypergeometric_functions unit_tests

file: tests.meshes.F90
Description: Contains a program to test the array functions.
Code lines: 70

program: test_meshes
Description: Test mesh functions.
Code lines: 50
Contained by: file tests.meshes.F90
Modules used: iso_c_binding meshes
unit_tests

file: tests.nodes.F90
Description: Contains a program which tests the nodes implementation.
Code lines: 163

program: test_nodes
Description: Tests the nodes implementation.
Code lines: 143
Contained by: file tests.nodes.F90
Modules used: array_utilities galacticus_error
galacticus_nodes input_parameters
iso_varying_string memory_management
test_nodes_tasks unit_tests

file: tests.nodes.task.F90
Description: Contains a module which implements a simple test of mapping a function over all components in a node.
Code lines: 82

module: test_nodes_tasks
Description: Implements a simple test of mapping a function over all components in a node.
Code lines: 62
Contained by: file tests.nodes.task.F90
Used by: program test_nodes

subroutine: test_node_task
Description: Implements simple tests of mapping functions over all components in a node.
Code lines: 25
Contained by: module test_nodes_tasks
Modules used: galacticus_nodes unit_tests
function: testfuncdouble0
  Description: A simple test function which returns the enclosed mass for a component. Used in testing mapping over a function over all components.
  Code lines: 10
  Contained by: module test_nodes_tasks
  Modules used: galactic_structure_options galacticus_nodes

subroutine: testvoidfunc
  Description: A simple void function used in testing mapping over a function over all components.
  Code lines: 10
  Contained by: module test_nodes_tasks
  Modules used: galacticus_nodes iso_varying_string

file: tests.power_spectrum.F90
  Description: Contains a program that tests power spectrum calculations.
  Code lines: 63

program: tests_power_spectrum
  Description: Tests power spectrum calculations.
  Code lines: 43
  Contained by: file tests.power_spectrum.F90
  Modules used: cosmology_parameters input_parameters
                   iso_varying_string memory_management
                   numerical_constants_math power_spectra
                   unit_tests

file: tests.random.F90
  Description: Contains a program to test random number functions.
  Code lines: 58

program: test_random
  Description: Tests that random number functions work.
  Code lines: 38
  Contained by: file tests.random.F90
  Modules used: fgsl
                   memory_management
                   pseudo_random
                   unit_tests

file: tests.regular_expressions.F90
  Description: Contains a program which tests regular expression functionality.
  Code lines: 40

program: tests_regular_expressions
  Description: Tests regular expression functionality.
  Code lines: 20
  Contained by: file tests.regular_expressions.F90
  Modules used: regular_expressions
                   unit_tests

file: tests.root_finding.F90

1906
19.1. Program units

**Description:** Contains a program to test root finding routines.

**Code lines:** 78

**program:** test_root_finding

**Description:** Tests that routine finding routines work.

**Code lines:** 58

**Contained by:** file tests.root_finding.F90

**Modules used:** root_finder  
unit_tests  
test_root_finding_functions

**file:** tests.root_finding_functions.F90

**Description:** Contains a module of functions for root finding unit tests.

**Code lines:** 49

**module:** test_root_finding_functions

**Description:** Contains functions for root finding unit tests.

**Code lines:** 29

**Contained by:** file tests.root_finding.functions.F90

**Used by:** program test_root_finding

**function:** root_function_1

**Description:** Function for root finding unit tests.

**Code lines:** 5

**Contained by:** module test_root_finding_functions

**function:** root_function_2

**Description:** Function for root finding unit tests.

**Code lines:** 5

**Contained by:** module test_root_finding_functions

**function:** root_function_3

**Description:** Function for root finding unit tests.

**Code lines:** 5

**Contained by:** module test_root_finding_functions

**file:** tests.search.F90

**Description:** Contains a program to test array search functions.

**Code lines:** 65

**program:** test_search

**Description:** Tests that array search functions work.

**Code lines:** 45

**Contained by:** file tests.search.F90

**Modules used:** arrays_search  
iso_varying_string  
kind_numbers  
unit_tests

**file:** tests.sigma.F90

**Code lines:** 73
program: tests_sigma
Description: Tests
Code lines: 55
Contained by: file tests_sigma.F90
Modules used: cosmology_parameters, iso_varying_string, numerical_constants_math, power_spectra, input_parameters, memory_management, numerical_ranges, unit_tests

file: tests.sort.F90
Description: Contains a program to test sorting functions.
Code lines: 52

program: test_sort
Description: Tests of sorting functions.
Code lines: 32
Contained by: file tests.sort.F90
Modules used: kind_numbers, sort, unit_tests

file: tests.spectra.postprocess.Inoue2014.F90
Description: Contains a program to test the Inoue et al. [2014] algorithm for IGM absorption.
Code lines: 53

program: test_inoue2014
Description: Tests the Inoue et al. [2014] algorithm for IGM absorption.
Code lines: 33
Contained by: file tests.spectra.postprocess.Inoue2014.F90
Modules used: numerical_constants_atomic, stellar_population_spectra_postprocess, unit_tests

file: tests.spherical_collapse.dark_energy.EdS.F90
Description: Contains a program which tests spherical collapse calculations for a dark energy Universe, specifically using an Einstein-de Sitter cosmology (e.g. Kitayama and Suto 1996; eqn. A2).
Code lines: 71

program: tests_spherical_collapse_dark_energy_eds
Description: Tests spherical collapse calculations for a dark energy Universe, specifically using an Einstein-de Sitter cosmology. Compares results to the analytic solution.
Code lines: 50
Contained by: file tests.spherical_collapse.dark_energy.EdS.F90
Modules used: cosmology_functions, input_parameters, memory_management, unit_tests, critical_overdensity, iso_varying_string, numerical_constants_math, virial_density_contrast

file: tests.spherical_collapse.dark_energy.constantEoSminus0.6.F90
19.1. Program units

Description: Contains a program which tests spherical collapse calculations for a dark energy Universe, specifically using a flat, $\omega = -0.6$ cosmology.

Code lines: 66

Program: tests_spherical_collapse_dark_energy_omega_zero_point_six
Description: Tests spherical collapse calculations for a dark energy Universe, specifically using a flat, $\omega = -0.6$ cosmology. Compares results to points read from Figure 6 of Horellou and Berge [2005] using DataThief.

Code lines: 45
Contained by: file tests.spherical_collapse.dark_energy.constantEoSminus0.6.F90
Modules used: cosmology_functions input_parameters

**module: tidal_stripping_mass_loss_rate_disks_simple**

**Description:** Implements simple mass loss rates from disks due to tidal stripping.

**Code lines:** 100

**Contained by:** file tidal_stripping_mass_loss_rate_disks.simple.F90

**Modules used:** galacticus_nodes

**Used by:** function tidal_stripping_mass_loss_rate_disk_simple

**function: tidal_stripping_mass_loss_rate_disk_simple**

**Description:** Computes the mass loss rate from disks due to tidal stripping assuming a simple model. Specifically, the mass loss rate is

\[
\dot{M} = -\alpha M/\tau_{\text{disk}},
\]

(19.40)

where

\[
\alpha = F_{\text{tidal}}/F_{\text{gravity}},
\]

(19.41)

\[F_{\text{tidal}} = F_{\text{tidal}r_{1/2}}, \quad F_{\text{tidal}}\] is the tidal field from the host halo (see §13.35), and

\[
F_{\text{gravity}} = V_{1/2}^2(r_{1/2})/r_{1/2}
\]

(19.42)

is the gravitational restoring force in the disk at the half-mass radius, \(r_{1/2}\).

  Description: Generic interface for Count_Lines_in_File function.
  Code lines: 4
  Contained by: module file_utilities

function: count_lines_in_file_char
  Description: Returns the number of lines in the file in_file (version for character argument).
  Code lines: 27
  Contained by: module file_utilities
  Modules used: galacticus_error

function: count_lines_in_file_varstr
  Description: Returns the number of lines in the file in_file (version for varying string argument).
  Code lines: 12
  Contained by: module file_utilities

interface: file_exists
  Description: Generic interface for functions that check for a files existance.
  Code lines: 4
  Contained by: module file_utilities

function: file_exists_char
  Description: Checks for existence of file FileName (version for character argument).
  Code lines: 7
  Contained by: module file_utilities

function: file_exists_varstr
  Description: Checks for existence of file FileName (version for varying string argument).
19. Source Code Documentation

**Function:** file_lock

*Description:* Place a lock on a file.

**Subroutine:** file_unlock

*Description:* Remove a lock from a file.

**File:** utility.hashes.F90

*Description:* Contains a module which implements “hashes” (i.e. associative arrays).

**Module:** hashes

*Description:* Implements “hashes” (i.e. associative arrays).

**Subroutine:** delete_integer_scalar_ch

*Description:* Deletes entry key from thisHash.

**Subroutine:** delete_integer_scalar_vs

*Description:* Deletes entry key from Hash.

**Subroutine:** destroy_integer_scalar

*Description:* Destroys thisHash.

**Function:** exists_integer_scalar_ch

*Description:* Returns true if the specified key exists in the specified thisHash, false otherwise.

**Function:** exists_integer_scalar_vs
19.1. Program units

**Description:** Returns true if the specified key exists in the specified thisHash, false otherwise.

**Code lines:** 15

**Contained by:** module hashes

**subroutine:** initialize_integer_scalar

**Description:** Routine to initialize (or re-initialize) an integer hash.

**Code lines:** 13

**Contained by:** module hashes

**type:** integerscalarhash

**Description:** Derived type for integer hashes.

**Code lines:** 89

**Contained by:** module hashes

**function:** key_integer_scalar_i

**Description:** Returns the key of entry number index in thisHash.

**Code lines:** 12

**Contained by:** module hashes

**subroutine:** keys_integer_scalar

**Description:** Returns an array of all keys in thisHash.

**Code lines:** 13

**Contained by:** module hashes

**subroutine:** set_integer_scalar_ch

**Description:** Sets the value of key in thisHash to value.

**Code lines:** 11

**Contained by:** module hashes

**subroutine:** set_integer_scalar_vs

**Description:** Sets the value of key in thisHash to value.

**Code lines:** 68

**Contained by:** module hashes

Code lines:  7
Contained by: module input_parameters

interface: get_input_parameter
function: get_input_parameter_array_size
Description: Get the number of elements in the parameter specified by parameter name is specified by parameterName.
Code lines: 36
Contained by: module input_parameters
Modules used: string_handling

subroutine: get_input_parameter_char
Description: Read a varying_string parameter from the parameter file. The parameter name is specified by parameterName and its value is returned in parameterValue. If no parameter file has been opened by Input_Parameters_File_Open or no matching parameter is found, the default value (if any) given by defaultValue is returned. (If no default value is present an error occurs instead.)
Code lines: 60
Contained by: module input_parameters
Modules used: string_handling

subroutine: get_input_parameter_char_array
Description: Read a varying_string parameter from the parameter file. The parameter name is specified by parameterName and its value is returned in parameterValue. If no parameter file has been opened by Input_Parameters_File_Open or no matching parameter is found, the default value (if any) given by defaultValue is returned. (If no default value is present an error occurs instead.)
Code lines: 68
Contained by: module input_parameters
Modules used: string_handling

subroutine: get_input_parameter_double
Description: Read a double precision parameter from the parameter file. The parameter name is specified by parameterName and its value is returned in parameterValue. If no parameter file has been opened by Input_Parameters_File_Open or no matching parameter is found, the default value (if any) given by defaultValue is returned. (If no default value is present an error occurs instead.)
Code lines: 59
Contained by: module input_parameters

subroutine: get_input_parameter_double_array
Description: Read a double precision parameter from the parameter file. The parameter name is specified by parameterName and its value is returned in parameterValue. If no parameter file has been opened by Input_Parameters_File_Open or no matching parameter is found, the default value (if any) given by defaultValue is returned. (If no default value is present an error occurs instead.)
Code lines: 60
Contained by: module input_parameters

subroutine: get_input_parameter_double_c
Description: C-bound wrapper function for getting double precision parameter values.
subroutine: get_input_parameter_integer

Description: Read a integer parameter from the parameter file. The parameter name is specified by parameterName and its value is returned in parameterValue. If no parameter file has been opened by Input_Parameters_File_Open or no matching parameter is found, the default value (if any) given by defaultValue is returned. (If no default value is present an error occurs instead.)

subroutine: get_input_parameter_integer_array

Description: Read an integer parameter from the parameter file. The parameter name is specified by parameterName and its value is returned in parameterValue. If no parameter file has been opened by Input_Parameters_File_Open or no matching parameter is found, the default value (if any) given by defaultValue is returned. (If no default value is present an error occurs instead.)

subroutine: get_input_parameter_integer_c

Description: C-bound wrapper function for getting integer parameter values.

subroutine: get_input_parameter_integer_long

Description: Read a long integer parameter from the parameter file. The parameter name is specified by parameterName and its value is returned in parameterValue. If no parameter file has been opened by Input_Parameters_File_Open or no matching parameter is found, the default value (if any) given by defaultValue is returned. (If no default value is present an error occurs instead.)

subroutine: get_input_parameter_integer_long_array

Description: Read a long integer parameter from the parameter file. The parameter name is specified by parameterName and its value is returned in parameterValue. If no parameter file has been opened by Input_Parameters_File_Open or no matching parameter is found, the default value (if any) given by defaultValue is returned. (If no default value is present an error occurs instead.)

subroutine: get_input_parameter_logical
19.1. Program units

**Description:** Read a logical parameter from the parameter file. The parameter name is specified by parameterName and its value is returned in parameterValue. If no parameter file has been opened by Input_Parameters_File_Open or no matching parameter is found, the default value (if any) given by defaultValue is returned. (If no default value is present an error occurs instead.)

**Code lines:** 67
**Contained by:** module input_parameters

**subroutine:** get_input_parameter_logical_array

**Description:** Read an logical parameter from the parameter file. The parameter name is specified by parameterName and its value is returned in parameterValue. If no parameter file has been opened by Input_Parameters_File_Open or no matching parameter is found, the default value (if any) given by defaultValue is returned. (If no default value is present an error occurs instead.)

**Code lines:** 66
**Contained by:** module input_parameters

**subroutine:** get_input_parameter_varstring

**Description:** Read a varying_string parameter from the parameter file. The parameter name is specified by parameterName and its value is returned in parameterValue. If no parameter file has been opened by Input_Parameters_File_Open or no matching parameter is found, the default value (if any) given by defaultValue is returned. (If no default value is present an error occurs instead.)

**Code lines:** 60
**Contained by:** module input_parameters

**subroutine:** get_input_parameter_varstring_array

**Description:** Read a varying_string parameter from the parameter file. The parameter name is specified by parameterName and its value is returned in parameterValue. If no parameter file has been opened by Input_Parameters_File_Open or no matching parameter is found, the default value (if any) given by defaultValue is returned. (If no default value is present an error occurs instead.)

**Code lines:** 68
**Contained by:** module input_parameters

**Modules used:** string_handling

**function:** input_parameter_is_present

**Description:** Return true if parameterName is present in the input file.

**Code lines:** 21
**Contained by:** module input_parameters

**subroutine:** input_parameters_file_close

**Description:** Close the parameter file (actually just destroy the internal record of it and clean up memory).

**Code lines:** 7
**Contained by:** module input_parameters

**subroutine:** input_parameters_file_open

**Description:** Open an XML data file containing parameter values and parse it. The file should be structured as follows:

```xml
<parameters>
```
19. Source Code Documentation

<parameter>
    <name>parameter1Name</name>
    <value>parameter1Value</value>
</parameter>

<parameter>
    <name>parameter1Name</name>
    <value>parameter1Value</value>
</parameter>

Description: Contains a module for storing and reporting memory usage by the code.
Code lines: 1742

module: memory_management
**Description:** Routines and data type for storing and reporting on memory usage. Also contains routines for allocating and deallocating arrays with automatic error checking and deallocation at program termination and memory usage reporting. Contains interface and type definitions for memory management routines along with storage space for pointers and sizes. This file was created automatically by tfamily Make_Memory_Usage_Routines.pl Contains memory management subroutines. This file was created automatically by tfamily Make_Memory_Usage_Routines.pl

Modules used: dmemory
galacticus_display
iso_varying_string
string_handling

subroutine: code_memory_usage
Description: If present reads the file \((executable).size\) to determine the amount of memory the \((executable).exe\) code needs before other memory is allocated. This is stored to allow an accurate calculation of the memory used by the code. The \((executable).size\) file is made by running the Perl script Find_Executable_Size.pl (which is done automatically when the executable is built by make).

21. Acknowledgements

In addition to the tools and libraries required to compile and run GALACTICUS, development of GALACTICUS has benefitted from extensive use of the following: GNU OCTAVE, MAXIMA, CANTOR, KILE, EMACS and VALGRIND. We are grateful to the members of the GNU FORTRAN mailing list for invaluable discussions and fixes for compiler problems. We thank John Burkardt for making available the BIVAR algorithm for performing interpolation on data irregularly spaced on a 2D plane and Dima Verner for making available codes to compute various atomic data for astrophysics. Chris Power provided instructions for installing GALACTICUS under Mac OS X. The community of GALACTICUS users\footnote{In particular, Christoph Behrens, Stephanie Dörschner, Jianling Gan, Markus Haider, Harald Höller, Eve Kovacs, Ting-Wen Lan, Adrian Pope, Luiz Felippe Rodrigues, Sergio Sanes, Martin White and Liyan Xu.} have provided invaluable feedback and bug reports. Gian Luigi Granato and Laura Silva kindly provided modifications to their GRASIL code to allow it to read GALACTICUS outputs.
Part VI.

Appendices
A. Merger Tree File Format

**Galacticus** uses a standardized HDF5 file structure for merger tree data. This allows for portability. This format is defined below.
A. Merger Tree File Format

A.1. Basic File Format

Merger trees are stored in HDF5 files for portability and convenience. Additionally, the format is intended to be sufficiently flexible to allow it to describe merger trees obtained in a wide variety of ways, including Monte Carlo algorithms (e.g. extended Press-Schechter algorithms) and from N-body simulations.

A.1.1. Flexibility and Extensibility

All of the groups/datasets in the file except for the treeIndex and haloTrees groups are, in principle, optional. This does not mean that a file created without some of these optional groups/datasets will be usable by a given code. It is the responsibility of a given code to check that all data that it requires is present in the file. You are therefore encouraged to include as much information as possible when constructing merger tree files.

Additionally, the file format is intended to be extensible. It is permissible to add additional datasets, for example to describe some other properties of nodes in each tree. Additional datasets should follow the structure of currently defined datasets, i.e. they should be stored as a single dataset combining all trees with nodes listed in the same order as for other datasets. For additional datasets which might be of general use you are encouraged to contact us and recommend them for inclusion in the standard—this allows their name to be standardized.

A.1.2. A Note on Scalar Attributes

Many of the HDF5 attributes discussed in this document are indicated to be scalar (rank 0) attributes. It is allowable within the standard that these be pseudo-scalars (rank 1 arrays containing a single element). This allows such attributes to be created using the h5lt API for example.

A.1.3. Example File Structure

An example of the structure of such a file, called “example.hdf5” is shown below using the format of h5dump. Each of the groups is described in detail in the following sections.

HDF5 "example.hdf5" {
  GROUP "/" {
    GROUP "cosmology" {
    }
    GROUP "groupFinder" {
    }
    GROUP "haloTrees" {
    }
    GROUP "mergerTrees" {
    }
    GROUP "particles" {
    }
    GROUP "provenance" {
    }
    GROUP "simulation" {
    }
    GROUP "treeIndex" {
    }
    GROUP "units" {

2000
A.2. Cosmology Group

The cosmology group describes the cosmological model within which the merger trees contained in the file were constructed. An example of this group, showing standard attributes, is given below.

```
GROUP "cosmology" {
    ATTRIBUTE "HubbleParam" {
        DATATYPE H5T_IEEE_F64LE
        DATASPACE SCALAR
        DATA {
            (0): 0.73
        }
    }
    ATTRIBUTE "OmegaMatter" {
        DATATYPE H5T_IEEE_F64LE
        DATASPACE SCALAR
        DATA {
            (0): 0.25
        }
    }
    ATTRIBUTE "OmegaLambda" {
        DATATYPE H5T_IEEE_F64LE
        DATASPACE SCALAR
        DATA {
            (0): 0.75
        }
    }
    ATTRIBUTE "OmegaBaryon" {
        DATATYPE H5T_IEEE_F64LE
        DATASPACE SCALAR
        DATA {
            (0): 0.045
        }
    }
    ATTRIBUTE "powerSpectrumIndex" {
        DATATYPE H5T_IEEE_F64LE
        DATASPACE SCALAR
        DATA {

        }
    }
    ATTRIBUTE "sigma_8" {
        DATATYPE H5T_IEEE_F64LE
        DATASPACE SCALAR
        DATA {
            (0): 0.9
        }
    }
}
```
A. Merger Tree File Format

A.2.1. Standard Attributes

The following are standard attributes in the cosmology group (others may be added as desired).

**HubbleParam** The Hubble parameter in units of 100 km/s/Mpc at $z = 0$, $h_0$;

**OmegaMatter** The density of matter (both dark and baryonic matter) in units of the critical density at $z = 0$, $\Omega_M$;

**OmegaLambda** The density of dark energy in units of the critical density at $z = 0$, $\Omega_{\Lambda}$;

**OmegaBaryon** The density of matter (both dark and baryonic matter) in units of the critical density at $z = 0$, $\Omega_b$;

**powerSpectrumIndex** The index of the primordial power spectrum of matter fluctuations, i.e. $n_s$ for power spectrum $P(k) \propto k^{n_s}$;

**sigma_8** The root-variance of mass fluctuations in real space top-hat spheres of radius $8h^{-1}$Mpc computed from the $z = 0$ linear theory power spectrum, $\sigma_8$;

**transferFunction** A descriptor of the transfer function used to compute the power spectrum.

A.3. Group Finder Group

This group, typically relevant only for merger trees derived from N-body simulations, describes the characteristics of the group finding algorithm that was used to find halos in the simulation. An example of this group, showing standard attributes, is given below.

GROUP "groupFinder" {
    COMMENT "Group finder parameters."
    ATTRIBUTE "code" {
        DATATYPE H5T_STRING {
            STRSIZE 7;
            STRPAD H5T_STR_SPACEPAD;
            CSET H5T_CSET_ASCII;
            CTYPE H5T_C_S1;
        }
        DATASPACE SCALAR
        DATA {
            (0): "CAMB"
        }
    }
}
A.3.1. Standard Attributes

The following are standard attributes in the groupFinder group (others may be added as desired).

code The name of the group finding code used in the construction of these merger trees;

linkingLength For friends-of-friends group finding algorithms the dimensionless (i.e. in units of the mean interparticle spacing) linking length used;

minimumParticleNumber The minimum number of particles that a group was required to have in order to be included in a merger tree.

A.4. Simulation Group

This group, typically relevant only for merger trees derived from N-body simulations, describes the characteristics of the simulation from which the trees were derived. An example of this group, showing standard attributes, is given below.

GROUP "simulation" {
  COMMENT "Simulation parameters."
  ATTRIBUTE "ErrTolIntAccuracy" {
    DATATYPE H5T_IEEE_F64LE
    DATASPACE SCALAR
    DATA {
      (0): 0.02
    }
  }
  ATTRIBUTE "TypeOfTimestepCriterion" {
A. Merger Tree File Format

```c

    STRPAD H5T_STR_SPACEPAD;
    CSET H5T_CSET_ASCII;
    CTYPE H5T_C_S1;
  }
  DATASPACE SCALAR
  DATA {
 (0): "spline"
  }
}
```
A.4. Simulation Group

ATTRIBUTE "softeningPlummerEquivalent" {
    DATATYPE H5T_IEEE_F64LE
    DATASPACE SCALAR
    DATA {
        (0): 0.005
    }
}

ATTRIBUTE "startRedshift" {
    DATATYPE H5T_IEEE_F64LE
    DATASPACE SCALAR
    DATA {
        (0): 127
    }
}

A.4.1. Standard Attributes

The following are standard attributes in the simulation group (others may be added as desired).

boxSize Relevant for cubic volumes typical of cosmological simulations, this attribute gives the length of the box in whatever unit system the file used (see §A.5);

code The name of the code used to run the simulation;

initialConditions A description of the initial conditions;

softeningKernel A description of the softening kernel used;

softeningPlummerEquivalent The equivalent Plummer softening length;

startRedshift The redshift at which the simulation was begun.

GADGET-specific Standard Attributes

The following are standard attributes in the simulation group specifically relevant to simulations run with the GADGET code. They typically reflect the values of parameters used by that code.

ErrTolIntAccuracy The integration accuracy used by GADGET;

TypeOfTimestepCriterion The type of timestepping criterion used by GADGET;

SofteningGas Specifies the (comoving) softening of the first particle group in GADGET;

SofteningHalo Specifies the (comoving) softening of the second particle group in GADGET;

SofteningDisk Specifies the (comoving) softening of the third particle group in GADGET;

SofteningBulge Specifies the (comoving) softening of the fourth particle group in GADGET;

SofteningStars Specifies the (comoving) softening of the fifth particle group in GADGET;

SofteningBndry Specifies the (comoving) softening of the sixth particle group in GADGET;

SofteningGasMaxPhys Specifies the maximum physical softening of the first particle group in GADGET;
A. Merger Tree File Format

**SofteningHaloMaxPhys** Specifies the maximum physical softening of the second particle group in GADGET;

**SofteningDiskMaxPhys** Specifies the maximum physical softening of the third particle group in GADGET;

**SofteningBulgeMaxPhys** Specifies the maximum physical softening of the fourth particle group in GADGET;

**SofteningStarsMaxPhys** Specifies the maximum physical softening of the fifth particle group in GADGET;

**SofteningBdryMaxPhys** Specifies the maximum physical softening of the sixth particle group in GADGET.

### A.5. Units Group

This group describes the unit system used throughout the file. Attributes should be included for length, mass and velocity units. In each case, three attributes are required to describe the units used (in the following *quantity* refers to length, mass, time or velocity):

- **quantityUnitsInSI** The units of this quantity expressed in the SI system;
- **quantityHubbleExponent** The exponent of the reduced Hubble constant, $h$, appearing in the units for this quantity;
- **quantityScaleFactorExponent** The exponent, $n$, of the expansion factor, $a$, required to convert this quantity into physical units. That is, multiplying this quantity by $a^n$ will give the quantity in physical units.

For example, if lengths in the file are expressed in units of comoving $h^{-1}$ Mpc, then we would have

- `lengthUnitsInSI = 3.08568e+22`
- `lengthHubbleExponent = -1`
- `lengthScaleFactorExponent = 1`

This allows a code reading the data from a merger tree file to automatically convert it into whatever unit/coordinate system it chooses.

An example of this group, showing standard attributes, is given below.

```plaintext
ATTRIBUTE "lengthHubbleExponent" {
   DATATYPE H5T_STD_I32LE
   DATASPACE SCALAR
   DATA {
      (0): -1
   }
}

ATTRIBUTE "lengthScaleFactorExponent" {
   DATATYPE H5T_STD_I32LE
   DATASPACE SCALAR
   DATA {
      (0): 1
   }
}
```
ATTRIBUTE "lengthUnitsInSI" {
    DATATYPE H5T_IEEE_F64LE
    DATASPACE SCALAR
    DATA {
        (0): 3.08568e+22
    }
}
ATTRIBUTE "massHubbleExponent" {
    DATATYPE H5T_STD_I32LE
    DATASPACE SCALAR
    DATA {
        (0): -1
    }
}
ATTRIBUTE "massScaleFactorExponent" {
    DATATYPE H5T_STD_I32LE
    DATASPACE SCALAR
    DATA {
        (0): 0
    }
}

    DATASPACE SCALAR
    DATA {
        (0): 3.1556926e+16
    }
}
A.6. Halo Trees Group

The **haloTrees** group contains the data describing the actual merger trees. Nodes from each tree must be stored contiguously. An example of this group is given below. In this example, `<nodeCount>` is the total number of nodes in all merger trees.

```
GROUP "haloTrees" {
    ATTRIBUTE "haloMassesIncludeSubhalos" {
        DATATYPE H5T_STD_I32LE
        DATASPACE SCALAR
        DATA {
            (0): 0
        }
    }
    ATTRIBUTE "haloAngularMomentaIncludeSubhalos" {
        DATATYPE H5T_STD_I32LE
        DATASPACE SCALAR
        DATA {
            (0): 0
        }
    }
    ATTRIBUTE "treesAreSelfContained" {
        DATATYPE H5T_STD_I32LE
        DATASPACE SCALAR
        DATA {
            (0): 1
        }
    }
}
```
ATTRIBUTE "treesHaveSubhalos" {
  DATATYPE H5T_STD_I32LE
  DATASPACE SCALAR
  DATA {
    (0): 1
  }
}

ATTRIBUTE "velocitiesIncludeHubbleFlow" {
  DATATYPE H5T_STD_I32LE
  DATASPACE SCALAR
  DATA {
    (0): 0
  }
}

ATTRIBUTE "positionsArePeriodic" {
  DATATYPE H5T_STD_I32LE
  DATASPACE SCALAR
  DATA {
    (0): 0
  }
}

DATASET "descendentIndex" {
  COMMENT "The index of each descendent node."
  DATATYPE H5T_STD_I64LE
  DATASPACE SIMPLE { ( <nodeCount> ) / ( <nodeCount> ) }
}

DATASET "expansionFactor" {
  COMMENT "The expansion factor of each node."
  DATATYPE H5T_IEEE_F64LE
  DATASPACE SIMPLE { ( <nodeCount> ) / ( <nodeCount> ) }
}

DATASET "halfMassRadius" {
  COMMENT "The half mass radius of each node."

  DATATYPE H5T_STD_I64LE
  DATASPACE SIMPLE { ( <nodeCount> ) / ( <nodeCount> ) }
}

DATASET "nodeMass" {
A. Merger Tree File Format

The following are standard attributes in the *haloTrees* group (others may be added as desired).
haloMassesIncludeSubhalos Indicates whether or not the masses of halos include the masses of any subhalos that they may contain. A value of 0 implies that halo masses do not include masses of subhalos, while a value of 1 indicates that they do;

haloAngularMomentaIncludeSubhalos Indicates whether or not the angular momenta of halos include the angular momenta contributed by any subhalos that they may contain. A value of 0 implies that halo masses do not include the contribution of subhalos, while a value of 1 indicates that they do. If this attribute is not present it is assumed to be equal to the haloMassesIncludeSubhalos attribute;

treesAreSelfContained Indicates whether or not trees are self-contained, in the sense that nodes never transfer from one tree to another. A value of 0 implies that nodes can move from one tree to another, while a value of 1 implies that they can not;

treesHaveSubhalos Indicates whether or not trees contain information on subhalos. A value of 0 implies that they do not, while a value of 1 implies that they do. This attribute is a convenience, as subhalo presence can be determined from the node data directly;

velocitiesIncludeHubbleFlow Indicates whether or not velocities include the Hubble flow. A value of 0 indicates that they do not, while a value of 1 indicates that they do. See §11.2 for important notes on velocity definitions in Galacticus.

positionsArePeriodic Indicates whether or not positions are periodic (as in a cosmological cube simulation). A value of 0 indicates that they are not, while a value of 1 indicates that they are periodic, with a period of boxSize.

A.6.2. Standard Datasets

The following are standard datasets in the haloTrees group.

angularMomentum The angular momentum of the halo. This can be either the magnitude of the angular momentum or a 3-D vector;

expansionFactor The expansion factor (normalized to unity at the present day) at which this node is identified (note that only one of the expansionFactor, redshift and time datasets is required, since they are simply related, but multiple can be present);

descendentIndex The nodeIndex of the descendent of this node in the merger tree, or −1 if there is no descendent;

halfMassRadius The radius containing half the mass of the node;

hostIndex The nodeIndex of the node which hosts this node. For nodes that are self-hosting (i.e. that are not subhalos inside another halo), the value of hostIndex should be set equal to the node’s own nodeIndex;

nodeIndex An ID number for the node, unique at least within each tree. If nodes are able to move from one tree to another, the ID must be unique within all trees. No other constraints are placed on nodeIndex (e.g. it does not have to be monotonically increasing within the file for example);

nodeMass The mass of the node;

position The three dimensional position of this node;
A. Merger Tree File Format

redshift The redshift at which this node is identified (note that only one of the expansionFactor, redshift and time datasets is required, since they are simply related, but multiple can be present);

scaleRadius The characteristic scale radius in the node (typically, but not necessarily, the NFW scale radius);

spin The spin parameter, $\lambda$, of the halo. This can be either the spin magnitude or a 3-D vector;

time The time at which this node is identified (note that only one of the expansionFactor, redshift and time datasets is required, since they are simply related, but multiple can be present);

velocity The three dimensional velocity of the node. See §11.2 for important notes on velocity definitions in GALACTICUS;

particleIndex If the particles group is included, this dataset should give the index of the first entry in the particle datasets that corresponds to the particle associated with this node;

particleCount If the particles group is included, this dataset should give the number of entries in particle datasets that correspond to the particle associated with this node;

A.7. Tree Index Group

The treeIndex group contains indexing information which describes which sections of the datasets in the haloTrees group belong to each tree. An example of this group is given below.

GROUP "treeIndex" {
  DATASET "firstNode" {
    COMMENT "Position of the first node in each tree in the haloTrees datasets."
    DATATYPE H5T_STD_I32LE
    DATASPACE SIMPLE { ( <treeCount> ) / ( <treeCount> ) }
  }
  DATASET "numberOfNodes" {
    COMMENT "Number of nodes in each tree."
    DATATYPE H5T_STD_I32LE
    DATASPACE SIMPLE { ( <treeCount> ) / ( <treeCount> ) }
  }
  DATASET "treeIndex" {
    COMMENT "Unique index of tree."
    DATATYPE H5T_STD_I64LE
    DATASPACE SIMPLE { ( <treeCount> ) / ( <treeCount> ) }
  }
  DATASET "treeWeight" {
    COMMENT "The number of such trees required per unit volume to create a representative sample."
    DATATYPE H5T_STD_F64LE
    DATASPACE SIMPLE { ( <treeCount> ) / ( <treeCount> ) }
  }
}
A.7.1. Standard Datasets

`firstNode` For each tree, gives the position¹ in the `haloTrees` datasets of the first node in the tree (note that dataset indexing begins at 0). This *does not* necessarily have to be the root node of the tree—nodes in a single tree can be stored in any order in the `haloTrees` datasets, providing that they are contiguous;

`numberOfNodes` For each tree, gives the number of nodes in the tree;

`treeIndex` A unique ID number for each tree;

`treeWeight` A weight factor specifying the number density of each tree required to construct a representative sample. If not present, it is acceptable to assume that the weight is $1/\text{boxSize}^3$ if that attribute is present in the `simulation` group.

A.8. Merger Trees Group

The `mergerTrees` group is optional and provides a convenience method for accessing the properties of individual trees. If present, it contains one group for each tree in the file, named `mergerTree<treeID>` where `<treeID>` is the ID of the tree. Each of these groups should contain a set of scalar references to the sections of the datasets in the `haloTrees` group to which this tree corresponds. For example, the `descendentIndex` reference for the tree with ID number 89 would be as follows:

GROUP "mergerTrees/mergerTree89" {
    DATASET "descendentIndex" {
        DATATYPE H5T_REFERENCE
        DATASPACE SCALAR
        DATA {
            DATASET /haloTrees/descendentIndex {(<indexBegin>)-(<indexEnd>)}
        }
    }
}

A.9. Particles Group

The `particles` group is optional and contains information on particle trajectories. It is intended for use with merger tree derived from N-body simulations for which it is often useful to track the location of, for example, the most bound particle associated with a subhalo even after that subhalo can no longer be tracked in the simulation. An example of this group is given below. In this example, `<particleCount>` is the total number of particles included in the group.

GROUP "particles" {
    DATASET "particleID" {
        COMMENT "The ID of each particle."
        DATATYPE H5T_STD_I64LE
        DATASPACE SIMPLE { ( <particleCount> ) / ( <particleCount> ) }
    }
    DATASET "redshift" {

¹That is, it gives the array index of the first node of the tree in the `haloTrees/nodeIndex` dataset for example. It does not give the `nodeIndex` of the first node in the tree.
A. Merger Tree File Format

COMMENT "The redshift of each particle."
DATATYPE H5T_IEEE_F64LE
DATASPACE SIMPLE { ( <particleCount> ) / ( <particleCount> ) }
}
DATASET "time" {
COMMENT "The time of each particle."
DATATYPE H5T_IEEE_F64LE
DATASPACE SIMPLE { ( <particleCount> ) / ( <particleCount> ) }
}
DATASET "expansionFactor" {
COMMENT "The expansion factor of each particle."
DATATYPE H5T_IEEE_F64LE
DATASPACE SIMPLE { ( <particleCount> ) / ( <particleCount> ) }
}
DATASET "position" {
COMMENT "The position of each node."
DATATYPE H5T_IEEE_F64LE
DATASPACE SIMPLE { ( <particleCount>, 3 ) / ( <particleCount>, 3 ) }
}
DATASET "velocity" {
COMMENT "The velocity of each node."
DATATYPE H5T_IEEE_F64LE
DATASPACE SIMPLE { ( <particleCount>, 3 ) / ( <particleCount>, 3 ) }
}

Each particle should be stored contiguously (i.e. entries with the same particleID should be consecutive) and it is frequently convenient (although not required) that entries for each particle be arranged in order of increasing cosmic time.

A.9.1. Standard Datasets

particleID An ID, unique within the entire simulation, for each particle;

redshift The redshift at which the particle is recorded (a single particle can appear in these datasets at multiple times);

time The time at which the particle is recorded (a single particle can appear in these datasets multiple times at different redshifts);

expansionFactor The expansion factor at which the particle is recorded (a single particle can appear in these datasets multiple times at different expansion factors);

position The spatial position of the particle;

velocity The velocity of the particle. See §11.2 for important notes on velocity definitions in GALACTICUS.

Note that only one of the expansionFactor, time and redshift datasets is required, as they are simply related, but multiple of them can be present.
A.10. Merger Tree Builder

**Galacticus** contains software which builds merger tree files in the format described in §A.1 from merger tree descriptions in other formats, such as ASCII output from an SQL database. The merger tree building engine can be found in `source/objects.merger_tree_data.F90`. Examples of how this engine is used can be found in `source/Millennium_Merger_Tree_File_Maker.F90` and `source/merger_trees.file_maker.Millennium.F90` which are designed to work with the `scripts/aux/Millennium_Trees_Grab.pl` script to convert data extracted from the Millennium Simulation database into a format that **Galacticus** can read, and in `source/Simple_Merger_Tree_File_Maker.F90` and `source/merger_trees.file_maker.simple.F90` which are designed to work with ASCII file representations of mergers trees that contain just the mass, redshift and descendant of each node.

The basic process for building a merger tree file is to inform the engine of the data file to read and where specific information is located within that file. The data can then be processed and, finally, output in the required format. Specific interfaces that can be used are described below. Many of these interfaces work on an object `mergerTrees` of `mergerTreeData` type. This object stores all information on the merger trees while they are being internally processed.

**Setting property locations:** Before reading data from a file it is necessary to inform the tree builder engine of which column in the file corresponds to which property. This is done with repeated calls to `setProperty`, one for each column to read, as follows:

```fortran
    call mergerTrees%setProperty(propertyType,columnIndex)
```

where `columnIndex` is the number of the column (counting from 1) which contains the property specified by `propertyType`. `propertyType` can take one of the following values:

- `propertyTypeTreeIndex` A unique ID number for the tree to which this node belongs;
- `propertyTypeNodeIndex` An ID (unique within the tree) for this node;
- `propertyTypeDescendentIndex` The ID of the node’s descendant node;
- `propertyTypeHostIndex` The ID of the larger halo in which this node is hosted (equal to the node’s own ID if the node is self-hosting);
- `propertyTypeRedshift` The redshift of the node;
- `propertyTypeNodeMass` The mass of the node;
- `propertyTypeParticleCount` The number of particles in the node;
- `propertyTypePositionX` The $x$-position of the node (if present, both $y$ and $z$ components must also be present);
- `propertyTypePositionY` The $y$-position of the node (if present, both $x$ and $z$ components must also be present);
- `propertyTypePositionZ` The $z$-position of the node (if present, both $x$ and $y$ components must also be present);
- `propertyTypeVelocityX` The $x$-velocity of the node (if present, both $y$ and $z$ components must also be present);
- `propertyTypeVelocityY` The $y$-velocity of the node (if present, both $x$ and $z$ components must also be present);

2015
A. Merger Tree File Format

**propertyTypeVelocityZ** The z-velocity of the node (if present, both x and y components must also be present);

**propertyTypeSpinX** The x component of the node’s spin parameter (if present, both y and z components must also be present; cannot be present if spin magnitude is given);

**propertyTypeSpinY** The y component of the node’s spin parameter (if present, both x and z components must also be present; cannot be present if spin magnitude is given);

**propertyTypeSpinZ** The z component of the node’s spin parameter (if present, both x and y components must also be present; cannot be present if spin magnitude is given);

**propertyTypeSpin** The magnitude of the node’s spin parameter (cannot be present if spin vector components are given);

**propertyTypeAngularMomentumX** The x-component of the node’s angular momentum (if present, both y and z components must also be present; cannot be present if angular momentum magnitude is given);

**propertyTypeAngularMomentumY** The y-component of the node’s angular momentum (if present, both x and z components must also be present; cannot be present if angular momentum magnitude is given);

**propertyTypeAngularMomentumZ** The z-component of the node’s angular momentum (if present, both x and y components must also be present; cannot be present if angular momentum magnitude is given);

**propertyTypeAngularMomentum** The magnitude of the node’s angular momentum (cannot be present if angular momentum vector components are given);

**propertyTypeHalfMassRadius** The half-mass radius of the node;

**propertyTypeMostBoundParticleIndex** The index of the most bound particle in this node.

Not all properties must be specified—any required properties that are not specified will result in an error. Likewise, some properties, if present, require that other properties also be present. For example, if any of the position properties is given then all three positions are required.

*Reading ASCII data:* Once property columns have been specified, data from an ASCII file with one node per line can be read as follows:

```plaintext
call mergerTrees%readASCII(nodesFile,lineNumberStart,lineNumberStop,separator=",")
```

where `nodesFile` is the name of the file to read. The optional `lineNumberStart` and `lineNumberEnd` arguments give the first and last lines of the file to read, while the optional `separator` argument specifies the character used to separate columns (white space is assumed by default).

*Setting particle property locations:* If particle information is to be stored in the file, the locations of particle properties within the input file must be specified with repeated calls to `setParticleProperty` as follows:

```plaintext
call mergerTrees%setParticleProperty(propertyType,columnIndex)
```

where `columnName` is the number of the column (counting from 1) which contains the property specified by `propertyType`. `propertyType` can take one of the following values:
propertyTypeParticleIndex A unique ID for the particle;
propertyTypeRedshift The redshift of the particle;
propertyTypeNodeMass The mass of the particle;
propertyTypeParticleCount The number of particles in the particle;
propertyTypePositionX The x-position of the particle (if present, both y and z components must also be present);
propertyTypePositionY The y-position of the particle (if present, both x and z components must also be present);
propertyTypePositionZ The z-position of the particle (if present, both x and y components must also be present);
propertyTypeVelocityX The x-velocity of the particle (if present, both y and z components must also be present);
propertyTypeVelocityY The y-velocity of the particle (if present, both x and z components must also be present);
propertyTypeVelocityZ The z-velocity of the particle (if present, both x and y components must also be present).

Reading ASCII particle data: Once property columns have been specified, particle data from an ASCII file with one particle per line can be read as follows:

call mergerTrees%readParticlesASCII(particlesFile,lineNumberStart,lineNumberStop,separator="","")

where particlesFile is the name of the file to read. The optional lineNumberStart and lineNumberEnd arguments give the first and last lines of the file to read, while the optional separator argument specifies the character used to separate columns (white space is assumed by default).

Setting particle mass: The particle mass, particleMass, can be specified using:

call mergerTrees%setParticleMass(particleMass)

Specifying tree self-containment: Whether or not trees are self-contained can be specified using:

call mergerTrees%setSelfContained([.true.|.false.])

Specifying Hubble flow inclusion: Whether or not velocities include the Hubble flow can be specified using:

call mergerTrees%setIncludesHubbleFlow([.true.|.false.])

Specifying subhalo mass inclusion: Whether or not halo masses include the masses of any subhalos can be specified using:

call mergerTrees%setIncludesSubhaloMasses([.true.|.false.])

Specifying reference creation: Whether or not HDF5 reference to individual merger trees within the haloTrees datasets should be made can be specified using:

call mergerTrees%makeReferences([.true.|.false.])

Specifying units: The units used in the files can be specified with repeated calls to setUnits as follows:
A. Merger Tree File Format

call mergerTrees%setUnits(unitsType,unitsInSI,hubbleExponent,scaleFactorExponent)

where unitsType is one of:
unitsMass Units of mass;
unitsLength Units of length;
unitsTime Units of time;
unitsVelocity Units of velocity;

unitsInSI gives the units in the SI system, hubbleExponent specifies the power to which $h$ appears in the units and scaleFactorExponent specifies the number of powers of the expansion factor by which the quantity should be multiplied to place it into physical units.

Adding metadata: Meta-data can be added to the file by making repeated calls to addMetadata as follows:

call mergerTrees%addMetadata(metaDataType,label,value)

where metaDataType is one of:
metaDataGeneric Add to the generic metaData group;
metaDataCosmology Add to the cosmology group;
metaDataSimulation Add to the simulation group;
metaDataGroupFinder Add to the groupFinder group;
metaDataTreeBuilder Add to the treeBuilder group;
metaDataProvenance Add to the provenance group.

label is a label for this metadatum and value is the value to store. Currently integer, double precision and character data types are supported for metadata.

Exporting the data: Once the data has been read, units and properties specified and any metadata added, the trees can be exported to an HDF5 file using:

call mergerTrees%export(outputFile,outputFormat,hdfChunkSize,hdfCompressionLevel)

where outputFile is the name of the file to which the trees should be exported, outputFormat specifies the format to use (see §A.10.1), and hdfChunkSize and hdfCompressionLevel respectively give the chunk size and compression level to use when writing the file.

A.10.1. File Formats

The merger tree file builder engine can currently export in one of two formats. These formats can be specified on the command line to both Millennium_Merger_Tree_File_Maker.F90, and Simple_Merger_Tree_File_Maker.F90:
galacticus merger trees are exported in GALACTICUS’s native format described in detail in §A.1;
irate merger trees are exported in the IRATE format.
A.10.2. Exporting Trees from GALACTICUS

By setting [mergerTreesWrite]=true, GALACTICUS will export each merger tree generated to the file specified by [mergerTreeExportFileName] using the format specified by [mergerTreeExportOutputFormat]. Currently, node indices (plus host indices, which are assumed identical to the node indices), descendent indices, masses and redshifts are exported. Positions and velocities are exported if available. If IRATE-format output is requested then “snapshot” numbers will be assigned to nodes based on the time at which they exist. This usually only makes sense if the nodes are defined on a time grid (i.e. if merger trees were extracted from an N-body simulation, or if trees were re-gridded onto such a time grid; see §13.31.2). Export happens after any merger tree pre-evolution tasks (see §17.4.3).
B. Plotting Support

B.1. Plotting with **GNUPLOT**

While **GALACTICUS** data can, of course, be plotted using whatever method you choose, two Perl modules are provided that we find useful for plotting **GALACTICUS** data. These are intended for use with **GNUPLOT** and with datasets stored as **PDL** variables. The first module, **GnuPlot::PrettyPlots** plots lines and points with two color style (typically a lighter interior color and a darker border) with support for errorbars and limits (show as arrows) on points. The second, **GnuPlot::LaTeX** provides a convenient way to process output from **GNUPLOT**’s **epslatex** terminal into PDF files (suitable for inclusion in documents), PNG images with transparent backgrounds or **OpenOffice ODG** files (suitable for inclusion into presentations).

A typical use of these packages would look as follows:

```perl
use lib "./perl";
use PDL;
use GnuPlot::LaTeX;
use GnuPlot::PrettyPlots;

$outputFile = "myImage";
open($gnuPlot,"|gnuplot");
print $gnuPlot "set terminal epslatex color colortext lw 2 solid 7\n";
print $gnuPlot "set output '.\"$outputFile.\".eps'\n";
print $gnuPlot "set xlabel '\"x-axis label\"'\n";
print $gnuPlot "set ylabel '\"y-axis label\"'\n";
print $gnuPlot "set lmargin screen 0.15\n";
print $gnuPlot "set rmargin screen 0.95\n";
print $gnuPlot "set bmargin screen 0.15\n";
print $gnuPlot "set tmargin screen 0.95\n";
print $gnuPlot "set key spacing 1.2\n";
print $gnuPlot "set key at screen 0.4,0.8\n";
print $gnuPlot "set xrange [0.0:6.0]\n";
print $gnuPlot "set yrange [0.0:1.0]\n";
print $gnuPlot "set pointsize 2.0\n";
&PrettyPlots::Prepare_Dataset($plot,
    $x1Data, $y1Data,
    title => "First dataset",
    style => line,
    linePattern => 0,
    weight => [7,3],
    color => $PrettyPlots::colorPairs('lightGoldenrod')
);
```

1If you create an **OpenOffice ODG** file it’s recommended that you covert it to a Metafile within **OpenOffice** before putting it into a presentation—this seems to prevent a bug which occasionally causes an element of the plot to be lost during saving...
The process begins by opening a pipe to GNUPlot and specifying the `epslatex` terminal along with `color` and `colortext` options, any line weight preferences and the output EPS file. This is followed by commands to set up the plot, including labels, ranges etc. Note that you must specify margins manually\(^2\). Following this are calls to `PrettyPlots::Prepare_Dataset` which prepares instructions for plotting of a single dataset. The first argument is a reference to a structure which will store the instructions, while the second and third arguments are PDLs containing the \(x\) and \(y\) data to be plotted. Following this are multiple options as follows:

- **title** Gives the title of the dataset for inclusion in the plot key;
- **style** Specifies how the dataset should be drawn: either `line`, `point`, `boxes`, or `filledCurve`;
- **linePattern** Specifies the line pattern (as defined for GNUPlot’s `lt` option) to use;
- **symbol** A two element list giving the symbol indices that should be used to plot the border and inner parts of each point respectively;
- **weight** A two element list giving the line weights to be used for border and inner parts of each point/line respectively;
- **color** A two element list giving the color of border and inner parts of each point/line respectively. Colors should be specified as `#RRGGBB` in hexadecimal. Several suitable color pairs and sequences of pairs are defined in the `GnuPlot::PrettyPlots` module;
- **pointSize** Specifies the size of the points to be used;
- **errorNNN** Gives a PDL containing sizes of errors to be plotted on points in the up, down, left and right directions. A zero value will cause the error bar to be omitted, while a negative value will cause an arrow to be drawn with a length equal to the absolute value of the specified value;
- **filledCurve** If the `filledCurve` style is used, this option specifies the type of filled curve (closed, \(x_1\), \(x_2\), etc.—see the GNUPlot help `filledcurve` text for complete options). The default is `closed`;
- **y2** If the `filledCurve` style is used along with the `filledCurve=closed` option, this option is used to specify a second PDL of \(y\)-axis values. The region between this curve and the usual \(y\)-axis curve will be filled.

\(^2\)The `GnuPlot::PrettyPlots` module works by generating multiple layers of plotting which are overlaid. Axes are only drawn for the first layer. If you do not specify margins manually, they will be computed automatically for each layer and so will not match up between all layers. This will result in data being plotted incorrectly.
Once all datasets have been prepared, the call to &PrettyPlots::Plot_Datasets will generate the EPS and LaTeX files necessary to make the plot. This resulting plot can be converted to PDF, PNG or ODG form by calling &LaTeX::GnuPlot2PDF, &LaTeX::GnuPlot2PNG or &LaTeX::GnuPlot2ODG respectively. The EPS file will be replaced with the appropriate file. The &LaTeX::GnuPlot2PNG routine accepts an optional backgroundColor argument in #RRGGBB format. If present, this color will be used to set the background color of the plot (otherwise white is assumed). Although the background is made transparent in the PNG, setting the background color is important as antialiasing will make use of this background. Note that both PNG and ODG options will switch black axes and labels to white. Finally, the &LaTeX::GnuPlot2PNG routine accepts an optional margin argument which specifies the size of the margin (in pixels) to be left around the plot when cropping.

The ODG option requires that both pdf2svg and svg2office be installed on your system (svg2office should be located in /usr/local/bin).

### B.2. Merger Tree Diagrams with DOT

The dot command, which is a part of GraphViz is useful for creating diagrams of merger trees. Galacticus provides a function to output the structure of any merger tree in GraphViz format. This function, Merger_Tree_Dump, is provided by the Merger_Trees_Dump module. Usage is as follows:

```c
call Merger_Tree_Dump(
  &index,
  &baseNode,
  &highlightNodes =highlightNodes, &
  &backgroundColor ='white', &
  &nodeColor ='black', &
  &highlightColor ='black', &
  &edgeColor ='#DDDDDD', &
  &nodeStyle ='solid', &
  &highlightStyle ='filled', &
  &edgeStyle ='solid', &
  &labelNodes =.false., &
  &scaleNodesByLogMass =.true., &
  &edgeLengthsToTimes =.true., &
  &path ='/my/path' &
)
```

Here `index` is the tree index (successive calls to Merger_Tree_Dump with the same index will result in a sequence of output files—see below), and `baseNode` is a pointer to the base node of the tree to be dumped. All other arguments are optional:

- **highlightNodes** A list of node IDs. All nodes listed will be highlighted in the diagram;
- **backgroundColor** The color for the background of the diagram;
- **nodeColor** The color used to draw nodes;
- **highlightColor** The color used for highlighted nodes;
- **edgeColor** The color of edges (lines joining nodes);
- **nodeStyle** The style to use when drawing nodes;
- **labelNodes** A list of node IDs. All nodes listed will be highlighted in the diagram;
- **scaleNodesByLogMass** Whether or not to scale nodes by log mass;
- **edgeLengthsToTimes** Whether or not to scale edge lengths by time;
- **path** Path to save the output file to.

---

3This is just a personal preference for plots displayed in presentations—other options could be added.
B. Plotting Support

highlightStyle The style to use when drawing highlighted nodes;

edgeStyle The style to use when drawing edges;

labelNodes Specifies whether or not nodes should be labelled (labels consist of the node ID followed by the redshift);

scaleNodesByLogMass If true, the size of nodes will be set to be proportional to the logarithm of the node mass;

edgeLengthsToTimes If true, the spacing between parent and child nodes will be proportional to the logarithmic time interval between them.

path If present, write tree dumps into this directory. Otherwise, the current directory will be used.

All colors and styles are character strings and can be in any format understood by dot. The tree structure will be dumped to file named mergerTreeDump:⟨ID⟩:⟨N⟩.gv where ⟨ID⟩ is the index of the tree and ⟨N⟩ increasing incrementally from 1 each time the same tree is consecutively dumped. These files can be processed using dot. For example

dot -Tps mergerTreeDump:1:1.gv > tree.ps

will create a tree diagram as the PostScript file tree.ps.

Glossary

**AB magnitude** An astronomical magnitude system in which the apparent magnitude is defined as \( m = -2.5 \log_{10} f - 48.60 \) for a flux density, \( f \), measured in ergs per second per square centimeter per hertz. 207, 2042

**ADAF** An advection-dominated accretion flow (ADAF) is a particular solution for an accretion flow around a black hole, star or compact object in which energy liberated by viscous forces is stored within the accretion flow and advected inward to the central object (see Narayan et al. 1998). 2043

**AHF** Amiga’s Halo Finder (AHF) is a software package which identifies dark matter halos in N-body simulations. Full details are given by Gill et al. [2004] and Knollmann and Knebe [2009]. 2043

**backward descendent** The primary progenitor of a node. This type of descendent is usually relevant when building merger trees and should be distinguished from a forward descendent which is relevant when considering how halos and galaxies evolve forward in time. 2041

**Bernoulli distribution** A discrete probability distribution which takes value 1 with success probability \( p \) and value 0 with failure probability \( q = 1 - p \). Read more on Wikipedia. 766

**BIE** The Bayesian Inference Engine (BIE) is a software package designed to facilitate exploration of complexes parameter spaces using Bayesian techniques. 2043

**CDM** Cold dark matter (CDM) is a hypothesized type of dark matter in which the particles move slowly compared to the speed of light. 2043

**component** An individual physical system within a node, such as a dark matter halo, a galactic disk or a supermassive black hole. 8, 210, 213, 215–218, 221, 222, 224, 228–231, 234, 236–239, 270, 272–275, 296, 307, 2041

**DSL** Domain-specific languages (DSL) are a type of programming language dedicated to a particular problem. In GALACTICUS a DSL is used to specify the structure of components. 2043

**forest** A collection of merger trees that are linked together by virtue of nodes which jump between trees. 151

**forward descendent** The node with which the mass (or majority of the mass) of a node will become associated with at a later time. This type of descendent is usually relevant when considering how halos and galaxies evolve forward in time and should be distinguished from a backward descendent which is relevant when building merger trees. 311, 2041

**HOD** A halo occupation distribution (HOD) is a mathematical model describing the distribution of the number of galaxies (of some given physical properties) found in a dark matter halo of given mass.. 2043

**Lyman continuum** The part of the electromagnetic spectrum which is capable of ionizing hydrogen, i.e. photons with wavelengths shorter than 91.1267 nanometres and with energy above 13.6 eV. 142
**maggie** A unit of luminosity defined to be equal to the luminosity of a zeroth magnitude object in the AB magnitude system. 143, 168

**MD5 hash** The MD5 Message-Digest Algorithm is a widely used cryptographic hash function that produces a 128-bit (16-byte) hash value. In GALACTICUS it is used to encode unique labels for modules which are incorporated into file names. GALACTICUS uses the glibc crypt() function to compute MD5 hashes, but switches “/” for “@” in the hash (since “/” is inconvenient for use in file names). 332

**mergee** For a given node in a merger tree, the set of mergee nodes consists of all nodes which will undergo a galaxy merger with the node at some point in the future. 174

**Millennium Simulation** The Millennium Simulation is a high-resolution N-body simulation of structure formation in a cold dark matter universe. 181

**PAH** Polycyclic aromatic hydrocarbons (PAH) are large organic molecules consisting of fused aromatic rings. 2043

**parent** In a merger tree, the parent node of any given node that exists at time $t_0$ is that node to which it is directly connected in the tree at time $t_1 > t_0$. 173, 174

**primary progenitor** The progenitor of a given node which is regarded as the direct descendent of that node (often, but not always, the most massive progenitor). Other progenitors are considered to merge into this primary progenitor. 173, 174, 2041

**SAM** Semi-analytic models (SAMs) are a type of galaxy formation model utilizing simple parameterizations of physical processes to follow the evolution of galaxies through a merging hierarchy of galaxies. 2043

**UUID** A universally unique identifier—this is a label which uniquely identifies some object (in this case, a GALACTICUS model). 147

**WDM** Warm dark matter (WDM) is a hypothesized type of dark matter in which the particle has non-negligible thermal velocity at decoupling. 2043
